IT is said that no Chinese paintings survive that are older than the Eighth century A. D., the period of the great Wu Taotz. Of this artist many fantastic legends are told. It is said that at one time he was commanded by the Emperor to decorate a room in the Imperial Palace. Wu Taotz labored for months and at last the Emperor was summoned to view the completed work. The curtains were drawn aside and he was shown the picture of a palace with splendid gardens behind it. Full of admiration, the Emperor expressed regret that he could never own the reality, to which the artist made reply by walking up to a door in the foreground of the picture, which he opened, entering, and inviting the Emperor to follow him. At that moment, so the legend goes, the doorway suddenly closed, shutting from view the artist, and the whole picture suddenly vanished, leaving the Emperor standing before a blank wall.

Universal Brotherhood Organization

Central Office Point Loma California

THE needs of a growing city are so numerous, and the resources and possibilities of

this our city of San Diego are so great, that at first thought it seems impossible to select that need which is greatest. But a moment of reflection shows that the thing most needed is not any one material advantage, but some fundamental principle which shall render possible the attainment of them all; something that is now lacking in our corporate life, and which being absent, leaves a void that cannot now nor ever, bring us the realization of those hopes and aspirations which should lie nearest to our hearts.

Let us enumerate and consider some of the opportunities open to this our city of San Diego. First and foremost, it has the finest harbor on the Southern coast, and a geographical location which renders it naturally the gateway to the East, the portal to the Orient. Its site is such a picturesque maze of hills and canyons, that in the mind's eye of the landscape architect there at once arises a panorama of unparalleled beauty. On these hills should be hundreds of beautiful homes, bowered by trees, linked by countless drives, and dominated by hill-crowning public buildings of noble beauty.

Along the margin of the bay there should be many miles of wharves and warehouses. A network of railway arteries and electric nerves should bind them all into a living system, and connect them with the enormous mineral and agricultural wealth of the adjacent country. Great four-track trunk lines should give us an open highway to the immense markets of the Eastern States.

San Diego, the Bay, and the roads to San Diego, should receive the attention they so plainly deserve. Nature has done more than half the work already, and they await the skill of man to perfect them. They should be dotted with beautiful buildings and bordered with parks and gardens, to become the most beautiful pleasure-drives in the world. And last, and most important, is Point Loma, standing apart and yet connected, the natural site of the greatest institutions of learning. Here we can speak, not merely of what should be, but of what will be,—upon its rugged hills, a great white city of colleges and temples, a focus for the world's mental and spiritual life and light,—a great seat of learning where shall be taught "the true Raja Yoga, the laws of Universal Nature and Equity, governing physical, mental, moral and spiritual life."

In view of all these opportunities, what does this city of San Diego, the Portal to the Orient, need most? Can we not best answer by saying that it needs a new order of citizenship, a new standard of civic ambition, a new method of effort? Not that we should discard the loyal impulse and effort of our citizens toward a larger city, but take whatever of this spirit that resides in our community and add to it the knowledge that nothing great can be achieved, unless the foundation of effort is rooted in far-sighted wisdom; then can we hope and build not only for a larger, but a stronger and a truer city.

In place of mutually destructive individual effort, does it not need mutual helpfulness and unity of purpose? What might we not look for if we were to substitute the latter for the former; if, in place of pride in size and wealth, were to be substituted the ambition to excel in beauty, culture and morality; if, instead of a chaotic assemblage of hobbies, its policy of development were to be the consistent plan of some mind great enough to grasp and contain all the possibilities of this city's future? A mind, broad enough and deep enough to realize that separation of interests brings a poverty of fulfillment, so convincing of the truth of human brotherhood, that none can idly thrust it by. Does not this city need such a mind; awake to all the opportunities, resources, needs and possibilities that are right at hand, and finding such a mind, to follow its guidance? The world has very nearly learned the lesson that no one can truly benefit himself without helping others; nor can we help others without benefiting ourselves in more direct ways than most people would suppose.

Brotherhood can no longer be regarded by the world generally as only

What Needs a City Most?

Read at Isis Theatre, San Diego, February 5th, 1905

a fitting theme for the consideration of the metaphysician, something "without form and void;" its full force stands abreast of the world and

points with solemn finger to the idle bickerings of centuries; to the futility of selfishness.

Those who base their lives on the hope that after all, there may be some way to escape the penalty of unbrotherliness, stand convicted in their own natures of a crime against themselves.

I quote from Katherine Tingley's teachings: "Is it not a fact that this city, or any city, would be more prosperous and be marked for its culture, refinement and purity, if every man lived up to one of the teachings of Christ, that 'Man is his brother's keeper'? I say this because this city has many churches, and where one sees many churches, one always expects to find the Christ-life manifested in a *very large degree in every department of life, and especially in the home.* And is there not in this thought of so many churches, so many different doctrines, so many different interpretations, a remedy needed, a consolidation of spiritual interests? Where there is true spirit, there is enlightenment and then must follow right action. Right action leads to love of one's fellows. This creates unity in God's great family and leads up to the universal idea of universal love, the religion of the heart, oneness with the Infinite.

"Look at the contrast to this picture. What makes up, at this time, at least, a portion of our own public life? Study the actions of men, and judge them by their works, and you will see that the spirit of the old Inquisition is found manifest in modern form. Who are the Inquisitors? Do we find any signs of the Christ spirit manifest in these? Well may we hold in our thoughts the words of Christ, 'Let him who is without reproach among you, cast the first stone.'

"Unless we have a love of justice, unless this is even as a very breath of life in all departments of our national affairs, we cannot expect to see prosperity and peace in our midst. Let us protest against some of the present acts of unbrotherliness that form a part of our city's life; let us build in their place the spirit of brotherliness, and hold to it that when one of our citizens is being unjustly treated, we also are injured. A man must be judged by the good he does in his city, and when he is accused let there also be comparison as to the acts, the lives and the motives of his accusers.

"A higher order of citizenship embraces a thorough knowledge of these truths as well as their application to the life force of the city. It would then be easy to break away from the old idea that public spirit and civic patriotism involve and require great self-sacrifice. That is not true, and yet all true citizens will be ready at all times to make sacrifice for the city's welfare, not only from civic pride, but also actuated by the knowledge that any advancement of the city's welfare must bring direct results to the lives of the individuals."

It is the eternal operation of the law of Brotherhood, from which has forever radiated every aspiration toward the betterment of human conditions; its recognition is essential if permanent results are hoped for.

Strike forward with a new zeal, a new hope and a new motive. Let from every heart arise a plea for the fulfillment of a higher standard of civic life and then will come the power of attainment, for as Katherine Tingley says: "If the spirit of real brotherhood were in the heart of every man in this beautiful city, the prosperity and happiness would follow, which would make it one of the greatest cities in the Nation."

W. ROSS WHITE

For the Benefit of Enquirers

REGULAR weekly meetings of the Aryan Theosophical Society, established in New York City by William Q. Judge, the second Leader of the World's Theosophical Movement, are held every Thursday evening at 8 o'clock in Isis Hall, 1120 Fifth Street, San Diego, California. These meetings are intended to meet that large and growing body of earnest enquirers who desire to know more of the different tenets of the Theosophical philosophy. Students from the Universal Brotherhood Headquarters at Point Loma, California, conduct these interesting gatherings to which every truthseeker is cordially invited.

great analogy in Nature, which would perhaps explain the reason of the rise and fall of nations and races.

"But the house always changes its character when the new inmate comes, and when finally he gets settled down we can often tell from simple signs what sort of an inmate he is, if we know how to read those signs aright. Thus the plant growing up from the tiny seedling hides the real essence of the flower, and not until the time of blossom and bloom does it give a complete expression to that subtle spiritual part of it which we cannot see, but which we can detect in some cases in the delicious odour that is sent forth.

"What a vast change takes place in our ideas of education when we allow Theosophy to suggest the wisest course! This can best be understood by following the history of Katherine Tingley's Raja Yoga Schools and noting the self-reliance, courage and candour of both little ones and older ones.

"Then in middle life Theosophy solves the problems of our sorrows and failures. It shows that man need never be conquered however often he may be hindered or obstructed in his path. He is indomitable if he will but learn the lesson of life, poverty and sickness; and all so-called evils may be dispelled as clouds before a rising sun.

"Then the mystery of death loses its terrors for the student of real life. He sees in all nature the cyclic movement of everything in periods of activity and rest; and so the approach of the day when he will withdraw from the occupancy of his fleshly tenement to retire for a time to conditions in which his soul-power may be intensified, has no terror for him. On the contrary, it is welcomed as the much needed resting-time after a day of stern and constant conflict.

"Time will not permit us to extend these examples, which can be multiplied to cover every phase and condition of human life."

Mr. Crooke then added some remarks upon the history and nature of the Universal Brotherhood Organization, sketching the origin of the modern Theosophical Movement under H. P. Blavatsky when it was called the Theosophical Society and Universal Brotherhood, to the time when under Katherine Tingley it became the Universal Brotherhood Organization and Theosophical Society. Unique features in the present Organization were referred to.

In describing the series of lantern views which followed, illustrative of life and work in Lomaland and of other events in the development of practical Theosophy under the leadership of Katherine Tingley, Mr. Dick outlined the various branches of activity such as the International Brotherhood League, the Isis League of Art, Music and Drama, the Point Loma Industries, the Raja Yoga Schools and Academy, etc. The work done at Montauk and subsequently in Cuba was described up to the celebration of Liberty Day in Santiago de Cuba, and the subsequent Raja Yoga Schools there and elsewhere were also illustrated, as well as many details of the life of the children in Lomaland. Passing references were made to an ancient legend connected with Point Loma, and to ancient cities and temples in Mexico and elsewhere, relative to the immense antiquity of man on earth. The views illustrative of these points aroused much interest, and the whole series of illustrations and descriptive talk was followed, here as elsewhere, with very great interest. Care was taken to define the meaning of Raja Yoga as applied to child education.

The music provided was of an excellent character, and the whole meeting occupied two hours. A collection was taken up by the children for the building of Raja Yoga Schools throughout the world.

The children who took part in this meeting had come all the way from Groningen, and so on the next morning these "young Crusaders" with their elder comrades travelled to Groningen together.

Groningen is a clean, bright city with a population of about 60,000, and impressed us as the most American-looking city of Holland. We were greeted at the station with much enthusiasm. On reaching the rooms of the Centre, we found they had been decorated in various ways very tastefully through the work of the Boys' Club. Both Boys' and Girls' Clubs addressed us in English. It was held in the Concert Hall, Poelestraat, which was wonderfully well decorated with many pine trees, shrubs, etc. The appreciative audience filled all seats and many had to

A STREET IN GRONINGEN, HOLLAND

stand. The following is the programme (in original) of the public meeting held at Groningen:

UNIVERSEELE BROEDERSCHAP EN THEOSOPHISCH GENOOTSCHAP
(niet-politiek en onsectarisch)
OPENBARE VERGADERING

op Maandag 23 Januari 1905, des avonds te 8 uur, in het
Concerthuis, Poelestraat alhier

SPREKERS:

de Heer HERBERT CROOKE uit Londen
President der Universele Broederschap Organisatie in Engeland
en de Heer FRED. J. DICK
Uitgever-Redacteur van de International Theosophist te Dublin
Toespraken over Theosophie
in verband met de praktische levensvraagstukken

PROGRAMMA:

- 1 Muziek: Impromptu No. 4 (op 90) - - - - F. Schubert
 - 2 Introductie en toespraken van kinderen der Lotusgroep
 - 3 Muziek: Adagio Sonate Pathétique - - - - L. v. Beethoven
 - 4 Toespraak van den Heer H. CROOKE
 - 5 Muziek: Ballet uit Rosamunde - - - - F. Schubert
 - 6 Toespraak van den Heer F. J. DICK
 - 7 LICHTBEELDEN van gezichten uit Point Loma, het Hoofdkwartier der
Broederschap
 - 8 Muziek: Hochzeit des Figaro - - - - W. A. Mozart
 - 9 Beantwoording van ingekomen vragen
 - 10 Muziek (slot): Egyptische Marsch - - - - J. Strauss
- De toespraken zullen worden vertaald

TOEGANG VRIJ

The below is a translation from the *Provinciale Groningen Courant*, Jan. 24, '05, of the same meeting:

The Universal Brotherhood held a public meeting yesterday evening in the rear-hall of the Concert House. The hall had been interestingly and freshly decorated and the stage was arranged in accordance with the character of the organization. In the hall were tall fir-trees and palm-trees, while the stage was white. After a short time four little girls appeared on the stage, with wreaths of flowers in their hair, wholly clothed in white costumes after the ancient Greek fashion. In their arms they carried bunches of flowers and garlands of flowers hung around their necks. This interesting picture was still more enhanced, when the children gave little speeches. In the meantime some musical selections were very well rendered. Mr. Crooke, who is the President of the Universal Brotherhood Organization in England, gave an address in English, which was interpreted by Mr. Goud.

The English speaker said that he was very glad to be in Holland and to be able to speak to such a large audience. He sketched the deep significance of Theosophy, which is so often misunderstood. "Theosophy is the art of living," he continued. "It teaches that all men are of divine origin and that the power, love and beauty of the Theosophical life can be the appanage of all." He compared life to a large school-house, where we go in the morning and from which we come and rest in the evening, day after day, life after life; where we suffer for our mistakes and rejoice over the blessing of the victories gained over our ignorance.

The second speaker, Mr. Fred. J. Dick, Editor of the *International Theosophist* of Dublin, had a very good interpreter in Mr. L. F. Schudel, especially in the explanation of the lantern pictures. Mr. Dick said, in part, that man has existed already many millions of years, and that he has lived many lives. "This is," said the speaker, "confirmed by the most recent archeological discoveries."

In a series of very interesting lantern views the speaker showed the life and work of the Universal Brotherhood as it is directed by Katherine Tingley at Point Loma, California. Afterwards, opportunity was given to the audience to ask questions, which were appropriately answered by Mr. Crooke. RECORDER

O FAVOURS EVERY YEAR MADE NEW!

WHITTIER

O FAVOURS every year made new!
O gifts with rain and sunshine sent!
The bounty overruns our due,
The fulness shames our discontent.

We shut our eyes, and flowers bloom on;
We marmor, but the corn-cars fill;
We choose the shadow, but the sun
That casts it shines behind us still.

God gives us with our rugged soil
The power to make it Eden-fair,
And richer fruits to crown our toil
Than summer-wedded islands bear.

The Survival of the Fittest

Nature exists for the purposes of soul.—W. Q. Judge

SOUL is universal and nature ever works for its high ends. From this view-point "the survival of the fittest" has a higher meaning than is possible for materialistic science to give it. In place of blind selfishness and cruel heartlessness, we have wisdom, justice and divine compassion working together for the highest good of all, the unfolding of perfected souls.

It is through experience that knowledge is gained, through conquest of the lower nature that the higher is unfolded. Sacrifice is a law of growth. The seed must die as a seed to live as a plant. Before any life can dwell in a higher form it must sacrifice the lower. And when any form can no longer serve the indwelling life, that form has to be sacrificed. Thus it is that the bodies of all die when they have ceased to serve the purposes of soul.

There is compensation for all loss, and high reward for high service. He who loses his lower life in service of the higher finds his life in the higher.

There is one Great Life which permeates all, and in which all beings exist, one great Indwelling Soul of which all souls are parts. Its purposes are universal and yet it has a care for each individual, however seemingly small. "Not a sparrow falleth to the ground" unnoticed or unrecompensed. Not a wrong is done that will not be righted, and the greatest suffering it brings is to the wrong-doer, who is thereby helped to the comprehension of a needed lesson.

It is not nature that is cruel, but man, who has departed from nature's ways in his selfish seeking and has impressed his own character on less-developed creatures.

It is the divine in humanity, the wise, loving and compassionate, which is fittest to survive. Physical strength, material wealth and brilliant intellect with a selfish nature, may enable their possessors to crowd others to the wall or crush them under their feet in their mad rush for power and place or whatever gratifies the lower man. But what surviving power have all these things? They fail to satisfy and pass with the death of the body, remaining only as seeds of pain, or tendencies to further folly which likewise brings its harvest of suffering. But these fires of pain will in time burn out the dross and leave that only which is fit to survive, and wrong-doers will in time, through suffering they bring upon themselves, learn to take the better way.

Whoever lives a life of service for the welfare of all beings, comes into oneness with the Divine Self of the world and allies himself with that which is ever-enduring. Such a one will ever survive. STUDENT

We would found schools which would turn out something else than reading and writing candidates for starvation. Children should above all be taught self-reliance, love for all men, altruism, mutual charity, and more than anything else, to think and reason for themselves.—H. P. Blavatsky

The Nature of Truth

WHAT Truth is and how it is to be discovered and tested has been the subject of many philosophies which, because they lacked the fundamental principle, came to no definite conclusion. In the light of *Theosophia* it becomes apparent that Truth is that which endures. In mechanics an exact balance is true, in music a concord is true, in geometry proportion is true, in colors a harmony is true, in human affairs Brotherhood is true and tends to perpetuate itself.

In higher planes are higher truths and it is our purpose in life to reach beyond life to spiritual Truth—to that which is incomprehensible to us at present. The only test of a thing, whether or not it is true, is Time, and even Time appears to tolerate some falsehoods which Duration will not.

Above all things Truth is silent, "The Gods do not philosophize nor seek to become wise, for they are so," said Socrates, and in like manner we may often have occasion to observe that he who knows the most, requires the fewest words to say it, and it is to be noticed that the greatest ideas are expressed in the shortest words. God, Law, Time, Space, Force, contrast oddly with the cumbrous polysyllables which are used to segregate minute portions of more or less exact knowledge, like fences to prevent the admixture of any other scrap of information.

Truth among the chattering ignorance of men is like the rock jutting out in the tide. The wave breaks over it in noisy tumult of foam and spray, under which the rock is hidden, but when the wave recedes the rock is seen, as unmoved as before. R. W.

FRIENDS IN COUNSEL

DEAR COMRADES: The business ideals of those who receive a commercial education at the Academy will differ very widely from those prevailing in the world today. Too often a business life is regarded as a disagreeable expedient for gaining a livelihood, to be discarded with relief on retirement with a competency. To the man of business who graduates at Point Loma his occupation will be looked on as a definite vocation, a "call" or summons to the service of his fellows. Intent upon the guiding hand of destiny as revealed in the shaping of circumstances, he will gravitate unerringly to the exact position which the Good Law assigns, in perfect confidence that larger opportunities will open as fitness grows.

Should he embark upon a mercantile career he will regard himself as one appointed in the public interest to bring about exchange of mutual benefits between producer and consumer and as at the approach of two electric poles a spark leaps forth, so will a keen delight attend on each transaction. His aim will be to satisfy the varied needs of man, and not to gratify his love of gain. The profits that arise in the course of trade he will consider as the means of maintenance meted out to him at the hands of the Law whose servitor he is, and he will not divert it to purposes of private indulgence. He will be as selfless as the winds that waft his vessel's sails, as free from private aims as are the tides on which his barges float. His mind, enlarged beyond the narrow circle of the self, will reach out to far-off lands, and sensing the fluctuations of international supply and demand, he will shape a far-reaching and enlightened business policy.

Such a selfless server of men will be forever freed from any fear of want. Employment would beckon him from every side and occupied in directing the stream of commodities, all good things would flow his way. His character would be reflected in the massive simplicity of office and warehouse, for his surroundings would be nobly planned with that deliberation due to the scene of his chosen life-work. Never will he importune for patronage nor seek to draw away another's trade. His reputation for fair-dealing and the quality of his goods will compel confidence and ensure a steady volume of increasing trade. The stream of foreign merchandise that passes through his hands will bring a living, human touch from those concerned in its production and faintly whisper of the lives of brothers far away.

Across the placid waters of the bay, Port Orient lies, as yet in embryonic sleep; but destined to become a great emporium of international trade. At this busy center a new type of merchant princes will ply their benevolent activities, and sound a new note of commercial morality whose deep reverberations shall re-echo through the markets of the world and shall affect all men to their betterment. STUDENT

MANHOOD

THERE exist
 Few fit to rule themselves, but few that use
 Their intellects intelligently. Then
 Well for the whole, if there be found a man,
 Who makes himself what Nature destined him,
 The pause, the central point, to thousand thousands,—
 Stands fix'd and stately, like a firm-built column,
 Where all may press with joy and confidence.—*Schiller*

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question What is meant by the statement in the *Bhagavad Gita*, "But for him that maketh no sacrifices there is no part nor lot in this world; how then shall he share in the other?" Does not the contrary usually appear to hold good, at least so far as *this* world is concerned?

Answer There is a very beautiful meaning underlying the word "sacrifice." Usually it is taken to mean merely the giving up of something, but the word itself means "to make sacred, or holy; to consecrate." And if we take into consideration man's real nature and the purposes of evolution, it is clear that unless he does sacrifice, *i. e.*, in the sense of making sacred at least a part, and eventually the whole of his life, he cuts himself off from the world's true progress. And the same is true also of the word in its ordinarily accepted meaning of giving up. If we desire the higher life, we must give up the lower. If we desire progress, we must give up the limitations and hindrances that hold us back.

There are several parallel statements to that quoted above, of which we select two: "Give up thy life if thou would'st live." "He that saveth his life shall lose it; and he that loseth his life for my sake, the same shall save it."

The ideas underlying the words, Sacrifice, Brotherhood, Duty, are all related, and have their roots in man's essential divine nature. But it is a great mistake to think that either sacrifice or duty is something disagreeable. If we make them so, we miss altogether their meaning, and indeed fail in both, following instead some will-o'-the-wisp of the lower nature. Where the contrary appears to hold, as said in the question, where man attempts to cheat himself in trying to escape sacrifice, and duty, just to that extent does he lose his hold upon not only the next world, but even upon this. He begins to lose his hold upon life itself, for he misses the true purpose of life. Those who have sacrificed, who have sought to perform faithfully their duty, who have made Brotherhood not a sentiment merely but a fact of their lives, know that this is so. And the only way to prove it is to experience it, and then one may know what it is to have part and lot both in this world and in the other.

STUDENT

Question In the Theosophical division of man's nature, what is it that distinctively marks the human stage of development? Ruskin somewhere says, "Human nature is a noble and beautiful thing; not a foul nor a base thing." How is it regarded from the standpoint of Theosophy?

Answer The term "human nature" is generally used more or less loosely, and with very different signification, by different writers, as will be seen from the following. For instance, we speak of "man's inhumanity to man," but at the same time we say, "To err is human, to forgive divine." Then again we speak of an act or sentiment as being contrary to human nature, while to act humanely is to act with compassion.

According to the teachings of Theosophy, man is compounded of three natures, that is, there is the higher nature and the lower, while he himself stands midway between the two. His *human* nature is thus doubly influenced, and he holds as it were, the balance of power, on the one hand responding to the higher divine nature, thus obtaining power to dominate and make subservient the lower; or, on the other hand permitting himself to become enslaved by the animal nature, cutting himself off from all the gracious, ennobling influences of the divinity within him.

Thus, the chief characteristic of human nature is duality, with the power of choice. Born from above, it brings with it the power of will to ally itself either to its source, or to prostitute its heaven-bestowed powers in the gratification of the senses. This power of choice neces-

sarily implies mind, reason, judgment, self-consciousness, and it is these that are usually said to mark the human stage of development. And while these human powers differentiate man from the animal, yet it is the degradation and misuse of them that cause him to sink below the animal and to become that which the mere animal never is, not only a hinderer, but an actual menace to the orderly progress of nature. For man to take his rightful place in evolution, he must link his human nature to the divine, and with this as his guidance subjugate and transform the lower.

In view of the above, we might change the quotation given so as to read, "Human nature can be made a noble and beautiful thing." Either we must make it so, or if we do not, it will, coming under the sway of the lower animal nature, become "foul and base." H. P. Blavatsky, speaking of the causes which make Universal Brotherhood a Utopia at present, says that of these "first and foremost is the natural selfishness of human nature. This selfishness, instead of being eradicated, is daily strengthened and stimulated into a ferocious and irresistible feeling by the present . . . education, which tends not only to encourage, but positively to justify it." And then she says that Theosophy alone can eradicate it. By the study of Theosophy we may come to know the complex nature of man, and by the practice of Theosophy we may bring the whole of our being into harmony, transforming human nature into something divine, regaining man's lost heritage of kinship with the gods.

STUDENT

Question In general literature, the terms mind, soul and spirit are mostly used indiscriminately, and even in theological writings there seldom appears to be any distinction made between soul and spirit, but I understand each of these terms has a distinct meaning in Theosophy. Will you please put me in the way of getting this, or explain direct?

Answer For the clearest explanation of these terms as used in Theosophical literature the enquirer is referred to *The Key to Theosophy*, by Madame H. P. Blavatsky. And it may be said here for the benefit of those who cannot readily obtain that work, that these terms are definitely used in Theosophical literature. The term "soul" is the one that is perhaps used with the most latitude, but generally speaking by "soul" is meant the man himself, self-conscious, the unit which calls and recognizes itself as "I." Now this "I" has a very wide range of experiences, at one time rising to great heights of spiritual consciousness, touching as it were the very hem of the garment of divinity; sometimes sinking very low, into degrading selfishness and sensuality; but, usually neither rising very high nor sinking very deeply, but answering to greater or less extent the promptings of the diviner side of our being or the impulses of the animal nature. And so to designate the "I" in these three stages, and to make clearer the reality of these parts of our complex nature, the terms "divine soul," "human soul," and "animal soul" are used. But where the term "soul" is used without any further designation, it is usually perfectly plain from the context what signification should be placed upon it. To illustrate the special meaning attached to the term "spirit" in relation to "soul" the following extract is taken from one of H. P. Blavatsky's writings. It is given by her as a quotation from a disciple's catechism:

"Lift thy head, oh disciple; dost thou see one, or countless lights above thee, burning in the dark midnight sky?"

"I sense one Flame, oh Master, I see countless undetached sparks shining in it."

"Thou sayest well. And now look around and into thyself. That light which burns inside thee, dost thou feel it different in anywise from the light that shines in thy Brother-men?"

"It is in no way different, though the prisoner is held in bondage by Karma, and though its outer garments delude the ignorant into saying, 'Thy Soul, and my Soul.'"

Spirit is the ocean of being, the souls of men are the "countless undetached sparks" or drops within that ocean. Or, considering the dual aspect of all existence, the term "spirit" is sometimes used to designate one pole of Being, the subjective, and "matter" the other, the objective. And "mind" is one of powers, aspects, instruments of the soul, by which it comes to know itself and its relation to the Universe. But so much of the philosophy of life is wrapped up in the meaning and right use of these words, that it is impossible here to do more than hint at an explanation. So, in conclusion, the enquirer is again urged to read. STUDENT

A Cry from the People

IT is one of the functions of the NEW CENTURY PATH to illustrate, by the voice of the people as reflected in the Press, the claims made by Theosophists. What follows is a specimen.

Theosophists maintain that the people in the world are heart-aching for the Truth, which they cannot find. Theosophists maintain that the whole of man's nature should be religiously cared for—body, mind, and Soul. Theosophists maintain that the Light comes from within, from the Divinity in man.

We read in a recent newspaper about the proposal for a "Workman's Church." It is to have Assembly Hall, Gymnasium, Reading Rooms, Kitchen, Bathrooms, Garden, etc. It is to be "a haven of rest for all who are engaged in the world's work, and who are desirous of fighting the battle of life honorably and in accordance with their highest aspirations."

The object of the church should be, not merely to come together Sunday after Sunday, for what is termed "worship," but rather that the members should realize that all worship should take the form of recognizing and obeying the prompting of the *Holy Spirit within, that makes for wholeness and health*. "In all thy ways acknowledge Him," not only on the first day of the week, when those who attend religious services are listening to the experiences of men and women in the past; but also in working for the sustenance of the body on the remaining six days; and in eating, drinking, working, trading, and in amusements, etc. The building or sanctuary should simply be the means to the end; and the end or result aimed at ought to be, neither the affirmation nor the denial of a belief in a future life, but *the promotion and development of the life that now is*—the life of the individual in its *physical, moral, and intellectual* aspects; the life of the *family*; the life of the town or city; the life of the nation; and ultimately international life, until the peace of the world becomes an actual fact; because humanity has learned that the angels' song of old was not merely a poetical fancy, but that *the remedy for the world's strife and consequent woe was to be found in the manifestation of "good will towards men," which is the fulfilling of the law of Jesus*.

In this project we recognize at once the urgency of the appeal, the truth of the intuition, and the helplessness as to the means of realization. What is to distinguish this church from a mere club? What lines will the moral culture take? Is not the bond of union for the most part a negative one? Where is the organizing and controlling power that will maintain the atmosphere of the church at its proper level and harmonize all differences?

Does not our heart go out to the struggling people in the world, doing their best under such difficulties; when we know that Theosophy and Universal Brotherhood gives the key to their problems—a nucleus around which these scattered ill-aimed efforts can gather? STUDENT

Must Everything Bow to the Dollar?

WE have had instances in the United States of the way in which wealthy people are able to dictate terms and conditions to our educational institutions by endowing them; and a similar instance has recently occurred in England. The University of Oxford has accepted the offer of an individual, famous only for the wealth he has amassed, to endow a professorship of a subject connected with the manner in which he got his wealth, and strictly limited in its scope by his personal fads and views.

We should have liked to see the grand old university independent enough to say, "Go and build a university of your own if you like." But for the want of people to give unconditional endowments, our institutions must take what they can get, or go without. The old feudal revenues no longer yield an adequate tale. These dignified seats of learning have become democratized—a necessary change doubtless, but one which we hope will eventually lead to a still more dignified status of learning. E.

English Notes

(By our London Correspondent)

LONDON, February 10th, 1905

THERE is a prospect of Paris coming to London. In other words, a French syndicate is negotiating to secure the Aldwych Site at a rental of £55,000 per annum. (The Aldwych is the new avenue that has been made between the Strand and Holborn). The object in view is to establish a kind of Parisian centre there. Art galleries, a French theatre and a café of distinction form one part of the scheme. Then there are to be ornamental gardens enclosed by shops. The shops are not to extend beyond a first floor, and their roofs are to form a promenade. There is likewise to be an open-air theatre for summer use. The shops will be chiefly devoted to the sale of French merchandise.

This is a highly practical method of educating the English public in the ideas of our artistic neighbors across the channel. But it provokes the reflection: has London anything to give in return? What feature peculiar to the huge metropolis is there that Paris would be thankful for? I suppose we must wait until the Raja Yoga system is firmly established in our midst before suggesting an exchange of ideas.

A few Sundays ago I was present at a rendering of "The Little Philosophers," by some of our East-London Lotus Buds. Could that scene—that tiny bit of London—be magically transported to Paris, I am sure that our friends would realize that London has really something artistic to offer—if only a few flowers, so to say. And these little flowers make others to grow like them, wherever they are scattered. Such is the magic of Raja Yoga!

Music is daily becoming a more absorbing theme. People differ as to the worth of various revival efforts that are being made on all sides. But they seem to realize that the musical element characteristic of them all is the moving power, and not the preaching. In other directions there is much thought about the power of harmony, and a keen interest is shown in its teachers. As an example, there is in a popular monthly this month, a graphic account of Sevcik (pronounced Shefcheek), the teacher of Kubelik, Marie Hall and other famous violinists. He refused three hundred pupils last year. Those whom he accepts are devoted to him, though he is a severe task-master. Eight hours practice per day is his *minimum* demand.

Perhaps the ordeal would not be so severe if those pupils abandoned the idea of fame and pecuniary reward as a result of success.

Dancing as a Fine Art

THE French dancing schools and all who regard dancing as one of the fine arts, are making an effective protest against the introduction of the "cake-walk" and other forms "of inartistic terpsichorean movements borrowed from the black people of San Domingo and elsewhere." An association has even been formed in Paris to conduct the campaign—The Academic Society of Professors of French Dancing. Instead of the cake-walk, this association will urge and exhibit the claims to revival of the eminently graceful and stately minuets of bygone generations, dances to which the old masters were not ashamed to write their best music. In those days dancing was certainly one of the fine arts and a very beautiful branch of education. There is no reason why it should not take the same place again. A.

Norway's New Way With Drunkards

The Norwegian authorities (according to "Le Bulletin Médical") are using a trenchant method with drunkards. The patient is placed in a room under lock and key and kept there alone. Food is supplied in plenty, but nothing whatever enters the room that has not been soaked in or strongly flavored with alcohol in one of its popular forms. For a day or two the regimen is enjoyed. Then it becomes gradually monotonous and finally utterly intolerable to the palate. It seems that this disgust persists, and that the patient is finally discharged with every prospect of a permanent cure. PHYSICIAN

Disharmony Among the Sciences

UNDER the reign of self-seeking, everything suffers from lack of coördination. Research and speculation, for instance, are a notable example of this. We have many sciences, and they do not pull together. One can buy a text-book of logic giving the laws of reasoning and full of precise and careful distinctions. But it is notorious that most scientific reasoning is blissfully innocent of strict logic. Physicists not only do not know anything about categories, abstractions, concepts, entities, and so forth, but positively glory in that ignorance. And the man who writes the text-book on logic is content to let it remain mere unapplied learning.

Could anything be more absurd than a pair of books, one on the laws of accurate reasoning and the other on the nature of the universe, the

former purely academic and the latter utterly illogical?! It is as if two explorers were to divide their labor so that one would do the exploring while the other sat at home and studied the map.

If logic were rigorously applied it would lead to truths instead of to where people want to be led. Theosophy is logical, and H. P. Blavatsky and W. Q. Judge in their writings show how the ancient teachings as to Man and the Universe are logically deducible from admitted facts and premises. But how many speculators are bold and disinterested enough to follow logic whither it will lead them? The various sciences do not always cooperate successfully. Thus Palæontology and History are mutually inconsistent on the question of time. The age assigned to Man by Palæontology, though far too short, is far greater than that recognized by history. Astronomy again gives still another scale of chronology.

Anatomy and physiology go very deeply into the structure and functions of the visible aspect of our organism. But when we seek information about the invisible factors, such as emotions and will, we must apply to an altogether unrelated science—that of mental philosophy. There is no link or common ground between them.

The most familiar instance of this separation is of course that between religion and science; and daily life is guided by neither one of these, but by that mixture of tradition and rough-and-ready instinct known as "common-sense."

When brotherhood brings back unity into life, perhaps all these heterogeneous elements of speculation may become more blended and mutually helpful. A common purpose will effect this. It is the diverse aims of speculators that make them so disunited: profit, fame, curiosity. All should be subservient to the one science—the science of life.

H. T. E.

The Solution of England

THE tendency which England is evincing to take a vast bath, is to be resisted. It is an old tendency. She has yielded to it three times since the days of Lemuria. Being allowed her own way, she disappeared wholly beneath the ocean waves. But perhaps the Lemurians and Atlanteans were occupied with other matters.

It appears that in the ten years ending 1867 no less than 57 million acres either fell into the sea or were gradually submerged. The same in the years 1870—80, '80—90, and '90—1900.

Besides this, the sea is eating into fertile land more insidiously, making useless marsh of it.

So it is time to move, especially as opportunity is here presented for the useful employment of the army of the unemployed. As a preliminary measure the products of the dredging of rivers and estuaries will no longer be dumped into the sea but used to extend the foreshore and consolidate marshes. This has been done before, and areas of immense value reclaimed and made cultivable. Sea-walls of various kinds will also be constructed at the bases of cliffs and the mouths of newly formed inlets.

The work does not look so formidable if one remembers what Holland did and does to maintain her existence. She keeps 1550 miles of sea dykes in efficient repair at an annual cost of hardly less than sixty-five millions of dollars. One of these dykes is nearly 13,000 feet long and 23 feet high, broad enough on the top for a railway. STUDENT

Another Genesis From Africa

VERY unexpectedly, the Adam and Eve story has been found among a little-known people in German East Africa—the Masai, a race distinct from the surrounding Blacks. How they came by the story is not easy to say; but it is very near to—but differing in certain interesting particulars from—the Garden of Eden narrative of Genesis. Munzinger, the well-known African traveller and specialist, thinks that the Masai, the Babylonians, the Hebrews and the Arabs owe their religious traditions to some far-back common "Semitic" source, and that the Masai variant is not in any sense derived from the Hebrew account.

In the Masai story the world was originally a void and dry desert in which lived only a dragon. To do battle with him God descended from heaven, slew him and watered the land with his blood, so that it became fruitful. Where the contest had taken place was now Paradise. Then were created the sun, moon, stars, the planets, the animals, and finally man. Man was created from heavenly materials; woman was added

next, made out of the earth. They were to eat every fruit except that of one tree, and in their innocence God frequently visited them, coming down from heaven by means of a ladder. They ate (of course) of the forbidden tree's fruit; the man duly blamed the woman and the woman the serpent—who in this story was three-headed. Then followed a state of increasing wickedness, and finally came a deluge which drowned all the sinners.

This is not exactly the first or the second of the two discordant accounts in Genesis concerning man, woman, and the animals; and there is only one tree. The legends of many other peoples present points of analogy with it. H. P. Blavatsky made it one of her tasks to collate them, and obtaining thus the original of which they are parts, showed it to be *history*—man's memory of his own past. STUDENT

Japan and Korea

ONE wonders how far the Koreans appreciate what Japanese victory in the present war means for them. They might, if they but consider what Japan has already done. There is a Japanese railway from Seoul to Chemulpo; another from Seoul southeasterly to Fusan, the nearest point to Japan, and an ocean ferry completes the junction; another from Seoul to Wija, the northern border city; and another is building to Gensan, the eastern treaty port. Besides these four, radiating in four directions from the capital, there will be connecting lines and lines along the coast.

As a lesson in good government—the Korean administrative system is corrupt enough to make a Turkish tax collector envious—Japan proposes to take over one of the eight provinces of the kingdom, develop its great and almost unworked resources, establish justice and humanity of administration—justice is no part of the ideal of Korean law, and nearly all punishments involve torture—and open it up for trade. If the Koreans like it, the same will be done for them in the other provinces. And in that case Korea will cease to waste her money on an army and a system of ministers and representatives at foreign courts. Japan will manage the whole thing for her, and the country will be fully opened up for trade. That means a great deal. The rich mineral deposits are almost untouched—gold, silver, copper, iron and coal—gold being even *forbidden* to be mined! Sheep and goats may only be reared by the king, and by him only for religious sacrificial purposes.

From which it may be judged that the peasantry is among the most abject, the most poverty-driven of the world.

On the whole it may truly be said that if Korea comes fully under the influence of Japan, it will mean that her people will take a step forward of some centuries in as many decades. STUDENT

A Mid-Pacific Cable Station

ONE wonders whether the archeologist of the far future, dredging in the Pacific, may ever discover the remains of a forgotten cable? When the last section of the 8000-mile-long strand was laid in the middle of last year, wireless telegraphy had already come to stay; and every month completes a step in its practical availability.

The wire rope ties the two sides of the Pacific together; to be more accurate, ties Manila to San Francisco. To be still more accurate, it ties Manila to the island of Guam, Guam to the island (or rather sandheap) of Midway, Midway to Honolulu—1200 miles—and the last to California.

Midway island consists of three heaps of sand, sticking up a few feet—forty feet in one place, much less elsewhere—above the level of the limitless water. The largest of the three is a little over a square mile in area, spotted with a little sickly grass and a few shrubs, and inhabited mainly by albatrosses. Somehow or other, digging reveals a little fresh water. Round the three runs a coral reef, 15 miles in circumference, 5 feet high, and of considerable breadth. It is this impregnable protection against the ocean that makes it possible to keep a telegraph station on the island.

The entire permanent colony consists of 16 persons, of whom one is a lady. There are also three dogs and a cat. They are made as comfortable as possible and they know the far-eastern news several minutes before San Francisco knows it. Perhaps that is a trifling compensation for a life that must in some of its aspects be appalling.

As the wind can rarely cease, and there is an occasional storm which blows the sand into the ocean at a speed of thirty miles an hour, it is curious that there should be any soil at all above water level. STUDENT

Radium in Thermal Springs—Baden-Baden's Precious Mud

IT is often seen how universal testimony in favor of an occurrence is disbelieved, in defiance of all laws of evidential probability, on the sole ground that the science of the day does not happen to have yet discovered a scientific explanation for the occurrence; and, how, when at last science does discover such an explanation, the ancient testifiers are admitted to have been truthful, but sneered at as charlatans for making a miracle out of a perfectly natural phenomenon.

Thus we know now that some of Paracelsus' famous cures were "nothing but opium."

In the same way the slime from the thermal springs of Baden-Baden, for hundreds of years supposed by the superstitious to have healing properties, but by scientists rejected as valueless because *they could find nothing in it*, is now shown to be valuable as a remedy after all. But then the ancients were charlatans, because there is nothing miraculous in the mud,—only radium!

According to reports, this "radium is forty times more powerful than that found in the residuum of cold-water springs or in mud-baths."

What a lesson this ought to be to the wise. Whenever anything is proven by overwhelming testimony to be true, remember that the lack of a scientific explanation does not invalidate the evidence. It is the duty of scientists to find explanations for what happens, and this duty they usually discharge with really quite commendable zeal. STUDENT

Useful Marriage Regulations in France

IN France every person who is married by the Maire, representing the civil authority, is presented with a small book. On the first page is a space to record the ceremony, then a page devoted to the life of the parents, then forms for recording the births and deaths of children. Finally there are several pages on the care of children, the proper foods, and the treatment of ailments; followed by information about consumption and how to hinder its spread.

This is at any rate something done in the direction of counteracting that awful ignorance and carelessness with which marriage and progeniture are entered upon. With peoples living close to nature, natural instinct may be a sufficient guide. But where artificial conditions of life prevail, there must be knowledge. STUDENT

Wabash Pearls

THE pearl-mussel is adding quite largely to the tale of jewels produced by the United States, and Wabash pearls are becoming celebrated. Hundreds of people are hunting mussel in the Wabash river, and a lucrative trade is made both by finders and speculators. The pearls have a fancy price in Paris at present, which enables skilled dealers to place their wares where they will realize a large profit over the prices paid to the finders in America. Pearl-mussel has been produced in many rivers of the world, but the Pacific yields a more abundant supply from a sea-mussel. The Wabash however seems to be quite exceptional in this respect among any of the rivers of the three continents. STUDENT

Lake Tchad Said to be Disappearing.

LAKE TCHAD, in Africa, south of the Sahara, which has an area of at least 10,000 square miles, is reported by a recent expedition to be gradually disappearing. It was estimated that the lake shallowed at the rate of five inches a year. The region around is a barren waste of mud and sand hundreds of miles in extent. This lake has long been known to vary in size according to season, and it is possible the explorers may have been deceived by this circumstance. E.

Notice

Attention is called to the importance of having all remittances to or for any of the different Departments of the International Theosophical Headquarters at Point Loma, California, sent either by postoffice money order or by draft. Otherwise responsibility for any losses must fall upon the sender. (Signed) CLARK THURSTON,

Chief of Finance.

Frontispiece—William Quan Judge

THIS week's cover-page of the NEW CENTURY PATH contains the face of Wm. Q. Judge, the second in the line of succession of the world's Theosophical Leaders. Mr. Judge succeeded to the Foundress of the Theosophical Society, Helena Petrovna Blavatsky. A successful lawyer, a brilliant writer, and a man of extraordinary insight into human nature, he was well fitted to carry on the great humanitarian and philosophic work of H. P. Blavatsky.

Brief Glimpses of the Prehistoric World

Archeology
Paleontology
Ethnology

Myths of the British Isles

MYTHS, to the Theosophical student, are portions, more or less fragmentary, more or less altered, of those wise books wherein was recorded in symbolical language the burden of the ancient Divine Science. Everywhere, when we trace back to the early times of a race or nation, we come upon these myths, similar because derived from a common source.

In Great Britain and Ireland, for instance, we find the same. In a recent book on the mythology of the British Isles, the author points out that the British, while they derived their energetic empire-building faculties from Anglo-Saxon sources, received from the Celtic side "that poetic vision which has made English literature the most brilliant since the Greek."

The Celtic mythology falls into two divisions: the Gaelic, in Ireland and Scotland; and the Brythonic or British, in England and Wales. The former is the more romantic. In it we find the familiar and universal story of the struggle between Light and Darkness; as to which the ordinary archeologist expects us to believe that all this vast and complicated dramatic machinery, together with the awe and reverence attaching to it, was merely a way of describing astronomical phenomena. There are fights between the family of the goddess Danu, dwelling on land, and the Fomors, giants living in the depths of the sea. The former win by the aid of Lugh, the Sun-god.

In the British legends, Arthur and his knights play an important part. There are several possible theories as to Arthur. Here are a few:

- (1) He was a historical character, whose adventures have been exaggerated.
- (2) He was a fictitious character.
- (3) He was a real character, whose name and deeds have been utilized as material for a sacred myth.
- (4) He was a King-Initiate, belonging to the period when our Celtic ancestors had not lost the early Aryan wisdom.

One of the races said in Irish tradition to have immigrated into Ireland is the Tuatha Dé Danann, which means "the tribes of Dé and Ana;" Dé being God, and Ana the mother of the Irish Gods. Hence archeologists do not know whether this was really an invading race or a cosmogony.

Instances of present-day survivals of the Celtic mysteries are found in the festivals, May Day, Midsummer Day, and Hallowe'en, and the pole and bonfires associated therewith; also in the holy wells, stones and trees.

A Treaty More Than 6000 Years Old

TEL-HOH in South Babylonia is one of the numerous places where excavations have recently been made. A magnificent palace, erected 2700 years B. C., has been discovered.

This palace was built on the ruins of a still older building.

Adam must have built that older building!! Several temples and other minor buildings were also discovered. In one mound was found a fragment of sculpture on which was engraved the text of a treaty date, B. C. 4200, 196 years before the creation of the world. The treaty is between an early Assyrian king and the inhabitants of Tel-hoh.

STUDENT

Antiquity of Oxford

OXFORD the town can date its origin back to the building of a nunnery in honor of St. Frideswide in or before the Ninth century, on the site of the present cathedral. Its name is found on coins of Alfred as *Oksnaforda* or *Orsnaforda*. It is mentioned in the *Anglo-Saxon Chronicle* under date 912. It was important in the early Eleventh century both as a stronghold against the Danes and as a meeting place for *gemots* or national councils. The *Domesday Book* contains a minute survey of the town (1086). The beginning of Oxford as a center of learning dates back probably to the Twelfth century. At this time it was already recognized as such; and very soon it became the chosen refuge of a number of scholars who had returned from France. For France, up till then a recognized center of culture, was expelling all foreign students from her domains.

STUDENT

Interesting Discovery at Tara

An interesting relic has been found near the hill of Tara, where the Irish kings used to be crowned. While some workmen were occupied in leveling a barren field to render it fit for cultivation, they came upon an ancient jewel in the gravelly subsoil. It was oval in shape $1\frac{1}{2}$ inch by $\frac{3}{4}$ inch, with a substantial gold framework of exquisite workmanship. On the front was inserted a dark grayish semi-transparent stone, with veins of a lighter color, surrounded by twenty-six small pearls of great brilliancy, of which four have been lost.

STUDENT

Chinese Character and Industries

DR. BERTHOLD LAUFER, who has just returned from a several years' stay in China, has brought with him a large collection of articles for the American Museum of Natural History. In lecturing on these, he made some interesting remarks on the Chinese themselves.

The Chinese are usually contrasted with occidental peoples; but in one respect at least they resemble occidentals and differ from all other orientals. This is in the matter of furniture. They are the only people who sit in a chair at table, instead of reclining or squatting on the floor. They use beds with stuffed mattresses, coverlets and sheets. Their houses are of stone and wood and resemble western houses more closely than do those of the Japanese.

The Chinese have wonderful memories, wonderful intellects. They are one of the most honest and moral races in the world; honest in business, moral in private life. They are bright, witty, full of fun, fond of a good joke or story.

I have lived alone in the interior, far distant from any other foreigner, and I never had one particle of trouble with any Chinaman. I never had one break his word to me, or offer me anything but kindness and hospitality. If foreigners have had trouble with them, all I can say is that I think it was the foreigners' fault.

The Chinaman has no religious fanaticism in his make-up. He has little imagination. His mind is of a sober, practical order. You would never find him going mad over a religion, either his own or anybody else's. Therefore he is tolerant. If you ever hear of an uprising against missionaries, you may be sure the cause is political, not religious.

The Chinaman's conservatism is founded on faith in his own sound qualities which have worked themselves out in his civilization; but he needs to know more about occidental races.

There is a misconception as to the grinding poverty of the lower classes. The agriculturists live better than the peasants of Europe. There are no great estates, but a vast system of small holdings. Every farmer has his own bit of ground, and they all have plenty to eat.

One of the most important artistic industries of China is the making of cloisonné ware. First a plain metal urn is made. On this the design is marked out in wire glued to the surface. The rich enamel is filled into the spaces in successive stages. It takes two or three weeks to complete one vase, which is fired many times.

In making lacquered plates, the metal plate is covered with a layer of the lacquer, which is a vegetable gum, and left to dry. Several layers are necessary, each taking several days to dry. When the lacquer is deep enough the carving begins; and it must be absolutely correct, as a single mistake would spoil the piece, corrections being impossible.

The Chinese make even the commonest utensils tasteful. One way is to paint little glass bottles—on the inside. This is done by the workman lying on his back, holding the bottle to the light, introducing a fine brush, and watching the work from the outside.

They are described as the best archers in the world, having magnificent bows and arrows. The collection contains many embroideries from Soo Chow, the center of that industry, where over 100,000 people are employed in it.

The collection above mentioned includes numerous specimens of bronze-work. They are antiques, for the ancient art of bronze-work has been lost. The specimens are from Sian Fu, which was the center of the oldest Chinese civilization. They come from the graves where they were placed long ago. Though it is against the law to rob these graves, and no foreigner dare attempt it, there are Chinese agents who make this a business. One bronze libation cup dates 3,000 years B. C. E.

The Trend of Twentieth Century Science

The World in a Drop

A STUDENT of science appears to have accomplished an epitome of the process of evolution in a drop of water. Of course the newspaper in which he publishes his results evinces an inclination, in its headlines, to credit him with having "found the spark of life," and "produced" both vegetable and animal life.

His method, as he gives it, was to expose drops of saline solutions to the air so that they evaporated. Of course they became the homes of germ life, for the air is full of germs, and various species would find themselves most at home in the solution according to the saline matters present. They lived their lives, and as evaporation proceeded, perished. Water was again added, and again and again. The forms of life present became, according to the account, more and more complex and evolved, since they had the worked-up remains of the former epochs to feed on.

At last, he says, he had definite plant and tree forms—microscopic, all in a drop of water. These seem to have occurred after the seventh evaporation.

Having reached tree forms, he now added a three per cent. solution of salt in considerable quantity, and after a month's evaporation of this at a temperature of 70 F., microscopic animal forms appeared, octopus, fish, and various molluscs, exhibiting for a few hours all the phenomena of life.

None of this reads improbable. It is evolution epitomised. There was no spontaneous generation, for it is not said that any precautions were taken to sterilize the original solution, nor to exclude germs afterwards. In accordance with nature's ways, variations upward in the scale of life appeared and flourished the moment that opportunity—in the shape of suitable food—permitted. And, dying in their turn, their substance became the necessary food for the yet higher forms which followed. The investigator himself says: "I only assemble the material and maintain environment. That anything is produced, shows to my mind an intelligence back of it all."

One wonders whether, in some of the more delicate biological experiments of the future, the intelligence of the operator may not, unknown to him, be itself at work as a guiding force? Man's own body contains all the forms of life below him, and these, working in his intelligence, may secretly expedite and control laboratory work in which he sees only the unassisted operations of external nature. STUDENT

Taking Cold

SOME interesting work in connection with the important subject of taking cold has been lately done, and there is a moral to it.

The germs upon which the "cold" depends are everywhere present where man is. But everybody is not always "taking cold;" very few people in warm weather, very many in cold weather, and most of all at times when warm is suddenly passing into cold.

The white cells of the blood produce a chemical substance which is fatal to the "cold" germs, and as fast as the latter arrive, so fast are they met with their poison.

But if the skin is suddenly chilled, or slowly chilled beyond a certain point, two things happen. The chilled blood-cells passing near the skin are rendered unable to secrete the substance with which they destroy germs; and they do not at once recover their power even after their return to the interiors of the body. And secondly; the shock of the chill is transmitted from the nerve-endings in the skin to the great nerve centers. These cease for a time, in some measure, to send out that current which sustains the blood-cells in their work—reaching them in a way we know not, since we do not yet understand the current. The cells, therefore, even in the unchilled interiors, are checked in their secreting work. So the germs have it their own way. But of course the cells shortly recover, unless a fatal disease has got headway, and resume their mastery.

And it has been found experimentally that by administering very short chills to the cells they can be educated so as to be no longer taken off their guard by much more severe ones. Moreover every one knows that after a few days of cold weather, it ceases to "chill" him. PHYSICIAN

The Divining Rod

THE divining rod is now to be permitted to exist. That is to say the facts connected with it may now pass from the realm of superstition into that of science. But they are cautioned that they must find their explanation in mechanical vibration. Water running beneath the ground causes a slight thrill throughout the neighborhood. This acts, says Sir William Preece, "upon the sensitive ventral diaphragm of certain exceptionally delicately framed persons," producing in a minute degree the phenomena known as sea-sickness. Then involuntary muscular action causes the rod to dip in their hands.

Of course it is something to have the fact admitted, even though nearly everyone not a scientist has known it for centuries.

But the explanation dowers the body with a good deal of intelligence of its own, apart from and unknown to that of the mind of the owner. For, according to the perhaps correct theory we quote, it perceives the thrill of the hidden water the person does not. It may not understand that the cause of the thrill is water; but it does understand that on perceiving the thrill it is expected to dip the rod. And it does so of its own volition, independently of the will and mind of its master.

This inference—that of an intelligent entity in the body—is not drawn by Sir William Preece. Its existence was taught many years ago by H. P. Blavatsky, and it is the explanation of many of the puzzles of physiology. On its own plane this entity knows much more than its master. Through it we come in touch with many of the finer forces of nature, and if our minds were not so blinded by our methods of living, we could learn much from it of these subtler activities in the organic and inorganic world. STUDENT

Nitrogen-fixing Bacteria

D. R. MOORE, of the Agricultural Department, in a recent lecture, gave his audience all the facts now known about the nitrogen-fixing bacteria. In one respect they are very human—or is it we who are very bacterial?—their love of luxury.

When they were first discovered, they were reared for farm purposes on gelatine. This rich nitrogenous diet was too much for their virtue; they ceased at once the laborious work of fixing nitrogen in its raw state from the air, and used the organic nitrogen of the gelatine instead.

As they become grandparents in an hour, this lazy habit was soon ingrained in the race; and when they were sown in the soil they refused to do any work and were consequently useless to the plants.

So in future they were fed with chemicals only, in silica jelly, which of course has no nitrogen. To get nitrogen from the air they had to use the utmost labor and soon became smaller and healthier than those (their ancestors) naturally living in the soil.

The duty of these creatures is to enter the root hairs of the plants and climb up a little way. They must get something from the plant, sap and carbohydrates probably, possibly warmth. In return they give the plant the nitrogen they have worked up—either after they have used it and then excreted it as we excrete urea, or as existing in the microscopic bodies of those that die as generations succeed one another.

The smaller size and greater vigor of the cultivated variety enables them to enter the root hairs of plants whose growth is considerably advanced. Those native in the soil can only enter plants whose growth is just begun. So science has improved on nature. The whole process is in its infancy. We still await a Burbank of bacteria. STUDENT

The Earth's Constitution

PROFESSOR ARRHENIUS has recently offered the following theory of the constitution of the earth:

Taking a line from the center to the crust, eight-tenths of it would be metallic iron, so hot as to be gaseous, yet under such enormous pressure as to be rigid. The next one-and-one-half tenths would be a mixture of various elements in a similar condition; then comes nearly one-half of a tenth of elements and compounds in a liquid state, also perhaps, in its deeper part under such pressure as to be rigid; and then the film of crust—of which alone we know something. Studies

Value of the Turtle

BESIDES being an epicurean luxury, the turtle has been found to have valuable dietetic and medicinal virtues. It possesses amazing restorative properties, and is invaluable in cases of influenza. Turtle oil is said to be more efficacious than codliver oil, and to make a fine soap.

Recently in London there was a temporary turtle famine, owing to disputes with the Nicaraguans, who seized some turtle vessels; for the chief source of supply is the Mosquito Coast and the Gulf of Mexico. T.

The Seedless Apple

THE latest instance of Man's work in modifying Nature is the seedless apple, already reported in the NEW CENTURY PATH. This has been produced by a Colorado fruit-grower after some years of experiment. He secured five trees, from which have budded two thousand more.

The apple is not only seedless, but it is coreless. And, being coreless it is also wormless, for the worms need the seed to live upon. Also there is little or no blossom: a stamen and a trace of pollen, but no flower; merely a few small green leaves protecting the young fruit. This blossomless condition renders the tree immune against frost-bite, for the blossoms are the vulnerable points. There is a hardening in the navel end, but this has already diminished in the new generation and will probably, as in the case of the seedless orange, soon become reduced to a minimum.

Undoubtedly this fruit will eventually oust the old variety from the market, as in the case of the seedless orange. The tree is hardy and the fruit ruddy, firm, and well-flavored. H.

Silk from Spiders

A CONSULAR report from Madagascar gives some particulars of the spider-spinning industry as carried on there.

The Madagascar spider, *Nephila madagascariensis*, is very large. The egg which produces it is laid by the female in a silky cocoon, and yields several hundred insects of the size of a pin-head. The female reaches $2\frac{1}{2}$ inches long, the male only one-sixth that size. The spiders frequent the forests, and in some of the parks they may be seen in millions. But they are by no means gregarious, for when the abundant food supply fails, they eat each other.

Dean Swift, whose prophecies have in more than one case come true, makes one of his Laputan dabblers use spiders for silk. The project was seriously discussed in France as early as 1710. At the Paris Exposition of 1900 a whole piece of fabric, 18 yards long and 18 inches wide, was exhibited, containing 100,000 yards of thread spun out of 24 strands, and requiring 25,000 spiders.

The cobweb has, since Greek and Roman times at least, been known as a stopper of bleeding. The silk has been known for centuries, even by the aborigines of Paraguay. A consular report from Venezuela, dated

1899, mentions a spider whose silk was used for making handkerchiefs.

The female spider yields the silk. They are brought from the parks, and native girls, each provided with a basket of spiders, do the spinning. A dozen insects at a time are locked into a kind of guillotine which allows only the abdomen to protrude on one side, keeping the head and legs out of the way; and the threads are collected into one thread and wound off on a reel. The empty spiders are carried back to the park, and in nine or ten days are ready for another operation. They can be reeled off five or six times, after which they die, having yielded about 4,000 yards.

The cost is at present high. 55,000 yards of 19 strands in thickness weigh only 25 grains, which makes the cost \$40 a pound. STUDENT

Sentience of Vegetable Kingdom

IN the vegetable kingdom, the structures and processes and functions seem to be every whit as elaborate as those in the animal; so researches are showing. Every day too we make further advances in the direction of proving that plant-life is guided by intelligence. In man and animals the various functions are tributary to a mind with emotions and thoughts. Why should the case be otherwise in plant-life? How can it be otherwise? Poets continually recognize this to be a truth; recognize it in that curious half-and-half way known as poetical imagery.

But nowadays, so rapidly are ideas changing, it is even becoming permissible to recognize the notion scientifically. A French professor, who is also an amateur botanist, is reported as having observed an instance of pining for lost friends in the lobelia. The story is as follows:

One morning he was watering some lobelias clustered in a corner of a conservatory, when all at once a feeling of sadness swept over him. There was no reason for it that he could define, yet an acute melancholy seized him, and not until he left that portion of the room did the feeling gradually depart.

The next morning while watering these plants the old sensation came over him. It was not associated with the odors of the plants, for these were familiar to him and always pleasant to his senses. The next morning and the next this feeling of acute sadness came over him in the lobelia window, and finally he spoke to his wife of the phenomenon. Suddenly she remembered that three days before a friend had called and been so pleased with the flowers that she had given a pot of them to the friend, who had taken them away.

The professor, who is unusually sensitive to the feelings of others, believes that he felt the mourning of the plants for those that had been taken away.

This story is sincerely told and commented on in an article on the intelligence of plant-life and the analogies between the vegetable and animal kingdoms. What a sign of the times! Such ideas would surely have consigned the Professor's father to the madhouse. Nowadays scientific opinion is becoming as liberal as religious opinion has become, and we may say things which a few years ago we dare not have ventured to hint. In a few years more what will have become of our scientific orthodoxy? STUDENT

COASTLINE OF WEST SWEDEN

TO A SKY-LARK

WORDSWORTH

ETHEREAL minstrel! Pilgrim of the sky!
Dost thou despise the earth where cares abound?
Or, while the wings aspire, are heart and eye
Both with thy nest upon the dewy ground?
Thy nest which thou canst drop into at will,
Those quivering wings composed, that music still.

Leave to the nightingale her shady wood:
A privacy of glorious light is thine;
Whence dost thou pour upon the world a flood
Of harmony, with instinct more divine;
Type of the wise who soar, but never roam,
True to the kindred points of Heaven and Home!

Woman and Business

WHEN the first woman plucked up courage to knock at the outer gate of that forbidden realm described as the "business world," she little dreamed of the marvelous changes which would come about. The ponderous doors hitherto closed to her by prejudice and tradition swung open and she was admitted, albeit reluctantly. Perhaps the denizens of this *nether* world were loath to have her disillusioned, for they had brought wondrous tales of what went on within, and how skilled they were in the art of turning everything to gold.

In spite of not being very gallantly received, undaunted she pushed on and another and another followed her, until today we find scarcely a profession, and few trades, wherein women have not proved their equal skill.

Mankind has gradually come to take a broader view, and the adverse criticism of the first years of invasion of their domain has changed to leniency, at least, and the endless witticisms at the business woman's expense have lost their savor. Business men appreciate her worth and are quick to avail themselves of her competent assistance.

By their intelligence and loyalty to duty women have worked their way to the front, and their place in the business world is now unquestioned. But what has been the effect of the new conditions upon the business woman?

It is true that women have not, at all times, been wise while taking advantage of their greater freedom—and this could hardly be expected. Reaction was inevitable; many absurdities have had to be faced before the middle line was found.

A certain type of business woman has been criticised for taking on masculine ways and trying to dress and act like men. In the matter of dress this is not entirely just, for she has had to adapt herself to the new environment, and the adoption of tailored clothes and heavy boots is not in imitation of men, but for practical common-sense reasons; they are more suitable, more economical and more comfortable.

There is more justice in the criticism which touches conduct and general bearing. Not only business women, but others as well, have sometimes forgotten that dignity, modesty and taste belong as much to the new condition as to the old, and that simple womanliness is ever a woman's truest shield.

Some women have erred in thinking that a matter-of-fact, mannish air made them appear more business-like, but it is always to their disadvantage in dealing with men, who universally dislike it and are even shocked at what seems to them a lack of modesty—which indeed it is. In the truest sense, the most successful business woman is she who keeps her

royal womanhood intact at all times; the very presence of such an one has an uplifting influence. This is a time freighted with golden opportunities for all women, in whatever field their duty lies; a time when the woman-nature has a chance to come forth and wield a mighty influence for the betterment of world conditions. There lies with each the power to use it to the utmost for righteousness. STUDENT

French Marriage Laws

IN some respects French legislation respecting the rights of married women is more favorable to women than the marriage laws of either England or America.

It seems there are two contracts which may be resorted to by a French bride. Under the one chosen by most wealthy women, she retains her property intact, her husband having management of it, but merely as custodian and under guarantees. In any case, however, the husband is entrusted with the management of his wife's fortune, for a French woman is regarded as a minor. She may not even sign a check. On this point, of course, she does not enjoy the freedom of American women, who may transact business on their own account, with the same protection accorded to men. Under the other system, the marriage contract is an exact partnership, the husband and wife having equal ownership of capital and equal right to all income and earnings.

French law is likewise judiciously framed respecting the welfare of children. Parents are equally responsible for their care and education. The child's inheritance is protected by law, for only a limited portion of the property can be willed away by its parents. On the other hand, children are held responsible for the care of their parents in their old age.

In France the religious ceremony is not taken into account by the law. The only legal marriage is that performed by the mayor or his authorized representative. STUDENT

Russian Women

ACCORDING to Dr. Wolf von Schierbrand, the curious and appalling discrepancy between the lot of the *grande dame* in Russia and that of the women of the middle or lower classes is the result not so much of greater wealth as of a complete reversal of standards. The Russian aristocracy is cosmopolitan and its women are, like the women of the powerful advancing nations of western Europe, an independent force, leading in society and domestic life; but the women of the bulk of the nation are still oriental and more the slaves than the helpmates of their husbands. The condition of these women is miserable in its degradation and hopelessness. As the author concludes: "Their outlook and their opportunities seem to be less advanced and their social status on a lower plane than in almost any other European country."—*Selected*

The Story of Evangeline

"When she had passed, it seemed like the ceasing of exquisite music."
 "EVANGELINE."—Longfellow

IT may be new to many that the story of *Evangeline* was given to Longfellow by Nathaniel Hawthorne. The author dined with the poet and a fellow guest, a priest, who had related the story of the Acadian exiles to Hawthorne with a view to making a story of it, mentioned the matter to Longfellow. "The theme is adapted more to a poet's expression than to a prose writer," declared Hawthorne, and by common consent Longfellow adopted it.

It is a remarkable fact that the poet could never be persuaded to visit Grand Pré. A friend of Longfellow's describes the inception of the poem to the writer:

Standing by the window of Craigie House in Brattle street, Cambridge, Longfellow looked out of the window and, as though the scene were before him, he described the story to his hearers in such wealth of detail and convincing elaboration that they could imagine themselves in Nova Scotia, overlooking the broad Dykelands facing the basin of Minas amid the sunshine and flowers of the Acadian Land, when the murmuring pines and the hemlocks were yet standing where now rich farmlands occupy the scene.

It is interesting to note that there is still an Acadian colony in Nova Scotia. From Digby almost to Yarmouth is a long straggling village almost forty miles in length—divided nominally into separate townships. Here perhaps 100,000 French speaking Acadians now live happily—but somewhat isolated along the Fundy shore. Some few years ago they were becoming a prosperous community and gaining a good knowledge of English and of business, but of late a reactionary movement has set in and progress is waning with the decline of the English language of the province. The erection of a large Jesuit college among them has fostered the old French language, but sadly hindered the real development of these interesting people by cutting them off from effective business relations with the outer world. W.

Agriculture for Women

SAYS a writer in a recent London daily concerning the work and training of young women at a recently established Agricultural Training School for Women:

I do not describe a dream or an ideal. This is an actual picture. I can take my reader to the scene of this new departure and point to the ladies who have chosen to earn their living healthily and actively, but, nevertheless, in essentially "light labour." There can I show him the long beds of spinach and cauliflower, onion and lettuce, mint and parsley, cucumber and marrow, asparagus and artichoke according to the season. I can show how closely crop follows on crop, how not a square yard of land is lying idle. I can show, too, where some of these gardeners specialize in flower-farming, and where crops of narcissus and lily, of primula and marguerite and carnation rapidly replace the other until, in the darkness of winter, the dense plots of Christmas roses bring high prices and reassuring profits.

This departure is unique in one respect. The young women students not only learn the secrets which insure success in market gardening, light farming and poultry raising, but are enabled to earn a livelihood at the same time. The first term of every student brings about, invariably, marked improvement in health—a contrast to literary colleges the world over.

We foresee that the Kew Gardens will yet have to open their gates to women who aspire to the final test of a knowledge of plants and skill in gardening. Many women in America as well as in England, during the last few years, have taken advantage of college courses in agriculture and gardening. A goodly number have fitted themselves for the position of head gardener. It will be but a few years before women are to the fore as specialists in floriculture and landscape gardening. STUDENT

Mrs. Agassiz

A DOZEN nations know the work of "Louis Agassiz, Teacher," as he used to sign himself, but very few know of the service rendered science and humanity by his wife. When Elizabeth Cary, a highly educated young woman, married Louis Agassiz, he already had three children, had not yet made his reputation and was receiving a salary far too small to meet even his scientific needs. Mrs. Agassiz, solely with the object of assisting her husband and giving him opportunity to carry on scientific research, started a school for girls in her own home, Agassiz himself becoming one of the instructors. It was not until the financial problems of the Agassiz family were entirely solved that the school was given up. After the death of the scientist, a terrible blow to his wife but one under which she did not succumb, Mrs. Agassiz stepped into an even wider usefulness. When Harvard Annex was established, she became a member of the governing board, and later when the Annex became formally "Radcliffe College" it was only natural that she should be asked to fill the place of president, an office, by the way, which was unsalaried. At the time of her retirement, a year or two ago, Professor Goodwin said, "To her influence is due the success of Radcliffe College and its position in the academic world."

Perhaps the most signal service rendered by Mrs. Agassiz to science was her diary-record of the excursion made by Agassiz and herself with a party to certain parts of Brazil practically unknown to Americans. Agassiz tells us that he got into the habit of giving his wife daily a careful account of his scientific observations, "knowing that she would allow nothing to be lost that was worth preserving." The information so recorded—for Mrs. Agassiz's knowledge was sufficient to render these notes scientifically accurate—is today exceedingly valuable. B.

"IN THE ACADIAN LAND, ON THE SHORES OF THE BASIN OF MINAS."—Longfellow

A WOMAN physician of Topeka, Kansas, will shortly introduce a bill into the legislature requiring pupils in the public schools to dress in a simple and uniform costume. The object of the bill is to save the children of poor parents humiliation and even ridicule, no less than to save the children of some of the

rich from being ruined by foolish vanity in the matter of jewelry and dress. "Many of the daughters of wealthy parents," declares this physician, "dress as if they were going to a party, while others are forced to wear cast-off clothing, which is even more unsuitable and often not warm enough." A step is this, certainly, in the right direction, and one long ago taken by private schools of the finer class.

M. SALEZA, who is said to be one of the greatest of French singers, recently paid this tribute to two of our American prima donnas, of both of whom womanhood may be proud.

What are the chief characteristics of their singing? What is it that we think of as most admirable in their art? First, perhaps, the excellence of their voice production. Next, the perfection of their diction. And next, the grace, elegance, and refinement of their phrasing. They play on their voices as a violinist plays on his instrument. Not only do they sing notes, detached notes set down for them in their parts, but they also know how to link them easily and smoothly, and to beautify them with color, feeling and expression.

THE Woman's Salon, recently opened in the Grand Palais, Champs Elysées, has brought about among Parisians the greatest interest in the woman movement. The first and second sections are devoted to dress. The third section shows the work of women in the realms of art and poetry. It is said that French women have not, as yet, entered the field of architecture. But, in the department that pertains to the decoration of the home, they have certainly won a reputation as creators of the "Home Beautiful." H.

OUR YOUNG FOLK

The Home Builders

IT was the evening of their first day in the country. Dorothy, seated on the verandah, was watching the moon rising over the low hills on the far side of the little Bay, while the other members of the party were discussing tennis and the delights of holiday pursuits.

There was a click of the garden gate and Dorothy looked up to see Madge and Rupert walking in with mandolin and guitar cases in hand. "What, are you here too?" she exclaimed, delightedly. "Yes," replied Madge, "we escaped from the city last night."

"Is Geoffrey down?" inquired Rupert. "Yes, but he has gone to his study to work tonight," said his wife. "Let us see if we cannot draw him out again," said Rupert. "Ah! with music!" exclaimed one of the girls. "How I wish our boys could play!"

They all gathered round while the visitors filled the air with beautiful melodies. All the dear old folk-lore songs they played, with now and again something from the great masters. Their hearts were in their music, and a sweet peace stole over the little group.

Geoffrey was tempted and softly opened his window which faced their way. Rupert heard, and with a smiling nod to Dorothy whispered, "It will do him good, he'll do his work in half the time tomorrow."

They finished at last with "Home, Sweet Home." "I love that song, it always gives me such a sense of security," said Dorothy. "Yes," added one of the boys, "when I am at home I always feel as if I could never get away again."

"Why, how earnest you all seem!" said a grave kindly voice behind them.

"Ah! Geoffrey, you've come at last, how good it is to see you," and they shook his hands warmly.

"Well, I believe your music had something of the Siren's power," admitted Geoffrey, "nothing else would have lured me out of my study tonight. What was that you were saying about home, Dorothy?"

"I will try to explain," she replied. "Whenever I hear the word 'Home' it brings before my mind, not only the picture of home as we usually understand it, but something greater, for after all, outer things are symbols of something greater than themselves—is not that so?"

"Truly," he answered—"and the deeper the feeling that lies behind the expression, the stronger and clearer the picture of the inner ideal it will convey. You seem to have let your mind dwell upon the idea a good deal—what more have you thought?"

"In all the countries where I have traveled I have found the same home-feeling among the people," replied Dorothy. "I believe 'home-life' is an expression for this inner reality which is ever being made deeper and truer."

"In the home we really know each other," said Rupert, "and when we are not occupied with trying to *appear*, then the real self has a chance to *be*."

"Ah, you musicians, you understand," said Geoffrey. "It is in the heart life that we strike magic harmonies and awaken the magic overtones."

They were silent for a time. Then Dorothy went on, "There seem to be National Home Builders, the true Kings and Queens who look

upon their people as their children and sound the key-note for the home life of the nation."

"And International Home Builders, who give that sacred feeling its widest expression on earth; but they are rarer!" exclaimed Geoffrey, his voice vibrating with enthusiasm. "Great and glorious is the age in which we live, that sees already an International spot of Unity upon old Mother Earth—at last," he continued quietly, "where representatives from many nations are gathered together. There have they journeyed to take their places, gifts in hand, and there they serve together for the common weal. Well is the place named 'Lomaland'!"

"The ideal that has prompted such actions is based upon the living fact of our Inner Unity; that is what I mean," said Dorothy. "Our real abiding place must be within that Unity. That is the home-ideal I mean."

Geoffrey looked at her with a sympathetic understanding. "Yes, the place of rest and peace, wherever it may be found, that is our real home," he said.

Rupert and Madge took up their instruments again and all sang the words of the old song together. STUDENT

Facts Worth Knowing

DURING the coming summer a notable eclipse of the sun occurs, and astronomers are preparing to make special observations.

At the Annapolis Naval Academy, which is, of course, directly under the authority of the United States Government, the use of tobacco has been absolutely forbidden excepting among Seniors. This is a recent ruling, but it is absolute. Students violate it only "under penalty of immediate dismissal."

THE value of the photograph in astronomical research has been recently demonstrated by the discovery of Jupiter's new satellite. It is a curious little body, discovered on January 4th last by Professor Perrine of the Lick Observatory, California, and it would have remained still unknown had its image not been detected on the photographic plate. More and more do we come to understand that what was formerly regarded as empty space in the heavens, contains a vast multitude of bodies, large and small.

ACCORDING to statistics the death-rate for children is lower in Japan than in either England or America, which is not strange considering the common-sense way the people there have of taking care of their babies and the sanitary and hygienic conditions generally. Their houses are almost invariably built

a foot or two above the ground, without cellars, and the air inside is as fresh as can be. Then, too, everyone bathes daily, a custom that might well be imitated in "civilized lands." By actual figures, nearly one million persons daily go to the public baths in Tokyo, a city which has a population of less than two millions! Considering the fact that there are many thousands of private baths in the city in addition, the question is, does a living soul in all that city go without a daily bath? Cleanliness is next to godliness, but are some of our "civilized" lands waiting for the Orient to teach them so?

A PEACE PALACE is about to be erected at The Hague. The buildings will be Greco-Roman and will be surmounted by a majestic dome.

A PEASANT OF MODERN GREECE

BE like a promontory against which the waves continually dash. It not only stands itself, but also stills the fury of the breakers.

Have you reason? I have. Why, then, don't you use it?

Has any man sinned or offended? He has hurt himself.

From the sayings of the wise Roman,
—Marcus Aurelius

THE CHILDREN'S HOUR

The Raja Yoga Question Box

IN the seventh century in England the abbeys were centres of learning. The Danish invaders destroyed these schools. But the wise King Alfred soon came, to revive learning and teach his people.

Who was Cædmon?

ANSWER — Cædmon was the first poet in England whose name we know. At first he did not know even the old battle songs of the people, and when the harp was passed to him at the festive gatherings, he could not sing. But one night in a dream he sang a song about the creation of the world. In the morning he told his dream. He was taken before a company of scholars. To them he recited the verses of his dream. After this Cædmon lived in the abbey at Whitby. Sacred history was read to him and he put what he heard into verses. These were the first hymns.

Who was Martia?

ANSWER — Martia was a famous Queen of London in the fourth century. She gave to her people the first code of English Common Law. King Alfred revived and enforced the laws of Queen Martia several hundred years later.

Who was Alfred the Great?

ANSWER — Alfred the Great was the best and wisest king England has ever had. The country was overrun with Danish invaders. Alfred routed them, and restored peace and order. He gained the first naval battle won by the English. King Alfred did much to improve his country. He encouraged trade and industry. He invited scholars to his court, and studied diligently so that he could translate books for his people. He founded schools. Alfred the Great owed much to his mother, who trained him carefully, and taught him to love his country.

Little Yu Shun of China

THIS little Chinese boy wishes to tell the Lotus Buds about his country. And how many strange things he could tell! For though China is so old, so old, we know very little about it.

First of all, little Yu Shun would tell about the great garden of his father's house. It is full of surprises. A narrow passage leads from the court into the garden. The sides of the passage are built of rock-work. The path is like a mosaic made of pebbles, for the pebbles are laid and fastened down in shapes like birds or animals. A child running along one of these paths looks down to watch what his next step will show—a bird, or a fox, or what? He may be so busy that he runs along forgetting to look up.

When he does lift his eyes, he will see a kind of fairy-land. The Chinese like to have a tiny lake in their gardens. And out on an islet in the lake is always a tiny summerhouse, reached by a queer little bridge. Think what a nice place to take a book, or a doll, right out on a tiny island in a tiny lake!

Beautiful creeping plants hang down over the shores of the lake. There are many flowering shrubs, and dwarf trees, and lattices covered with vines in the garden, and always a fish pond, where the children can watch the shining carp and goldfish.

Often there are steep little hills in the garden, too, with footpaths along the side, just as there are out in the country. Is it not a pretty idea to have a hill right in one's garden?

On the shore of the lake a terrace is built, where the Chinese ladies sit and enjoy the air. Away in the distance on a high hill you can see a pagoda. No town is without these pagodas on the hills. And they are a pretty sight, with their many galleries, where the people rest and look at the scenery.

Little Chinese boys like Yu Shun are taught very early the wise sayings of the great teachers of China. This is an important part of their training. They learn to say, "He has little courage who knows the right and does it not;" and "The glory of the state may arise even from the excellence of one man."

Are these not good quotations for a little boy to know?

A RAJA YOGA TEACHER

NO ONE can ever suffer without the suffering casting a shadow over all. We may not realize it, but such is the case, and even in their joys Raja Yoga boys and girls do not turn away from sorrowful places and saddened hearts. Ireland is not so far distant that the shadow of hunger that has fallen across the west of that island has not reached sunshiny Lomaland. The famines of Ireland constitute one terrible series. Will they never cease? Yes, they will, when the children of Lomaland have taught the nations Raja Yoga—which they shall do. H.

A Peep into Wonderland

DEAR CHILDREN: Would you like to take a peep with me into wonderland? If so, look through my microscope at the ants' nest in this glass case. Do you see all the little creatures hurrying hither and thither so busily? This open space is the queen's chamber; she is a very important personage and has a bodyguard whose duty it is to protect her and to wait on her. And here is the nursery where all the eggs are taken care of by trustworthy nurses who, you see, keep rolling them into the warm sunny places. This is the dairy, and these are the cows. If you had time to watch long enough, you would see these clever engineers construct passages and tunnels and even bridges!

Is it not like fairy-land to see such wonders accomplished by such tiny creatures?

Of course the secret lies in their unity. They all help each other, working together.

Ants are so much one, that they almost seem to have their thinking apparatus in common! And this instinct (as we call it) unerringly guides them to do the thing most needful to be done, and to do it ever in the best possible manner, so that in the ant-world there is no waste of time, nor of energy, and law and order everywhere prevail.

Can we say as much, children, for our world? I know Raja Yoga children can. M. V. H.

No Moods in Lomaland!

IN the Raja Yoga school there is no time allowed for the gloomy, discontented moods into which children fall at times, and in which they are encouraged by the lack of firmness of older people. Raja Yoga children learn the magic of their Warrior-nature. When this Warrior is appealed to, a happy smile drives away frowns and sulks. The boys and girls of Lomaland, even the tiniest ones, learn self-control, and they love the older people who help them in their battles with the naughty, selfish nature. They learn to be glad that their teachers do not permit them to waste hours in bondage to moods. It is not kindness to indulge children by leaving them in states that make neither themselves nor older people happy. Such treatment but increases their selfishness and just fits them to be miserable. Useful work and healthful play, something to bring into wholesome activity the body, mind and heart—that is a Raja Yoga secret. Just recently the Lomaland children's most beloved Teacher told them this: "Discipline the body, the temple of the living God. Make it a sweet, pure, strong vehicle for the life work of the soul." Do you wonder that to Raja Yoga children the world over "Life is Joy?" COUSIN MARJORIE

THE THEOSOPHICAL FORUM, IN ISIS THEATRE

Reincarnation

Recently read at public meeting of Universal Brotherhood and Theosophical Society Australian Center, Sydney, N. S. Wales, Australia

ARE we not parts of the "One Great Life" which has always been and will always be? Have we not seen how life goes on through sleeping and waking, how it sleeps in the seed and wakes in the plant, casting aside the old form of the seed, as it takes on the new form of a plant? In this new body it lives and works during the waking time making buds for future growth; the leaves help the tree in its growing, and when each time of growth is ended they drop off. Is it not so with our bodies when one time of growing being ended, they drop off and we call it death? But is it any more death to us than the dropping of the leaves in autumn is to the tree? Does not the tree rest before another summer's growth, when the leaves begin to grow again? Is it not so with us, do we not rest before taking up the growth of another earth life, or the coming again into a new body of flesh, or incarnating—the body of which has been built up and moulded into shape by the thoughts, feelings and actions of the previous life? Are we not then each life responsible for the bodies we have and the life we live? Let us then reason together, and will we not see that it is through Reincarnation that this mind life or soul goes on gaining experience and carrying with it the results of past deeds and thoughts, losing nothing that it has gained, for does not the soul ever aspire to the onward and upward? Is it not the "Soul Warrior" within the body of flesh which is ever making a stand for Truth, seeking to purify the lower self, making it subservient to that higher consciousness which governs us and all the universe? For is not the whole universe alive and conscious, the divine mind permeating it all? Is it not true then that Reincarnation is the promise of human perfection?

Mr. Judge said "that man as a thinker, composed of soul, mind and spirit, occupies body after body in life after life on the earth, which is the scene of his evolution, and where he must, under the laws of his being, complete that evolution once it has begun."

Did not St. Paul say: "The spirit (soul) is willing but the flesh is weak?" Have we not each one of us in our blindness and selfishness given too much thought to the flesh—ever recognized the body as the

real man—consequently overlooking the indwelling spirit, the Christ, the real man? Is it not because this real man exists, which is higher than the body, higher than the mind, higher than the emotion—that he can be the controller? Instead, do we not allow ourselves to be controlled and lose ourselves in the rush of the workings of the bodily passions, which are termed the failings of the flesh? Will you not agree with me, then, that it is only through life after life, birth after birth, and frequent incarnations into earth-life, that man gains, through experience and environments, a complete knowledge of the indwelling God and how he can merge his lower nature into the higher nature? Will he not have learnt that reincarnation is in harmony with the general plans of nature, that the soul itself is pure, wise and beneficent; that as man lives and dies, so he lives and dies again? Aye, verily, it is so! And these periodical reincarnations shall not cease until man has learnt those lessons life has for him. Then shall he be joined to the God within him; man shall have become one with his Father which is in Heaven.

A. W. W.

Notice

The meeting to have been held at Isis Theatre last Sunday night, and duly advertised, was unavoidably postponed by the severe equinoctial storm which burst over San Diego and vicinity during that day. The drive to Isis Theatre from Point Loma (there and back some sixteen miles) could not have been done without seriously exposing both adults and children, as well as the horses, to the inclemency of the weather.

The meeting, however, will be held as prepared, on the following Sunday night, March 19, when Katherine Tingley will speak.

Theosophical Meetings for Sunday Nights

Public Theosophical meetings are conducted every Sunday night in San Diego at 8.15, at the Isis Theatre, by the students of Lomaland.

Theosophical subjects pertaining to all departments of thought and bearing on all conditions of life are attractively and thoughtfully presented.

Other interesting features of these weekly gatherings are the excellent music rendered by some of the Students of the Isis Conservatory of Lomaland, and the efforts of the children of the Raja Yoga Schools at Point Loma. Theosophical literature may always be purchased at this meeting.

Universal Brotherhood Organization

Central Office Point Loma California

THE temporary manifestation of religion forms an interesting study for the human mind.

If we would gain wisdom and happiness, we must observe the counterfeit as well as the true in human life; for by contrasts can we discern the real, the permanent and the true. We cannot expect that all Humanity will be able from ordinary observation or from contact with these things, to find the way to the Light. Man must study himself and gain knowledge.

Theosophy declares that "the religion of the day is but a series of dogmas, man-made and with no scientific foundation for promulgating ethics;—while our modern science as yet ignores the unseen, and failing to admit the existence of a complete set of inner faculties of perception in man, it is cut off from the immense and real field of experience which lies with the visible and tangible worlds. But Theosophy knows that the whole is constituted of the visible and the invisible, and perceiving outward things and objects to be but transitory, it grasps the facts of nature, both without and within.

"It is, therefore, complete in itself and sees no unsolvable mystery anywhere; it throws the word 'Coincidence' out of its vocabulary, and hails the reign of law in everything and every circumstance." (Words of Mr. Judge.)

Now, right here we must point out that all which goes to serve the permanent life, the true and ennobling life, comes from experience and those gradations of thought and effort which are found in experiences. To understand the laws of human life, and the way to use them for the up-building of the character, one must recognize the latent forces in man; the mysterious and wonderful powers of the human soul, which are ever striving to manifest the divine self;—and also the subtle, savage, lower qualities that play their parts in the drama of life so effectively, obscuring Wisdom, and leading man to the depths of indifference, despair and recklessness.

To redeem man, man must know himself, and these mysteries. And in his research along the path he must revive the soul-energies of his being. He must not be satisfied with the common belief of Humanity to the effect that man possesses an immortal soul; he must know that he is one, and that he can evolve and bring his whole nature into a high state of spiritual strength if he wills and works with the higher laws of his being.

At this point there must be a careful consideration and recognition of the difference between instinct and intuition;—between emotion and illumination.

Instinct is the director of the lower nature; Intuition is the Guide of the higher humanity in man,—a part of Soul-Life. A man who has evolved to a point of drawing the dividing line, and taking a heroic stand for his Soul's advancement and for that of his fellows, needs not exciting influences nor other people's fearful exhortations to call him to his own. The reviving, the revivifying of spiritual life, works its ways slowly and surely into the larger field of endeavor along the path of righteousness,—through aspiration and self-control;—and in the years to come he will be found well up the mountain path, never satisfied not to be more tomorrow.

Where instinct has worked in a human life, or emotion, which is its companion-in-arms;—where fear has been used as a compelling force to intimidate man into avowing himself to be what he is not,—there is found the impermanent;—the transitory manifestation,—a semblance of a revived life. We may be sure that in all the true revivals of the spiritual life, the psychology of force has had no play;—human animal magnetism is directly noticeable in its absence; the fear of punishment and the hope of reward play no part in the great change for the better life.

We must remember that there are numberless influences, seen and unseen, which touch the human heart, and move it towards the path of purification. A breath of sweet wisdom from the Orient,—or from the Occident;—a strain of soulful music; a true tone of compassion from a human voice;—possibly a golden thought from the words of Confucius:—"Conquer your foe by force and increase his enmity.

True Revival

But woe unto you, scribes and Pharisees, hypocrites! for ye shut up the kingdom of heaven against men.—Matthew xxiii: 13

Conquer by love and you reap no sorrow." A loving word from the teachings of Jesus the Christ:—"There is no fear in Love, but perfect love casteth out fear."

First Ep. of John, iv: 18. Possibly just such words as these from Gautama the Buddha:—"Blessed is he who has become an embodiment of truth, for he has accomplished his purpose and is one with himself and truth. He conquers although he may be wounded!—he is glorious and happy, although he may suffer; he is strong, although he may break down under the burden of his work; he is immortal, although he may die. The essence of his soul is Immortality." These simple words may have been the quickening power which formed the link binding the aspirations of the man to the opportunity.

When a real revival takes place in the life of a man, each day thereafter must tell for better things in that life; and this growth will unceasingly proceed into the eternities. Where the revival, so-called, is but a counterfeit, there may be the appearances which mark spiritual advancement; but, if we look behind the scenes into the inner life,—into those hidden forces in man, we might see the truth and discover that it is hollow and that the soul has made no real advancement. It is still shut out from its own; held back, because it has been misled;—starving for the Truth, and having it not;—crying out in its misery and isolation.

Christ taught tolerance; and not he alone, but other great World Teachers taught the same. Some of the most elevating and inspiring words of Buddha are living again in the Christian Scriptures;—and it is the eternal ignorance of ancient teachings, which preceded those of Christ, that ever keeps truth-seekers from the Truth. . . . Theosophy protests!

Even at this very hour the Christ life is manifest to a very large degree in the Orient by those who have learned lessons of Brotherhood from the Buddhist teachings. Note the tender humanity manifest in the Japanese towards those, who, under the banner of the Man of Mercy, call their soldiers to arms to overthrow their fellows.

Let not Humanity be deluded by the seeming. Christ drove the hypocrites out of the Temple; and this act was as merciful to them as to their victims. Let us discriminate, and separate the true from the false; accord to every man the largest tolerance and right to his own belief. Yet let us ever be vigilant against ourselves, and against those who depend upon the weaknesses of man to delude him.

It would be well for us in thought to span the gap of one hundred years,—looking into the future,—then the beneficent influence of Theosophy will be more fully grasped. Then, we shall read a record of a glorious harvest of Theosophic thought, sown by our earnest workers throughout the World in years past and now. There will be an accentuation of mental discrimination; aye, a spiritual discrimination; from discernment men will act. In this step, they will discover that where the true Christian light is to be found there will be the Theosophic life, and vice versa,—for false dogmas and creeds will have gone to their graves.

One of the greatest factors used to obscure the real meanings of Christ, and the real Rights of Man, has been the ignoring of the teaching of the doctrine and law of Reincarnation. Listen to the words of Christ, and other teachers on this subject:

"Among men that are born of women there hath not risen a greater than John the Baptist. If ye will receive it, this is Elias, which was for to come."—Jesus Christ.

"What sleep is for the personality, death is for the will (character or individuality); and through this sleep of death it reappears refreshed and fitted out with another intellect, as a new being."—Schopenhauer

"The soul, if immortal, existed before our birth.

"What is incorruptible must be ungenerable. Metempsychosis (re-birth) is the only system of immortality that philosophy can hearken to."—Hume

"Ages past the soul existed, here an age 'tis resting merely."—Browning

"As to you, Life, I reckon you are the leavings of many deaths. No doubt I have died myself ten thousand times before."—Walt Whitman

This doctrine was almost universally believed in by men up to a few hundred years after Christ, when at one of the ecclesiastical councils it was expunged as a heresy. A man who believes in Reincarnation, has no fear of any punishment except that which he knows he has merited through his own misconduct, and this is inevitable and certain. No promises of reward move him to the righteous path; for he lives not for himself, but for his fellows. . . . Let us study the teachings of Great Teachers and discover Truth in all religions.

Let us cry tolerance, again and again. . . . Yes, a larger and still a larger tolerance for our fellows; for all those who are seeking the righteous life. Doing this, we shall, in very truth, work in consonance with Christ's teachings, and with the Higher Law;—and thus, in the example of OUR lives lead those in the valley of despair to the real Knowledge;—to a superb revival of man's Divine nature—to his Immortal Path. KATHERINE TINGLEY

Students'Path

KNOWLEDGE AND WISDOM

TENNYSON

WHO loves not knowledge? Who shall rail
Against her beauty? May she mix
With men and prosper! Who shall fix
Her pillars? Let her work prevail!

But on her forehead sits a fire:
She sets her forward countenance,
And leaps into the future chance,
Submitting all things to desire.

Half-grown as yet, a child, and vain,
She cannot fight the fear of death.
What is she, cut from love and faith,
But some wild Pallas from the brain

Of demons? fiery-hot to burst
All barriers in her onward race
For power. Let her know her place:
She is the second, not the first.

A higher hand must make her mild,
If all be not in vain; and guide
Her footsteps, moving side by side
With Wisdom, like the younger child:
For she is earthly of the mind,
But Wisdom heavenly of the soul.

Self-possession

I

ONLY so far as we have the help of the Higher Self can we get possession of the lower self. Whenever we loosen our hold on the higher the lower takes possession of us and carries us away from our true selves. We must break loose from our attachment to the lower in order to possess the higher. It is always selfishness in some form that prevents self-possession. A selfish fear of what others may think of what we do or say or how we may appear causes us to lose our hold on the Self, or our self-possession. Anger, envy, jealousy or any other selfish feeling that gets possession of us takes from us for the time being our possession of ourselves. Hence, in order to acquire and keep self-possession, it is necessary to root out selfishness from our nature. We have to acquire that equal-mindedness regarding pleasure and pain, praise and blame which the *Bhagavad Gita* sets forth. Then nothing can move us from our firm hold on the Self Divine and we shall make the lower self our servant instead of our master, thus coming into complete possession of ourselves. But we must cast our anchor in the higher nature to do this. Every motive must be challenged, and, if not able to stand the test, must be ruled out; we must let no failures discourage us, and no successes cause us to lose our balance, and so little by little we shall come out of bondage into freedom with all we have gained by conquest.

We shall possess the whole self, the lower as servant and the higher as guide, and we shall be able to rest secure and undisturbed in the True Self.

BANDUSIA WAKEFIELD

II

TAKEN literally the term expresses its meaning very clearly in two ways because, by its construction it signifies either possession of the self or by the Self.

And truly it means both, and one who is really self-possessed has reached an adjustment and harmony of his dual nature which unites its factors, the Higher and lower selves, into one, so long as and to the extent that his self-possession extends. For self-possession is a wholly relative term which differs with every person, and, even in the same person differs at various times and under diverse conditions. The same thing which would scarcely agitate a person at one time may, at another when he is off his

balance, completely upset his equanimity.

Self-possession, calm, sure and permanent, can result only from the yielding up of the personal will to the Higher Divine Will. This is shown by the fact that, in its relative degrees, self-possession extends only so far as the personal will or mind is brought into abeyance, for when it is no longer controlled it will refuse to obey the calm judgment of the Higher Self and disturbance will result.

But one who has reconciled himself to all possible eventualities of life is indifferent to the result and in consequence better able to act properly. His faculties of perception and discrimination are unimpaired and his physical senses and powers remain in a condition of ability to act promptly and accurately.

Taken broadly then, self-possession is that condition called in the *Bhagavad Gita* the "control of the self by the Self," i. e., of the lower personal self, by the Higher Self, and toward which all proper training must tend. It is, in ordinary life considered the mark of good-breeding to be always self-possessed and calm—but it only too often happens that the outward quiet is forced and that of the true self-poise and harmonious adjustment of the faculties there is merely the semblance. What we should aim at is so to govern our lives that we may acquire the true self-possession, to be able at all times to act and speak for the right. Tennyson very beautifully puts it thus:

Self-knowledge, self-reverence, self-control;
These three alone lead life to sovereign power,
Yet not for power—power of itself would come unasked for,
But to live by law, acting the law we live by without fear.

STUDENT

FRIENDS IN COUNSEL

DEAR COMRADES: A certain quality of fearlessness marks the demeanor of the children here, and this is shown not only in moments of danger, as once, when fire broke out upon the stage, but enters into their behaviour throughout the day's engagements. This habitual boldness is not a cultivated mannerism, but the simple result of allowing the higher nature some measure of controlling power in daily life. A quiet confidence is the natural attitude of the soul which feels its oneness with Divinity. Exultant in the knowledge of its everlastingness, it does not fear disaster and laughs at disease and death.

A terrible wrong is done when children are brought up in an atmosphere of dread and taught to regard themselves as "guilty worms" upon whose heads at any moment the vials of God's wrath may be outpoured. Not as yet "sinless beings," our children do from time to time give forth a note at discord with life's harmonies; but they await with perfect equanimity the inevitable readjustment. They neither supplicate to have the penalty remitted nor do they wish that some innocent party should suffer the punishment that is their proper due. Perhaps one reason for their confident bearing is that they are taught to make a fair and honest inventory of their lower natures and, as they recognize the source of every evil in the personal selfishness they find there, they are incapable of being shocked at anything they may encounter in the world outside.

Many a man, in a daring mood of introspection, has looked into the inferno of his lower nature and, terrified at the seething chaldron of chaotic forces, has replaced the lid and ever after gone about like one who treads the quaking crust of some volcanic region, forever fearful lest the boiling lava may burst forth and overwhelm him in its flow. The lower elements in man, however are not to be regarded as inherent defects to be apologized for, or wept over, or to be terrified at, but simply as forces to be grasped, subdued and used. As Vulcan amid the black smoke, the lurid flames, and the loud clang of iron on iron, wrought out his flashing blades and shining mail, so must the modern hero be prepared to grapple with the fierce wild forces underneath before he can forge out the weapons that he needs for life's great battle-ground.

STUDENT

INTRINSICALLY, Theosophy is the most serious movement of this age; and one, moreover, which threatens the very life of most of the time-honored humbugs, prejudices, and social evils of the day. . . . Slowly but surely it [the Society] will burst asunder the iron fetters of creeds and dogmas, of social and caste prejudices; it will break down racial and national antipathies and barriers, and will open the way to the practical realization of the Brotherhood of all men.—H. P. Blavatsky

GEMS

LEWIS MORRIS

STRONG souls within the present live,
The future veiled, the past forgot;
Grasping what is, with hands of steel,
They bend what shall be to their will;
And, blind alike to doubt and dread,
The End for which they are, fulfil.—*Selected*

The water placed in goblet, bowl or cup
Changes its form to its receptacle;
And so our plastic souls take various shapes
And characters of good or ill, to fit
The good or evil in the friends we choose.
Therefore be ever careful in your choice of friends,
And let your special love be given to those
Whose strength of character may prove the whip,
That drives you ever to fair Wisdom's goal.

—Translated from Japanese

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question Does Theosophy teach that man passes directly from one physical body to another, or is there a period when he is not incarnate and if the latter, what is the relation of this period to earth life, and what is its purpose?

Answer Only a brief reply can be given to the question here, and the enquirer is referred to our literature for a fuller statement of the teachings of Theosophy on the subject. Taking the case of the ordinary man, the teaching is that he does not pass directly from one incarnation to another, but that there is a period of rest intervening.

There is an almost complete analogy existing between the successive days of our earth life and the successive incarnations of the Ego, each of these being, as it were, a day in the long pilgrimage of the soul. And just as, after the day's activity, the business of life is laid aside with its cares and sorrows and disappointments, and the tired physical body goes to sleep; so, after a life's work is ended, the soul seeks its rest, leaving behind the worn-out physical body, and all its outer faculties and lower nature. Then, after the soul has completed its period of rest, when the hour strikes for its return to incarnation in earth life, it comes back again to take up anew its work and duties in the world.

There is this difference, of course, between our awaking to a new day after the night's rest, and the soul's return to incarnation after the long sleep, the entrance into which we call death; that after the night's rest we awake again in the same body, and in the latter case we find a new body prepared for us, but we are in each case the same Ego and awake again to resume our work in the world.

Another analogy might be made, which gives more completely another point of similarity. It is to compare our life on earth to school life, each school term being, as it were, one incarnation; then comes the school vacation, and school is closed for several weeks. When we return to school, it is almost like entering upon a new life; there are new faces, some of the old schoolmates are gone, we have probably forgotten some of the details of the lessons we learned during the previous term, but what we really learned then has become assimilated and our characters have grown and become more developed.

So we might say that the main purpose of the intervening period between earth lives is rest for the soul, and assimilation of the experiences of the previous incarnation, by which they are woven into the fibre of character. The details of these experiences may seem to have been forgotten, but their essence and result we bring back with us in the character and inherent tendencies with which we are born, and which form the starting point, capital, stock in trade, for the new incarnation. But while we have this as a basis on which to work, we can set in motion new causes which will give us a new starting point for the next life on earth. We do not change our characters during the period of rest between earth lives—that is a time for assimilation of what we have previously gathered; and we may perhaps get a new meaning from the words of the Scripture, "Work while it is called today, for the night cometh when no man can work." The time for work is now, in this life, here on earth; and if we would have greater opportunity in the next life we must sow the seeds for

it now, and it is the law that the harvest shall not fail.

STUDENT

Question Several times I have seen reference to man's lost heritage: what do you mean by this?

Answer If we think seriously about the matter, it will be very plain that man is not what he should be. The misery, poverty, vice and selfish greed, famine and war and desolation, all show humanity's sad and terrible condition. Should these things be? Do we feel in our hearts that they are in the orderly course of nature's progress, and according to her beneficent purposes—if indeed her purposes are beneficent, and to doubt that would be to go against all the highest promptings of our soul? Or on the other hand, are not all the evil, all the wrong, and all the wretchedness in life the result—according to law certainly—of a violation, long continued, oft repeated, of nature's laws? Have they not come about through a wilful disregard of her behests? And is it not because of our violation of nature's laws that we have gradually lost our rightful position in the world—in fact lost our heritage.

In many ways the knowledge has been kept of what our heritage is. Every great Teacher has come with the avowed purpose of pointing out the way to regain it. The great religions of the world all tell of it. The traditions of the great peoples of antiquity all describe it. Man's lost heritage is an "empire"—the empire over himself, and that means too the empire over nature. Man has lost the latter because of his loss of the former, and all the while he has been seeking to regain empire over nature without realizing that he must first regain the empire in the domain of his own nature, he has but touched the outermost fringe of the material world, and has failed to find the happiness he has so vainly looked for.

Expressed in another way, man's lost heritage is the Golden Age, told of in the traditions of all the great races of antiquity. And Theosophy comes with its message of the Golden Age to come, of the recovery of man's lost heritage, of his regaining of his rightful estate, of his becoming again, as he was and is essentially, divine, holding sway over the lower forces of his own nature, a king in his own domain, and becoming again a co-worker with Nature.

It may seem that we are at present a long way from the attainment of all this, but the first step is already taken when once we can realize what our lost heritage is and that it may and must be regained. And then at least we can help the children that they may not have the difficulties to face that have confronted us, in self-knowledge, self-control, self-conquest,—if we will but help the children, living our own lives also, that we may better help them, the dawn of the new day in which man shall regain his lost heritage is not so far distant.

STUDENT

Question What do Theosophists think is the Main Purpose of Life?

Answer According to the Theosophic point of view the main purpose of life is to work in harmony with the law underlying the unfolding into the manifested world of the perfect plan that exists in the Universal Mind. It is the human destiny to learn that law, and attune to it the life of man, so that he may work in conscious harmony with it.

At the present time, the Theosophist would consider the main purpose of life more particularly to be the working unselfishly for the enlightenment of the human race, so that the principles of brotherhood may be restored as the working basis of life. Only by the practical application of these principles to the daily life, and thorough re-adjustment of ideas, habits, actions, can humanity awaken to its destiny, and consciously work with the Law.

The Universal Brotherhood Organization by promulgating the principles of brotherhood and demonstrating them, is teaching humanity the main purpose of life. This has long been obscured to men's minds by the predominance of personality and selfish desire. But the onward movement of the evolution of man holds for the race an awakening of heart and intellect and will, and the teaching of Brotherhood is the entering wedge for stores of soul-wisdom, that will gradually purify and uplift life on earth, making man fully conscious of the purpose of his life, and of his power to attain to realms of creative activity now far beyond his imaginings. But the first step is the practice of Brotherhood. M. M. T.

Incredible "Occult" Foolishness

THE Universal Brotherhood and Theosophical Society are synonymous with wholesome common-sense, and that is why they appeal to healthy common-sense people. As an example of the opposite, which, incredible as it must seem, does nevertheless appeal to some people calling themselves American citizens, take the following. It is from a printed circular:

Every Sunday morning at 11 a. m., Divine Worship at Hygienic Home.
Subjects most interesting and elevating.
If you are unsettled in your ideas and uneasy as to your conscience take a few well-drawn breaths, take up ———ism in all its simplicity and become an important factor in this world.
Talents and the gift of tongues assured

M. BLANK,
PANTOPATH.

Private instructions in health and breath

Breath and Health Culture: Written by the eminent Rev. Dr. [oriental name], expressly for his worshipful pupils, by special requests and untiring pleadings.
200 pages, bound, \$5.00. Single lessons in paper cover, 50 cents.

Besides Pantopathy, or the art of panting (!) there are taught homœopathy, hygiene and "mental gymnastics." On sale are soap, bread, "wind puffs," etc., the last presumably in connection with the panting. There is a program of the weekly meeting, which includes "How to Arrest Pain by Will," "How to Live on Two Cents a Day," and a "Demonstration of food. Everybody expected to bring their own plate and spoon." (Sic.)

The above, which is a mere sample, exceeds all the possibilities of burlesque and parody. It shows to what depths of rottenness and insanity the pursuit of "occultism" leads. How well the wily Oriental understands his American public. How little trouble he takes to disguise his wiles. And how he must despise his customers as he pockets their dollars.

H. T. EDGE.

A Bell-Ringing Record

AT a church in Leicester, England, an attempt was recently made to ring a peal of 21,024 changes on eight bells, according to the scheme known in bell-ringers' phraseology as "double Norwich court bob." The total possible number of changes on eight bells is, of course, factorial 8, or 40,320. Leaving out the less euphonious combinations and arranging the remaining ones in various orders of succession, we get the schemes known by those extraordinary names, "bob-major," and so forth. On this occasion one of the men was taken sick after ten and a half hours' ringing; and, though the peal failed, a world's record of 17,184 was established.

Eastern and Western Mourning

IN one of its ways of mourning the East certainly betters the West. White is worn instead of black. To place a sick man in a bed with white sheets would appear to him a sentence of death. The victory of black is not however complete in the West. The hearse used at the funerals of children is often white; and in England the hatbands and sashes are white in the case of the funerals of young unmarried persons.

The wearing of black is one of the ingenious means by which we make death feared by ourselves and by children. In an English or New England village, everybody turns out to see a funeral. If there is a hearse, it is usually hideously black-plumed; behind follow the mourners, often on foot, also in profound black, accentuated by the white handkerchief which it is proper to hold to the face. And the undertaker and his assistants carefully carry out the idea. In fact the whole thing is a hypnotic and unremovable suggestion to the young that death is a final tragedy, a blot on existence. All the accessories are in keeping with this idea. We carefully arrange the symbolism of our cere-

monial so that it shall not carry the faintest hint that the dead still live. Should we do so if we really believed what we say, believed it as we believe the sun will rise tomorrow? .

In Europe

(By Our Special Correspondent)

FEBRUARY 10, 1905

AS was anticipated, it seems probable that the new French government will carry on the great work left to it by its predecessors. Strikes are on the increase throughout Europe. What will be the general result, at this epoch of *unrest*, it is difficult to say. So much depends on the underlying motive. In one strike now pending the motive is new, and impersonal. Some time ago a conference was held at Orléans to consider the evils arising from the use of white-lead for industrial purposes. Subsequently the National Federation of Painters declared in favor of a *general strike*, with the object of abolishing the use of white-lead in paint. A strike against a deadly poison certainly suggests higher motives than a strike for mere increase of pay. But there are other deadly poisons besides white-lead. Will the workers of Europe (and America) organize themselves for a strike against the use of *alcohol*? Perhaps if they did, strikes of the ordinary character would become superfluous. A gigantic combination of workers the aim of which was *self-conquest*! Think of it! Not all the syndicates and trusts in the wide world could prevail against such a combination. Their power would be gone.

The troubles of Russia are the absorbing question of the hour. Even in Spain, whose own troubles are plentiful, this theme is prominent. An interesting article has appeared in a recent issue of the *Heraldo de Madrid*. It is contributed by a Russian Prince in London. The writer is hopeful as to the ultimate issue of the present struggle. He says: "That which strikes all Europe is that honourable men of all the social classes, including the Nobles, the *bourgeoisie*, and likewise the clergy—have united in one and the same peaceful manifestation in support of the claims of the working people." He notes that prior to the event of June 22d, reformers in Russia were divided in their aims and often opposed. Now there is a new spirit of unity spreading—however much the outward signs of it are repressed. On this he bases his hopes for the future.

Yes, the leaven of Universal Brotherhood is working in the minds and hearts of the Races. An idle vision it seemed, ten years ago!

John Bunyan

AMONG truly great writers, whose work has the touch of genius that gives universal and lasting popularity, must be classed John Bunyan. This man surely had many faculties combined in that just proportion which, as Poe says, so enhances the efficiency of them all and gives the commanding strength that springs from symmetry. A writer whose work ranks next to the Bible in popularity, and who has won the unbounded praise of men like Macaulay, Coleridge, and Dr. Johnson, must be a genius. Like the work of other geniuses, his success is achieved by means so simple that narrow critics are perpetually attributing his fame to popular delusion. Such people do not understand that simplicity is the inimitable attribute of the great. Those who cry "tinker" and "carpenter's son," are they not of the same family as those who are always imagining someone else is getting more than he deserves from a stupid public which overlooks their own claims?

Vivid imagination, bringing the scenes and characters bodily before our eyes; simple ingenuousness, free from the least suspicion of affectation; absolute faith in his cause; deep knowledge of and sympathy with human nature;—these are some of the many traits which Bunyan combines. The *Pilgrim's Progress* is a real epic; and, apart from its particular theology, may well stand for an allegory of the experiences of a soul on his path to liberation from the bonds of self. The Antarctic Continent

A RECENT summary of the results of Antarctic explorations gives some interesting particulars of the mysterious continent around the South Pole. In studying what the teachings of antiquity say about the South Pole, we find that to the ancients geography was more than it is to us. It was, like all their science, intimately related to the life and history of man. The earth was divided into regions, according to the character of the influences prevalent among them. The South Pole has always been associated with malign and passionate influences. The Atlanteans, says H. P. Blavatsky, gravitated toward the South Pole—the "Pit"—"whence breathe hot passions blown into hurricanes by the cosmic Elementals, whose abode it is."

Compare this with the following account from the *Discovery's* reports:

What is probably the lowest temperature on record has been recorded, 67.7 Fahrenheit below zero. There were hurricanes up to eighty-five miles an hour. The prevailing winds at the *Discovery's* quarters were east and south-east; west winds brought blizzards and storms; south winds, that is winds from the Pole, usually raised the temperature as much as 40 degrees.

The land is deeply covered with ice, in some cases perhaps thousands of feet thick. In Victoria Land, however, there are places where the rock is bare, and it is found to be volcanic. There is everywhere evidence of vast volcanic activity in the past.

In a sandstone exposure, one explorer found fossil plants, showing that at no remote date (geologically speaking) the climate was warm.

The results of the British and German expeditions show that the glaciation once extended farther than it does now. There has been a shrinkage within recent years, but it is not known whether this is constant or fluctuating.

The Aurora Australis was often seen, but never so brilliantly as the Aurora Borealis. The position of the magnetic pole is not yet determined, but may be determinable by plotting and coördinating the observations collected.

The Antarctic continent is surrounded by deep sea on all sides except probably toward the south point of America. One authority conjectures that it was formerly continuous with South America and extended as far as New Zealand.

The continent on which the Third Race of humanity flourished over 8,000,000 years ago, and called by H. P. Blavatsky **Lemuria Was a Vast Continent**, a name invented by Selater for a continent whose existence he conjectured on zoological grounds, extended from Madagascar to Ceylon and Sumatra and included part of Africa and New Zealand.

The Polar lands remain ever the same throughout the world-cataclysms marking the divisions of the great Races. STUDENT

New Lamps for Old

THEY are selling printed cottons for women's dress in Madras on which, instead of the exquisite native designs consecrated by centuries, there are rows of bicycles! From that and similar examples, the Indian of a certain class makes his acquaintance with western art! And he is beginning to accept it, to imitate it, and to stop the production of his own fabrics, colors and designs carrying the atmosphere of a perfect old-world culture. Sir George Watts, who has just published a most interesting catalogue of the Indian Art Exhibition at Delhi—though that took place two years ago—dwells with great force on the serious injury which is actually being done to ancient Indian art by this sort of intrusion of Western Brummagen products. He mentions with approval the suppression of a "moral pocket-handkerchief" which was having a considerable sale. This was however not suppressed because it was a hideous piece of printing, or because it bore a text, but because along with the text it bore a print of a rupee banknote. C.

Arabia and the Arabs

HAS Arabia a future? Yes, but not altogether for the Arabians, thinks Consul Ravndal of Beirut. Two-thirds of the country is cultivable land, whereas there are but from four to six people to the square mile. It awaits the railway, the telegraph, irrigation, and in general the Twentieth century.

The Consul quotes with disapproval the remark of a recent writer in the *Egyptian Gazette*: "Had the Wahabi power continued, Arabia would probably have been a highly-civilized and flourishing Mohammedan country at the present time. But when, in 1818, the Turks destroyed all this fresh machinery of Arab civilization and development, they substituted nothing in its place."

The Wahabi movement was the work of a seventeenth century reformer, and in its way was a good one. It introduced justice, reformed morals, controlled and punished crime and restored order. So far it was good and no further. For it contained no seeds of progress, took no account of modern civilization, and was merely a return to primitive, rigid Islamism. The Turk, of course, played his usual part, but if he had not, if Wahabism had had its every chance, Arabia and its inhab-

Some Views on XXth Century Problems

The Psychology of Childhood

THE Director of a large South American school has published a careful statistical study of the development of over 200 children. His figures have a moral which he does not draw. He has noted some suggestive phenomena occurring at the child's critical age—at and about 13. The higher life-current is setting in with all its possibilities in both directions. The first sign is an enhanced activity of memory; the brain cells are the first to be touched by the rising tide; they become quicker to apprehend and stronger to keep.

This phase does not last. Memory at 14, says the Director, is not equal to what it was at 13; but the reasoning faculties have taken a marked step. And with them, or a little after, the creative imagination springs to the front.

The recession of memory between 13 and 14, may easily be accounted for. Reason is the perception of relations between facts. From the moment of its appearance, holding to and presiding over facts whose relations it perceives, it does not dwell upon and detain facts that are mere detail, and do not lend themselves to its synthetic work. It begins to guide the constructive life current, to make it build, to suit its plan, the work it wants to do. One child will never forget a fact in science. Another will with difficulty register such facts, but will never lose hold on a phrase of music.

This is the time when, if ever, parents should watch their children. An injustice suffered now will never be forgotten. Let it be counted as a new beginning, with new opportunities for those who watch and guard. More now may be done to give direction to the tendencies that will sway the whole life, than at any other period. What bent will be given to the nascent creative imagination, the gift of the soul? Upon what pictures and thoughts is it now to be allowed to do its first work? Those supplied by the newspaper and the dime novel? As it begins it must continue, unless, when years later full self-consciousness has come, it is remodeled with an infinite labor and tenacity of purpose to which few are equal. But at this place of the parting of the ways, the right path is as easily entered as the wrong, the child's divine nature as easily helped as thwarted.

STUDENT

One Child in Five

FIELD AND STREAM notes that one child in five in this country spends the years between the ages of ten to fifteen, at work in coal-mines, factories, or similar places. Education is at a stand-still; there is no recreation in field or forest; nothing to develop mind or character, everything, on the contrary, to hinder or distort their growth. At fifteen the unhappy little creatures, dwarfed in every direction, pass into circulation. In a few years our citizens' roll will be one-fifth made up of such.

In his installation address President Roosevelt said many fine things about our duty and our dawning destiny to lead the world. Make any allowance you judge fit for possible over-statement in the figures we quote; the picture will not be greatly relieved. For there is the other and worse side of it that child-labor is one, and only one, product of the greed and indifference of those who are knowingly operative in causing this stupendous piece of cruelty. They are a worse blot on the roll than the children, become adults, will be.

In *what*, are we to lead the world? Humanity of conduct? Unselfish disregard for gain? How long does a nation's public policy remain in advance of its average private standard?

These children are slaves who derive no shadow of benefit, nothing but harm, from their slavery. Morally and mentally dwarfed men and women, they are prematurely fathers and mothers whose children register and reflect the moral and mental status of their parents.

We once held "these truths to be self-evident: that all men are endowed by their Creator with certain inalienable Rights, that among these are Life, Liberty, and the pursuit of Happiness."

But perhaps the signers of the Declaration of Independence were not thinking of children in those momentous days!

STUDENT

Emigrants and Immigrants

THE countries of Europe are awaking to the fact of the steady emigration to this country of their best stock, just as we are awaking to the immigration of their worst. If we were not, last year we should have received 500,000 of the latter in addition to the 800,000 of the former whom we welcomed.

Three years ago the Italian government cut down the numbers of agents soliciting the poor to come here, from 7000 to less than one-tenth of that number. In every other European country except England, such solicitation is illegal.

The Spanish emigration laws are very strict, and so are those of Hungary. The Government of Austria has assumed the right to veto the emigration of any given person, as well as to dictate to him by what route and under what conditions he may leave if finally permitted.

When a baby cries, the mother does not usually tie up its mouth. She tries to find out and remove the cause.

The simple idea does not seem in favor with the Governments of Europe. They do not inquire why there is this unflattering eagerness of their people to escape from under their wings. One or two only have done something. In Italy, free education has been extended, and taxes on the poor reduced to the utmost. In Hungary, public works have been started for the employ of the destitute unemployed.

Of one reason, at any rate, these governments are perfectly aware. They know that eagerness to emigrate is almost in proportion to the length of compulsory military service. The emigrants are escaping from the loss of years continuously, or of months of each year, which the various forms of conscription entail. The vast military burdens, with their resulting taxation, make it hard enough to live anyhow. And the difficulty is much worsened by these idle years—idle from the victim's standpoint.

Perhaps there are other reasons which honest enquiry of the more intelligent of the emigrants, if allowed to speak freely, would elicit.

But this one lies nearest to hand. It would seem commonsense to try to rectify it before it starts to vehemently rectify itself.

The Ideal of Old Age

DR. OSLER'S somewhat cruel lecture on the relative uselessness of old men has caused the suicide of an aged scientist in St. Louis. For several days he discussed the theory with his friends, and finally decided it to be correct. Whether Dr. Osler will approve of this reduction of his mischievous theory to practise, we do not know. Whatever views he may hold in other compartments of the mind, the one that contained that view was given over to materialism. It is an identification of the *man* with the sense-mechanism; an assumption that there is no seer who, when experiences have been gathered, can gain wisdom from their survey.

For the consciousness of old age is often like that of night, when the activities of the outer senses and the physiological process coming to a minimum, a deeper stratum of mind, one nearer to the spiritual, may be uncovered. This should be the normal state of the aged, and on it rests the traditional ascription to them of wisdom. That it is rare in our day is due to loss of belief in the spiritual presence in man with which old age should bring him into closer touch. Youth is undisciplined and wasted. The mind of the child is never taught to look in for a higher light than its own. All real knowledge, it is taught, comes but through the senses. So the deeper side of life, the greater, the subjective, remains unexplored. The very faculty of exploration lies latent. No wonder that when age comes and the mechanisms are rusting, that which sustained them is powerless to illuminate consciousness with a new light. In words we believe in the soul; in act and thought we live as if it was not.

When children are once more trained to a *knowledge* of their own divinity, *their* old age, when it comes, will be that of the ideals of antiquity, wise with a wisdom that ripens on to the very death-hour.

Brief Glimpses of the Prehistoric World

Archeology
Paleontology

Some Remarks on the Ancient Greeks

DR. BUTCHER, a Harvard lecturer, has this to say, among other things, in appreciation of the culture and qualities of the ancient Greeks:

For the Greeks the paramount end was the perfection of the whole nature, the unfolding of every power and capacity, the complete equipment of the man and of the citizen for secular existence.

One notices the familiar distinction between sacred and secular, implying that the Greeks, however excellent, were still worldly and perhaps "heathen."

They realized, in the words of Aristotle, that the State existed "not for the sake of mere life, but of the noble life." A wanton display of wealth was accounted "vulgar, Oriental, inhuman." "Simplicity in the home, splendor in the city—that was the principle." And with it went the "conviction that the things of the mind have a worth, an inherent dignity, which cannot be measured in terms of money;" that a true ideal of citizenship implies an adjustment of work and leisure.

A certain novelist, in contrasting Italians with Anglo-Saxons, makes the remark that the former seek to make life pleasant, and the latter seek to make it profitable. Clearly the Greek ideal was to make it noble and beautiful.

And so, too, in discussing Greek art, Dr. Butcher shows that the dramatists, the orators, and the writers of prose not merely observed the negative principle of "nothing in excess," but that they expressed profound emotions without ever losing their intellectual grasp; that "reason and intuition," "art and inspiration," entered into alliance and were justly balanced.

Balance, harmony, proportion, equal development, coöperation of all the functions of the soul and the intelligence, was their principle. Without this, art breaks up into conflicting schools.

We cannot, however, agree that the Greeks "invented" geometry, or that it was the Greeks who first put the question "Why?" This is ignoring the Egyptians and all older civilizations, and going back to the old orthodox limited views of human history and origins. STUDENT

Who Were the Nabatæans?

AN archeological report states that the Princeton expedition to Syria sent out last summer, has made important discoveries about the Nabatæans.

The places excavated were Arak-il-Emir, Amman and Bosra; and especially a place called Siah, the most important religious center in the Hauran mountains from early Nabatæan times until the end of the second century. The discoveries at Siah include the full plan of the great Temple of Baal Shamin, the magnificent gateway of the forecourt of this temple, and the head of Baal Shamin, the sun-god, with his crown of rays. The carved details of the gate are extremely rich and show no influence of Greek or Roman art. Other buildings were found, pre-Roman, earlier than the Christian era, new to the history of architecture, and of unusual beauty. Inscriptions were found, and it is hoped to clear up much about these people who "ruled Damascus when St. Paul was there."

Now who were these Nabatæans? They are a mysterious people whose place in history is but little understood. They occupied ancient Arabia, and in the time of Josephus their settlements gave the name of Nabatene to the border-land between Syria and Arabia. In 312 B. C., we hear of their being attacked by Antigonos. They are described by Diodorus as being at this time a strong tribe of some 10,000 warriors, preëminent among the nomadic Arabs, pastoral and simple in their life. They had an Aramaic culture and wrote in Syriac characters. They flourished through the first Christian century as nominal allies of the Romans, but turned from a warlike into a commercial tribe.

In 1860 a curious work, too curiously true to be recognized by the "authorities," was translated by an Orientalist named Chwolsohn, under the name *Nabatæan Agriculture*. H. P. Blavatsky spoke highly of this book. She says:

In the opinion of the translator that archaic volume is a complete initiation into

the mysteries of the Pre-Adamite nations, on the authority of undeniably authentic documents. It is an invaluable compendium, the full epitome of the doctrines, arts and sciences, not only of the Chaldæans, but also of the Assyrians and Canaanites of the prehistoric ages. These Nabatæans—as some critics thought—were simply the Sabæans, or Chaldæan star-worshippers. The work is a retranslation from the Arabic, into which language it was at first translated from the Chaldæan.

Masoudi, the Arabian historian, says the Nabatæans founded Babylon and were descendants of Ham; and Chwolsohn finds that this is in accord with *Genesis*. The contents of this ancient work are, says H. P. Blavatsky, if properly understood, almost all of them identical with the ancient Wisdom-Religion. It is the record of the oral teachings of a Babylonian sage named Qû-tâmy, who used for his lectures materials still more ancient. The first Arabic translation is placed by Chwolsohn at the Thirteenth century B. C.

The word "agriculture" seems to be used in the same kind of way as the words "masonry," "alchemy," "geometry," etc., in other arcane works.

The book tells of periods of vast duration and of numberless kingdoms and dynasties that preceded the appearance on earth of Adami (the "red-earth"). Chwolsohn's translation aroused great opposition owing to its confuting Biblical chronology. It proves that the patriarchal names in *Genesis* are generic names, as is the case with so many other mythological records, which are brief memoranda wherein persons do duty for nations.

Some critics, including Renan, objected that the *Nabatæan Agriculture* was a compilation by some Jew. But of what was it a compilation, and is the Old Testament entitled to any better description? We must judge books by their contents. And with regard to this book, H. P. Blavatsky shows that it was very well known as a valuable work in antiquity, cites various allusions to it by writers of different ages, and discusses its teachings.

Thus it is clear that the Nabatæans, whatever their status in later names, are a very ancient people, and that whatever archeologists discover about them, is likely, if candidly interpreted, to vindicate Theosophy. STUDENT

The Meaning of the Word "Pontifex"

THIS word comes from *pons* and *facio* and means a bridge-maker; but the explanation usually given is puerile—that the Roman pontiffs were so called because a priest built the Sulpician bridge, or because priests had charge of bridges. There were pontiffs earlier than that time. Some authorities, recognizing the absurdity of this explanation, have tried to derive the word from other roots. But to a Theosophist the meaning is surely clear. Does not Longfellow hit it off when he says:

Well has the name of Pontifex been given
Unto the church's head, as the chief builder
And architect of the invisible bridge
That leads from earth to heaven.

Clearly a pontifex is a Teacher who makes a way to liberation for men, a bridge over the chasm between sensual earthly life and the higher or eternal life. STUDENT

Symbology of the Mince Pie

THE Christmas mince pie was originally a compound of the choicest spices and edible productions of the Orient. It was eaten in commemoration of the offerings of the three wise men who carried rare spices, frankincense and myrrh from the distant countries of the East to the infant Christ. Another authority, however, makes the mince pie emblematic of the manger in which the Savior lay, the paste over it being made in the form of a hay-rack. H.

Artistic Taste in Antiquity

In commenting on some beautiful vases, made in the shapes of birds, found in Egyptian tombs, a writer makes this remark: "As they were made probably two thousand years before the Christian era, one must admit that they display no little artistic taste." The notion that artistic taste is in the inverse ratio of antiquity will not hold water much longer in view of the discoveries we are making now. T.

The Trend of Twentieth Century Science

Universal Evolution

AMID all the scientific speculations as to the duration of the life yet remaining to the sun, and therefore to the earth, there is never a suggestion that they will remain alive as long as they want to or as long as they are wanted to. And they are always imagined as finally condensing into two cold, dark stone balls, profitlessly circling in indifferent space. The two big stones, whether transcendently hot, or utterly cold, are not considered as organically related to the conscious life thereon, or as coming in under the same law of evolution. We are asked to think of life as evolving, but of the *home* of life as degenerating.

But yet there are signs of preparation for a new step in thought. Professor Rutherford, after enumerating various speculations about the time during which the sun has supported, and may continue to support, terrestrial life, says: "As for the future we may say . . . that inhabitants of the earth cannot continue to enjoy the light and heat essential to their life for many million years longer, *unless sources now unknown to us are prepared in the great storehouse of creation.*"

Then he points to such a possible source—of course radium. "If radio-active matter is distributed throughout the whole earth to the extent that experiment indicates, the heat evolved by the radio-active matter would compensate for the heat lost to the earth by conduction to the surface."

This makes the earth a generator of its own heat. The highly complex radio-active atom, breaking down into the simpler atoms of other elements, liberates the heat necessary to replace that which is lost into space.

But suppose that while one radiant atom is thus degenerating, another is being built up. We know that some of the emanations of the sun are the force used by vegetable and animal matter to build themselves up into ever complexer tissues. Why limit the process? Why is not mineral matter also evolving, complexifying itself, under the influence of the same solar emanations? Why *must* mineral matter be supposed as ever degenerating and cooling, whilst organic matter is obviously evolving and synthesizing? The supposition is an unconscious bit of self-hypnotism, "born of the darkness," to which, so far as we know, every scientist without exception, is the victim. It is an ancient belief that there is an order of consciousness peculiar to each kingdom of nature, manifesting everywhere as the energy of evolution, of new material formation. All degenerations are but temporary back-washes of the ever-advancing tide. Human consciousness is slowly spiritualizing itself. Animal, vegetable, and mineral consciousness are making a similar advance according to their nature. The whole is one, each degree rooted in the degree below. And the physical sunlight is the body of a spiritual light, each evolutionarily active on its own plane.

Was there anything in that old belief to which science can say no? If it be true all existing speculations about the future of sun and earth are beside the mark. For if matter everywhere be slowly evolving, its constitution and properties a hundred million years hence will be such as we cannot foresee. The "new heaven (sun) and the new earth" may be gradual evolutions even now in progress.

Not long hence, thinkers will look back with wonder to our day, asking each other how it was possible men could believe in the Haeckelian universe, a set of stone balls unconsciously fathering conscious units and then slaying them.

STUDENT

Tides on the Great Lakes

IF the attraction of the sun and moon produces tides in the sea, it ought by the same law to do so in the great lakes, and indeed in every body of water, however small. But a comparison of the relative sizes of sea and lake will show that the tidal motion in the latter would be very small. But there are other fluctuations to which lakes are subject in a greater degree than is the ocean. Differences of barometric pressure at the two extremities will produce a difference of level of two feet, causing a "tidal wave" to roll across; and the wind has a similar effect on some lakes. These movements entirely mask the true tidal effect and are ascribed by the uninitiated to other causes. STUDENT

"Creating Life"

WHEN a crowd, desiring entrance to a theatre, finds that the door has been unlocked, it naturally surges in. Was the opening of the door the compelling cause of the entry, or was it only the means which made possible the gratifying of the desire to enter? Does the opening of the door create the people who enter by it?

A recent newspaper account of some biological experiments reads thus: "Loeb creates Artificial Life; Eggs of the Sea-Urchin are vitalized." He has created it in the same sense that the opening of the door creates the people.

The account then quotes a paragraph from the experimenter's report, and goes on: "These fields of further research at which Professor Loeb hints are nothing less than the rewriting of the mystery of the reproduction of life in all organisms from animalculæ to man, in chemical and physical terms, the elimination of that divine force at the sources of life which has previously baffled materialistic science."

Why do not editors give the science work on their journals to men who know something of science? At the will of a torpedo fish an electric current is discharged from its batteries under the skin. The wonder of the phenomenon is not the battery, which man can crudely imitate; but its direct obedience to the consciousness of the fish. No man-made battery stands in any such relation to the consciousness of the man who made it.

Nature has provided a special method for energizing the living cells of the Sea-urchins' eggs so that they shall start on their development into nature organisms. The experimenter Loeb has found another method, chemical or electric. So he has "Created Life"! He has opened another door than the one through which the crowd would presently have entered anyhow, which it would have opened for itself; and so he has created the crowd! Nor did the crowd enter because it wanted to, but because the opening of the door not only created it but compelled it to come in!

The mystery is that latent Presence which the material combinations, either man-made or nature-made, enable to manifest; itself being the active force in nature; itself being even Loeb's wish to understand.

STUDENT

A French Scientist on Action at a Distance

IN a recent number of the NEW CENTURY PATH it was shown that the "atomo-mechanical" theory of the universe involves physicists in the following dilemma: Action at a distance is impossible; but *all* action is action at a distance.

This is confirmed by a French scientist whose posthumous work, now under review, has come under notice. He points out that the "universal ether" was postulated in order to supply a necessity which does not exist. That is, the ether was invented in order to explain the interaction between sun and earth across space, on the assumption that action at a distance is impossible. But, since *all* action is action at a distance, there was really no need to try to invent another explanation in this one particular case. If an atom can attract another atom across the intervening space, why cannot the sun influence the earth across space?

If we do need an ether to account for interplanetary actions, we shall equally need it to account for every other sort of action whatever, since all force is supposed to be transmitted from particle to particle of matter across the gaps.

But the question then arises (as this scientist admits), what structure shall we assign to this ether? If we assign an atomic structure, the same difficulty arises again. If we assign any other kind of structure, why could we not have assigned that structure to ordinary matter, and thereby have obviated the need of predicating an ether at all?

The fact is, that if we predicate an atomic structure for matter, we must be content to accept *actio in distans* as an axiom. It is matter of common knowledge that mathematics can only formulate the relations between phenomena—not their causes. In any system of formulation there must be axioms somewhere. We cannot reduce our conception of action at a distance to any simpler elements without leaving the range of our dynamics altogether and entering upon an enquiry into the nature of our perceptions and conceptions, into the ideal world in short. E.

Studies

Luther Burbank and His Work

THE Carnegie Institute has made Luther Burbank a grant of \$100,000 to be expended as he may think fit in the furtherance of his work. He can now, as he says, give up business cares and devote himself exclusively to the experiments which have made his name known throughout the world. One of the first results of this liberation will be the commencement of a book on the whole subject of plant-breeding and hybridism, such as no one but he could produce. It will be illustrated by a corps of skilled artists, and charts and sketches will make it the most valuable book of the kind ever published. In fact there is so far no such book pretending completeness. A laboratory will also be erected for the carrying out of delicate experiments with perfected apparatus.

If, half a century hence, the majority of flowers and fruits in our gardens and on our tables shall be such as would be unrecognizable to the gardener of today, assuredly to Luther Burbank more than to any other living man the credit will be due.

But these are the days of new things in every field of thought and research.

STUDENT

Animals Have Hearts

IT is related of Landseer, the great animal painter, that, when asked how he exercised such a remarkable influence over dogs, he replied, "By peeping into their hearts."

Animals sometimes pine from want of recognition and sympathy, for which the proffer of food is but a poor substitute.

A dog values the esteem of his master far more than his food. Perhaps we do not recognize the finer nature of animals enough. Like children, they can be ruled through fear and appetite,—or otherwise. Hard and fast theories as to the interior make-up of animals, and whether they have "souls," do not work well in practice. In any case a "law" is only a rough summary of general facts, and individual cases may lie without its limits.

So animals may have faculties to which we claim the exclusive right; and if there be any higher faculties they do not have, we ought to remember that our own outfit is not always a thing to boast about. Sympathy is a magic wand and may call forth things new and unexpected. STUDENT

THE MOUNTAINS BEHIND FUNCHAL, MADEIRA ISLAND

New Process of Preserving Foods

THE process of evaporating from vegetables and fruits their large percentage of water, and thus reducing them to a form in which they can be packed in very small compass and kept, has been improved so that all vegetables and fruits, and even meat and eggs, can be greatly reduced in bulk and at the same time so sterilized as to render them capable of practically indefinite preservation. The process consists of treatment by hot air. The foods are perfectly dried but not cooked, and the addition of water restores them to their original bulk, appearance, flavor and color. The dried products are put up in round pasteboard boxes and need only to be kept dry. They will be most useful for camps, expeditions, and armies of soldiers or of workmen.

Potatoes lose eighty per cent. of water, and assume the appearance of rice; but when water is added they regain their normal volume and can be served as mashed potatoes. Spinach loses ninety per cent. and resumes its original color when water is added. Cabbage dries down to a kind of tissue paper, only eight per cent. of the original weight. Eggs, meat and fish can be dried with powdery substances, which can be used in made dishes.

It is expected that the new portability and preservability thus acquired by the substances will revolutionize the economics of provisioning. STUDENT

Vigor of Life at Point Loma

THE life energy at Point Loma is so vigorous that anything, vegetable or animal, seems ready to appear in profusion at a moment's notice, if only the weather conditions are suitable. An unusually copious rainfall, followed by warm cloudy weather, has produced an unprecedented quantity of insects of the daddy-long-legs and midge varieties. All these creatures are doubtless purifiers of the air. Strange funguses too appear on the damp ground. The flowering shrubs are in luxuriant blossom and clouds of small butterflies are provided by nature to deal with them. The frogs of course are having a glorious time; but when several stentorian members of this tribe think fit to spend the whole of every night sitting on lotus leaves and "singing" in a tank a few feet from one's window, one can only console oneself with the thought that they at least are enjoying themselves more than their hearers do. STUDENT

LET us propagate, propagate, propagate, lest our nation decay! Let us urge a bit forward the birth-rate in its neck-and-neck race with the death-rate."

That is the cry of many a would-be reformer, now,—and in America! In England we hear the same cry. To quote from a recent daily paper:

The people of England are declining in physique and are ceasing to bring forth their increase. Last year only 52,000 out of the hundred thousand men who sought to enter the army passed the necessary tests. In other words, one, roughly, out of every two candidates, was rejected as unfit to represent his country on the battle-field. As to the birth rate, that has long been steadily declining, especially in the industrial communities, and most of all, we believe, in Lancashire, where the employment of women in the mills is evolving a sterile and physically decadent race.

Those who look out over the world's affairs with an eye to moral conditions cannot conscientiously echo this lament, realizing as they do that it is but the soiled and raveled fringe upon the garment of the real problem. The swarms of ill-fed, neglected, anæmic and morally unbalanced children that may be encountered in the slums of our great cities are a living protest against the theory that a nation's welfare depends upon an increased birth-rate. Half a philosopher, at such a sight, would echo Katherine Tingley's words, "Fewer children and better ones." There is a close analogy between the human body and the great body of humanity, of which each unit-soul is, as it were, a cell. No one is so lacking in sanity as to argue that the way to preserve the human body unto long life and the greatest usefulness is to increase its bulk. No one would argue "health germs, disease germs, good food, pernicious food, anything and everything that will increase the size,—load them all in!" What would be the result of such a course? Disease and death—there could be no alternative. Is not the analogy plain? Load up our nation, increase its size, good and bad, anarchist, lunatic, scoundrel, moral pervert, load them all in—or some day some other nation will be larger than we are! What a philosophy!

Of course this is not actually said by those who are worrying about a possibly decreasing birth-rate. But it is the logical deduction from what they do say, and from the position they take. Their failure to admit it merely indicates that they have viewed the problem upon its surface and have not looked within its depths. The commonest stock-raiser will

Signs of the Times

THE ideal which the wife and mother makes for herself, the manner in which she understands duty and life, contain the fate of the community. Her faith becomes the star of the conjugal ship, and her love the animating principle that fashions the future of all belonging to her. Woman is the salvation or destruction of the family. She carries its destinies in the folds of her mantle.—*Amiel*

not breed inferior animals merely for the sake of increasing the number in his possession. All experience shows the folly of such a course. Yet there are those who look complacently upon the pregnant women standing before the machinery of our factories; those who raised no voice of protest when they learned of the women working in mines, harnessed like animals to carts of ore, which they dragged, crawling on hands and knees—many of these women mothers, many of them about to become so. These conditions do not now exist, thank God, but they did, not much more than a generation ago. What kind of children, think you, are likely to be given to the world under such conditions? Good material to build nations out of?

Looked at from the standpoint of the Eternal and the True, a nation as small as Greece is worth more to the world if its ideals are high, its people pure, its children well-born, than an entire hemisphere if that hemisphere be filled with disease, moral and physical, because its children are not well-born.

What the world needs is a higher ideal, an ideal that will invest men and women with a conviction of the sacred responsibility of fatherhood and motherhood. The only thing that will save any nation is education on right lines.

The world is waiting today for someone who shall come with the greater message, the message, that, if listened to, will make it forever impossible for men and women to become fathers and mothers from any but the purest motives. Given a pure heredity, generations stand on sure ground indeed. Until that time the world will be the chaos that we see it; lunatics and criminals will multiply and sensuality will claim its victims by the thousands. We need not worry about a decreasing birth-rate when every daily paper gives plain proof that, as a nation, we would be vastly better off if a certain proportion of our population had never been born at all. Let us pause—and think. STUDENT

In a recent lawsuit in New York between a husband and wife, it was stated by the wife, as one of the causes for complaint, that she was regarded merely as a domestic servant in the house and as nurse to the children of the husband by his first wife. Comment is not needed. The simple statement opens a long train of thought and speculation, particularly to women who have known the meaning of what might be termed "domestic disadvantages." The law court after marriage furnishes but a sorry substitute for the knowledge that should have been gained before. H.

Mozart's Sister

BY this name is Maria Anna Walburg Ignatia Mozart best known to the world. Although as a child she was a remarkably gifted pianist, her talents seem to have been completely overshadowed by the genius of her renowned brother, Wolfgang.

When both were mere children, the sister ten, the brother six years of age, the father took them on an extended trip through the larger European cities. The skill and wonderful musical ability of both children excited the wonder and admiration of all musical critics. In the publications of that date, the sister is said to have "played the most difficult pieces of the greatest masters."

Considering that she had to stand comparison with her brother Wolfgang who was four years younger, and the most gifted musical prodigy the world has known, and yet made favorable comparison, there is proof that Maria was an unusual musician as well as her brother.

A striking similarity is noticeable in the musical comradeship existing between Mozart and his sister, to that of Mendelssohn and his sister. How much benefit the sisters may have been to the brothers in both cases, it is hard to determine, for these ties are often of such a subtle nature that the actors themselves are not always cognizant of their real value. But the influence of a good woman has always been a potent factor in the perfect development of man's best efforts.

E. C. S.

The Gist of Passing Meditation

MAN has long been dominant. According to the law of balance, woman should some time be so. Has that time arrived? Bulwer indicated it in *The Coming Race*—others, elsewhere. Surely that which is incarnating is what we call, on this plane, feminine; though on its own plane the terms masculine or feminine must be inapplicable.

He who would be filled with the benign influence now incarnating must do his share. Nature cannot make gods of those who do not bear a proportional part of the burden; who do not energize with the force of their own Divinity as much as they can.

Solomon built a temple. But who was Solomon, and what was the temple? Before Solomon's time the ark had no resting place. There is a spiritual temple not built by hands. Before the ark can find a resting-place this temple must be built. This temple is now being built. The builders have been called together. In it the ark shall rest. The great waters shall flow back and the old land shall arise. H. P.

A YOUNG woman was recently refused the privilege of registering at the Waldorf-Astoria, because of her extreme mode of dress. She wore a Derby hat, a long belted man's coat, man's shoes, a short skirt, and her manner was not particularly womanly.

It is faddists such as these who have brought reproach upon the effort made by noble workers in recent years to secure to women something like a sensible dress. In these days, when tailor-made suits are so comfortable and when even the fashions prohibit the uncomfortable or unsuitable in the street or traveling dress, there is no excuse for going to extremes that are discreditable to the sex to which one belongs.

H. P. B. used to say, "Heaven save me from some of those who profess to be my friends! I can easily take care of my enemies!" which is but another way of stating the age-old truth that a great cause suffers not half so much from its avowed opponents as from the over-zealous, the fanatical—in a word, the extremists—within its ranks. M. E.

Traveling Libraries

THE work of the Federations of Women's Clubs in various states in introducing traveling libraries into isolated and deprived communities, deserves to be better known. In almost every state in the union the work was undertaken and carried on by women's clubs until finally recognized and supported by the Legislatures and State Library Committees.

The first traveling library was sent out from New York State February 8, 1893. Today, books—first-class, up-to-date books—are, under this system, to be found in the most isolated sections of the country—among the dwellers in the sod-roofed homes of the West, the rice fields of Louisiana, the mining camps, ranches, and even in the homes of the "poor whites" of Kentucky and Tennessee. In spite of the fact that State Commissions have taken up the work in various places, there remain thirty-one states in which women's clubs still are the moving spirit in this work which means so much to those who are deprived.

Recently, in asking for books for the Kentucky mountaineers, this significant request was sent in: "Send histories, for example those of Cuba and China. Also send something on Mormonism to refute the Mormon agents in the mountains; and do not forget books on education and character building." This is but one of the many humanitarian enterprises whose inception would have been long delayed except for women's clubs. The time has come when to decry these organizations is but to place a label upon one's own ignorance, not to say pettiness and folly. STUDENT

Useful Work for Women

IT seems that the visit of the Paris doctors to London has aroused the French medical world to a sense of the value of cultured women's services in attending the sick. The superiority of the British hospital nurse over the French one, who is either a Sister of Mercy, often lacking in professional knowledge, or a lay nurse inspired with neither devotion nor sympathy, has appealed to the doctors. Again, the outlet for women's energies is very restricted, the teaching profession being overcrowded and underpaid, and the learned professions being open only to women of means.

Efforts are therefore being made to provide for the establishment of a system of women nurses such as exists in England. Prejudices, however, have yet to be overcome, especially from Catholic mothers. E.

RECENTLY a prominent club woman, who is also prominent in the more exclusive social circles in one of our great cities, said: "There can be no fixed rule governing woman's place in the home.

"The first duty of a woman in the home is to have perfect order, for without order and discipline little is to be accomplished. Order is the foundation, and on this we should rear a beautiful structure. Our homes should have an atmosphere of refinement, be possessed of an air of sweet contentment.

"There is nothing too worthy for the home. When possible it should be embellished by good music, a carefully chosen library and worthy pictures. The truest hospitality lies in permitting our friends to share our pleasure without any desire at ostentation."

The time is approaching—for this is but one of many "signs"—when the term "society woman" will no longer serve to stigmatize, even in the remotest degree; for society itself, through the efforts of a few earnest and aspiring women, in time will be transformed. C.

MOZART'S SISTER

OUR YOUNG FOLK

The Young Girl's Opportunity

WITH young girls blossoming into womanhood we naturally associate grace and beauty and sweetness. Fathers and mothers cherish their young daughters as they would tender plants. They try to protect them from all that is rude or shocking, and to shelter them during their growth into pure womanhood. Is it because they feel the great promise and hope that the life of every young girl may hold for the human race?

Today a world of varied activity and achievement is open to young girls. To begin with, they are now not only permitted, but encouraged, to join in games and physical exercises that strengthen the body and prepare it for great work. And when young girls look forward to the work they should long to do in the world, they need no longer wonder if it will be possible for them. Brave women and wise men have broken down the barriers that shut young girls out from being given their rightful opportunities, so that now boys and girls have almost equal advantages, and may choose any career, and thoroughly prepare themselves for it.

Many people are beginning to realize the part that women have played in the history of the world. The more deeply they study, the more certain are they to find that whenever young girls were taught wisely, there were to be found glorious women who rendered noble service. And whenever young girls learned to think only of the pleasure and power that may come from beauty and grace, there were to be found women whose vanity and ambition led them to be cruel and selfish, when they might have conquered only to bless. Hypatia, the learned teacher of Alexandria, and Joan of Arc, the Deliverer of France, both beautiful young girls, were examples of what a young girl's life may be, if she have in her heart the Warrior-spirit of true womanhood.

We know that in the soul of every young girl lies the power and the knowledge that have been gained in many lives on earth. Why, then, do young girls ever appear vain, or silly? Why do they grow up into women who are happy only when they are admired? Why are there helpless or discontented young girls in the world? Why are they not all heroines?

A young girl may be so beautiful and graceful that the whole world admires her; she may be such a good student that all her teachers and school-fellows praise her; but unless she learns in the days before she grows into a woman, to have pure thoughts and to love to work for others, she will never have the strength of the strong nor the power of the pure.

If these two lessons are not learned in the spring-time of her life, she will find, later on, that selfish thoughts have eaten away her power of helping. She may learn later to long to do noble service, but her strength will be less than it might have been, and it will then be difficult for her even to try to be a heroine.

But when, from wise teachers, young girls learn these lessons of pure thought and loving service to others, there opens in their inmost hearts a spring of crystal purity. In this the soul shines, and lights them on their path of noble service. Then glorious women go forth—heroines. The world waits for women such as these. The bitterest need of humanity today is for such pure, strong unselfish hearts. Only they can awaken to life the noblest efforts. To them will belong truest grace and exquisite beauty, yea—and the power to bless humanity. A RAJA YOGA TEACHER

American Indian Games

By A RAJA YOGA BOY

WHITE people enter their games for fun, enjoyment, or recreation, but the Indian regarded his games in quite a different light. The Indians were essentially children of Nature, and they had no intellectual pursuits as we regard them. Their games were symbolical and divinatory, playing an important part in their religion and education.

The Indian boy, like all boys, loved sports and fun. Boys were not encouraged to imitate the sacred sports of their elders, so they delighted in sham battles with pellets of mud, sham buffalo hunts, and wrestling, running, and swimming contests. In the winter months, they would make sleds out of buffalo ribs and hides and go "tobogganing." But in all these sports the Indian boy always had the ideal before him of developing into a strong and upright Brave or Indian Warrior.

The games of the adults all had a common origin. They were symbolic and meant a very great deal to the Indian. He entered into his sports seriously and with reverence. The games fall into four natural divisions: Lacrosse; Chunkee or Ring and Javelin; Straw or Indian Cards; and Platter or Dice. An Indian, if injured in a game, never made a sound, but bore the pain with unflinching bravery. To develop a strong, brave, honorable man was the aim of the Indian games, and they certainly, in many instances, succeeded in doing so. THORLEY VON HOLST

Facts Worth Knowing

IT IS said that a mirror, a crystal and a sword are carried before the emperor of Japan on all state occasions. "Know thyself" is the message of the mirror; "Be pure and shine" is the crystal's injunction; while the sword is a constant and glorious reminder to "Be strong."

AT THE Brooklyn Navy Yard, U. S. A., has been discovered a rare and very valuable Japanese sword, probably made by the Muramasas, the celebrated sword-makers of the fourteenth century. It was brought to this country by a state officer to whom it was presented as a gift in Japan about twenty-five years ago; but only recently has its great value been known even to the owners of it.

AND now our philosophers are discussing this question, "How may the evils of war be lessened?" Why not abolish war? Wouldn't that lessen the evil?

HAROLD BOLCE recently wrote in the *Booklover's Magazine* these splendid words about the Japanese:

If one can imagine a being that is in everything the opposite of a rowdy, such might be a Japanese, for by far the most common characteristic of both men and women is their extreme gentleness, and no nation has so completely mastered the "soft answer which turneth away wrath" as that of Japan has. A sensitive man walking through the streets of one of our great cities is almost certain to hear or see something that leaves an unpleasant impression; and should he visit the slums, his thought must be, "What an inferno our modern civilization has created."

In Japan there is not a trace of this. There is no drunkenness and no quarrelling, and should a dispute arise it would be conducted in a dignified way, for the Japanese when excited do not raise their voices, and the nation possesses no oaths. These remarks are not meant to apply only to the better residential quarters, but also to the meanest parts of the great cities. A foreigner may go through the narrow lanes of the district of Shibo, where the poorest in Tokyo live—and very poor they are—and not only not see anything objectionable, but find that, though the surroundings are very humble, the manners to him are seemingly the same as in the aristocratic quarter of Koji Machi, in which the Emperor's palace lies.

YOUNG GIRLS OF JAPAN, THAT LAND OF GRACE, BEAUTY AND TRUE COURTESY

OUR LIVES ARE SONGS

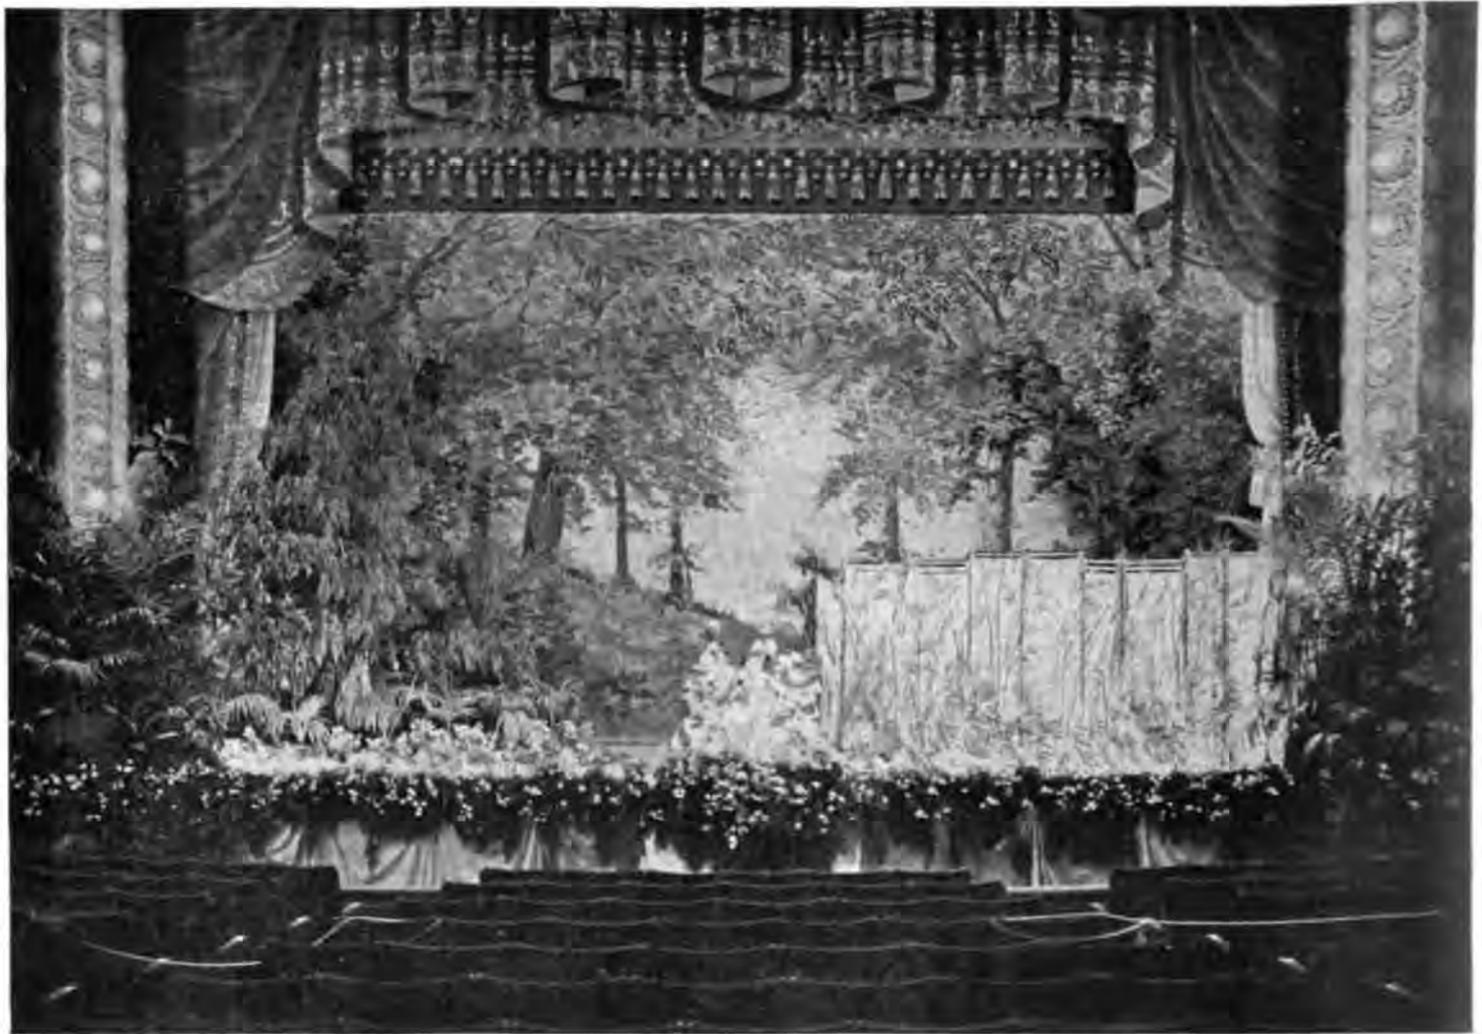

OUR lives are songs;
God writes the words,
And we set them to music at leisure;
And the song is sad, or the song is glad,
As we choose to fashion the measure.

We must write the song,
Whatever the words,
Whatever its rhyme or metre;
And if it is sad, we must make it glad,
And if sweet we must make it sweeter.

THE THEOSOPHICAL FORUM, IN ISIS THEATRE

The Drama in America During Colonial Times

ACCORDING to the best authority the drama was introduced into America in 1733. It is a well-known fact that this effort was considered an innovation by the Puritans. Virginia was the first to welcome the dramatic art among its people. It was in this state that the first theatre was opened.

The second theatre in America was opened in Philadelphia in 1759. At that time the good Quakers of that little sombre town were most strenuous in their efforts against this undertaking. They went so far as to besiege Judge Allen, in whose jurisdiction the theatre was, with petitions and denunciations of the players, to have them put down. The Judge ignored their pleadings, and it is in the chronicles that he gave them a serious talk and rebuked them thus: "I have learned more moral virtue from plays than from sermons."

From this time the drama was encouraged in Philadelphia, and in 1760 the theatre that had sprung into life under such adverse rulings of the Quakers was enlarged and the proprietor, Mr. Douglas, gave a benefit for the City College "for improving youth in the divine art of psalmody and church music!" Often in those early days the actor or actors would solicit patronage from house to house.

The first theatre was built in Charleston, S. C., by Mr. Douglas, which he had been invited by the people to do. During this time many theatres were started in other cities, but in 1774 the first congress passed a resolution by which they discouraged "every species of extravagance and dissipation, such as gaming, cock-fighting, exhibitions of shows, plays, and other expensive diversions and entertainments."

After this all theatres were closed, and it was not until ten years later, when the colonies had gained their independence, that theatres were again opened.

During the Revolutionary War some British officers in Boston wrote dramas and plays, which, it is said, were for the purpose of attracting attention to the cause of toryism. After the peace, the players returned from the trenches to the stage, and the Southwark Theatre was opened in Philadelphia in 1785. Lewis Hallam, who was the leading spirit, met with considerable opposition from the Puritans. Time was, when actors were refused Christian burial! *Tempora mutantur et nos mutamur in illis.*

THE SOUL OF A NATION

FROM PRESIDENT ROOSEVELT'S LETTER TO FRÉDÉRIC
MISTRAL, THE FRENCH POET

YOU are teaching a lesson that none more need to learn than we of the West, we of this eager, restless, wealth-seeking nation, the lesson that after a certain not very high level of material well-being has been reached, the things that really count in life are things of the spirit. Factories and railroads are good up to a certain point, but courage and endurance, love of wife and child, love of home and country, love of lover for sweetheart, love of beauty in man's work and in nature, love and emulation of daring and lofty endeavor are the homely work-a-day virtues and heroic virtues. These are better still, and if they are lacking, no piled up riches, no roaring, clanging industrialists, no feverish and many-sided activity shall avail either individual or nation. I do not undervalue these things of a nation's body: I only desire that they shall not make us forget that beside the nation's body there is also the nation's soul.

Notice

The meeting at Isis Theatre last Sunday night, March 19th, was again postponed until the following Sunday on account of a repetition of the severe equinoctial storm which visited Southern California on March 12th, and which had continued with scarcely a day's intermission during the entire week. It may be said *en passant* that such truly un-Californian weather is altogether an anomaly in this fair Southland. Probably the sun-spots are to be held to account as much as anything. The postponed meeting will—weather at all permitting—be held as above said on Sunday night, March 26th. Katherine Tingley will probably speak.

Theosophical Meetings for Sunday Night

Public Theosophical meetings are conducted every Sunday night in San Diego at 8.15, at the Isis Theatre, by the students of Lomaland.

Theosophical subjects pertaining to all departments of thought and bearing on all conditions of life are attractively and thoughtfully presented.

Other interesting features of these weekly gatherings are the excellent music rendered by some of the Students of the Isis Conservatory of Lomaland, and the efforts of the children of the Raja Yoga Schools at Point Loma. Theosophical literature may always be purchased at this meeting.

Art Music Literature and the Drama

An Old Pompeian Fresco—The Marvelous Beauty of Its Color

THE following extract from a letter recently received from a student—an artist—who is at present traveling in Italy, is of special interest at the present time, for not in centuries has there been witnessed such a revival of interest in mural decoration. Even the temporary—though often gloriously beautiful—buildings that have been erected upon Exposition grounds, as at Chicago, Paris, St. Louis and elsewhere, have displayed upon their walls masterpieces of mural decoration. Today it is as recognized a necessity of our great public edifices as are stonework and mortar. In fact, our own age closely parallels, in some respects, the period during which this fresco of old Pompeii was probably painted; for Pompeii, it must be remembered, was being rebuilt on a lavish scale just at the time when the great catastrophe occurred. Artists and architects were given *carte blanche* and that is doubtless why so many frescoes are today being constantly brought to light. Will the colors of our own mural paintings be as fresh and pure after two thousand years have passed as are those of this rare fresco of old Pompeii?—

But I must share with you the greatest privilege that so far has been mine, a glimpse of the wonderful fresco recently discovered in Pompeii. It is now in the National Museum at Naples. It is impossible with words to give you any idea of the marvelous beauty of the coloring of this fresco, the serenely classic dignity of its composition. With little effort one might imagine it to be the work of some artist of the modern *plein air* school. From it our contemporary mural decorators—even Puvis de Chavannes himself—might well learn. I wish I might give you some idea of the exquisiteness, the mystery, of its treatment. Naturally, to an artist, the treatment is of almost more importance than the subject matter itself, yet that should be mentioned, so much is it being discussed by historians and archeologists, who do not on every point entirely agree. Beyond a doubt, however, the subject is taken from one of the many legends of Rome's origin. In the distance is seen beautiful Monte Cavo, on the slopes of which, according to tradition, once stood the palaces of the Alban kings. Nearer, yet still in the background, is the Palatine, on whose summit is a temple. Beside this temple is the vestal, Rhea, and before it is burning a fire. In the center of the picture is a figure descending, probably Mars, and in the heavens the Sun, represented by a glorious youth, drives his chariot with two noble white horses. In the foreground are other figures, among them Romulus and Remus and their foster mother, the wolf. But the strange beauty of the coloring is what appeals to me most and is what, I venture to say, will live longest in the minds and hearts of those who are so fortunate as to see this rare work.

THE national song of Japan has been much quoted, recently. Few, however, are aware that the poem—an ode—is very old, having been taken from the *Manyoshu*, a work dating from the eighth century. The author is unknown. The stanza (which, when sung as the national hymn, it is the custom to repeat three times) is in the form of the typical Japanese ode, containing the usual five lines of five and seven syllables, making thirty-one syllables in all.

Upon thoughtful consideration it seems a mistake to "harmonize" this hymn, as a number of American writers have recently done. The hymn itself is a gem, and as easily ruined by an unwise setting, such as would be our modern harmony. It is sung invariably in unison, and serves to body forth the native patriotism of those who love their land. Its simple form is a rebuke to our modern idea that harmony is indispensable.

The Musical Life of Japan—What Bringeth the Future?

DURING the last generation the world has witnessed, so to speak, the rebirth of a nation, or, rather, the blossoming of something long believed to be but in the bud. It is strangely suggestive to observe that what Japan has attained is essentially Japanese, a growth from within outwards, the product of her own resources, developed by her own skill. She has borrowed, but never slavishly; always has she re-created, adapted and fitted.

It is not to be expected that the music of a nation should fulfill its mission or arrive at its ultimate goal during the nation's pioneer stages, and, since this is true, it would seem that Japan's real musical life is yet to appear. Her musical history is a vague and inaccessible quantity to Westerners, partly because patient investigators are few, but mainly because those who safeguard the real records of Japanese ancient life, are not yet ready to give them to a world psychologized with the notion that "Oriental" means necessarily "the decadent."

From the standpoint of musical theory, Japanese music seems to have been largely adapted from the Chinese. It has for its general basis the five-toned or pentatonic scale, although the rule of that system of notation is disregarded in many of the folk-songs and modes. Some of the Japanese music seems but a remnant of an art once highly developed and carefully nurtured. Preserved by the noble Emperors of ancient "spirit dynasties," its real truths were finally lost by the less enlightened rulers of that once spiritually illuminated nation. It is not unlikely, however,

that Japan has hidden somewhere within her heart-life musical knowledge that, when the time comes, will break forth to illuminate the musical life of the world as the sunrise illumines the sea. STUDENT

MANY musicians suffer from so-called "nervousness" when performing for others, and some are so handicapped by this difficulty as to be forced to retire from public appearances.

But how many are there who label this misnamed nervousness by its true name, which is "self-consciousness?" How many are willing to admit that it is the result of an anxious concern for personal

success? Is it not a form—albeit very subtle—of egotism? The performer is so engrossed with the idea that he, as executant, is all-important, that he forgets the credit due the composer of the work he is interpreting—forgets that the sacred mission of his music should be to educate and uplift his hearers.

There is an inspiration in the thought of singing or playing solely to help others that gives one the power to do his best, and to stir in other hearts noble impulses. The inspired musician is he who forgets the personal self completely. Such an one is not thinking of applause, and perhaps that is why there are times when applause seems, even to the casual listener, out of place.

When we are most deeply touched only the silence expresses it, and the moment's stillness which often follows a superb performance is the greatest tribute which an artist can receive. The self-conscious player demands applause. The artist, to whom "nervousness" is unknown, neither demands the tribute of silence nor refuses the tribute of sound. He is indifferent to all save the Message of the masterpiece he interprets. Would that such artists were not the exception but the rule! STUDENT

THE NATIONAL SONG OF JAPAN

THE NATIONAL SONG OF JAPAN

KIMI ga yo wa
Chiyo ai yachiyo ai
Sazare ishi no
Iwao to sarite
Koko so mizu made

Of which a literal translation reads:
"May our Sovereign live for thousands and ten thousands of years, even until the tiny pebble becometh a moss-grown rock."

STUDENT

Universal Brotherhood Organization

Central Office Point Loma California

ON February 18th Julian Hawthorne's Visit to Lomaland

ON February 18th Julian Hawthorne, the well-known author and journalist, with the Mayor of San Diego and members of the City Council of San Diego, were entertained by Katherine Tingley at Point Loma. Julian Hawthorne, it will be remembered, is a native of Massachusetts and a grandson of the noted writer Nathaniel Hawthorne.

The impressions Mr. Hawthorne received from his visit to Lomaland are expressed in the following press clipping:

"After breakfast arrived a great carry-all with four horses, for the trip to Point Loma, where dwell Mrs. Tingley of the Theosophists and her flock of children and other disciples. It must have been an experience even more unusual for the inhabitants of San Diego than for me to get stuck in the mud in this relatively rainless domain of eternal summer; but the sun was shining as, it seemed to me, it never shone before, and the greenness of the world lay laughing beneath the heavenly blue. The bay was calm, like a silver mirror highly polished on purpose to duplicate the exquisite scene; and on it lay the White Squadron, five ships and a black torpedo boat, potential war looking like a dream of everlasting peace. After crossing the ferry, amid sea-birds unscared at our propinquity, we took the road north and west, and were soon leaving the new town and approaching the old one at the point of the bay. Our driver was one of the Yuba Bill sort, skilled against all contingencies, a type of old California. We proceeded at a deliberate pace through the mud, and presently were ascending the side of the Loma headland, and beginning to get command of a prospect which, as it then appeared, in the morning light and sunshine, with the silver mirror at our feet, the outspread city in the middle distance, and the mountains afar, seemed to me the most exquisite sight I had ever beheld in my wanderings.

"It was vast, and yet could be comprehended at a glance. It was broad, and yet the detail was not lost. The hues were soft and sweet, color melting into color, steeped in tender light, rendered ethereal by clouds that pressed up behind the mountain range, like waves about to pour over a barrier, yet always remaining in the act of breaking, as if their very loveliness had caused them to pause. It was a sight to make the Sons of God shout for joy; or it was the visible rendering of angelic music. No element of beauty was lacking. The greeting of the gentle air was balm, and the freshness and tranquil majesty of the ocean lifted the harmony to grandeur. There are all kinds of perfect days; but the perfection of this day was a thing apart. It gave the answer to Lowell's query: 'What is so rare as a day in June?' It was a day in the middle of February, in San Diego.

"Up the acclivities of the Point we now began to mount. If Theosophists be students of the wisdom philosophy, of the beauty and peace of life, trainers of childhood to the paths of love and goodness, builders of virtue and the higher happiness, champions of the heart, believers in the pure simplicity which lies deep below the toilsome glitter and sound of the surface—then assuredly, no better place than this for them to dwell in could be found on this planet. Merely to live in the midst of such a scene must be an education and an inspiration such as no mortal school could supply. High on the ridge stands their great domed temple, approached by long avenues and flights of steps; around it, at greater and lesser distances, are the little houses and tents in which they abide and work, commune and teach. The women wear simple dresses; the men, khaki uniforms, as soldiers of the cause; there are, I believe, two hundred children, of ages from a few months to fourteen years. The faces of all these people have the same expression—a look of sincerity and peace, of content and cheerfulness. One soon becomes aware of a spiritual atmosphere pervading the place, which, in the class rooms of the children, becomes so dominant and penetrating as to be apparent almost to the physical sense. There is everywhere an absence of self-consciousness, a presence of good-will, a shining of happiness, which make one wonder what has become of the troubled old world that most of us live in. Can that be it, over yonder across the bay? No, that is

fairyland, and we must have traveled further than we knew through the magic of the morning.

"After visiting some of the tiny, immaculate, reposeful interiors of the children's bungalows and after having been entertained at luncheon in the studio of Miss Edith White, the famous California flower artist, we formed in column to approach the temple. As we came to the steps, a group of teachers, men and women, appeared above, and at the moment when our hands met theirs a burst of music poured through the open doors of the great hall. Thither we were conducted, and in a moment Mrs. Tingley herself appeared and gave us greeting. It is not my purpose here to discuss her, or the cult of which she is the head; but it is impossible to be many minutes in her company without understanding why she attained and holds her position. The Newburyport girl of forty years ago is where and what she is because she could be in no other or lesser place. I can imagine few books more interesting than her autobiography would be.

"There are some pictures of a symbolic cast in the outer corridor, painted by an English artist resident among the disciples, which surprised me by their artistic mastery and spiritual significance. The handling a little recalls Burne Jones, but the designs are superior to any work of that master. They are alive with meaning, and would repay the study of many days. But we had much to accomplish, and were led to one of the children's class rooms, where the little creatures with souls were assembled on their benches, with their kind-eyed teachers among them.

"I hold my pen suspended—but decide that it would be vain, in these limits, to attempt the portrayal of this scene. For it was what was felt, far more than what was seen and heard, that was of import. The children sat there, quiet-eyed and composed, with not a trace of uneasy self-consciousness, but attentive to what they were about, confident in their power, and happy in their results.

"They sang in unison, they made recitations, they answered questions, they spoke little poems and speeches; one of them presented a member of the visiting party with an illuminated address, accompanied with a spoken speech of welcome; and it was all as sweet, as earnest and as simple as child's play. They were not embarrassed, they were not bold or forward, they were profoundly natural. Their little minds, as evinced in what they did, were as clear and as tranquil as untroubled waters; their voices were distinct and soft, their faces were seriously cheerful.

"While I contemplated and listened, Mrs. Tingley, beside me, gave me insight into the methods of the school. They were demonstrated in the results. No force, nothing arbitrary, is ever known here; the mind and soul unfold spontaneously under favoring conditions; the obstacles to growth are tenderly removed, as the husk falls from a budding plant. Pure ideals are implanted, and support and guidance given at need. Only two and a half hours of indoors study are allowed; the rest of the day is spent in outdoors play or occupation, and in eating and sleeping. It is lovely to behold this; it must be nearly heavenly to experience it.

"After this we were admitted to some of the nurseries and to the apartments of the teachers, which are all decorated in a manner artistically effective, yet with such materials as might be picked up on the seashore or in the fields, or wherever things are elementary and primitive. They are an object lesson for those whose taste is good while their means are small. We strolled down to the cliff above the sea, and looked out over that wonderful expanse. We even, after saying farewell to the heads of the Association, invaded the privacy of Mr. and Mrs. Spalding, who came here years ago to see, and stayed to build and to live; and they have built and are living to good purpose. But the time for going had to come, and we climbed aboard our wagon and drove back down the slopes, with the declining sun turning the house-fronts of distant San Diego into gold, and transfiguring anew the enchanted mountains and the winding bay. It was a sight to dream of, not to tell, as Coleridge remarked of a very different spectacle long ago. There is work being done at Point Loma which involves a mighty responsibility, and looks to a vital issue, whereof more will be heard and known by and by."—*Los Angeles Examiner*

Students' Path

WE are selfish men:
O, raise us up, return to us again!
And give us manners, virtue, freedom, power.
Thy Soul was like a Star, and dwelt apart:
Thou had'st a voice whose sound was like the sea:
Pure as the naked heavens, majestic, free,
So did'st thou travel on life's common way
In cheerful godliness; and yet thy heart
The lowliest dattica on herself did lay.—*Wordsworth, on Milton*

The Most Difficult Thing in the World

THE more one studies the teachings of the great masters of thought of ancient and modern times, the more one recognizes that the ideals set forth by the Universal Brotherhood Organization are verily no new fangled notions of *modern* growth. They have existed at all times, as the basis of every world reformation. They lie at the *very* root of the constitution of man's being, and they require no proof or elaborate justification. They appeal to the *simplest* understanding, whilst their scope is as deep as the *sum* of human knowledge.

Witness the teachings of Meng-tze, the Chinese philosopher, a pupil of Confucius, but thought by many to have excelled his master in wisdom. Under the heading of *The Most Difficult Thing in the World*, he taught as follows:

The mutual attacks of State on State; the mutual usurpations of family on family; the mutual robberies of man on man; the want of kindness on the part of the sovereign, and of loyalty on the part of the minister; the want of tenderness and filial duty between father and son: these, and such as these, are the things injurious to the empire. They are produced by the want of mutual love.

Here is a prince who only knows to love his own State, and does *not* love his neighbor's, and he therefore does not shrink from raising all the power of his State to *attack* his neighbor. Here is the chief of a family, who only knows to love it, and does not love his neighbor's; he therefore does not shrink from raising all his powers to seize on that other family. Here is a man who only knows to love his own person, and does not love his neighbor's; he therefore does not shrink from using all his strength to rob his neighbor. Thus it happens, that the princes, not loving one another, have their battlefields; and the chiefs of families, not loving one another, have their mutual usurpations; and men, not loving one another, have their mutual robberies; and sovereigns and ministers, not loving one another, become unkind and disloyal; and fathers and sons, not loving one another, lose their affection and filial duty; and brothers, not loving one another, contract irreconcilable enmities. Yea, men in general not loving one another, the strong make prey of the weak; the rich do *despite* to the poor; the noble are insolent to the mean; and the deceitful impose upon the stupid. All the miseries, usurpations, enmities, and hatreds in the world, when traced to their origin, will be found to arise from the want of mutual love.

All this may be changed by universal mutual love and by the interchange of mutual benefits. This law would lead to the regarding another kingdom as one's own. That being the case, the princes loving one another would have *no* battlefields; the chiefs of families loving one another would attempt no usurpations; men, loving one another would commit no robberies; rulers and ministers, loving one another would be gracious and loyal; fathers and sons, loving one another, would be kind and filial; brothers, loving one another, would be harmonious and easily reconciled. Yea, men in general, loving one another, the strong would not make prey of the weak; the many would not plunder the few; the rich would not insult the poor; the noble would not be insolent to the mean; and the deceitful would not impose upon the simple. The way in which all the miseries, usurpations, enmities, and hatreds in the world may be made not to arise, is universal love. On this account the *benevolent* value and praise it. And the *scholars* of the empire and *superior* men say — "True: if there were this *universal love*, it would be good. It is however the most difficult thing in the world." E. V.

The Gist of Passing Meditation

THE student can make of each day an incarnation—as, in fact, it is. In a lifetime experiences are gathered; afterwards the waste is purged from them and the nutritive assimilated. Thus from life to life does progression go on—in art, industry, mechanics, statesmanship, architecture, agriculture, mathematics. But the same is equally true

of day and night. So, one who refuses to be discouraged, ever renewing his efforts, will each day put, at least, one foot forward, and at the end of a life thus spent have acquired more than in many less determined incarnations.

Each little ache has its original cause somewhere within yourself. How wonderful is the intuition of the poets? It may be less exact in pedantic detail than that of the scientist but it is profounder. Milton says in *Paradise Lost*, "What he gives . . . to man, in part spiritual, may of purest spirits be found no ungrateful food; and food alike those pure intelligential substances require as doth your Rational; and both contain within them every lower faculty of sense, whereby they hear, see, smell, touch, taste, and corporeal to incorporeal turn." . . . "Time may come when men with angels may participate, and find no inconvenient diet, nor too light fare; and from these corporal nutriments, perhaps, your bodies may at last turn all to spirit . . . and wing'd ascend ethereal, . . . or may at choice, here or in heavenly paradises dwell." STUDENT

Out of the Mouths of Babes

"And a little child shall lead them."

THE teacher of Nazareth set a very high value upon the character of little children and also upon their wisdom, saying upon one occasion that "things hidden from the wise and prudent were revealed unto babes," so it may not be out of place to put on record three artless sayings of children in reference to that much-discussed topic—Reincarnation:

(1) "I couldn't be a black man, could I, Daddy; but if I was to die and rise again in Africa, I might be, mightn't I?"

(2) "When I'm born next time will it be in England or in India?"

(3) A lady playing with her nephew had occasion to rebuke his roughness, saying, "If you pull my finger so hard it might come off and then I couldn't get another one, could I?" The child pondered seriously a moment, then replied, "No. You'd have to wait until you got another body and then you'd get a new finger."

A belief in previous earth lives is surprisingly common among children, but their suggestive remarks are usually suppressed as "stuff and nonsense." Yet Wordsworth, like the great reforming Jew, does homage to the intuitive wisdom of the child when he apostrophises him in his celebrated "Ode on the Intimations of Immortality:"

Mighty prophet! Seer blest!
On whom those truths do rest
Which we are toiling all our lives to find,
In darkness lost . . .

In conclusion then, it is well to study the artless prattle of the children. It "*proves*" nothing, of course, but seeing that there are no outside influences to encourage the idea of previous lives, the question arises in the thoughtful mind, "How did the child acquire the notion?"

STUDENT

Practical Theosophy—"Silence"

RIGHT speech comes only with knowledge, but knowledge comes through silence. Real knowledge comes from deep within, and only when the bustle of the outside world is not allowed to reach our mind. The outward silence is one thing, the inner quite another. This inner silence is that which is all-important; it may exist amidst the greatest outward turmoil, and it comes only when peace exists within, when many-tongued clamoring desire has been overcome. It is a state of mind; it is no mere absence of sounds, for often there may be stillness without, while turbulent tempests rage within.

Silence is most intense and active life, and with it comes a steady, healthy, rapid growth of body and of mind. It purifies the temple, gives the soul room to expand, and grow, and learn of many things which had been hidden to it for so long. For far more powerful than any words is this voice of the silence. When all is quiet within it speaks to us of many truths of beauty and of goodness, of love and harmony and unity and life eternal. It tells us then how worlds were built and of our places in this universe; it gives us rules of conduct which will never fail, and opens wide to us the book of nature and the hearts of men.

In silence only do we truly know our fellows. We reach out then, expand, and share their pain and joy, their fear and hope, and give our sympathy. A single, fleeting glance will then reveal more than long years of speech, for even in speech it is that which goes with it to the heart which says most and not the words themselves. E. T. S.

The Isle of Man

ONE is apt to forget, if he even ever knew, that the Isle of Man is quite separate, in an administrative and legal sense, from Great Britain. It is a "dominion" of the crown of England, and its government is vested in a Governor, a council which acts as an upper chamber of the legislative body, and the House of Keys or lower chamber. These three together constitute the "Court of Tynwald." The approval of the British sovereign is required to its enactments, but acts of the British Parliament do not affect the Isle of Man unless it is specially mentioned in them. The Governor is Captain-General of the military forces and presides in various courts.

In an English paper one reads a couple of columns devoted to Manx politics; and it is curious to hear of questions as to the relative powers of the Governor and the House of Keys, Bills of Rights, Redistribution, Liberalism, etc., discussed just as they are in a country of continental dimensions.

The Isle of Man is about 227 square miles, its greatest length being thirty-three miles and its greatest breadth twelve. The population is about 53,000. There is one large town, Douglas, the capital. The Manx language is a dialect of the Irish branch of the ancient Celtic. It is only little spoken now, and is not taught. It will probably soon become extinct unless antiquarian scholars revive and preserve it.

There are Roman remains on the island and Druidic circles. The earliest person mentioned by tradition and history is Mannanan-Beg-Mac-y-Lheirr, a paynim who "kept the land under mist by his necromancy." It has been under Welsh, Norwegian and Scottish domination. The arms of Man are three legs joined at the thighs. They represent the stability of a fully-developed character. The arms of Sicily, known as the *Trinacria*, are even more symbolical—one head, two wings, three legs, and four snakes; and the motto which means "I always fall on my feet," or "One who is at home everywhere."

Skill and Apparatus

AN eminent man of science recently pointed out that great discoverers use the simplest apparatus, and that it is their inferior followers who have multiplied costly and elaborate apparatus; and that therefore investigators unable to procure such outfits should not despair, but rather be encouraged.

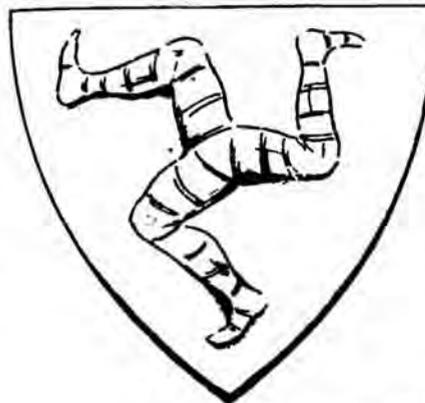

There is to some extent an inverse ratio between skill and appliances. Stubs of pencil and scraps of paper have done wonders when fountains-pens and cream-laid foolscap have utterly failed to yield an inspiration. An Indian goldsmith can execute beautiful designs on metal with a nail, and a turner pivots one end of his wood in his chest and the other on the ground and spins it with a bow-string while he holds the cutting tool in his free hand. Oriental workers in general can do many things better with primitive apparatus than we can with machine tools.

This is a topic that might be treated at great length, but one lesson claims special attention. Is it not perhaps better that we should accustom ourselves to making the best use of what we have, rather than be always straining after greater conveniences and comforts?

If we once begin to insist on having the most perfect external aids and comforts, where are we going to stop? Shall we not tend towards the condition of that oriental sybarite who could not sleep because one of the rose-petals of his bed was crumpled, or that other who had to have a slave to lift the food to his mouth? On the other hand the wise man is at home everywhere. His appliances are in his own body and his skill enables him to turn every situation to the best advantage. Depend on it the need for external comforts and conveniences is a sign of feebleness, and is it not a source of perpetual worry? The Eastern nations, older than we, and in many respects wiser, have found this out. Yet we consider them lacking in knowledge of our advantages. But they can use our inventions too when they have a mind to. STUDENT

THE ARMS OF SICILY

THE ARMS OF MAN

Decay of Old Buildings and the Remedy

THE saints are turning into plaster of Paris and the cathedrals into Epsom salts. This sounds like a joke, but it is merely a terse way of saying that the sulphuric acid in city atmospheres acts chemically on the buildings and statues.

In London the combustion of coal containing pyrites generates sulphurous anhydride, which, with the air and moisture, yields sulphuric acid. This turns marble into sulphate of lime, and magnesium carbonate into the sulphate or "Epsom salts."

The Bell Harry Tower of Canterbury Cathedral and the towers of many old London churches are slowly crumbling and dissolving under this influence. All the delicate carving of the pinnacles has disappeared, the limestone or calcareous sandstone being rapidly decomposed by rain-water containing sulphuric acid. Every ton of coal generates nearly fifty pounds of sulphuric acid in this way. The rotting may penetrate to a depth of six inches or more; tons of Epsom salts might be taken out of the walls of Westminster Abbey.

Lichens and mosses cannot grow in an atmosphere which, however, harbors human beings; so that the stone lacks their protection. Lime-wash is recommended by the Society for the Protection of Ancient Buildings, to be applied from time to time; but, though it is admitted that the noses and ears of the saints are blistering and their limbs in a fair way to drop off, the idea of whitewashing these venerable relics of antiquity was received with horror.

Spraying with baryta-water has been found the best remedy. This does not form an immediate crust on the outside, but penetrates to the root of the decayed part; and the sulphuric acid generates the highly insoluble sulphate of barium, which converts the whole into solid rock. STUDENT

A Key to Work and Health

SOMEBODY recently asked Edison how he managed to do his immense day's work and keep in good health. This was his answer: "I keep my health by dieting. People eat too much and drink too much; eating has become a habit with most every one; it is like taking morphine—the more you take the more you want. People gorge themselves with rich food. They use up their time and ruin their digestions and poison themselves. Diet is the secret of health. I eat almost nothing. I eat less than a pound of food a day; three meals, but just enough to nourish the body. I don't really care whether I eat or not; it is not my pleasure. One soon gets out of the habit of caring much about his meals. If the doctors would prescribe diet, instead of drugs, the ailments of the normal man would disappear. Half the people are food drunk all the time. Diet is the secret of my health. I have always lived abstemiously. It is a religion with me. My father before me practised dieting and he instilled the idea into me."

The Joyous Thibetan

"The Thibetians are of the middle height, and combine with the agility and suppleness of the Chinese, the force and vigor of the Tartars. Gymnastic exercises of all sorts and dancing are very popular with them, and their movements are cadenced and easy. As they walk about, they are always humming some psalm or popular song; generosity and frankness enter largely into their character; brave in war, they face death fearlessly; they are as religious as the Tartars, but not so credulous."—*Abbe Huc*

King Alfonso a Considerate Automobilist

The story comes from Madrid that one day while the King was driving in his automobile to Guadalajara, some mules harnessed to a cart took fright and bolted, leaving the driver in the road. Unlike many automobilists, the King turned back, and calling to the muleteer to jump in, whisked him along until the mules had been headed off, and did not leave until the driver was in his cart. This promises well for Spain. E.

The Spirit That Denies

WHAT one might call the *Not so* tendency is well worth a little study. It might be otherwise known as the *Human Belittlement* tendency. Thus:

Mankind has always known that it was of a divine nature, ensouled. *Not so*, says our *advocatus diaboli*;

you are merely will-less matter, and the monkey is your ancestor.

All mankind has memories from a vast antiquity, memories of an age when there was no sin, and the soul reigned everywhere and in all. As that age departed, the greater and wiser among the races caused great works to be constructed, pyramids, statues, mighty cromlechs, commemorative of their knowledge and power.

Not so, we are assured; there never was any Golden Age; the memories are myths babbling about sunrise and the stars and seasons. The

pyramids of Egypt are but three or four thousand years old; the prehistoric Menes was but another thousand years before that. The legendary heroes and teachers are only savage chieftains, or again the sun and dawn and planets. There never were any mighty civilizations; the stories told by the eye-witnessing soldiers of Cortez and Pizarro are "travellers' tales;" the Mexican ruins tell no story save brute industry; the Easter Island statues, Stonehenge, Karnak, the Bamian statues—they are very

Wilful Ignorance Denies All Truths

recent, and when the tourists and the hotel-keepers and time shall have removed them, we shall show you reason to doubt whether they ever really existed. Meantime, they were the work of savages. Even the legends themselves, and the poems of old lore, the Eddas, the Vedas, are really quite recent, most of them post-Christian.

The *Not so* tendency has for some time now been doing its sharp-shooting at even historic characters. Homer, Tell, Shakespeare, King Arthur, Zoroaster, and many another are already *Not so*-ed. Jesus Christ is very doubtful. Plato they have not as yet dared to begin on.

Universal human belief has it that at all times there have been men who have entered so closely into touch with the soul of nature that they have known more than any of the senses could teach and wielded powers utterly out of reach of common men.

Not so, says science. Not only has nature no soul, but man could not reach it if she had. His mind is limited to that which the senses tell it; it can never know reality—if there be any; and all belief in magic powers is superstition.

Humanity has always looked forwards to a divine destiny, a renewed Golden Age of Purity.

Golden Age of Purity Impossible

There is no such possibility, we are assured. The earth and sun will cool and empty their energy into space, and no life be possible. There is no guiding thought in the universe; life is an accident of chemical processes.

And if man should still cherish the ideal of his own purity, his own union with the divine, self-achieved,—behold the *Not so* theory in the very realm of religion itself! "Man is a mere worm, of himself impotent; the Great Teacher did not *show the way for us to walk*; he *walked it for us*;" belief in that vicarious walking, self-abasement and reliance on human intercession—these are the necessities, not virile self-reliance and self-treading of the path *shown*.

All these are but examples. The tendency may be noted wherever there is an attempt to belittle man's past in its duration or its achievements; for if its duration be thought great, there is room for imagination (which is memory) to imagine the half obliterated achievements; if the achievements be credited, then powers not now active must lie waiting a new and perhaps greater re-awakening.

It may be noted in all attempts to show that the heroes, teachers, poets, and leaders of the near or far past, did never exist or were the legendized compounds of many men; in all attempts to deny will and its powers "magical" or "normal," to deny man's right to achieve self-domination unto perfection, to deny a golden future when men shall almost fill the ideal stature of the gods.

And lastly it may be seen in the denial of the tendency to deny, in Satan's ridicule of the idea of his own existence, heard above his more secret ridicule of the puppets who dance to his pulling. For there is a Satanic as well as a Christly spirit, an evil as well as a divine breath; and the very first care of the former is now to have men doubt itself and win renown by witty and learned ridicule of belief in that very spirit that inspires them.

STUDENT

Humane Common-Sense in War

DR. L. L. SEAMAN has just returned from an observation tour with the Japanese army, giving special attention to field-hospital sanitation. He gave evidence recently before the House committee on military matters, adducing some extraordinary facts as to the efficiency of Japanese surgery and medicine—and our inefficiency.

"They go us a million times better," he said, with more force than grammar, "in sanitation and military supplies;" adding that but 1 per cent of sickness is fatal with the Japanese army; while in the American army during the Spanish war 70 per cent of the sickness was fatal.

And the Japanese have learned all their medicine and surgery in the last few years—from us!

The consequence of their care has been that their armies have remained healthy, and that thousands of wounded and sick, having recovered, have returned again to the fighting lines. It is not only humanity; it is common-sense. STUDENT

Lost Explorers

A RECENT writer has been trying to group together all the cases of lost, but possibly living, explorers; and he makes a very painful list of them.

Belknap was last heard of in 1903, and is believed to be a captive of the nomad bands that roam the desert of Gobi.

Captain Barreta has been for several years a captive of the Chapiri natives in the Paraguayan forest belt.

Captives of the Tuaregs, in the Sahara, are, and for years have been, several members of *Captain Flatter's* exploring party.

The present condition of such of these unhappy people as may be alive today hardly bears thinking of.

There are others not *known* to be dead, but who almost certainly are so.

Mr. Ince, for example, of the South Polar exploring ship "*Discovery*," getting separated from his companions while on a sledging expedition, has never been seen since.

Baron Toll and a party set sail for the New Siberian Islands five years ago, and were probably lost.

And eight years ago, *Andree, Strindberg and Fraenkel* set out for the North Pole in a balloon. It is almost a question whether they should have been permitted to throw their lives away in such a venture. Needless to say, they never returned.

Among new-planned expeditions there is one for the wilds of Labrador. *Leonidas Hubbard* tried it last year and died of starvation and exposure. *Dillon Wallace* proposes to try his fate this year. His success would mean a considerable addition to our geographical and perhaps archeological knowledge, for only one white man—*John McLain*, in 1839—has ever traversed this wild and dangerous country, a tract as bleak as Greenland, though on the same latitude as the British isles. STUDENT

Re-establishing Lycurgus

THE now well-known historian, *Emil Reich*, has been making a somewhat unexpected protest against the modern tendency to deny the existence of *Lycurgus*. It is of course the same tendency that would fain wipe out the names of *Shakespeare*, *Homer*, *Tell* and others; and makes of every hero of a sufficiently remote date a solar myth or something of that kind. Any man, in fact, whose powers and therefore influence greatly pass the normal human limit and demonstrate what the *soul* can do if allowed free play, must somehow be made to lose outline and finally be obliterated. *Dr. Reich's* protest is therefore unexpected.

Sparta had a marked and important part to play in human history and the extraordinary genius of *Lycurgus* showed her how to do it. *Dr. Reich* maintained that we might with as much reason deny Sparta as *Lycurgus*. Even if—which he denied—Greek texts made a myth of the hero, nevertheless the very nature of the Spartan State outargued any philological argument. The ultra-natural and all conquering strenuousness of the Spartan life could stand alone as proof of a master hand and master mind inspiring it.

We may now confidently await the contention that *Lycurgus* was a generic name, owned by a multitude of little men, each of whom did a little bit. The solar myth view is got at by several stages, and this is often one of them. STUDENT

Teaching Deaf-Mutes to Speak

IT seems marvelous how children born deaf and dumb can ever be got to understand conversation by lip-reading; yet it is not more wonderful than many other things which we habitually do, such as recognizing faces a long way off. In a large number of elementary schools in England, congenital deaf-mutes are taught to speak by being shown the lip movements and made to feel the vibrations of the larynx by placing the hand on the teacher's throat. They also soon learn to interpret speech by watching the lips of the speaker, and can thus converse like ordinary people, yet without hearing a sound. STUDENT

New Cuban Cabinet

THE new Cuban Cabinet recently formed by President Palma is representative of the moderate party, and none of the recently-resigned cabinet officers has been reappointed. The names of those who accepted portfolios are as follows:

Secretary of State and Justice—*Juan Francisco O'Farrill*.

Secretary of the Treasury—*General Ruis Rivera*.

Secretary of the Interior—*General Freyre y Rado*.

Secretary of Public Works—*General Rafael Montalvo*.

Secretary of Public Instruction—*Eduardo Yero*.

Secretary of Agriculture, Industry and Commerce—*Ernesto Castro*. H.

Where Nature Smiles --- Fair Spain

IT has been said that in this cycle of time, force of character has fled to the severer climes, leaving the sunny south a prey to lassitude and heedlessness. The review of a travel-book on Andalusia gives some illustrations of this. The writer says:

The thought impressed itself upon me while I lingered in that peaceful spot, that there was far more to be said for the simple pleasures of sense than northern folk would have us believe. The English have still much of that ancient Puritanism which finds a vague sinfulness in the uncostly delights of sunshine and color, and ease of mind. It is well occasionally to leave the eager turmoil of great cities for such a place as this, where one may learn that there are other more natural ways of living; that it is possible still to spend long days, undisturbed by restless passion, without regret or longing, content in the various show that nature offers, asking only that the sun should shine and the happy seasons run their course.

And he asks, "Is it worth while to be quite so strenuous? Let us do our best to be happy. The earth is good and sweet-smelling. There is sunshine and color and youth and loveliness, and afterwards—well, let us shrug our shoulders and not think of it."

But then the scene changes. A group of returned Cuban soldiers, fever-wasted and stunted, reminds him of the consequences of Spanish insouciance—death and corruption, loss of power and land and honor, ruin of countless lives.

Cannot we be gay without being reckless, or enjoy life without wasting it? Must we choose between Sheffield and Andalusia, between grimy thrift and sunny indolence? Or can we UNITE *heart and head, beauty and utility, joy and energy, in a glad harmony?* STUDENT

Brain-work Increases Life

A MEDICAL man has recently testified in a British Law-court on the subject of brain-work and longevity. One-third of the laborers in rural districts, he is reported as saying, die of brain-softening, and the average vegetative rural laborer dies much earlier than the hard-thinking lawyer, simply because his brain rusts from lack of exercise. "The use of the brain prolongs life."

Wear and tear of brain does not impair it any more than wear and tear of body impairs the body. It strengthens and develops it. Similarly non-use atrophies and weakens the brain as it would the muscles. How important, then, for us to keep our brains active, if only by way of exercise and training!

Then again, as often said in the *NEW CENTURY PATH*, the thinker lives on a higher level than the vegetating laborer; he cultivates a more durable layer of his make-up. The vegetator gradually grossens and hardens, as he develops the earthier parts of his nature in undue proportion.

It is not brain-work, but abuse of the brain, that kills; but then any other kind of abuse is also destructive. The emotions of worry, covetousness, anger, etc., may goad the brain to harmful activity, but steady work can only be beneficial. STUDENT

Insecurity of Venice

ST. MARK'S CHURCH, in Venice, is now in danger from the instability of the foundations upon which that wonderful old city is built. The floor of the church undulates like a petrified sea. Much pile-driving and modern engineering will have to be done, or we shall awake one day to find that Venice has vanished in as mysterious a manner as has her ancient fame. There is a curious correspondence between the gorgeous but evanescent grandeur of this city-empire, and its architecture of stately palaces built on such a precarious foundation. STUDENT

THIS week's cover-page of the *NEW CENTURY PATH*, contains the picture of *W. Q. Judge*, the second Leader of the World's Theosophical Movement.

Some Views on XXth Century Problems

The Legumes as Food

WE would recommend every one interested in the science of diet to get *Farmers' Bulletin No. 121*, of the U. S. Department of Agriculture. It is a very elaborate study of the distribution, chemistry, dietetic value, and methods of cooking, of all the legume (bean and pea) tribe.

Representatives of this family are found in all climates and countries, and everywhere one or more of them form part of the diet of the people. Differing from other vegetable foods in the large quantity of nitrogen (flesh-forming matter) they contain, they constitute the equivalent for the vegetarian of the meat and other animal products used in the ordinary mixed diet. In fat, with the exception of peanuts—really a legume, though not usually known as such—soy beans and chick-peas, they stand low; but the deficiency is fully made up by the other (carbohydrate—starch) heat-producer. As a matter of chemistry these vegetables would therefore take the very highest place among foods.

But in practise several corrections have to be made. It seems, for instance, that beans cooked in the ordinary way, whole and without removal of the skins, are not only slow and difficult of digestion but are little more than half absorbed. Roughly summing up the results reached in the discussion, the points to be observed if the various beans, for example, are to be made to do perfect work as food, are: that they should receive a twelve-hour preliminary soaking in cold water, followed by a cooking of nearly equal length; that if possible the water for the soaking and cooking should be rain or distilled, and that if it is not, to two quarts of water, for a pound of beans, a half teaspoonful of baking soda should be added; that the skins should be removed as far as possible; and that not more than four ounces of dried beans should be taken on any one day. Less than this should be the ration of sedentary workers. And it may be added that animal products other than milk should not be taken at the same meal.

Of the soy bean, on the whole the most nutritious of the whole family, the Japanese make a series of very curious products. One of them is a sort of cheese called "tofu." The bean, after soaking and crushing, is boiled with rather much water. The water and beans are then filtered through cloth and to the resulting milky fluid about a fiftieth of its bulk of concentrated sea-brine is added. A precipitate of plant casein settles which is compressed into little white cakes. In other cases the beans, after boiling and still hot are wrapped in straw and placed for twenty-four hours in heated closed cellars. A fermentation results, resulting, it is said, in a very agreeable flavor. C.

Newspapers as Adjuncts to Financial Affairs

A RECENT writer deplores the change that has come over the press in thirty years. American newspapers used to be run by individuals, who made their personality and opinions felt. Now they are run by abstract financial entities, of which the editor is a subsidiary function. Thirty years ago:

There really was such a being as a single, dominant, responsible, personality in control of each great newspaper. . . . Ownership and editorship were substantially identical. . . . The editor knew no superior and he did whatever he chose, with a genuine pride in his profession and a zest in his work which could be felt thrilling and stinging through every line that came from his pen. He was not filling space. He was not just earning his living.

But now:

The newspaper has been swept into the same vortex that has swallowed up so many other agents of civilization. The money kings long ago saw the value of a newspaper as an adjunct to financial operations, and so by degrees they secured control of them.

The editor is a puppet and the paper can have no real policy, as the owners are able to dictate its opinions to suit their purposes at the moment. It is the day of "syndicate journalism," not a profession, but a trade. Happily a few newspapers here and there still honorably maintain the old traditions of journalism, possessing and expounding honest opinions on public affairs. STUDENT

A Pessimist's Outlook

THE school geography books usually give a few sentences of description to the people of the countries with which they deal. If they would add one more detail it would be worth almost all the rest—the relative numbers of the poverty-stricken; poverty meaning lack of the necessaries of health. The young people might then be able to form some just comparison of the real well-being of the countries. And as future citizens of America it might come to them as something of a salutary and thought-producing shock to learn that ten millions of Americans are now in the defined state of poverty.

The figures, very carefully arrived at, are given in a recent book. Of the whole number, it is estimated that six millions are still struggling against their fate; but that four millions have given up the struggle and become hopeless, irreclaimable paupers.

The writer shows that the evil is increasing and he thinks will increase, generation by generation. Nor can he suggest any very important remedy.

The six millions belong to the class of unskilled laborers, squeezed into poverty by their numbers. And the numbers increase—and therefore the poverty—because not only these, but the other four millions, breed children into their poverty-stricken lives, children mentally and physically birth-stamped for the ranks of the unskilled; by the annual immigration of thousands of the unskilled of other countries; by the dropping back of those whose health has been ruined or limbs maimed at insanitary or dangerous skilled work; and by the addition of those whose childhood was blasted and sterilized by factory labor.

Our writer thinks the evil as incurable as its cause—selfishness, greed, the universal clutch. And that he seems to regard as a radical fact in human life.

If this view is right, it would be hardly worth while even to try the palliatives. But the leaven of human brotherhood is working in the mass, appearances notwithstanding, and the time for its fuller manifestation, for a completer victory than any of which history tells us, is close at hand.

STUDENT

A Needed Alliance

THE *Philadelphia Press* has been roundly arraigning the churches and clergy of that city for their neglect to deal adequately with the problem presented by the district known as the "Tenderloin." "The clergy of the city have expressed themselves as astonished and horrified by the revelations of what vice is to be found there; they should be equally shocked by the thought of what is lacking there—churches moved away, Christian people shunning the neighborhood, not a single reading-room, playground, gymnasium, clean concert hall or other form of wholesome diversion. Only a few small and inadequately manned missions stand in the "Tenderloin" to give any sign that the Christian people of Philadelphia want to extend a lifting hand to the fallen."

The pulpits have another duty than the denunciation of vice as sin; another duty than the establishment of countervailing centers of amusement, important as that is:—the duty of denouncing it as a waste and perversion of the life-essence, a waste which in later years will be bitterly regretted. As men go, that argument will tell more than the moral one. They must call the reputable members of the medical profession to their aid. And upon the latter will then fall the duty of contradicting and exposing the mischief of the horrible fallacy that periodic indulgence is a necessity of sound health and for sound health; the duty of demonstrating the immediate connection between vice and neurasthenia, early senility, and nerve diseases in general, from locomotor ataxy downwards. Disease is unnatural and if in respect of this one thing men lived with governed mind and body the average life length would immediately double, and in another generation triple, itself. The body is furnished with every necessary apparatus for the destruction of invading disease elements, and if the apparatus will not work, it is because the life-essence has been uselessly squandered. It is not one of the laws of nature that the average life-length should be less than forty years. PHYSICIAN

Osiris and Isis in Germany

IN the middle of Germany is a mountain chain called the Fichtelgebirg, and the most prominent of its peaks is known as the Ochsenkopf (bull-head). On the side of the Ochsenkopf is the source of the river Main. Many old and beautiful sagas cluster around this mountain: about a wondrous temple inside; about King Solomon and his warriors awaiting within for the coming battle for Truth and Right; about King Arthur and his twelve knights in an enchanted castle, which peasants sometimes enter; about sibyls and wise men who have dwelt there (a sibyl book is even yet extant); and so on.

On the Ochsenkopf are found many big rocking-stones, and other queer boulders in the shape of human heads, that cannot have got their form and present situation through the play of natural forces. On the summit is the sign of a bull's head, cut with three lines on a huge rock. This sign is mentioned in the oldest manuscripts about the Fichtelgebirg, or German Paradise, as it was called in the Middle Ages. At the foot

to come himself and convert them with "fire and sword and sorcery." Bayreuth and the Wagnerian theater lie close at the foot of this mountain range.

Formerly there came to the Ochsenkopf many Italians in disguise, apparently to seek for treasures; but they were well-disposed and brought to the people the arts of making Venetian glass and glass-painting. These Italians are said to have all possessed magical powers, and the people around the mountains still relate many a strange tale of them.

Behind the Wagnerian theater lies a huge rock, carved like the bust of a man, with ancient characters on the head and an ancient cross on the north side, the face looking south towards Bayreuth. The old Narisci, who lived in the locality of Bayreuth, are said to have strongly denounced the use of the Roman wine, because it would rob the people of their intelligence.

Till lately Bavaria has had the most liberal religious laws, due to the wisdom of King Ludwig II, so that the so-called free religious societies could educate their children in pure science and true religion, in spite of their dependence upon the teachers, who were mostly hardheaded Hæckelians.

But now Württemberg, the country next to the source of the Ister (Danube), where many priests have already laid down their office for conscience' sake, has taken the lead by establishing a law whereby no child of any total dissenter from all churches can be forced to attend religious lessons in school. The religious education must remain entirely with the parents.

Thus the land of the founts of Ister, "known and blessed of Osiris," leads Germany in religious liberty for the children.

The Caves of Elephanta.

ELEPHANTA is a small island between Bombay and the mainland. Its real name is Gharipur, but the Portuguese called it Elephanta, from a colossal statue of an elephant, which is at the landing-place. The island is celebrated for its ancient cave-temple. The entrance to this is sixty feet wide and eighteen feet high, supported by pillars cut out of the rock. The sides of the cave are excavated into compartments containing statues of Hindu deities, which have, however, been defaced by Portuguese and by Mahometan "zeal." A bust of the Trimurti (Brahmâ, Vishnu and Shiva), or else of Shiva alone in his triple aspect, stands in the center; the faces are six feet long. There are numerous other statues, but Shiva predominates. This temple contains many remarkable sculptures as well. There are two other caves, also containing sculptures, in a ravine connected with the great cave.

of the mountain there still remains a good-sized piece of the once-famous Fichtelsee (Pine-lake), sacred to the Hertha (Isis).
Now, according to Diodorus (I., 27), there stood at Nysa, in Arabia, a monument said to be the burial place of Osiris and Isis, two pillars of which bore inscriptions. The one dedicated to Osiris ran as follows:

Kronos is my father, the youngest of the Gods. I am Osiris, the ruler, who have led my hosts into all countries, to the uninhabitable India and northwards to the source of the Ister and still farther up to the Ocean. I am the eldest son of Kronos, born from a beautiful egg. There is no place in the world where I have not been and upon which I have not bestowed my benefits.

Now the Ister is the Donau (Danube) which comes from the Schwartzwald; and since Osiris is said to have gone farther north to the Ocean, he may have gone over the Fichtelgebirg and thence to the Ostsee (the Baltic) where we still have the Island of Rügen, which is considered as having once been sacred to Hertha (Isis) with her white bulls.

The people around the Fichtelgebirg, the Suevi and the Narisci, longest resisted the introduction of the Christian religion, and Charlemagne had

Ancient Urn Found Near Bournemouth

EVEN in countries that have been densely populated for years, archeological remains are continually found, and that near the surface too. What riches must the American continents contain! A large sun-baked clay urn, two thousand years old, has recently been turned up near Bournemouth, on the south coast of England, during the construction of a road which cut through an ancient burial mound. The urn was only a few inches below the surface, yet was intact. The heather roots had found their way into the dust and ashes within. As other such mounds lie in the projected path of the road, other discoveries are looked for and their results awaited with interest by archeologists. E.

The Trend of Twentieth Century Science

The Genesis of the Frenchman

A BRILLIANT French writer has been energetically calling in question the ordinary description of his people as one of the "Latin races." More than that, he denies the applicability of the description to the Spanish and the Italians. He points out that compared with the population of her vast dependencies, that of Rome itself was but a trifle. And on taking possession of a new country, the Imperial City sent thither but a mere handful of rulers and soldiers.

In the times of its conquest by Rome, Gaul contained several millions of people. And as say 30,000 Romans is about the limit of the forces kept there in permanency by Rome, it is easy to see that this small proportion could have had no appreciable effect on the blood of the future Frenchman.

Somewhat the same with Italy itself. The country was for centuries a rendezvous for all the races of men. It was successively or simultaneously overrun by Gauls, Spaniards, Greeks, Asiatics, Egyptians, Jews, Germans, Bretons, Africans, Goths, Lombards, Byzantians, Slavs, Norsemen, Saracens, and others. Can the survivors of all this crowd be called Latins?

And again the same with Spain. "Most of the people who poured across France and Italy had their share in the transformation of Spanish blood—to say nothing of the Africans," who took the largest share of all.

So M. Finot winds up: "Considering the conspicuous absence of Romans among all the 'Latin' peoples, the name we have given them becomes a huge joke." Yet what France is *not* ethnologically, he thinks she may justly claim to have been or to be, intellectually. And because of the temperament thus inherited, France has ever been able to welcome and assimilate new currents of thought from every quarter. "Her mentality is the quintessence of human civilization and progress enriched by the fruits of her own interpretative and creative genius." So as a loyal Frenchman he sees great things in store for France. STUDENT

Negro Skulls in Europe

SOME anthropologists seem to think that they must be descended from the owner of any bone, animal or human, which they happen to dig up. A recent French scientist has been discussing the question "Were our ancestors Negroes?" solely on the ground that ancient negroid skulls have been dug up in France. One skull, from a dolmen at Pointe de Conquêt, is assigned to the beginning of the neolithic period; another, from an island in Brittany, to the Gaulish epoch. Both are of pronounced negroid type. Other instances are mentioned.

These skulls are those of degenerate remnants of the Atlantean race who were scattered abroad, some to Africa, some to Asia, some to Europe. H. P. Blavatsky remarks:

Has not the presence of African negro types in Europe in the prehistoric ages been now ascertained? It is this presence of a foreign type associated with that of the Negro, and also with that of the Mongolian, which is the stumbling-block of Anthropology.

This existence all over the globe of degenerate races possessing similar characteristics, varied superficially by the fact of the isolation of some of them on islands or in the interior of continents, is another proof of the radiation of prehistoric humanity from a central civilization; and the architecture and religious myths, so similar, tell the same story. STUDENT

Ancient Insect Forms

A ZURICH zoologist, experimenting on the development of butterflies, has succeeded in getting forms belonging neither to here nor now. Taking large numbers of caterpillars, he placed them, and kept them, under various temperatures to which they were unaccustomed, as high as 100° F. and as low as 25°. Most of them developed into butterflies of ancient species, very rare or extinct; others into entirely new varieties. Insects of the Arctic circle and of the Torrid zone came forth according to the heat or cold under which they developed. The new varieties, often of the most gorgeous coloring, were obtained by crossings in addition to the temperature. STUDENT

The Earth's Interior

AN English astronomer once suggested that the visible parts of mountains bore a very small proportion to the invisible; that every mountain was in fact but the extreme tip or peak of a much larger mass buried beneath the earth's crust, floating in the fluid layer that is supposed to lie between the (supposed) fiery and gaseous center and the solid shell.

The theory has been lately revived, and it accords with certain facts; but yet it does not work very well. A plumb-line theoretically points to the center of the earth; but in the neighborhood of mountains it does not do so; it is drawn by the mountain somewhat out of the perpendicular. And in the case of very large mountains, the deviation is so great as to support the hypothesis that the core of the mountain extends a relatively long way towards the earth's center.

Why then is this core, projecting into a layer hot enough to remain molten, itself not melted and intermingled with the rest? And if this layer is a genuine fluid and not merely a solid under such an enormous pressure as to be liquid, why does the core and its visible peak not sink?

It is evident that we are a long way yet from understanding the condition of the earth's interior—perhaps as far as one would be from understanding the human body if the dead epithelial scales which we brush off were the utmost that it was possible for the would-be anatomist to subject to examination. STUDENT

Fauna and Flora of a Dollar Bill

IT appears from recent investigations that paper money will carry germs for a month, but that on metal money they die in twenty-four hours. By the end of a month a dollar bill must often have seen much and motley company. As it passes from pocket to pocket, amassing new kinds of dirt and germs, it will be a veritable menagerie, leaving in each new residence samples of all the previous ones. Fortunately it is easily cleaned, though we never heard of anyone doing so. A night in alcohol would perfectly sterilize it; even a ten-minute bath would be fatal to most of its microscopic inhabitants. It might look, after drying, as dirty as before, but in the eyes of the bacteriologist it would be clean.

Why should not the paper mills where the official material is made, take a hint from the food adulterators and infuse a good percentage of salicylic acid? C.

Bas Reliefs by Photography

BAS RELIEFS are now produced by the action of light on chromium gelatin. This substance swells when light falls upon it. But as the swelling is greater with light of low than of high intensity, it follows that when the rays are passed through an ordinary negative, the gelatin becomes a positive in relief. The areas of it lying under the dark parts of the negative, which correspond to the most luminous parts of the original object, rise into relief. Thus the relief is in proportion to the varying illumination of the parts of the object. Plaster molds are subsequently taken from it. PHOTOGRAPHER

Devices in the Three-color Process

WHILST we do not seem to get any nearer the secret of true photography in colors, the methods for the three-color process become more and more ingenious. The last comes from Paris and seems to be the best of any hitherto used. The minute granules of potato starch are colored in three lots—red, green and violet. They are then intimately mixed and spread on a single screen. The result of the mixture is a uniform dead grey surface. Its effect on the light passing through it is the same as is produced by the use of three screens of different colors. The process of mixing is very interesting to watch as the eye ceases to distinguish the three colors and loses them in the final grey. It is a useful lesson in illusions. So far, our plates seem to be getting more sensitive only in respect of the time they require, now reduced to minute fractions of a second. The higher form of sensitivity—to rate of luminous vibrations—they still lack. STUDENT

Nature

Studies

Moss on Trees

INVESTIGATIONS that have been made as to the conditions under which moss grows upon trees have resulted in throwing doubt on the often heard statement that expert woodsmen can tell the points of the compass by noting on which side the moss grows, it being thickest on the north. The investigations show that moss grows wherever moisture is retained by the surface of the tree, and this may be any side, though naturally the south is least likely, other things being equal. Moisture is retained on the upper surface of an inclined trunk and of horizontal boughs, on rough or cracked bark, on bosses, in forks, and at the base of trunks. Hence moss grows most in these situations; and, once started, the moss itself acts as a retainer of moisture, thus promoting its own extension. STUDENT

The Brown Rat

THE common brown or Norway rat (*Mus decumanus*), distinguished by its brownish-grey color, large size (eight or nine inches long), and extreme energy and fecundity, is believed to have originated somewhere in Central Asia, and a species like it has recently been discovered in China. Thence, like the Aryans, it appears to have spread westward, driving all other species before it. In England it has almost completely exterminated the black rat (*Mus rattus*) which is smaller and less fierce, and is now represented by the white and piebald specimens kept in cages.

The brown rat breeds four times a year and may have as many as ten at a birth, the young themselves breeding at six months. The extent to which they will multiply is limited only by the amount of food available. Hundreds of them are often killed in wheat-stacks by sending in ferrets and killing the rats with sticks as they come out. There seem to be few if any eatables they will not eat; sometimes they are reduced to

ARBOL DE LA PAZ—SURRENDER TREE. A TREE OF HISTORIC INTEREST TO CUBANS

cleaning out broken bivalves which the waves throw up.

A writer describes seeing several hundred rats drinking at a pool after a heavy thunderstorm, it being the only available water for a long distance.

The brown rat is perhaps the astutest and warriest animal in existence, especially aged ones, who are used to man's ways. He moves cautiously, with all his senses alert, avoids traps and poison, and lives to a hoary antiquity. But he is no match for the ferret, weasel or stoat, in spite of his quickness and his teeth; for these rodents are quicker and fiercer still, and one will put to fight a whole swarm of rats. STUDENT

Optimistic Persistence in Plant Life

THE renewed life of the springtime growth shows us again one of Nature's great secrets of success. *An opportunity is never lost.* If it is located where the soil is favorable it makes a fine growth; but if the soil is scarce, with but little moisture, of course it cannot do so well. The favored one may be several feet high with many blossoms; while the other bears its one tiny flower only a few inches above the earth. We humans might profitably follow their example by going ahead as best we can, without wasting our time in useless lamentations because we have not some other way more pleasing to

our fancy. The smallest plant grows by the same laws as the largest, and we may find in the circumstances of our own humble lives experiences which in some other life may be written large across a nation or an age.

The tree in the marsh may become of enormous size, while the herb on the rock may be only a nail's breadth; but if each has done his best the credit is equal. It is by this profuse lavishness of effort that Nature so often succeeds in propagating plants in such conditions that it would seem impossible if one were to stop to think about it. W. E.

"That common motherhood
May help to make the common brotherhood."—Gerald Massey

IT is related of the Mikado of Japan that, recently, on being shown a picture of the statue of

Liberty, he enquired of the American owner of the picture, "Why was it of a woman rather than a Washington or Lincoln?" As we cannot believe the Mikado to be ignorant of the ancient symbolism that personifies liberty in woman's form, we must infer that he was a bit sarcastic.

The idiosyncrasies of some American women abroad, by which they attract the attention of the public mind, have long been the subject of comment. Nevertheless it takes away one's breath almost to see a woman of Mrs. Perkins Gilman's brilliant gifts, giving utterance to such extreme views, as stated in reports from London.

Mrs. Charlotte Perkins Gilman has been interesting the London public recently with her eloquent addresses on Woman in the different departments of her "sphere." In one of the most sensational of these lectures, "Woman and Beauty," she aroused great excitement among her English sisters present by her sarcastic epigrams on woman, they having expected something quite different. While much that Mrs. Gilman said was true, quite as much was overdrawn, and apparently given more in the spirit of sarcasm and enjoyment to herself than with any sincere desire to utter beneficial truths.

But possibly Mrs. Gilman believes in administering her medicine in allopathic doses to effect a quick cure. Her whole argument was that woman knows nothing at all of beauty. "Novelists often spoke of signs of beauty in a house as evidences of 'the touches of a woman's hand.' But any one who made a slight study of the science of antimacassars, or went into the subtle composition of cushions and other schemes of home decoration, such as hand-painting, in which the painting looked as if it had been done with the feet, would find that women had little sense of beauty."

There is truth in that not very original statement—but when she declares that "All the great works of beauty in the world were the works of man; and that was so because man was *more human than woman*," it is so unfair and false that one is astounded. Coming as it does from the lips of a progressive woman like Mrs. Gilman, who claims to be trying to improve other women, it goes far to prove how much even those who are considered to be the most enlightened, have yet to learn.

While it is true that man has executed most of the great works of beauty, *so far as we know*, yet in many instances a woman has inspired

The Woman's View

None ever climbs to mountain heights of song,
But felt the touch of some good woman's palm:
None ever reached God's altitude of calm,
But heard one voice cry, "Follow!" from the
throng.

—Selected

the deed, given the necessary impetus, encouragement and enlightenment to the man who executed the work.

Today, in America, on the point of land running out into the blue waters of the Pacific, called Point Loma, there is a work of beauty originated, and most of it executed, by a woman, Katherine Tingley. The scope of this work is so vast, the purpose such a noble one, the beauty of it so perfect that we can conceive of nothing greater that has ever been executed by man. Not that we are unwilling to give man all that is his due,—but let us at least *do justice to woman*, who, shut in by her limitations, has yet with all her frailties, and superficialities, been *sufficiently human* to become the mother of men capable of executing beautiful works.

Woman holds the scales of justice in her hands when she is most womanly, perfected in motherhood and womanhood. Women often lose sight of these facts, especially those who wish to attract attention to themselves as great reformers, and do much more harm than good to the advancement of women.

Numberless cases might be cited to prove the fallacy of Mrs. Gilman's statement, but it is unnecessary.

All crimes shall cease, and ancient fraud shall fail,
Returning Justice lift aloft her scale.

So sang a well-known poet, when prophesying a return of the Golden Age with the Goddess of Justice. But the Golden Age, and returning Goddesses, will be myths only, until the barriers of separateness and selfishness, which women have erected among themselves, are overthrown.

Would it not be better, if those who wish to enlighten other women, would show them how to strengthen and develop the virtues they already possess? We doubt the efficacy of a method that criticizes and tears down but offers nothing as a substitute.

E. C. S.

MISS JANE VOORHEES, a graduate of Vassar College, is the horticulturist at the New Jersey State Experimental Station. One can hardly realize, unless accustomed to greenhouses, how much trouble and expense are involved in the preparation of the soil alone, not to mention the thousand and one other details which need attention. Miss Voorhees is at present making experiments in subwatering, this being believed to produce finer blooms and longer stems, something always sought after by florists.

The Man's View

WHEN Robert Louis Stevenson was twenty-five a friend gave him a photograph of the "Three Fates" of the Parthenon sculptures. The deep impression this made upon him is dwelt upon at length in one of his letters:

I wonder so much why they should have been women, and halt between two opinions in the matter. Sometimes I think it is because they were made by a man, for men; sometimes, again, I think there is an abstract reason for it, and there is something more substantive about a woman than ever there can be about a man. I can conceive a great mythical woman, living alone among inaccessible mountain-tops or in some lost island in the pagan seas, and ask no more. Whereas, if I hear of a Hercules, I ask after Iole or Dejanira. I cannot think of a man without a woman. But I can think of these three deep-breasted women, living out all their days on remote hilltops . . . not pausing, not pitying, but austere with a holy austerity, rigid with a calm and passionless rigidity; and I find them none the less women to the end.

And I find them none the less women to the end—what is that rare and subtle truth that lies hidden within the heart of this simple sentence? It is worthy the pause—and the conjecture. STUDENT

The Home Life of Hawthorne

THAT Nathaniel Hawthorne and his wife were ideally happy in their home life is evident in his book, *Mosses from an Old Manse*, as well as in her letters and journals written during their life at the

old Manse in Concord: "In the evening, when the astral enacts the sun, and pours shine upon all the objects, and shows, beneath, the noblest head in Christendom, in the ancient chair with its sculptured back—and whenever I look up, two stars beneath a brow of serene white radiate love and sympathy upon me. Can you think of a happier life, with its rich intellectual feasts? That downy bloom of happiness, which unfaithful and ignoble poets have persisted in declaring always vanished at the touch and wear of life, is delicate and fresh as ever, and must remain so if we remain unprofane."

—From *Memories of Hawthorne*

INTERIOR OF ONE OF THE GROUP HOMES OF RAJA YOGA SCHOOL

MRS. CATHERINE WAUGH McCULLOCH,

a successful woman lawyer of Chicago, ascribes the power of a certain notorious woman largely to the fact that she knew how to dress. Mrs. McCulloch is probably nearer right than appears at first glance, for the psychological effect of dress may be made considerable, either for good or evil. However that may be, it is certainly true that when good women possess as much knowledge, wit and tact as some of their lawbreaking sisters, justice will no longer look so meek in the land nor evil continue to be so triumphant.

THE Philosophical Faculty of the University of Vienna, one of the most conservative in Europe, has decided to allow women to lecture within its walls. Beginning with the next semester, several prominent women will regularly lecture to the students. This action is the result of the petition of a young woman, Elise Richter, Ph. D. She was at first laughed at by the people of Vienna, who declared that she had imbibed modern ideas in the United States, but she won her fight and made possible a step of great importance to the women of Austria—in fact, to womanhood everywhere.

A BILL has recently been introduced in the Albany legislature which prevents the eviction of persons in New York City during storm or inclement weather. The fact that such a bill should be needed is commentary enough upon the unbrotherliness of the present age. Even without other and more positive record, what would the historian of the future, upon a perusal of Twentieth century history, inevitably conclude?

A Great Evil

THE Society for the Prevention of Vice deserves, and will doubtless receive, the thanks of the Japanese government.

It appears that there is a custom—necessarily very recent—among certain classes in Japan which is known as "photograph marriage." In this ceremony the bridegroom, whom the bride may never have seen, is present only as a photograph, the girl being subsequently sent to him.

The opportunities for abuse are obvious, and have been fully used in this country. Doubtless for a money consideration, very ignorant families have been induced to send their daughters here after a "marriage" at home to the photograph of an American. The affair is conducted by Japanese procurors, with whom the original of the photograph is in league. The fate of the unhappy girls may easily be imagined, and until the Society for the Prevention of Vice took action they were claimed on their arrival as the legal wives of their pretended husbands. One of these men had made claim upon a Japanese girl who was in the care of the Japanese Woman's Home at San Francisco. In pity for her distress, the matron, in conjunction with the Society, appealed to the law, obtaining a ruling that such marriages are without validity in this country. That particular child, having fortunately got into friendly hands, is safe. But what of the many others? They have mostly left their country under compulsion of their parents, and knowing nothing of their fate and nothing of any law to which they can appeal. The Japanese government will doubtless quickly take action, but it is to be hoped that in the meantime every effort

will be made for the safety of these young girls. It is perhaps too much to hope that the villains at whose instance they were imported may be adequately punished. C.

Women as Archeologists

IT is stated in a report of the University of Chicago's archeological expedition to Adab in Chaldea that there is one woman in the expedition, "the only woman who has ever accompanied such an expedition." But women have engaged in archeological work, and still do so with devotion and advantage. Was it not Dr. Le Plongeon and his wife who investigated the antiquities of the Mayas and Quichés of Yucatan? The discoveries in Lycæonia mentioned in the NEW

CENTURY PATH, February 5th, were made by a man who, all through his report, speaks most appreciatively of his wife's services as an explorer. Madame Dieulafoy and Miss Boyd have done invaluable work, and other instances must surely be known to readers. The particular traits that are most developed in a woman's mind are of the greatest value in this as in other kinds of work. The "intuition," or faculty of direct perception of essentials, has often succeeded where the masculine intellect, with its devotion to method and precedent, has blundered and missed the mark.

A SOCIETY of young men, some of them of considerable social prominence, has recently been formed in Berlin. Its title is "The Association of Active Friends of Animals." It has already distributed pamphlets throughout Berlin in which women are respectfully requested to stop wearing birds upon their hats! And what has the conventional "haus-frau" to say to this? Will she doze or awaken and help?

ANOTHER step has been taken towards the emancipation of German women in the admission of the Countess Helene von Schweinitz of Berlin to the ranks of surgeon-dentists.

THOSE who are most familiar with American Indians say that the mothers invariably refrain from teaching their infants "baby talk." Papooses are taught to speak correctly from the first. What an example to thousands of the educated mothers of our civilized lands!

OUR YOUNG FOLK

The Wife of Columbus

"BUT was there a Mrs. Columbus?"

It was a Raja Yoga girl who asked the question, and big brown eyes looked up at me from the book over which a curly brown head had been bending.

"You have been reading about little Diego," I said, intuitively, and she answered, "Yes."

Of all the records of Columbus' life, one pathetic little fragment has clung most closely of all to my memory, the picture of the forsaken, yet undiscouraged man, wandering from place to place with his little son, searching, searching for some one who should credit his vast plans. It was not strange that the question should arise, "Who was the wife of Columbus? Who was little Diego's mother?"

With regard to the wife of Columbus history is strangely silent and the general reader would be utterly unable to find out any facts connected with her short and beautiful life except for the researches made a few years ago by two people, one, a Portuguese writer of some note, and the other, an energetic American woman, member of the Lisbon Geographical Society. It was entirely owing to the efforts of the latter that these researches were begun.

And this energetic woman discovered, after much searching among genealogical and historical records, that the mother of little Diego, and the wife of Columbus himself, came from a long line of distinguished and noble ancestry. Where Columbus by birth ranked with the common people, his father being a woolen merchant and himself without fortune or rank, Donna Phillipa Moniz de Mello could trace her ancestry back to the bluest blood of ancient Spain and Portugal.

Her father, Bartholomew Perestrello, was a navigator in a small way. His one great ambition was to be a discoverer, but alas! beyond the discovery of a single barren island, he is only known for his total failure in a wild scheme to render it fertile by covering it with soil. He left maps, doubtless, and it may be that Columbus later made use of them. As to that we do not know, for Donna Phillipa's father died when she was but five years of age and of course never knew his illustrious son-in-law that was to be.

The mother of Donna Phillipa was a descendant of the celebrated Moniz family, even more glorious in history than the family of her husband. Marrying thus below her station, according to the false estimates held in those days—and in our own day, too,—we may be reasonably sure that the marriage was one of love, not of convenience merely. There is left some account of the young wife's beauty, charm, talent

and high breeding, but beyond the mere statement that a year after the marriage little Diego was born and that shortly after this his mother died, we know nothing of her short life. She came and went as come and go birds and flowers, sunshine and blue skies. And that is all we know.

AUNT ESTHER

Facts Worth Knowing

THE Emperor of Japan is the one hundred and twenty-second sovereign of his line. The crown he wears has descended to him directly, from father to son, since the Seventh century, B. C.

JAPANESE carpenters, so tourists say, plane and chip, mortise and saw, with astonishing neatness and ease. They work on a very different plan than do our carpenters and with quite different tools.

JAPAN'S triumph in the recent war appears to be owing to three things—a faithful and moral ruling class, a most adaptive and versatile artisan class, and a peasantry which appears to have no limit in the matter of health, endurance and capacity for self-sacrifice. The ruling class is the descendant of the great feudal aristocracy which has for many centuries dominated not only the life, but the ideals, of Japan; and these ideals have ever been high and knightly.

ACCORDING to statistics, New York has the most expensive city

government on record. The Emperor of Japan reigns over 44,000,000 of people. For many years they have been preparing for war and it is evident enough by this time that the preparation was thorough and very expensive. In addition, many reforms which have cost a great deal, have been recently brought about in Japan; and yet their government, in 1903, cost only \$122,000,000—just what, if New York does not mend her ways, the government of that city alone will cost in 1908.

THE five great festivals of the year in Japan fall on the following days: New Year's day; the third day of the third month, which is the dolls' festival; the fifth day of the fifth month, which is the feast of the flags; the seventh day of the seventh month, which is the day of the star, Vega; and the ninth day of the ninth month, which is the festival of the chrysanthemum. The greatest of these is the New Year's holiday which sometimes lasts two weeks. The dolls' festival is especially devoted to girls, and the feast of flags to the boys. There are also many other flower festivals, such as those of the plum, cherry, wisteria, iris, maple, lotus and morning glory. At the time each of these is in bloom the people flock to the country to enjoy the flowers and the day's outing. Half the nation seems to go, as if to some picnic or festival.

COLUMBUS PRESENTING HIS PLANS BEFORE THE LEARNED MEN OF SPAIN

ENDURANCE is the crowning quality.

And patience all the passion of great hearts;

These are their stay, and when the leaden world

Sets its hard face against their fateful thought,

And brute strength, like the Gaulish conqueror,

Clangs his huge glaive down in the other scale,

The inspired soul but sings his patience in,

And slowly that outweighs the ponderous globe,—

One faith against a whole earth's unbelief.

—James Russell Lowell

THE CHILDREN'S HOUR

The Raja Yoga Question Box

THESE two monarchs of modern times still live in the hearts of the people whom they loved and tried to serve.

1 Who was Queen Louise?

ANSWER—Queen Louise was the wife of Frederick William III of Prussia. She was very beautiful and of noble character. Prussia was overrun by the conquering armies of Napoleon. The Queen had to flee with her children. There was sorrow and distress on all sides. The Queen was an example to every one. She showed great patience and dignity during this sad time. Queen Louise was brave and patriotic. She gave her jewels to help to pay the great sum of money which Prussia had to pay to her conquerors.

2 Who was Joseph II?

ANSWER—Joseph II became the sole ruler of Germany in 1780. He was the son of the illustrious Queen, Maria Theresa. Joseph II was a man of pure motives. He believed that a king should lead his people on the path of progress. He freed the serfs, reduced the taxes, granted religious freedom to all, and gave freedom to the press. Joseph II also issued a new code of laws in which the rights of every man were recognized, and he set aside capital punishment. King Joseph II founded public libraries and colleges, and schools for the middle classes. He encouraged art and new manufactures. He caused the River Danube to be opened for navigation. But Joseph II was in advance of his time. The clergy and nobility opposed his reforms. He is today spoken of in Austria as "the good King Joseph."

A Morning March

IF you had looked down upon this little city of children's homes any bright sunny morning a few months ago, your heart would have warmed at the sight that would have met your eyes,—the tiny tots at their first morning march.

Out of the vine-covered porch steps very sedately a little company of two-year-olds. They form in line at the call of their teacher, two by two, hand in hand. This is the proudest moment of their day, when they march in a line like the big Raja Yoga boys and girls. They know very well what it means to get in line. Haven't they watched the other children every day from their verandah? And now their turn has come. Having "found their feet," and being able to step along firmly, they too shall march around the Lotus Home Grounds every morning.

What adventures they have! There are so many little gardens, so many flowers to admire, so many "brothers stout and tall" who are gardening, but who pause to watch this tiny troop on the march. Between two of the houses is a path down a little slope. You should see the eyes brighten, the hands tighten their grasp of the little companion's hand, as they prepare to run down this path. You see, they do not wish to break the line. Across the broad path they go to a sheltered place between the pepper trees and the honeysuckle-laden fence. They take long whiffs at the perfume, and notice the sharp points of the aloes, looking up to their teacher to say "O see pin!" As they march past their own little home a bird rests on the very peak of the roof. This gives them great delight. When they come to the "circle" where the bigger children are playing games, they look on with calm interest. They know they are going to have a long play on the grounds later on. But just now they are out for a walk *in line*. So they march on into the grove of eucalyptus trees. The fence on this side is covered with honeysuckle too. If a horse, or a team, or the donkey cart on the way out through the Egyptian gate, passes by, there are cries of delight. One morning a courier passed swiftly on a bicycle. All eyes gazed, then turned enquiringly to the teacher. "Horse?" "No." "Donkey?" "No." They strain their eyes to see again.

Then the little company pass through a gate, which one of them holds open politely, while the others pass through to the west walk. Here is a sight they love, the "big blue." It is the Pacific Ocean, which they never fail to greet with "O-o-oh, O-o-oh!" There are many other sights, the lawn with trees and flowers and the busy center home; but when the white bonnets reach the hedge of blue Australian daisies which

you can see in the picture, the steps begin to quicken and the line breaks. They disappear behind the hedge for a grand romp on the green lawn. Drill for the two-year-olds is over until tomorrow.

It is six months since these Raja Yoga babies made their first morning march. What *would* you say if you could see them drill now? I think you would say Oh-o-oh!

A RAJA YOGA TEACHER

HAPPY LITTLE SUN-BEAMS

HAPPY little sunbeams
Darting through the blue.
Even little sunbeams
Have a work to do.

Shining at our brightest,
We with radiance clad,
Help to make the rainbow,
Make the great world glad.

Happy little sunbeams
Darting through the blue.
Even little sunbeams
Have a work to do.—Selected

children spin two tops together, one inside of the other. They are a happy lot, and show a rare unselfishness in their sports and games, that children of other nations might well emulate.

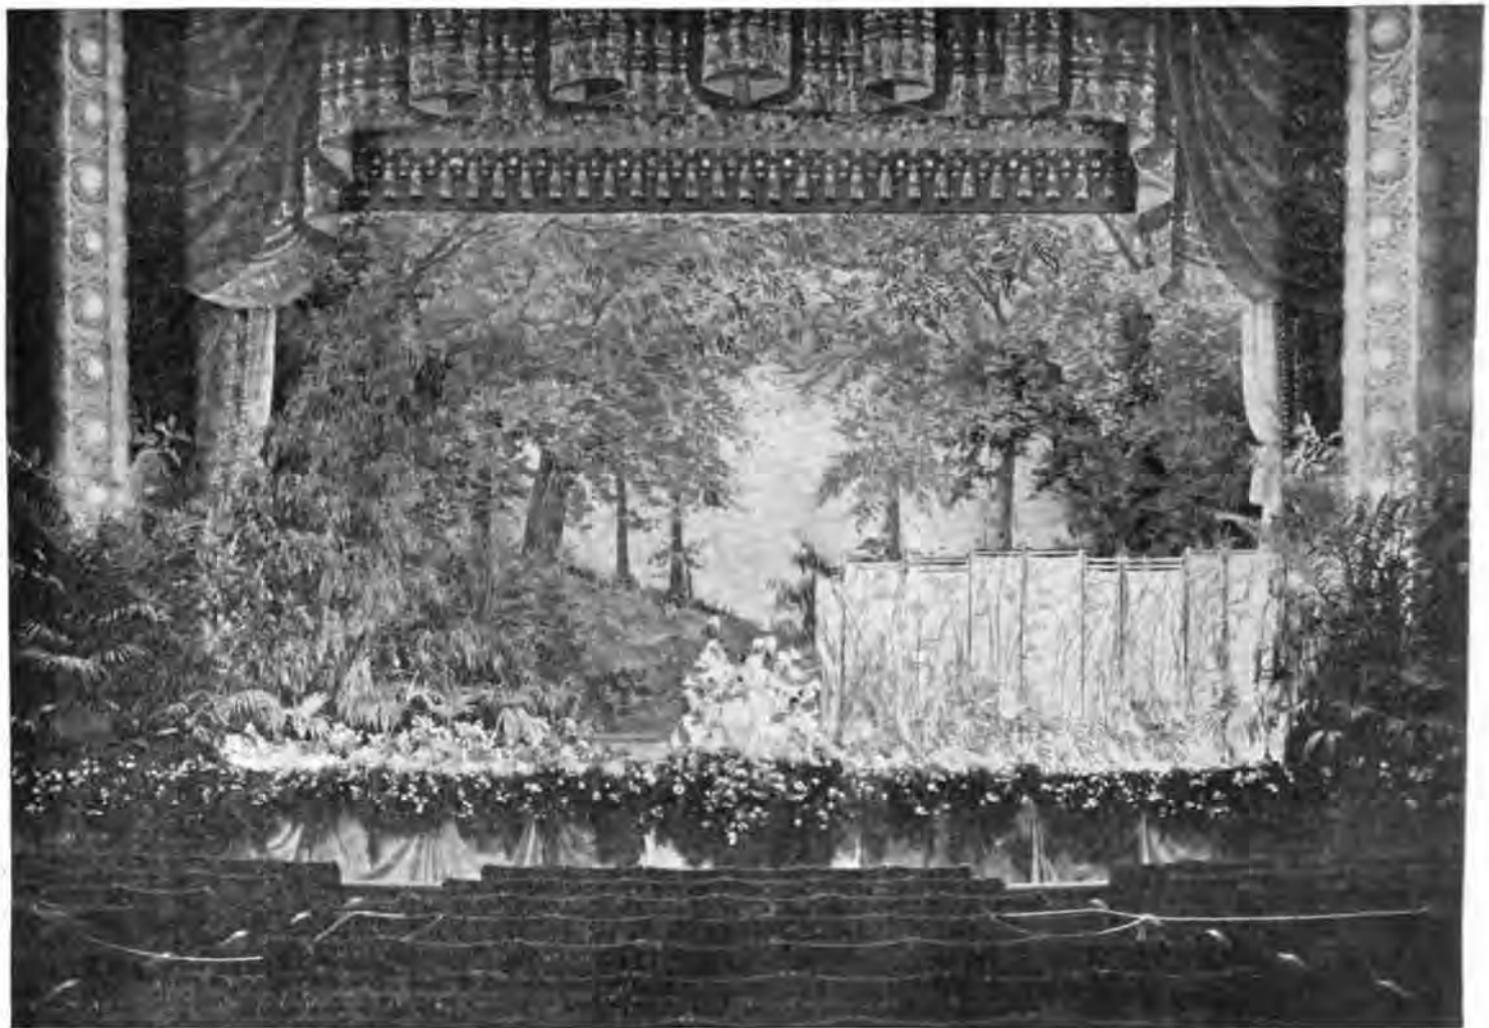

UNCLE FRED

THE five hundred trained collies which, some time since, were sent to the scene of the Russo-Japanese war, have proven themselves to be invaluable helpers in the work for the wounded. The dogs are carefully trained, first to hunt up the wounded soldiers, then, in case the wounded man is unconscious, to bark or use other means to arouse him so that he can make use of the aid the dog brings. Each dog carries a gray blanket and two flasks, one of water and the other of some stimulant, two little biscuits, a roll of bandage and some splints. When the soldier is too seriously wounded to help himself, the collie is taught to send out a call of distress to summon men to help him, or else to rush to the nearest hospital tent for a surgeon. This is even more remarkable than the way in which the St. Bernard dog rescues unfortunate travelers in the Alps.

How grateful poor wounded soldiers must be for such help as these dogs bring! What a lesson in Raja Yoga—and on a battle-field, too! H.

Isis
Theatre
San
Diego
California

THE THEOSOPHICAL FORUM, IN ISIS THEATRE

AN audience that filled Isis Theatre to the doors assembled last Sunday night in response to the announcement that Katherine Tingley would speak. The stage decorations were even more attractive than usual, a profusion of foliage and blossoms giving a charming touch of nature to the scene.

Mrs. Tingley's appearance on the stage was greeted with most cordial applause. She spoke for nearly an hour, her address, as usual, being entirely extemporaneous. In fact, she remarked that she had changed her topic at the last moment. She had intended to speak upon "The Effect of the Drama on Education," but instead chose for a topic, "The Unrest of the Age." Her address was throughout one of the strongest, most earnest and eloquent that she has delivered before a San Diego audience in a long time. She declared that while all recognized the unrest and dissatisfaction in the world today, different classes of people would attribute to it different causes and suggest different remedies.

She said that this unrest of the age grew out of separateness and selfishness. We find in every community that nearly everyone is declaring for brotherhood, yet combating the views of everyone else. She believed such diversity of views would not exist if we viewed life more seriously. We need a revival; but it should not be a forced one; it should come spontaneously from the heart—a natural reaching out for the higher life. A passive desire for a better condition of the world is not sufficient; we should be willing to sacrifice something of our comfort for the welfare of our fellows, and not rest until the suffering and misery of the world are relieved. We should realize that the low and sinful, the unfortunate, are still our brothers and have within them the spark of divinity. The speaker declared that in spite of the tentative efforts made by many people and by many organizations to reform unfortunate women, drunkards, etc., yet little was accomplished, for the means used do not appeal to the hearts of those they are seeking to help. She said that in such cases there must be a better and profounder knowledge of human life, and especially of the causes at the root of the degradation of these unfortunates, and that in remedying this, no two individuals should be treated alike.

Let us remember that the fallen women, so called, aye, the criminal,

are a part of our humanity and deserving of our sympathy and our help. The lost men and women are not lost. We should hold out to them a helping hand and encourage them to have faith in themselves. But to help others we must be sincere and honest ourselves. The most degraded woman on earth, labeled as such, is better than a hypocrite masking in the guise of morality.

"Something more is needed, as all fair-minded men will admit. The world is calling for the remedial agent, and what is it? I declare to you that it is Theosophy. The real reformer must be a Theosophist in the true sense of that word. Having the knowledge and leading the life, he has learned the power of self-control and can and will impart that glorious power to another. Thus he guides and reforms."

The speaker declared that if we but traced the unrest of the age back of the sin and selfishness that we see around us we would find its real cause to be—ignorance. Ignorance of our own nature and the divine laws of life. Mere book learning and religious training are not sufficient. She protested most earnestly against the "isms" and fads in which people fritter away their time and energies, and this, too, while suffering humanity so sorely needs a helping hand.

The large audience was in full sympathy with the speaker, interrupting her again and again with hearty applause. It was quite apparent throughout the address, that the remarkable word-pictures of the speaker sank deep into the consciousness of her audience. The evils portrayed were so graphically delineated, and the remedy therefor so convincingly shown, that it is safe to say not one single individual of the hundreds of listeners left Isis Theatre without feeling that a revelation of the social side of our civilization had been vouchsafed to him—a revelation showing at one and the same time a fearful evil and its right and proper eradication on the lines of highest human altruism. Delightful music was rendered by the Point Loma orchestra and several songs were sung by a choir of Raja Yoga children from Point Loma.—*San Diego News*

Theosophical Meetings for Sunday Nights

Public Theosophical meetings are conducted every Sunday night in San Diego at 8:15, at the Isis Theatre, by the students of Lomaland.

Theosophical subjects pertaining to all departments of thought and bearing on all conditions of life are attractively and thoughtfully presented.

Art Music Literature and the Drama

The Work of Art Ever Reveals the Heart-Life of the Creator

THE art of painting is more indiscreet than any other. It is the unfailing witness of the moral state of the painter at the moment he held the brush. That which he intended to do he did; that which he weakly cared for is marked by indecisions; that which he did not wish is justly absent from his work, whatever he or others may say. A distraction, a lapse of thought, a lukewarm interest, a superficial view, a little less attention, a little less love for the thing he is studying, the bore of painting and the fury of painting, all the shades of his temperament, even to the temporary lapse of feeling before the object, all this shows itself in the work of the painter as clearly as if he told us so.—*Fromentin.*

Fromentin, artist, critic and thinker, knew more about painting than about anything else. Because of this, his statement has flown a bit wide of the actual fact. Yet it suggests a mighty truth—the truth that, to those who can see below the surface, the deed ever reveals the doer.

Truly the art of painting is indiscreet, even though not more indiscreet, as he declares, than any other. One has but to visit a large art gallery,—to go from a sleek Bougereau to a restful Millet,—then to a grim Verestchagin. One has only to go from an Inness to a Constable or a Ruysdael, and then study these men's lives, —or at least the lives of those whose biographers are able to look an inch or two below the surface, and who will even admit that effect is born from cause. Not only does each painting reveal the abiding characteristics of the artist, but even the very mood in which it was painted, —nay, more,—perhaps the very mood struggled against at the time.

Nor are paintings more tell-tale than sculptures,—than the musical composition or the dramatic work. One might almost contend that they are less so. Compare Canova's Venus with the celestial fragment found on Melos. Compare some modern interpretation of the Three Fates to those indescribably majestic figures of the Parthenon pediment. Compare almost anything with the glorious examples of modern French sculpture, Chapu's "Joan of Arc," Barrias' master-group, "The First Funeral," Rodin's "Citizen of Calais," or any one of a score of the most marvelous portraits known to sculpture in any age. Then declare, if you can, that these things do not reveal the very secrets of the souls of those who brought them into being.

Nothing that mind can conceive or that hand dares strive to interpret, but is an open secret to those who know life,—who know human nature, and can recognize the truth when they see it. Each work, be it a work of art, literature, music, science, or of domestic service, unfailingly reveals in itself the nature of the worker, his strength or weakness, his heart's pessimism or its joy.

When our critics shall perceive this they will easily step upon those heights where alone shines the light of that divine insight of the soul. Then shall they be teachers and soothsayers indeed, reclaiming for all the arts, today so largely misunderstood, their heritage of appreciation. And this, their true work, is even now begun. STUDENT

A MANUSCRIPT copy of Poe's little poem "Ulalume," has recently been sold at auction in New York for \$1000. Pity is it, indeed, that the value of this man's work could not have been appreciated at the time when he was suffering from cold and hunger in the little cottage at Fordham, forced to see his beautiful and beloved girl-wife die for want of ordinary comforts.

AND now the Judges are worrying over the question as to whether a boy violinist under fourteen plays or works. It is said that upon the judicial decision of this question depends the legality of certain recent enactments instituted by the State Department of Labor of Illinois.

Affectation in Singing—The Seal Upon Vanity and Self-Consciousness

AFFECTATIONS express themselves in our every gesture, to the amusement of the onlooker and the enlightenment of the student of character; but in nothing do they more readily find expression than in singing. The vocal organs seem to be especially under the influence of the feelings. What is it that produces those spasmodic contractions of one part and laxity of another part, which teachers toil to overcome? Is it not vanity, self-consciousness, fear, or some other emotion or combination of emotions? Few people allow their voices to be natural and easy, but aim at an effect, of the quality of which they themselves are the worst possible judges.

If we can make the study of singing an integral part of our general and continual study of the art of natural living, we can learn much as to how to get rid of the affectations and spurious elements in our character. And much beside musical knowledge will be gained. STUDENT

IT is said that the Pontifical Commission organized by the Pope to carry out the reforms in church music instituted by the latter, is having some difficulty. Strong protests have reached Rome from many countries and in most of them no effort has so far been made to

carry out the papal decree forbidding women to sing in church choirs. From the letters received, it is evident that the bishops regard the step as impractical in small churches, it being impossible to find a sufficient number of trained male singers to replace the women. The larger churches issues still more strenuous objections, declaring that they run the risk of finding their congregations deserting them and frequenting other churches where mixed choirs are still to be heard. But what do their congregations go to church for? The question fairly asks itself in the face of such admissions as these.

M. MISTRAL, the Provençal poet who recently shared the Nobel prize with a Spanish dramatist, proposes to use the money in founding a museum in his native town. He declares that the prize came to him simply because he did his duty to his native soil, and that he proposes to devote the money to the welfare of Provence. Surely he is an example to his compeers.

THE popular impression that actors, as a class, are short lived, is not borne out by the facts, the theory being based on the misconception that stage life is dissipated and far from healthful. But probably no other profession can claim so many examples of longevity. Only recently three well-known actresses died within a few days of each other, their ages being respectively 74, 83 and 88 years.

There is, too, an ever-lengthening list of men and women well past the so-called "prime" of life who are either still on the stage or who have retired from it after many years of service.

ONE industrious individual has counted the standard hymns and he has already listed some fifty thousand of them. Only a small fraction of these are in common use, yet the comparison of something like twenty recent hymnals, revealed the fact that we have more than five thousand different hymns at present being actually sung in the churches of America and Europe.

UPON an Egyptian temple, probably erected in honor of the goddess Neith, is an inscription of which the following is a translation:

I am all that is.
I am all that ever was or will be.
No mortal man hath ever raised my veil.

Beethoven used to say, "That is my religion," and the little inscription, in his own handwriting, used to hang above his study. Recently, labeled "Beethoven relic," the bit of writing was sold at auction.

FRAGMENT

From Prologue to the Canterbury Tales.—*Chaucer*

WHAN that Aprille with his schowres swoote,
The drought of March hath perced to the roote,
And bathed every veyne in swich licour
Of which vertue engendered is the flour:
When Zephyrus cek with his swete breeth
Enspired hath in every holte and heeth
The tendre croppes, and the yonge sonne
Hath in the Ram his halfe cours ironne.
And smale fowles maken melodie
That slopen al the night with open yke.
So priketh hem Nature in her corages:
Thanne longen folk to goon on pilgrimages.

Central Office Point Loma California

The Changing Spirit of Christ

CHRISTIANS need a little reflection on the difference of meaning between the terms *The Christ Spirit* and *The Spirit of Christ*.

The Christ Spirit is that consciousness that grows up in a man's heart, unobserved, putting forth leaves and blooms; it is the plant of the seed sown there by the *Spirit of Christ*. That seed-sowing takes place when there is a fixed attempt to find that World-Spirit.

The real Christian believes that World-Spirit to be constantly present among men, and to have been always present, inspiring the inspired, trying to touch the hearts of humanity's leaders, the light of all true teachers, the cause of devotion, of noble strength, of sacrifice; the sword of right, by whomever wielded, in history.

Men change; their needs change. The general mind is not what it was one hundred years ago, or five hundred, or one thousand. Every mother knows that the mood of her child today is not what it was yesterday. One day it is quiet; another, full of activity. She does not try to force one mood to the other, but to guide each mood into its best form; for the alternation is natural.

The words *Christ-Spirit* convey the idea of meek sinlessness, all-submissive humility.

But that cannot be the whole of the matter. The *Christ-Spirit* in men is the child of the *Spirit of Christ* in the world. And the child should seek to answer to the changes of the moving parent Power. That Power is present in every nation, lending a specific inspiration to the leaders of that particular nation so far as they will receive, so far as they are not playing the ignoble game of their personal ambition. The pressure and quality of its inspiration must be different for each nation and period, because the needs and the things best to be done are different in the different nations and periods. Although of course it presents a general inspiration to right life and conduct which is alike for all times and peoples.

The above must be true, unless this Power is unintelligent, ignorant of the changes in human life and of the different things at different times proper to be done to lead on the nations to the Light.

Well then, if we make a mental picture of *meekness*, submissiveness, as the one characteristic of the *Christ-Spirit*, we are forcing the *Spirit of Christ*, as it enters us, into a mold. Was that the one keynote of its inspiration in the hearts of the patriots of Cuba; or of the Roumanians when, forty years ago, they threw off the Turkish yoke? Or the men of this nation, who, more than a century ago, pointed to the principles on which a nobler national life might be founded?

Let us be wider in our views, seeing the divinely changeable work of the Spirit of Christ wherever Light breaks through Darkness, wherever in any people or man, life breaks out into a nobler expression.

May we not admit the possibility that at certain periods in the world's history, periods of great moment when a touch would have altered the destiny of nations, there have appeared men, leaders, teachers, who had so fully assimilated the spirit of Christ, so completely lost their personality, their personal desires and ambitions in it, that they were to it as it were hands and feet and brain? Nor, in such an achievement, would they have lost their individual consciousness, but rather dissolved its limitations. And sometimes it might be through a Movement like that of the Universal Brotherhood that the spirit of Christ would find its fullest expression.

CHRISTIAN

Unity of Religious Teachings

IN different ages and countries, great Teachers have appeared to again vivify discouraged and degraded humanity with the touch and teachings of the living truth. They appear, as Krishna says, "whenever there is a decline of virtue and an insurrection of vice and injustice in the world; and thus I incarnate from age to age for the preservation of the just, the destruction of the wicked and the establishment of righteousness." Appropriate messengers are sent to meet the needs of each

time and people. Their teachings are essentially one, but their language and their methods differ with the time and place. The Nazarene, who came to a materialistic, practical people like the Jews, dealt less in metaphysics than in plain parables, as would appeal to the literal mind. But the teachings of Jesus were essentially the same as Krishna had given, centuries before, to the contemplative, subtle minds of the Far Orient.

As men wandered away from the spirit of the teachings, and emphasized the forms and externals, each set of believers grew more estranged from every other. Meantime the ignorance and cupidity of the leaders kept them separated. Not rarely is it the fate of false teachers to come at last to believe their own falsehoods, by the denial of truth; he who shuts out the sunlight of truth cannot reap its warmth and light. Sometimes there were those who thought the common people were unable to understand the truth because they failed to teach it in the simplicity of its greatness. And so the believers have been bewildered with distortions of truth which were practically errors.

It is at this puzzling point in the Bible which is being written by the race, that Theosophy again presents the verse of Universal Brotherhood, with which to begin a new chapter. The present is an appropriate time to study ancient and modern religions and to find their essential unity. It has always been too easy to misunderstand the other man's creed, for we cannot hope to comprehend that in which we have no sympathy. No one may hope to taste truth who approaches its fountain in a spirit of bitterness. Only through love may one begin to know God.

Aspiration is the same force seeking expression in Pagan and Christian, in savage and in saint, independent of the name of the deity addressed. The sentiments which actuate humanity are universal, not local or limited to time. Worship is not a matter of words, or love or reverence dependent on language. As well speak of English tears as the only real sign of sorrow, or of French laughter as the only genuine mark of joy.

Love and brotherhood speak a universal language which often the animals understand, and to which even the lower kingdoms respond. Was not Job comforted with the beautiful thought: "For thou shalt be in league with the stones of the field and the beasts of the field shall be at peace with thee"? The pages of history are stained with the horrors of religious wars. For ages men quarrelled and fought and died because they disagreed in the reading of the Golden Rule, which was a feature common to them all. The religious wars have been waged on the basis of *how* one should love his neighbor. Brotherhood teaches that the vital question must always be, not *how* to love him, but *how much*. In the light of the knowledge of our dual nature, it is clear that the real conflict is not with outside unbelievers, but with the doubt and discord of one's lower self,—the common enemy within. The hopefulness of the incoming cycle of spiritual force depends upon the growing recognition of this. The name by which a Teacher or Leader is known is of less importance than the knowledge of the Christ principle which dwelleth in secret within each heart.

LYDIA ROSS, M. D.

Notice

Attention is called to the importance of having all remittances to or for any of the different Departments of the International Theosophical Headquarters at Point Loma, California, sent either by postoffice money order or by draft. Otherwise responsibility for any losses must fall upon the sender.

(Signed) CLARK THURSTON,
Chief of Finance.

For the Benefit of Enquirers

REGULAR weekly meetings of the Aryan Theosophical Society, established in New York City by William Q. Judge, the second Leader of the World's Theosophical Movement, are held every Thursday evening at 8 o'clock in Isis Hall, 1120 Fifth Street, San Diego, California. These meetings are intended to meet that large and growing body of earnest enquirers who desire to know more of the different tenets of the Theosophical philosophy. Students from the Universal Brotherhood Headquarters at Point Loma, California, conduct these interesting gatherings to which every truthseeker is cordially invited.

NEW CENTURY PATH

SUPPLEMENT

The Theosophical Crusade in Europe

1905

THE following are brief extracts from the general account of the movements of the Crusaders in Sweden, from the time of completing their work in Holland:

At Helsingborg

The Crusaders reached Helsingborg, Sweden, on the 24th of January, coming from Holland, and proceeded to the Universal Brotherhood Center, where they found a large number of children of the Lotus Groups waiting to receive them. There also was Dr. Erik Bogren, Director of the Theosophical Center in that city. He, with the other Comrades, assisted in making this reception a new link for World-Brotherhood. Later a gathering of members was held. The evening public meeting was conducted in the Masonic Hall, of which the following is one of the press notices, giving but a brief outline of the first work of the Crusaders in Sweden:

The Universal Brotherhood Center in this city held a public meeting yesterday, at the Masonic Hall, so largely attended that the people were packed in the ante-room and on the stairway.

Two special messengers from Katherine Tingley, the Leader of the Universal Brotherhood Organization throughout the world, Mr. Herbert Crooke from London, and Mr. Fred J. Dick from Ireland, addressed the audience. The meeting was opened by a musical number, *Händel's Largo*, which was rendered in a very beautiful way by piano, violin and organ. During this music there appeared a procession of Lotus children dressed in beautiful antique Greek costumes and garlanded with beautiful flowers. They marched through the Hall to the platform, which itself was decorated in white, with green palms and many flowers. Each child read a short sentence from the writings of the three Leaders of the Theosophical Movement, H. P. Blavatsky, W. Q. Judge and Katherine Tingley. After this, the Director of Helsingborg Center, Dr. Erik Bogren, read an announcement of the purpose of the meeting.

Mr. Crooke, in opening his address, spoke about Theosophy and the practical problems of life, and showed how Theosophy can help men to realize their divine nature. He said that life was like a school-house, into which the soul comes in the morning of life, and from which it goes for temporary rest in the evening, to return the next morning to continue its work of attaining perfection.

Mr. Dick following, spoke about Katherine Tingley and Point Loma, and how Mrs. Tingley had traveled all around the world; how she had given help to thousands of wounded soldiers after the Hispano-American war; and how she had founded Raja Yoga Schools for children in London, Cuba, San Francisco, Point Loma and other places. This address was illustrated with lantern views. The English lectures were interpreted by Dr. Bogren. Between the addresses, and at the close of the meeting, beautiful musical selections from Wagner and Schubert were rendered. The music and the lectures were followed with intense interest by all present.—*Oresunds-Posten, Helsingborg, Sweden, January 25th, 1905.*

The Recorder of the Crusade has placed on file many interesting facts showing the influence of Theosophy in this progressive Swedish city.

When one realizes that the workers of this Center, as well as of all the Theosophical Centers connected with the Universal Brotherhood Organization, in Sweden and elsewhere, are unselfishly devoting time and money to human needs, without reward or honors, one cannot be surprised at the marvelous results that have been universally achieved.

At Gothenburg

"On the 26th of January, the members of the Gothenburg Center of the Universal Brotherhood Organization, had the joy of receiving Mr. Herbert Crooke, President of the Universal Brotherhood Organization in England, and Mr. Fred J. Dick, Director of the Universal Brother-

hood Center in Dublin, on their journey through Sweden as representatives from the International Center at Point Loma, California.

"The Crusade had the able services of Dr. Erik Bogren from Helsingborg, all through Sweden. Dr. Bogren rendered valuable service as interpreter of the interesting lectures given in English, at the public meetings.

"Many of the members from neighboring Centers of the Universal Brotherhood in Sweden, came to Gothenburg to meet the Crusaders, and to attend the gatherings. These joined with the local members in a most hearty reception to the visitors from abroad. Torsten Hedlund, Director of the Gothenburg Center, was most active in entertaining the welcomed Crusaders.

"Mr. Herbert Crooke, in expressing his acknowledgments of the kindly reception accorded to him and his fellow-worker Mr. Dick, brought the Movement and the workers at Point Loma, California, close to the hearts of the members present.

"Mr. Dick's remarks were most timely, and he held the close attention of the eager members with his interesting description of the Work at Point Loma and the extension of the Organization, and how the Theosophic thought was being brought to all countries.

"Before the members' meeting closed, a crowd of people was standing outside of the hall doors, anxiously awaiting the opening of the public meeting. Every seat, as soon as the doors were thrown open, was quickly filled, and the imposing hall became a living picture of decorously subdued interest.

"The whole programme brought home to one's mind the conviction that Theosophy was indeed a living power in the World today. One of the very absorbing features of this public effort, was the work of some of the little children connected with the Organization. The music and the decorations were a marvel of artistic beauty." A SWEDISH MEMBER

At Jonkoping

Here the Crusaders were met by Director Johannes Karling and other members. At this Center there were many evidences of progressive work on Theosophical lines. The public meeting was largely attended, and a very great interest in Theosophy is the result of the Crusaders' visit to Jönköping.

At Malmö

The Crusaders held a public meeting at Malmö in the Odd Fellows' great hall on Gustav Adolf Square. This large hall was exquisitely decorated with festoons of greenery and with flowers. The meeting was opened by several of the Lotus children. There was an overflow attendance, and the members of Malmö Center, and the Crusaders, joined hands in new work for Sweden.

Brother Crooke, in his long and interesting report of this Center, pays high tribute to the untiring efforts of the devoted workers there.

At Stockholm

Here is the great Center of Theosophical Work for all Sweden. Dr. G. Zander is the Director. In Stockholm there are not only two large bodies of active members, but there are several Boys' Clubs and Lotus Groups as well. In connection with this Center, there is a branch under the supervision of the International Brotherhood League, which is an integral part of the Universal Brotherhood Organization.

The reception accorded the Crusaders in Stockholm and the work done by them during their short stay in that city, mark a great event in the history of the Universal Brotherhood Theosophical Movement.

Members' meetings were held as well as a great public meeting; and

not a moment was lost by the Crusaders in their splendid efforts to bring before the interested public some of the fundamental teachings of Theosophy and the practical application of the same to daily life.

Brother Crooke's address was most apt; and it answered many questions concerning the Theosophical Work in the minds of listeners.

Brother Fred J. Dick's address was descriptive of the Work of the International Theosophical Center at Point Loma, California, and was illustrated by varied lantern views.

It would take pages to describe all the details of the Crusaders' work in this beautiful city. The seed has been sown; and the harvest will be reaped with joy and peace in the coming years.

Other Centers were visited in Sweden, but space will not permit the continuation of the report. In the archives of the Theosophical Headquarters at Point Loma, will be placed a detailed record of the Crusaders' work of 1905 in Sweden; there will also be filed a full report of the progress made by the Theosophical Centers in that country. Sweden has advanced along true lines of human altruism, and its Centers are real foci of spiritual energy.

May this not be due in great part to the noble stand taken by the Swedish members in supporting the Successor of William Quan Judge, Katherine Tingley, the present Leader and Official Head of the Universal Brotherhood and Theosophical Society? RECORDER

A STREET SCENE IN STOCKHOLM, SWEDEN

THE following is reprinted from *Universal Brotherhood* magazine, Vol. xiv., No. 8, November, 1899, which records part of the work done by the first Crusade to Sweden:

"King of Sweden and Norway. Oskar Frederik II., Attends a Reception of Universal Brotherhood

STOCKHOLM, September 19, 1899

"The Universal Brotherhood Organization has, during the past month, been spreading its Brotherhood teachings in Europe.

"Mrs. Katherine Tingley, the Leader and Official Head of that organization, with the members of her Cabinet and a number of others, has just held a Swedish Congress in this city, and the party is now on a tour through Sweden, visiting the principal cities, on their way to England, where also a Universal Brotherhood Congress will be held.

"The Congress at Stockholm was largely attended and created great interest among the most intelligent class of people.

"At the closing assembly of the Swedish Congress, His Majesty, Oskar II., King of Sweden and Norway, was present at a reception given by Katherine Tingley and her Cabinet on the anniversary of his accession to the throne, where they were presented to the King by Dr. Gustav Zander, President of the Universal Brotherhood and Theosophical Society in Sweden. A pleasant feature of the reception was the presentation to His Majesty of a handsomely bound volume, *The Key to Theosophy*, by H. P. Blavatsky, in which was inscribed the following:

"TO OSKAR FREDERIK BERNADOTTE
KING OF SWEDEN AND NORWAY

"The Great Promoter of the Principles of Brotherhood and Justice
"This volume is presented as a token of their esteem by the members of the
Universal Brotherhood in America

"And, later, with the silk flags of Cuba and America mounted on silver-tipped staffs of American wood, held together by an escutcheon bearing the coats of arms of these two countries, encircled by a cable-tow and similarly inscribed.

"The King was highly pleased with the gift as an appropriate expression of the unity which should exist among all nations, through the binding thought of Universal Brotherhood. His stately figure, manly and courteous demeanor, impressed the observer with the feeling that he is not only a ruler, but also a royal and humanitarian Brother.

"Views of Point Loma, San Diego, California, the site of the "School for the Revival of the Lost Mysteries of Antiquity," which were presented as one of the features of the reception, greatly interested the King, especially the shores of the broad Pacific Ocean, with its peaceful waves lapping the rock-ribbed Point."

SINCE 1899, the work of the Swedish members of the Universal Brotherhood and Theosophical Society has been progressing by jumps. The energy and intelligence exhibited by them under the very able guidance of Dr. Gustav Zander, President of the Movement in Sweden, has borne glorious fruit in the almost national recognition of the work of the Universal Brotherhood in that country.

They have sown good seed, and the day shall come when their splendid recompense will fill their hearts to overflowing. OBSERVER

THE WEAVER

WILLIAM H. BURLING

CEASELESSLY the weaver, Time,
Sitting at his mystic loom,
Keeps his arrowy shuttle flying—
Every thread aneers our dying;
And with melancholy chime,
Very low and sad withal,
Sings his solemn madrigal,
As he weaves our web of doom.

"Mortals!" thus he, weaving, sings:
"Bright or dark the web shall be,
As ye will it: all the tissues
Bleeding in harmonious issues,
Or distant colourings,
Time the shuttle drives; by you
Give to every thread its hue,
And elect your destiny.

"God bestow'd the shining warp,
Fill it with as bright a woof;
And the whole shall glow divinely,
As if wrought by angels' faculty.

To the music of the harp;
And the bleaded colours be
Like perfected harmony,
Keeping evil things aloof.

"Envy, malice, pride and hate,—
Foulest progeny of sin!—
Let not these the web entangle
With their blind and furious wrangle,
Marring your diviner fate;
But with love and deeds of good
Be the web throughout cadenced,
And the perfect ye shall win."

Thus he singeth very low,
Sitting at his mystic loom;
And his shuttle still is flying—
Thread by thread aneers our dying;
Grows our shroud by every throw,
And the hues of woe or heaven
To each thread by us are given,
As he weaves our web of doom.—*Selected*

Children Who Do Not Know the Joy of Giving

IT has been the painful and surprising experience of a Lomaland Raja Yoga teacher to meet with children, not in Lomaland, who are positively ignorant of the very possibility of giving; to whom Christmas, birthdays, etc. are times of receiving; who reckon up the gifts they expect to receive from this relative or that friend; and who have stared with blank amazement when the utterly novel and revolutionary idea of giving presents even to a mother or father was broken to them.

Most of us can look back with regret at the selfishness of our own past, but surely there are few who cannot remember Christmas and other people's birthdays as bright spots when a deeper joy was felt than the somewhat heavy and cloying pleasure of receiving presents.

Such children as those mentioned are certainly more to be pitied than the child-laborers, greatly as the latter are to be pitied. For they have been deliberately barred from the light of life—and by their natural protectors! We shudder at the wretch who rears artificial cripples for the show-market, but what can be worse than this starvation of the soul and strait-lacing of the heart?

What is the use of framing laws of liberty for citizens that are to be brought up like this? Will they not grab and grab? How can they help grabbing when grabbing is the sole condition of life for them?—the first thing they learned. Even if we imagine a person, with such an upbringing, devoting himself to brotherhood work, we cannot but foresee for him infinite difficulty in eliminating from his motives the notion of self-advantage, so deeply ingrained.

What a very great deal of good a very little Raja Yoga training may do in our civilization!

STUDENT

The Inspiration of Sunrise

AFTER the darkness of night the glory of the dawn and the bright coming of the sun, old yet ever new, symbol of the indwelling spiritual Life and Light from which the visible garb of radiance springs! How it appeals to the soul and awakens within it something which words cannot express, a stirring of that Divine Life which is in the heart of all things! It lifts us out of the petty personality into a sense of the Great Universal Life, fills us with courage and hope and inspires us to new and higher endeavor. All this it does and will do if we seek such inspiration.

The sun is not only the fountain of physical life for our system, but it has its spiritual center from which spiritual forces flow; for behind all

physical life and physical manifestations is the Eternal Spiritual Life from which they spring. And if we dwell on this inner life in our thought, we come into closer and more conscious touch with it, feel more of the Universal throb and broaden our horizon to take in all.

As we begin a day we set a keynote for it that seems to run through all the day may bring. How important that we should begin aright, that our aim should be high and pure, that it should be above the narrow service of the selfish self and should reach out to all in helpfulness, as do the rays of the rising sun that shines for all and not for self. So should we let our light shine, a joyous giving forth without thought of return. The rising sun is a perpetual lesson to us in this regard, a type of what our lives should be. The clouds may gather but the sun still shines and though for us the light is dimmed, still is there light.

As the nights of earth are but the shadows which it casts, so our darkest nights are but the shadows of ourselves, which fly away when we turn our faces towards the sun of Love Divine. Then have we sunrise in our hearts and all the songs of birds, with the beauty and the fragrance of the flowers; for "Life is joy," and we but turn from death to Life. Hail to the rising sun of Brotherhood on earth, to the new day that begins to dawn! May humanity turn from its dark night of selfishness and face the rising Sun of Love!

BANDUSIA WAKEFIELD

FRIENDS IN COUNSEL

DEAR COMRADES: It sometimes happens to a lover of his kind, on looking around upon a world where cruelty, injustice and oppression walk unhindered in the light of day, that he is fired with a burning indignation or falls into despondency. The hosts of evil are so strong and his resisting power so slight, that any substantial betterment seems hopelessly remote. At such times the recollection of a certain ancient doctrine comes to mind with healing, stimulating power.

According to this old teaching man is a microcosm or epitome of the world in which he lives, so that the good and evil forces warring in public life are represented by corresponding tendencies in the individual. From this it follows that, by taking sides against his lower nature, he is actually helping in the conflict of light and darkness that forever wages in the world outside. It is a pleasant and an easy thing to mount a pulpit or a platform and denounce a class in society or a political party, and never fails to elicit applause from one's sympathetic hearers, nor to rouse the pleasing sense of self-approval in ourselves, assuring us that we are beings of a superior kind to those erring brothers whom we have assailed. The real foes of a man are "they of his own household," the cherished inmates of his inner world, his self-created passions and desires. Instead of turning a white-hot stream of indignation against some public wrong, let him calmly enter into the secret corners of his own being and with the "whip of small cords" drive out the noisome brood that defiles the temple of his divinity. A day spent in the honest endeavor to overcome our personal evils brings with it at the close a solid sense of resistance met, of actual work performed; but when the time has been passed in condemnation of our neighbors we are haunted by an empty feeling of futility, as though we did but beat the air or wrestle with the unsubstantial mist.

Men there are from whom the reproof terrible that flashes forth from a heart of compassion is fitting and in place, but to denounce effectively a man must first administer "the reproof terrible" to his own unruly passions and bend them to his will. For most of us, however, the force of indignation is better employed when turned inwards, although the process may be painful, and yields no public recognition and applause. And after steady application to the weeding of our private plot of ground, we may chance to lift our eyes and find our neighbors have been busy too and the whole face of the landscape has been changed.

STUDENT

WE often hear of the gifts of God and the grace of God, but how many realize that grace and graciousness in the ordinary details of life are godlike?

There is a chivalry of the soul. It is kindly, courteous, considerate, fearless, non-complaining, unselfish and helpful—helpful particularly to those in distress. It exists without orders, insignia, or ceremonies; it is the basis of all orders of chivalry, all insignia of chivalry, all acts of chivalry. Without it, nowhere, and at no time, can any chivalrous act be done, or word spoken.

OPPORTUNITY

by JOHN J. INGALLS

MASTER of human destinies am I;
Fame, love and fortune on my footsteps wait.
Cities and fields I walk: I penetrate
Deserts and fields remote, and, passing by
Hovel and mart and palace, soon or late,
I knock unbidden once at every gate.

If sleeping, wake; if feasting, rise before
I turn away. It is the hour of fate,
And they who follow me reach every state
Mortals desire, and conquer every foe
Save death; but those who doubt or hesitate,
Condemned to failure, penury and woe,
Seek me in vain and uselessly implore—
I answer not, and I return no more.—*Selected*

THEOSOPHICAL FORUM

Conducted by J. H. FUSSELL

Question Why does Theosophy seek specially to learn of ancient religions?

Answer The question would be better put as follows:—"Why do members of the Universal Brotherhood and Theosophical Society seek to learn of ancient religions?" For while the study of Theosophy includes the study of ancient and modern religions, it cannot strictly be said that "Theosophy seeks to learn," &c., because Theosophy is wisdom, knowledge of man and nature, and includes the knowledge of the history of man in all phases of his development, and hence also of the religions of the world.

Quoting from the Constitution of the Universal Brotherhood Organization:—"The subsidiary purpose of this Organization is to study ancient and modern religion, science, philosophy and art; to investigate the laws of nature and the divine powers in man."

It cannot therefore be said that Theosophists seek *specially* to learn of ancient religions, but of both ancient and modern religions. But according to the question, Why of ancient religions?

What are modern religions but re-statements of the old, new superstructures built upon old foundations? What is Christianity, *i. e.*, in the ordinary acceptance of the term, not in the simple sense of "the teachings of Christ?" Is it not, as generally accepted, and as evidenced by what is called the "Christian Bible," a superstructure of Christ's teachings upon the older Jewish scriptures, an attempt to blend the old Mosaic law of an eye for an eye, and a tooth for a tooth, with the *new* commandment of Christ, "that ye love one another," and that a man should forgive his brother "until seventy times seven." And is it necessary to ask *which* of these laws is the rule and guide of life in *Christian* countries—the Mosaic law or the law of Christ?

Then, further, is not the Jewish scripture a superstructure upon, an addition to, a still more ancient one, a fragment of which is found in *Genesis*?

But good Christians may say that at least Christ's teachings were new, that it was a new commandment which he gave, as referred to above. New perhaps with reference to the old Mosaic law; but new in the world?—No! Six hundred years before Jesus, Gautama the Buddha taught, "Hatred never ceases by hatred at any time, hatred ceases only by love." Not new in the world, because ages before recorded time, it had been the rule and guide of life, and had been taught by Teacher after Teacher who came to keep alive the spiritual nature of man.

There are still many, but each year it is a lessening number, who hold that *their* religion is the only true one and that all the other religions are false. But an intelligent and unprejudiced study of ancient and modern religions broadens the mind and sympathies, and reveals the fact that behind the man-made creeds and dogmas, in the words of all the great Teachers and Saviors of mankind, the same truth is to be found, that the same light shines in the teachings of all, and that man has never been left without guidance and help from the wise Elder Brothers of Humanity. These are some of the things that may be learned from the study of ancient religions, and too we shall come to learn that though religions may be many, yet Religion is one and is Theosophy. As a very ancient scripture has it:—"In whatever way men approach me, in that way do I assist them," and "In whatever form a devotee desires with faith to

worship, it is I alone who inspire him with constancy therein."

This underlying unity of all the religions of the world is one of the great facts and evidences of Universal Brotherhood; and if we would understand and know the true meaning of our own religion, we must study ancient religions.

STUDENT

Question I have seen reference made to three different sorts of Karma, but do not quite clearly understand what is meant. I can understand "good Karma and bad Karma," but what is the third kind? Will you please explain.

Answer When speaking of the three sorts of Karma, reference is not made to what is called good and bad Karma, as will be seen from what follows. The question of the use of the terms "good" and "bad" Karma will be discussed separately.

The three sorts of Karma do not mean different kinds in the sense of producing different effects, but have reference to the time of their coming into action, and what we might call their degree of availability due to circumstances and events. For instance:

(a) There is the Karma which is operative now, in our present lives and present conditions, and which we experience through the present associations of this life, in our family and among our acquaintances, and through family and racial tendencies,—these providing the appropriate instruments and circumstances for its action. It is remarkable indeed how in some lives changes come about from apparently the smallest causes. An insignificant change in some little plan, a few moments delay, a "chance" meeting with some stranger for only a few moments, may bring to pass momentous events that change the whole course of our career. But how can these things be unless they are the ripening harvest of good or bad seed sown in past lives, and that the harvest time has come? The lives of others may be entirely uneventful, again the result of past causes in previous lives which have finally culminated in present conditions. But—

(b) Not all the causes set up in the past can be worked out in the present life, for lack of suitable conditions and environment. That is, there is a class of Karma held or stored up, which, to quote the words of W. Q. Judge, "has not begun to produce any effect on our lives owing to the operation on us of some other Karmic causes" . . . "The force of a certain set of bodily, mental and psychical faculties, with their tendencies, may wholly inhibit the operation on us of causes with which we are connected, because the whole nature of each person is used in the carrying out of the law."

This may be illustrated by a farmer who plants an orchard of different kinds of fruit trees, all about the same time; but some of the trees will mature earlier than others, and even when all become fruit-bearing, some—such as, for instance, cherries and apricots—will ripen in early summer, while others, as pears and apples, will not ripen until autumn. Each must have its suitable conditions, and ripens in its own season.

And the third class, to quote again from W. Q. Judge, is—

(c) "That Karma which we are now making or storing up by our thoughts and acts, and which will operate in the future when the appropriate body, mind and environment are taken up by the incarnating Ego in some other life, or whenever obstructive Karma is removed."

Some of this may even come to fruition in after years in the present life; and again we may take the illustration of the farmer, who in one season plants his seed and may have to wait many seasons for the gathering of the fruit. So is it with our actions and thoughts, some come to fruition in the same life, others may remain a long time before we reap their result, perhaps many lives, awaiting the conditions which will permit their harvest to be gathered. And this too is, in part, an explanation of great and sudden changes which sometimes come into one's life, apparently without any connecting links with the previous circumstances and events of that life.

Those who wish to study further should read what W. Q. Judge says upon these three classes of Karma. The question of good and bad Karma will be taken up in a subsequent issue.

STUDENT

ONCE heard they [*i. e.*, the teachings of Karma and Reincarnation] are seldom forgotten, and even if rebelled against they have a mysterious power of keeping in the man's mind, until at last, even against his first determination, he is forced to accept them.—*William Quan Judge*

The Alhambra

A RECENTLY issued book on *The Alhambra*, recalls the remarkably and persistently unhappy fate of that unique palace.

Immediately that Spain had expelled the Moorish builders, she began to deface their work, to obliterate the painting and carry away the gilded walls and roofing. The open work was whitewashed and the furniture destroyed or removed.

Charles V. then took a hand in the spoilation, razed the Winter Palace, and began a building on that site which was more to his taste.

Philip V. was not to be outdone. He Italianized the rooms and put up interior walls which entirely blocked out of sight whole chambers.

Through the next centuries various monarchs and private persons continued on the same lines and in 1812 the French blew up some towers.

Nine years later, as if to set her approval on what had been done, Nature shattered the remainders with an earthquake, and in 1890 there was a tremendously destructive fire! This seems to have been a sort of malignant answer to the attempts of Queen Isabella who in 1862 and for years after tried to have the pile restored to something like its original condition.

THE FAMOUS HALL OF COLUMNS

It was erected during the century 1250—1350, and surpassed anything of its kind that the Moors had ever done. Never had a monarch of any time a more exquisitely beautiful residence.

STUDENT

Sport, Once Honored, Now Degraded

ALL our institutions need rescuing from their corruption by the gambling spirit and other forms of selfishness. And not the least in need of this purification is Sport.

The Games of ancient Greece were regarded as more sacred than we regard the most solemn acts of worship. National prosperity depended on their right celebration; everything was laid aside for them; the victor's wreath was a crown of glory. Contrast the reputation of these games with that of a modern race-course. The latter is often a synonym for moral laxity, coarseness and crime.

The following pictorial satire once appeared in an English paper. John Bull in a weak moment makes a bet with himself and enters it on his thumb-nail. On the spot where he made the bet a "pimply thing" sprang up, represented as a juvenile betting tout with pocket-book, etc., emerging from the ground. And the pimply thing grew, and now John Bull cannot even go to see his sons row a race but the pimply thing (now a giant) is there bawling in his ear.

So large has that "pimply thing" grown that now it appears as if the entire racing sport is run by a clique of gamblers for gamblers. Out of 152 trainers, we are told, only eleven are known as absolutely straightforward men. A sporting paper, analyzing the subject of "backing jockey's mounts," gives a table showing that the backer lost during the season over £2000 and won less than £10. The bookmaking trade is evidently profitable!

Everything in this universe is coming to be regarded solely as a means by which the cunning and unscrupulous can coin money out of the sheep.

Good reason why, in Lomaland, we should try to reestablish games and athletics on the original pure basis, and learn to regard the culture of bodily strength and skill as a most sacred and essential duty and as a glorification of the godlike powers vested in man.

Good reason, too, why the healthy energetic generous spirit that lies back of the sporting instinct, and is one of our best and most undying heritages, should not have to waste itself on trivialities or worse. We have better uses for our racial manliness. STUDENT

Our Educational Ideas Too 'Utilitarian'

THE utilitarian spirit is among those which, in this age, have been pushed too far. Of course it is right to direct one's endeavors to useful, not frivolous, ends, and to aim at making the best use of time and faculties. But the word "utility" is generally circumscribed to mean only a very narrow and lowly range of objects, namely those which can be readily apprehended by ordinary minds.

When we ask, "Of what use is such a study or pursuit going to be to me?" we have in mind some material benefit, such as money or position. But there are higher uses than these.

These higher uses are not among those which can be seen at once.

They are of such a nature that perhaps they will not become apparent until after we have worked for a long time blindly. Their recognition demands the eye of faith—the assurance of enlightenment to come.

School curricula and professional training are designed to meet these immediate and obvious material uses. This is what makes many so narrow, artificial, superficial and soulless. With dollars and worldly advantages as a goal, there is little need for the refinements and the breadths and depths of culture.

All education has to begin on a basis of faith and trust between teacher and taught; for how can the ignorant understand the future advantage which the wise teacher knows?

And it would be better if this fundamental principle of education were more uniformly and generally recognized and followed.

The impatient query, "What's the use?" would then be answered, "Wait and see." We need more of the culture which has no particular or immediate object in view, but which is pursued from love of study—that is, from an intuitive feeling of the higher usefulness of the pursuit.

Education is not solely or even chiefly, for the imparting of that which will make one prosperous in the worldly sense. Even the ideal "a useful member of society" is too low. Education is to broaden and elevate the mind so that it can grasp the idea of higher purposes in life than can be seen at the outset.

There are many studies which are being dropped because they have no direct bearing on the dollar question. Those who have not undertaken these studies cannot at once understand their benefit; and those who have cannot easily explain it to those who have not. Let us embrace every opportunity to study, without troubling too much about utility; and try to have a little faith in the old idea that a cultured and well-equipped mind is at home everywhere. A true philosopher can beat a specialist at his own trade with a little practice. He has the faculty of knowing, and the other knows only one thing. STUDENT

'Theosophical' Quackery

AN individual who is lecturing about the country and drawing audiences by the use of the word Theosophy, is reported in an interview as saying:—"We accept the Darwinian theory as true. History proves it. We came from the lower animals [a portrait of the individual is given]. We were born again and again, and many times, each time our condition improving. . . . Some thousand years hence the savage in Africa will reach our present standard of civilization."

As to the Red Indian, we are told that there was a time when a body with a red skin was good enough for any soul, but now it is no longer good enough, so the race is dying out. "What is an astral body?" asks the interviewer. "An astral body is an inhabitant of the astral world. Our astral bodies are our real selves. You have one and so have I." E.

The Opium Evil In the East

are well worthy of consideration:

In 1773 the quantity of opium passing from India to China was 200 chests, each of 150 pounds. The production and trade were in the hands of the Portuguese. Then the East India Company took the matter over, and so magnified the evil that by 1790 no less than 4000 chests were entering China. By 1830 the annual number had risen to 17,000.

From time to time the Chinese Government had tried to stop the mental and moral ruin of its people that the opium habit was causing.

In 1796 an Emperor had even affixed the death penalty to it. This failing, the Government attempted to restrict the use to such as was grown within Chinese borders, and made it illegal for a foreigner to have anything to do with the trade. In spite of this law, and in spite of repeated remonstrances addressed to them, foreigners continued to import the drug in ever increasing amounts, smuggling it into various ports.

Finally China took decisive action. In 1839, more than 20,000 chests of opium were destroyed. This led to war, as a result of which, it is said, England, a Christian Power, forced upon China the keeping open of a number of ports to the entry of the Indian product. As is usually the case, official morality did not rise to the level of individual. To this day the English people do not appreciate what is doing in their name.

America has done what she could to save the Anglo-Saxon reputation. Growing no opium herself, she has been saved the temptation to which the English Government in India succumbed. Several times the Chinese authorities have been notified that we should not interfere in any action they thought proper to take against Americans found engaged in the opium trade.

Japan's influence has always been exerted as strongly as possible in the same direction. No opium is in use in that country except as medicine; and even so only under definite restriction. The same wise attitude is maintained with respect to cigarette smoking, which is prohibited to those under 19 years of age. America, with her ominously growing popular consumption of morphia, and her great army of youthful cigarette slaves, might well learn something from this new Eastern Power.

Some time ago a committee was appointed to investigate the opium problem in the East in order to find the best method of facing it in our Philippine possessions. The report has just come in, and its recommendation is, roughly, that Japan's policy in Formosa—the island she acquired as a result of her war with China—should be followed by us.

There are about 70,000 Chinese in the Philippines, probably mostly opium users. But the Exclusion Act will prevent any increase in their numbers. The report suggests that as the sudden removal of their narcotic would be contrary to humanity, a period of three years should be permitted to them in which to break themselves of the habit, to place themselves in homes of cure to be erected and maintained by us, or to leave the islands. The manufacture of the drug is to be entirely taken over by the Government for these three years, to cease at the end of that time. Every habitué must register himself and his amount. This quantity he may not increase; nor may any fresh cases be permitted; nor may any others than these obtain the drug at all.

If these recommendations are adopted, the Filipinos will have more to thank us for than they will readily realize. H. CORYN, M. R. C. S.

Races Are Born Again

WE often speak with regret of the decay and final disappearance of great races and civilizations, quite oblivious of the fact that a race must follow the same universal law of change, or of birth and death, as applies to individual men, to seasons, to plants, etc. The same interacting forces are at work in a race as in an individual life.

Now, in the case of an individual life, Theosophy has taught us to see in death, not an end and a catastrophe, but merely a change; a change of greater magnitude than, yet of the same character as that which goes on all through life. The dweller within the body has outgrown his clothes to such an extent that they can no longer adapt themselves and a change is necessary. Moreover, the physical organism is only timed to last for a relatively short time.

So with races. The collective mind of the race has outgrown the physical environment provided for it, and the individual souls in that race have gained all the experience they can in that race. The birth-rate falls off, the race weakens because the strong souls no longer enter it. It disappears as such. But the souls have reincarnated in other dominant races; perhaps, however, not so uniformly as to justify us in saying that any particular race is an incarnation of another.

The same enlarged views also modify the popular idea that new races kill off old ones; whereas, as W. Q. Judge points out, the fact is that it is merely the bodies that cease, while the race itself passes on to a

higher destiny. Similarities of trait have been noticed between settlers and aborigines which cannot all be explained by theories of climatic influence. E.

The French in Tunis

THAT modern science is not incompatible with the — Mohammedan religion! was the thesis of a lecture inaugurating a new era of teaching at the University of Tunis under French inspiration. For there is a Mohammedan university in this immensely antique city—one of the three in Africa. Up to quite recent years the scholastic course was entirely Arabic and mediæval, though for twenty-four years the province has been a dependency of France.

M. René Millet describes a long and earnest conversation with a professor at this institution. "I reminded him that in the Middle Ages Islam and Christianity occupied mutually opposite situations to their present. Moslem was the enlightened, Christianity the obscure. What is the cause of the change? Is it not that you have the faults that we had in the Middle Ages?" The professor listened gravely and admitted that in "the material sciences" Christianity certainly had the better of Moslemism. Hence the lecture and the new era of modern culture. There is now at Tunis an exclusively Moslem society for the advancement of science.

M. Millet hopes that under the influence of France the Moslem religion in Africa will evolve into "a mere faith" and lose its political significance. France is making every effort to be conciliatory and to govern Tunis as far as possible through native Moslem hands. Turkish government had, of course, left much room for improvement, especially in the matter of taxation, which according to Turkish methods means the extortion of the maximum of tribute by intermediaries, of which a minimum reaches the imperial coffers. All that has been changed.

It is a very interesting collection of peoples. "In the south we have the survivals of the pure Berbers themselves. They are like their very flocks, as simple and untouched by progress. I produced the same sensation among them that some sultan of Carthage might have produced twenty-five hundred years ago." In the centre of the country is the Bedouin nomad. And lastly there is the Mussulman bourgeoisie of the town. We have three thousand years gathered together, so to speak, in one place. STUDENT

Immigration Prospects

THE estimates of immigration for this year made by steamship agents are as follows:

Italy	200,000	France	16,000
Austria-Hungary	178,000	Sweden	25,000
Russia	210,000	Switzerland	6,000
Great Britain	100,000		
Germany	35,000	Total	770,000

A very large number of these will be Russian Jews, for whom the conditions at home have now become impossible. These are said to be good agriculturists in spite of the theory to the contrary. Their own government has allowed them no opportunity to hold land. They go West and take farms. Next year's emigration prospects are estimated at over a million.

Here is a vast process of race-mingling going on, and what power is to control it? Is it to be left to that unclassified congeries of causes called "chance?" Are we to rely on the inherent virtue of the people themselves? And be it remembered that the Anglo-Saxon stock is not by any means, boast as we may, the one least in need of control. The Universal Brotherhood organization, with its practical application of Theosophy and its Raja Yoga schools, was not started any too soon. STUDENT

A Museum of Sociology

A MUSEUM of sociology is being founded at Harvard by Professor Peabody. It sounds an odd conjunction of words, and at first sight one does not see what the science of sociology can afford in the way of materials for a museum. It is, however, to contain diagrams, photographs, models, etc., illustrative of the various enterprises for human social betterment that are going on in different parts of the world; and it will supplement the library on that subject. The museum has already secured such material from several countries: for example, charts showing the work of workmen's mutual benefit associations, pho-

tographs showing modes of identifying criminals, drawings of tuberculosis sanatoria, an exhibit from the Tokyo deaf and blind school, and so on. Such a record will be valuable as a means of comparing and methodizing sociological work; but it appears to be more of a library than a museum. STUDENT

Self-Sacrifice and Money --- The Martinique Disaster

IT is reported that, of \$100,000 contributed three years ago for the relief of sufferers in the Martinique eruptions, only \$4,600 was distributed by the French officers who visited the islands, while the expenses were \$10,000; and that this was due to red-tape. At this rate it would have taken over 20 years to use up all the money, and over two-thirds would have been expenses. Fortunately the money has now been distributed.

As regards the moral dynamics of this question, the subscriptions to the fund probably represented an almost negligible amount of personal self-sacrifice on the part of the subscribers. Money of itself is not a power; it is only a means, a passive instrument. Here there was no overwhelming tide of pity behind it to vitalize it. To write a check and mail it to an official requires so little exertion that it is no wonder if the force was inadequate to the intended result. Jesus recognized the true law when the widow gave her mite, but the bystanders were sorely puzzled. These moral forces are realities, and our religious ideas suffer from the lack of a proper knowledge of them. Some day we shall have to study them, to simply hold our own in the evolutionary sweep onward of humanity. E.

East Africa and the Jews

THE piece of land in East Africa offered by the British government to the Jews is about the size of Wales, say 5000 square miles in area. It is a plateau, elevated about 4000 feet above the level of Lake Victoria Nyanza and on its southwestern border. From the coast it is about thirty hours by rail; and this distance, and the elevation, protect it from the sea-level and plain miasms.

Israel Zangwill, in his Cooper Union speech, comments upon the alternative localities, remarking that the British Foreign Office was able to perceive what the Sultan of Turkey could not—that it is profitable to an empire to have its empty territory worked up by an industrious people. He supposes it now too late for one of the American United States to be Jewish; Canada is too cold; and "the Argentine, where the Hirsch colonies have made a beginning, is certainly too Catholic. We have never got fair play except in Protestant countries." STUDENT

Liquor Trade Statistics for Great Britain

LIQUOR traffic statistics for the United Kingdom of Great Britain and Ireland show an annual expenditure on alcoholic liquors alone of £175,000,000. Bread, butter, cheese, milk, eggs and fruit together amount to 172 millions; meats, sugar, tea, coffee, cocoa, potatoes, fish, together come to 174 millions; education is 14 millions, clothing 93 millions, coal 93, and taxation 130. Thus drink far outstrips everything else.

One distillery made over \$1,500,000 profit in a year, but paid only \$100,000 in wages. The trade is encouraged and protected in every possible way by government and the powers that be, and very many people have an indirect interest in it. What can a nation do that is struggling in the clutches of such a vampire? E.

San Diego's New Jewel is Popular

KUNZITE, San Diego's jewel, has been introduced by a London jeweller into London, where it is much admired. Of a pale, rose-color, a cross between an amethyst and a pink topaz, it looks well mounted with diamonds, and combines advantageously with green stones, such as olivine. The cost is about the same as amethyst. E.

Frontispiece---Helena Petrovna Blavatsky

THE cover-page of the NEW CENTURY PATH this week shows the well-known face of Helena Petrovna Blavatsky, Foundress of the World's Theosophical Movement.

Her work and teachings have startled thinking men by their depth and scope in a humanitarian and philosophic sense, while their characteristic feature is that they bind all men together in an absolute Brotherhood of Humanity.

Some Views on XXth Century Problems

The Creative Climax

IF Dr. Osler had known a little about reincarnation he would never have made his much-contested assertion that man has passed his chief creative period at the age of forty. As the *New York World* remarks:

Some mature early and begin to decay early. Others mature late and begin to decay late. An Alexander may run his course in thirty-three years, and a Moltke may organize a Sedan at seventy. A Pitt may die of old age at forty-seven, while a Gladstone may fight the battle of Home Rule at eighty-four. The military genius of Napoleons was practically spent at forty. Grant's had not been awakened at forty. A Keats may finish his song at twenty-six, and a Milton publish a *Paradise Lost* at fifty-nine.

We could add a column more of names to those adduced by *The World*, of men who went on ripening through every hour of advanced years. The key lies in Reincarnation, in the wisdom or unwisdom with which the years, not only of this life but of the last, were spent. Power used, grows; power unused, atrophies. The older nations, who believed in Reincarnation and lived their lives accordingly, had the secret. In *The Light of Asia* Sir Edwin Arnold translates a sermon of Buddha's almost verbatim:

Each man's life
The outcome of his former living is;
He cometh, reaper of the things he sowed,
Sesamum, corn, so much cast in past birth;
And so much weed and poison-stuff, which mar
Him and the aching earth.

Man's proper business on earth is creation, which is imagination. Through that he brings the contents of his spiritual being into the world. If he places this electric energy of creation below, and at the service of, his sensual nature, it will not only be in that proportion beyond reach for the purposes of idealistic creation; but its pulsations burn out the body, beginning with the higher intellectual essences and coming down at last to the gross fiber. Long life, from the spiritual standpoint, is not duration of body, but the duration of the power of intellectual creation. Ordinary thought and the common functions of life may go on years beyond that.

Rebirth is not altogether the beginning of a new career, but the resumption of an old one with its habits and tendencies. And if, in the last birth, the creative energy was allowed to take frequent plunges downward, it will do so now, exhausting the man's genius—if he has any—early and perhaps killing his body early. In one life man may not be able to redeem himself from the effects of old habit, nor from the habit itself. In the case of such men as Gladstone, the painter Watts, and Victor Hugo, the creative essence had never been permitted to burn itself out below, to exhaust the subjective life of the body in sensuality. And so their creative powers went on ripening for many years after forty.

Legalized Brutality

San Francisco fighting trust.

Why not now gratify the same people and the same instinct by making executions public? It might also be interesting to make the condemned criminals fight each other with the prospect of pardon for the survivor. There is an element in most men, dating from when and where we know not, to which the sight of bloodshed, pain and death—of others—affords an infernal stimulant. It is to that element that the majority-voters condescended to give voice in their arguments.

Here is one of the chief of these arguments, advanced by Hartman of San Francisco: "To pass the bill will be to place a premium on cowardice." So the ring men would fain be excused, only fighting under the compulsion of the popular lust for blood! And it is the latter, safe outside the ropes, who call the former cowards!

The proponents of the bill must make other, and other, attempts to remove this blot from the civilization of the Golden State. STUDENT

Gentlemanly Theft

further exploits.

WE congratulate the Los Angeles Library Board on their courage in excluding from the shelves a volume of stories whose hero is a "gentleman-burglar." The popularity of the book is so great that in a subsequent series the hero was reintroduced and put through

The Board took action in consequence of some crimes committed by a well-known contractor, who in explanation said he had taken up burglary for the fun of it, the idea having been suggested by the romantic light in which it is placed by the stories in question. They pander, in fact, for the cultured, to that instinct which in the uncultured is fed by "Gentleman Jack the Highwayman" and its like. The construction is exactly the same. Representing a common thief as either brave or generous or muscular or quick-witted or fond of music and painting—one or more of these—the writer puts him through a set of adventures in which the act of theft is subordinated into a mere incidental occasion for the display of the fine qualities. But a stench blurred with perfumes spreads disease exactly as if they were not there. One would certainly not care to admit to the society of one's children the author of the stories excluded from the Los Angeles Library.

STUDENT

Infant Mortality

SOME facts collected in France show that infant mortality is directly related to the factory employment of mothers. One might have known that, of course, *a priori*; but it is useful to have it nailed down in figures. If mothers are at work in factories before the birth of the child, it is likely to be born of feeble constitution not only because of the poverty and privation that makes such work necessary, and not only because of the injury to mother and child of hard labor during those critical months, but perhaps even more because of the depressing mental influence of the monotony and baldness of factory work. The child's *mind* is born blighted.

The average infantile mortality for the whole of France is 10 per cent., but the average is made up of figures that here and there reach as high as 25 per cent. In Creusot, a large industrial city, the percentage is, notwithstanding, only 9. Thanks to the great amelioration in the condition of the working classes achieved by the efforts of M. Schneider, there are now only eighteen married women employed in the factories. The rest can nurse and look after their own children.

Some infant mortality is of course due to accident; some to ignorance of the laws of health. The first cause hardly varies; the second only very slowly. Where variation is marked for better or worse, is the place to study the most active cause. Such cases as that of Creusot are our opportunity.

STUDENT

Professor Berthelot's Simile

THE famous French chemist, Berthelot, has made a very interesting simile of the ever resolving, ever continuing, antagonism between religion and science.

They may be compared to two men going up a tower. Every now and then one declares he has gone high enough and lags behind. The other mounts continually, his view extending over an ever widening horizon. . . . Galileo cries out that the world revolves and is not a flat plain. The theologian down below will not admit this, and claps Galileo into prison for telling lies. Then the world revolts, and science and religion once more come into something like accord. And so the process goes on *ad infinitum*.

Very good: but there are other men going up that tower. Ahead of the science man is one at whom the former is continually shouting "*superstition, charlatan*." But though he shouts he toils after, and as he reaches the stages just left by the other, he fixes a label "*orthodox science*," and then looks up and resumes his shouting.

There was a time when the facts of the material life, and the facts of the spiritual life were not held apart, the investigators of each sneering or snarling at the others. Gradually came separation, and with that, knowledge of both spiritual and material became partial and distorted. There are signs that a day of reunion is not far-off, and when that comes, dogmatism and materialism will alike be phases of an evil past. C.

Tower of the Winds, Athens

THIS horologium, or water-clock, was built by Andronicus Cyrrhætes, the Syrian, at Athens in the First century, B. C. Situated at what was the eastern end of the Roman Agora, it is forty-two feet high, twenty-six feet in diameter, octagonal in plan, and of marble. Each of the faces carries a representation of the wind which blew from the corresponding quarter, sculptured near the frieze of the entablature; such as Boreas blowing his conch on the north, Notus in the south with his water-jar emblematic of rain, Zephyrus the west wind with flowers, etc. Formerly the tower supported the figure of a bronze Triton which served as a weather-vane. There have been sundials under the figures of the winds, and the interior was a water-clock supplied from a spring on the Acropolis.

STUDENT

The Esquimaux

THERE seems to be rather derogatory ideas concerning the Esquimaux, derived probably from first impressions and from the appearance of scattered members of the race who belie the true character. The Esquimaux are usually thought of as a very squat ill-favored race, coarse and ignorant. As a matter of fact they are enterprising, making long voyages. They are light-hearted, given to music, song, and drawing, humorous, excellent mimics, quick at learning. Their height is from 5 feet 4 inches to 5 feet 10, but their dress makes them look stunted. They have a genial, smiling appearance, and are often handsome. They are very skilful craftsmen.

As to the Esquimaux religion, one of their tenets is that a man consists of three principles, the living body, the thinking faculty, and the "name." The name enters the body when the child is named, and survives death. Remembering that name and soul mean the same thing in many ancient religions, we recognize here a prime teaching of Theosophy, pointing back to the time when the ancestors of these Esquimaux knew that system.

The Esquimaux, in common with the Chinese and the majority of the present human race, are descendants of the seventh sub-race of the Fourth Race. Though the Fourth Race is behind our Fifth Race, it had reached its seventh stage, whereas our Fifth Race has not yet reached its seventh stage. Hence these descendants of the Fourth Race inherit a knowledge that was greater in many respects than ours.

The Esquimaux inhabit the Northern shores of America from Mt. St. Elias to the Gulf of St. Lawrence, and extend into Siberia. The land in the Arctic Circle was formerly warm and was the home of the race from which the Esquimaux are descended.

Archeologists know of the Glacial epoch, and are prone to conjecture also the existence of this warm epoch. But there have been many seasonal changes since the beginning of human history. STUDENT

TOWER OF THE WINDS, ATHENS, GREECE

Eight Thousand Statues Discovered at Karnak

THE Temple of Amen-Ra at Karnak, Thebes, is the most stupendous relic of the mighty architecture of ancient Egypt. The main entrance is through a propylon more than 360 feet wide, leading to a court 329 by 275. The great hall is 170 feet by 329, and is supported by 134 columns, some 70 feet, others 40 feet high. There are many other structures connected with the temple, whose ruins are piled up on every side.

It is among these ruins that explorations have been carried on for the last nine years among the mud and flood-water of the Nile. In the course of the excavations, the director, M. Legrain, discovered a pit which had been filled with statues and all kinds of monuments, belonging mostly to the Ptolemaic period, but some much older. Eight thousand statues in gilded bronze have been found, and more than five hundred in granite, basalt, beryl, limestone, petrified wood, and other materials. Almost all bear inscriptions.

There are many fine statues of kings, bearing the familiar aspect of calm majesty, with broad frontal and great eyes, long and wide-set, indicative of breadth of vision mentally as well as physically. None

of the narrow pig-headed conservatism, attributed to these kings by modern historians, do we find on those serene faces; nothing but a consciousness that they were the heirs and preservers of a knowledge vast and sublime. But the restless spirit of the Greeks invaded their tranquillity at last, and the ancient spirit slumbers until the hour strikes for its reawakening. S.

An Archeological Squabble

DR. HILPRECHT'S Babylonian discoveries are at present the subject of one of those terribly bitter and inextricable disputes which sometimes break out between rival antiquarians. The "Temple Library" which Dr. Hilprecht claims to have discovered is not believed in by many Philadelphia archeologists, who wonder why the Doctor does not publish the texts instead of keeping them to himself. As to the tablets which he has published, it is declared that they came from elsewhere and are not new. Great rivalry exists between various archeologists as to the part each took in the expeditions and researches.

The discoveries, as announced some years ago, may be exaggerated in some particulars; but we may continue to feel confident that in Babylonia, as in other places, surprises await the archeologist which will far outstrip any exaggeration that the scholarly imagination is likely to be able to furnish. An archeological squabble over one particular field of exploration cannot affect the import of the wonderful discoveries being made everywhere in proof of the vast attainments of these old civilizations. E.

The Trend of Twentieth Century Science

Mysterious Powers Hidden in the Sun

THE condition of the sun and the effect of its changes upon the earth are latterly creating increasing interest in the scientific world, and the intelligent public is following the revolutionary theories based upon the newly-discovered facts with attention. A very few years ago it was regarded as preposterous to suggest that the sun had any other important functions, as far as we are concerned, than regulating our journey in space and supplying us with a constant amount of light and heat. But when H. P. Blavatsky came she showed that the sun is responsible for many more of the conditions around us and within us. She taught that the sun-spots had an intelligible cause and function, indispensable to the working of the electro-vital circulation of energy around the solar system. She also discussed the problem of the solar magnetic control of the planetary movements in their orbits, etc. And now we find a stream of new theories, suggestions and discoveries pouring in to support and elucidate the hints she gave those who were wise enough to attend. The recent enormous sunspot, of about eighty thousand miles diameter, has aroused unusual interest, not only on account of its dimensions, but because astronomers were able to predict the magnetic storm it excited. A connection between Jupiter's period of revolution and the 10—11 year sunspot cycle is being investigated; and now we find Flammarion, the eminent French astronomer, giving, as the results of his careful observations commenced thirty-five years ago, his opinion that the migration of birds is either hastened or delayed according to the frequency or otherwise of the sunspots. He found the clearest connection between the solar cycle and the arrival of the nightingale, swallow and cuckoo in France. This unexpected observation opens a new field for research, and may throw light upon one of the most fascinating of nature's secrets, for the causes of bird migration are involved in profound mystery. If the birds travel, as has been suggested, along lines of terrestrial magnetic force, why should not the solar outbursts, which now we know powerfully affect the earth's magnetic condition, facilitate or hinder their progress?

Some years ago it was suggested, only to be ridiculed, that the Indian famines corresponded with the solar cycles, but now that it is being more than suspected that magnetic conditions govern the weather changes, the idea does not seem so far-fetched. Then in the spring of 1903 a sudden and marked dip in the output of the sun's energy took place, which has not yet resumed the normal; this was accompanied by a drop in the temperature of the earth's atmosphere generally of several degrees. We are obviously at the beginning of great discoveries showing that the influence of the sun as governor and ruler of our conditions of life has not been at all fully realized in modern times. The ancients who symbolized the glory of the Divine Power and its beneficence by the image of the sun, had a far truer and more reverential appreciation of its true nature than modern materialism has permitted.

C. J. R.

Rarefied Metals in Medicine

A NEW method of using the metals in medicine suggests the possibility of the passing of the evil days of the serums and anti-toxins. A French physician reports his discovery that certain metals "in a state of very fine subdivision," administered in very minute doses hypodermically, appear to act as ferments with remarkable power over disease.

A ferment is a substance which, itself remaining unaltered, induces changes in other substances. Pepsin, for example, which causes the changes in meat known as digestion, and is not itself changed, is a ferment. The various serums now in such vogue, contain ferments. Ferments, in fact, seem to stand exactly on the boundary line between living and not living matter, having influence in both directions.

The doctor in question appears to have mainly experimented with gold and silver, and the dose he injects varies around one three-hundredth of a grain—one that would be employed by many homœopaths. But it seems quite probable that the unusual results he reports are due to the method by which the metals are got into solution. It is done by electricity, poles of the required metal being placed in water. And it would

seem natural to suppose—though there is as yet no scientific warrant for the idea—that metals thus got into solution are not in the same state as when otherwise dissolved—perhaps much more active physiologically.

PHYSICIAN

Trial by Water

IN the Middle Ages, some countries had a rapid way of determining whether an accused man were guilty, especially in use for charges of witchcraft. They flung him into water, and if he floated it was obvious that he *was* guilty. Association with the Evil One would naturally produce that result. The accused's limbs were, of course, tied so that he should not swim; and if it was important on ecclesiastical or political grounds that he should turn out guilty, it would be easy, by using a large quantity of rope to ensure his floating.

A Paris journal, commenting upon a little quarrel upon the point which took place between the Abbé de Fleury and Voltaire—the former, of course, trying to make it appear that the method was more likely to exonerate the guilty than implicate the innocent—gives the known facts as to the specific gravity of the body.

It is exceptional when the body is not heavier than its bulk of water. The lightest of the liquid tissues has a specific gravity of 1.005; the heaviest 1.055. Of the solid tissues the heaviest is bone—nearly twice the weight of its bulk of water; the lightest, except fat, is brain—1.030. Fat is the only tissue, solid or liquid, that is lighter than water; its specific gravity is 0.941. Unless the body contains a large amount of this material it will therefore sink in water unless swimming movements are made. In a few abnormal cases, usually disease, the bones may, however, become so hollow and light that even though there is little fat, the body will float. These people, and the very obese would therefore have stood very small chance in submitting to the ordeal of trial by water. If there were any reason for making the verdict not guilty, it was doubtless arranged by putting more or less iron chain work into the rope by which the limbs were secured.

C.

Why Do We See Right Side Up?

ANY object at which we are looking is pictured on the retina upside-down and right-side-left, because the rays of light all cross each other as they pass through the crystalline lens. And yet we see the object as right-side-up. This fact appears to be an eternal puzzle to opticians. They want to know how the mind corrects the image. Some of their explanations reveal a most extraordinary confusion of thought. Probing the confusion, one finds that they are thinking of the mind as another little erect being with another pair of eyes looking at the picture on the retina. A French writer, for example, has set himself to make an anatomical explanation. The nerve fibers leaving the retina and going back to the optic center in the brain cross left-right and up-down on their way. He thinks therefore that in the optic center another image of some sort is formed, this time right-side-up. So the mind, sitting there, sees it correctly! In other words, he is thinking of the mind as having a top and a bottom corresponding with the top and bottom of things in the world.

Of course the mind has no such limitations. It can for instance in a few days' time learn to read print that is upside-down or reflected in a mirror. And a few days' more time will enable it to "see" exactly the same thing in each case, though the *retinal* picture is in each case different—even to forget, in its absorption on the ideas conveyed in the print, which way the print is standing on its retina.

The difficulty is in fact due to a radical materialism, to thinking of the mind as a physical something in physical space.

STUDENT

Electricity in Fractures

AN Italian scientist has been experimenting on the effects of electricity, galvanic, static, and faradic, in hastening the healing of broken bones.

All the forms of electricity turned out to be beneficial, the galvanic very markedly so. There is a lessening of the duration of the healing process, less muscular wasting and stiffness; and in obdurate, ununited fractures, the union of the fractured parts begins at once.

Scenic Beauties in Lomaland

HOW many people take walks through the fields, and when they return have nothing to say about their journey except to grumble about the heat of the sun or the depth of the sand! How many fail to observe the beautiful composition and harmony of the wild-flowers, the grandeur of the earth-formations, and the innumerable nature-pictures waiting to be seen and studied!

In the fields of Lomaland there is such a wealth of beauty and interest that even the most unobserving must find something to think about in a morning's walk. Especially is this the case in early spring, when the wild hyacinth, snapdragon and countless other flowers of variegated colors cover the hillsides in every direction. Traveling along the tops of the lower hills, we pass the boundary of the wild hyacinth and de-

Lomaland Photo and Eng. Dep't

A CORNER OF ONE OF THE CITY PARKS, SANTIAGO DE CUBA

scend into the water-way of a steep cañon. On the south bank are abundant bushes, grass and wild flowers; on the north the vegetation is scantier, revealing, however, the beautiful forms into which the earth has been sculptured. Here we see a little alcove overhung with vines; there we meet a jutting promontory which has turned the water towards the opposite bank, undermining it. Thus do the shapes vary with each successive rainfall, as the gorge grows in depth and expanse. The flowers on the south bank are spread in glad profusion among the fragrant sage and sumach, the wild hyacinth on its graceful stem overtopping the rest.

The next cañon reveals yet another of nature's wonders. Before us lies a Greek theatre in miniature, almost perfect in construction, with a steep precipice falling from the farther side of the stage. The seats are nearly worn away and the stage slopes, yet the resemblance of the whole is striking, and there are jutting rocks on which an orator might well stand and declaim. How the ancient Greeks, with their sense of fitness, would have adapted such a spot, instead of erecting a brick building, as we should.

Below the theatre the waterway winds among bushes and under boulders, forming miniature cliffs and lake-beds, in which every geological formation is represented on a small scale. From the hill-brow

above we obtain a rare prospect of the beauties of Lomaland. In the foreground is the little theatre, its grey earth fringed with sage and sumach, and the pale purple of the yerba santa; beyond, the plateau, gaily decked with wild flowers, each variety in its own cluster, and framed in chaparral of vivid green. Over the abrupt edge of the cliff the sea seems about to cast its breakers over the fields and flowers; but the waves vanish from sight beneath, and their heavy roar is heard as they fling themselves on the beach in their ceaseless task.

The whole scene, viewed from above, presents a marvelous variety and harmony of vivid coloring. The numerous cañons that break the cliff-line contrast in their brown earth with the green and purple and yellow of the plateau. The deep blue ocean is fringed and variegated with white breakers. On the horizon the noble blue mountains are can-

opied with white fleecy clouds, hanging low, as if to form a border to this wonderful nature-picture. We are startled as we first turn our eyes upon it after climbing the steep hillside. There are many such vivid contrasts here; yet so perfectly are they blended that the whole effect is a harmony.

Fortunate indeed is the eye that can perceive Nature as a perfect whole, instead of losing sight of her grand entirety in a microscopic poring over the details. STUDENT

Sublime Scenery of the Cascade

MAGNIFICENT scenery, in which rock-formations and vegetation combine, is created where the Columbia River breaks through the Cascade Range, between Mounts Hood and Adams, to pour itself into the Pacific. The river, after a long course across the arid lands to the east, turns and passes between the two peaks in a narrow but deep channel. Thence it descends in a cascade, passing over a succession of rugged ledges towards the sea. The scenery is said to be unrivalled in the world, for the river cuts through volcanic rock, which towers in pinnacles to heaven; and on these pinnacles trees have grown and flourish in the rich material afforded by

the rock's disintegration. Two of these basaltic columns, rising from the edge of the river, have been called the "Pillars of Hercules." There are castles, domes, and innumerable fantastic rock-formations.

The Indian legend says that the two earth-giants—the extinct volcanoes Hood and Adams—once quarreled and hurled rocks at each other, which fell around and in the river; and that a roof of rock which spanned the stream was broken in. E.

Does Nature Waste?

"NATURE'S waste" in putting forth myriads of seeds which never sprout, and bringing forth creatures the majority of which are not reared, is often a sore puzzle to those whose intuitive wisdom is out of harmony with their intellectual conceptions. The waste is only apparent. Life is indestructible. If a seed does not sprout, the life withdraws from it and goes elsewhere.

Errors of this kind are always made when we regard things in detail instead of as a whole. Out of many individual seeds, most may perish; but the life-energy which plants put forth is not destroyed.

Again we might conclude *a priori* that, to our confessedly limited vision, Nature's work must seem incomplete and full of loose ends. STUDENT

"What wouldst thou be?"

A blessing to each one surrounding me.—*Frances R. Havergal*

BACK of the mixed pleasure and the pain of all activities is the soul's impelling purpose to gain greater consciousness—the only adequate reason for its incarnation. Were it not for some inner vision of the larger truth to be won by experience, the brain-mind would early succumb to despair from the disciplinary failures, disappointments and sorrows of daily life. The purpose of the soul is never lacking in dignity and beauty, however its meaning may be obscured by translation upon the lower plane.

Though the greatly-increased force now operating in modern activities is largely expressed by humanity along materialistic lines, there are many signs of an awakening of the higher nature. By diverse and not always pleasant paths the woman soul especially is becoming more conscious of its innate powers and possibilities, of its strength and courage—is finding itself. Undeterred by the accusations of unwomanliness from narrow critics, the awakening woman continues to grow more consistently human.

Those individuals who follow the lead of the intuition which underlies the physical and mental senses, gain a clearer conception of the developing humanity which unites the complementary qualities of the masculine and feminine natures. The intuitive sense, naturally more marked in women than logical ability, subconsciously adjusts the individual to the underlying tendency of the times, however much conventionality may deny its progress.

In the advance of the modern civilized world, nothing is more striking than the rapid change in the conditions of woman's life. That she has proven herself capable in unfamiliar avenues of thought and work is less remarkable than the courage displayed in attempting this after ages of repression and limitation. Fear of the unknown has ever been the great paralyzer of human endeavor. The natural inertia of the earthly body yields only to the urging pain of the outgrown standard, when the suffering from old limitations compels the growing consciousness to step forward and to find an equally secure and more comfortable foothold in what had seemed like unknown, empty space.

In this movement, however, reflection will support the statement that there has been an unusual lack of timidity. The awakening woman has been so inspired with her novel role—having thoroughly outgrown the old one—that she has gotten well into the play without the customary stage fright. She has been free from vacillating anxiety about accepting the part. The inner urge of the subconscious woman to make a place for all womanhood has brushed aside the ordinary obstacles.

✻ The Awakening Woman ✻

The increased masculine activities have been an extension of the established scientific and economic lines; though modern woman's work may have been the force. Her apparent ignoring of domestic claims for outside interests has filled her critics with concern. They have failed to note that her success in untried fields was only possible by working *with* the evolutionary law which regulates and which ripens the quickened nature to fit the times.

Plainly, then, the most marked progress has been made by the intuitive natures who have instinctively responded to an illuminating touch which partakes more of light than of logic and is more a matter of feeling than of thought. Through multiplied avenues of expression the woman soul is finding occasions for tests of courage and strength, of skill and conscious endurance,—is seeking to know itself.

Meantime the men who kept faith with their own intuition naturally trusted the really progressive woman, and their business, social and domestic ties gained the uplift of a wider comradeship. Not so with the average materialist—either of the scientific or unlettered kind—whose finer senses were confused in the increasing speed of the mere machinery of life; he has been quite disturbed by the new woman's developing independence—of him. The Prince Charming is a less important figure on the stage when the Princess is found wide awake and contentedly busy. She may or may not be very glad to see him; but he feels that he has been napping to suppose that her time was spent in idly dreaming of his coming.

The modern Princess is less dependent upon the Prince for the awakening touch of love, which too often loses its magic in the familiarity of a physical union that is given an exaggerated sense of its own importance. She is not disconsolate if the little circle of sunshine her lover threw around her grows dull and cloudy. She is becoming more conscious of herself as a radiating centre which, in expansive giving, gains as a vehicle of warmth and light, being "enlarged with its own shining." She is learning not to wait for the coming lover who will lead her into a new world to find an enriched sense of her own inner life. In the outgo of generous, helpful, loving thought and feeling for a needy world she becomes a widening channel for the great tides of human consciousness, of which the average love is a personified symbol. She does not flatter weak masculine natures by cultivating a clinging dependence; but by the growing knowledge of her own courageous soul she can strengthen any man's moral courage and help the honest seeker to find himself. What joy if they move onward together!

It is not only in business life that women are becoming better poised. There are eminently domestic wives and mothers who fulfil their duties to the home ties and yet maintain a consciously-developing centre within. Whether they are agreeably or otherwise disappointed in love, they are not dismayed to find that the heroes they have married are but human. The weak points of their partners may become stimuli which develop their own potential strength and serve to more firmly weld the real tie by mutual helpfulness.

Not even the most devoted lover can gain consciousness for another soul. Each must learn the meaning of its own lines and in the end must have played all the parts. It is Eve's old lesson, which began with her first taste from the tree of knowledge and Adam's generous division of the honors of responsibility!

LYDIA ROSS, M. D.

Hasty Marriages

AN English contemporary condemns the custom now existing among the poorer classes in London, of indiscriminate marrying:

The folly of human nature is shown in few things so strongly as in the haste with which the poor often rush into matrimony. They have infinite opportunity of learning how heavy are the penalties of an ill-judged marriage, yet every day sees them undertaking the gravest of responsibilities with supreme recklessness. One case that came before a magistrate yesterday disclosed how a Russian Jewess with a dowry of £5 undertook to marry an old man who had a clothing store, merely on the recommendation of a marriage broker. She was actually duped with a sham ceremony, and found it necessary to sue her "husband" for obtaining money by false pretences. Yet she is willing to let bygones be bygones if he really marries her! In another case a man, committed for trial, rejoiced that he was out on bail because that would enable him to get married before going to prison. We do not advocate the scientific marriage theory, but at least we should like to see some means of checking the utterly irresponsible marriage, which is bad for the community, and worse for the individual.

Such deplorable conditions, it is sad to say, are not peculiar to England—they still exist in all of the so-called civilized countries. It is pitiable to see the ones most illy fitted for matrimony and maternity and paternity—the irresponsible part of humanity—rush so foolishly and blindly into these important relations. But ignorance is the cause—and marriage theories will avail nothing until humanity itself has been educated to know and discriminate on these subjects. Proper training in childhood is the true basis for that educational work. M.

THE Crown Princess Sophie of Greece, with the Crown Prince, the King, the Queen, the Minister of Public Instruction and many prominent officials, assisted in the opening of a new restaurant for the poor, recently established at Athens. Its inauguration is due to the efforts of the Princess. It is located near the Acropolis. Princess Sophie herself was the first to taste the food which will be served to the poor of the city at almost less than a nominal price. On the opening day the poor were served by the most distinguished women of Athens.

Jane Lathrop Stanford

RARE indeed are those who find the real consecration that sorrow holds hidden, the real fulness of life that only the unselfish ever deserve and win. Mrs. Jane Lathrop Stanford, whose death has been felt by thousands of young students as a personal loss, was one of these. Born in comparative obscurity, acquainted with what we term the "realities" of life, she yet gained in strength and sweetness with every experience. In later life, as mistress of an enormous fortune, she proved her real worth. The crowning sorrow of her life—the death of an idolized son—was as an open doorway both to herself and to her husband, for it was in consecration of the son's memory that they founded Stanford University, at Palo Alto. During her husband's life Mrs. Stanford was known merely as a philanthropist and a woman whose social duties never served to obscure the innate gentleness of her character. In later years, after her husband's death, unexpected qualities came to the fore and she became known as a clear-headed woman of business, with well-defined and high educational ideals.

Lomaland Photo and Eng. Dep't

A PROVINCIAL CUBAN HOME

The above is one of the many family homes hidden away among the palms in the provinces of Cuba. These families till the soil to an extent and carry their fruits to market.

THE Royal School of Embroidery at Athens was founded by Lady Egerton, wife of the former British minister, and Madame Catherine, who is now in charge. At the present time its president is Princess Ellen Vladimirovna, wife of Prince Nicholas of the Hellenes, who is himself quite a genius in various branches of artistic work.

This school is situated in an attractive quarter of the city, and is unique in having its practical work under the personal supervision of its royal patronesses, besides a number of other ladies of distinction.

Its influence extends over every part of Greece. Besides the two hundred women working every day in the school, there are hundreds of lacemakers in the country whose

work is directed and sold by this institution. Apprentices receive free instruction and materials, and when proficient are employed at good salaries. Branch establishments exist at Agya, Ægina, Volo, Corinth and Koropi.

Mme. Catherine makes a European tour every year, to keep up with the latest designs, which, however, scarcely rival those originated by the students at the Athenian school.

It is a favorable sign for any country when new avenues are opened for the development of artistic tendencies. It is through the love of the beautiful that the soul first begins to speak; and by the cultivation of the creative powers, the finer forces in human nature are brought out and become potent factors in the brightening and uplifting of the lives of the world's heavy-laden ones.

It is not surprising that this truly-important work should be started in Athens, for in that classic land must linger still the echoes of those by-gone times, when art was the inspiration of daily life, and the drama and music were the teachers of the people. As the years pass the real unity of art and artisanship will be better understood. STUDENT

OUR YOUNG FOLK

William Q. Judge

A BRIGHT new day has dawned for humanity. To the world's children has come Raja Yoga, to teach them to live a life of kingly conquest over all that is selfish in their natures. And the more widely Raja Yoga is taught, the better do people see that humanity has been led through a long and dangerous defile, where the gloom was so dense that men forgot that the light of soul was shining anywhere. Selfishness was growing like a monster of evil. Men were struggling in the darkness, looking on one another as enemies, forgetting to do battle with the selfish desires within.

A Teacher came to the world. H. P. Blavatsky proclaimed the truths of Theosophy, the teaching of the soul, and of brotherhood. In America she found William Q. Judge, her helper and co-worker. To him she entrusted the work of guiding humanity on its path.

William Q. Judge stood alone, yet he had such a burning desire to help the world that a flame arose in his heart. He never let it die out. He kept it burning by unselfish, loving work. Other lights sprang up here and there in the gloom. A few began to look within and conquer the selfish nature. They discovered that when they tried to do this, they could do another thing. They could work together. Soon there were groups of lights shining, and groups of people working together for brotherhood.

Many Centers of Brotherhood were formed among these by William Q. Judge, all lighted from his own heart-light. All these Centers were strongly linked to him as Teacher. He guided their work, and taught them how to help the world.

Eleven years ago W. Q. Judge told his workers of a great School to be founded in the West, where the children of the race should be taught wisdom. If William Q. Judge had not been steadfast and true, if his heart-light had died out, we should not have had such marvelous Raja Yoga Schools today.

But now that the light streams out from the great Center at Point Loma, now that we are learning daily the strength of the Warrior nature, we know how great was this Teacher who fought his way through the defiles of darkness, leading discouraged humanity by his strong hand. And we love and honor William Q. Judge more and more every day—more and more every year.

Many dangers beset W. Q. Judge and his work. The greatest danger was that the Leader might perish before he had brought the work to a place of safety. Cruel enemies threatened, and fought to drag him down. But as they could not stand together, they soon fell away from the onward moving band of workers, and left the path clear.

Only a tried Warrior, one superb in action and master of himself, could have guided humanity in this struggle between the forces of light and darkness. Only one pure in heart and of strong soul could have guarded the sacred truths of Theosophy from the poisonous influences of evil minds. Not until his work was done could the cruel attacks of the enemy force William Q. Judge to lay down his body.

Friend and Guide, Warrior and Teacher, all these was William Q. Judge. To him our hearts turn daily with deeper love and gratitude. His birthday shall ever be one of our greatest joy-days, verily a day of springtime for the heart and soul, a day of inspiration and true uplift for our faith and our will. A RAJA YOGA TEACHER

WILLIAM QUAN JUDGE

Fragment from *Io Vitis*, by W. W. Story

SPEAK, History! Who are Life's victors?
Unroll thy long annals and say,
Are they those whom the world called the victors—
Who won the success of a day?
The martyrs, or Nero? The Spartans,
Who fell at Thermopylae's trust,
Or the Persians and Xerxes? His judges,
Or Socrates? Pilate or Christ?

Hints Worth Heeding

From the writings of William Q. Judge

NATURE always works towards harmony.

WHAT were we before we were born here?

THEOSOPHY offers a purpose and an aim for life.

STRENGTH comes only through trial and exercise.

MAN is a spiritual being—a soul, in other words.

OUR God within us is what we call the Higher Self.

EVERY noble thought, idea or aspiration is immortal.

LET us use with care those living messengers called words.

THE will and mind are only servants for the soul's use.

NO ONE is so originally sinful that he cannot rise above all sin.

MEN are, as a scientific fact, united whether they admit it or not.

THE universe is for the experience and emancipation of the soul.

EACH man is his own creator, creating his future life by his present.

IN life's pilgrimage nothing is gained by favor, but all depends on merit.

GOD-LIKE perfection is the great goal for a human soul to strive after.

MAN is a thinker and by his thoughts he makes the causes for woe or bliss.

WE have all lived and taken part in civilization after civilization on earth.

THEOSOPHY hails the reign of law in everything and every circumstance.

IT is man's own hand that forges the weapon which works for his punishment.

THE civilization of the present day is selfish and built on the personal element.

THERE is no favoritism possible in nature; no man has anything he has not deserved.

EACH man's life and character are the outcome of his previous lives and thoughts.

GREAT teachers work not for the praise of men, but for men's best and highest good.

PERSEVERE, and little by little, new ideals will drive out of you the old ones. This is the eternal process.

RELY within yourself on your Higher Self always. That gives strength, as the Self uses whom it will.

THERE is a habit of belittling the ideas of the ancients which is in itself belittling to the people of today.

THAT man possesses an immortal soul is the common belief of humanity; to this Theosophy adds that he is a soul.

JESUS himself would be called an impostor if he appeared in some Fifth Avenue church, rebuking the professed Christians.

THE soul is superior to mind and has the power to grasp and hold it, and then only the real end and purpose of mind is brought about.

THE CHILDREN'S HOUR

The Raja Yoga Question Box

WHO was William Q. Judge?

ANSWER—William Q. Judge was the second leader of the Theosophical movement in this century.

When did Mr. Judge meet Madame Blavatsky?

ANSWER—Mr. Judge met Madame Blavatsky in 1874, in New York. Together they formed plans to help the world to be unselfish.

What is the Theosophical Society?

ANSWER—The Theosophical Society was formed on September 8, 1875, at H. P. Blavatsky's home, in New York. Madame Blavatsky and William Q. Judge were the principal founders. Its original name was "The Theosophical Society and Universal Brotherhood."

What is the Aryan Theosophical Society?

ANSWER—The Aryan Theosophical Society was founded in New York in 1883 by William Q. Judge. Its object has always been to help humanity. Its headquarters today are in Lomaland. Part of its work is the holding of public

meetings throughout the world, to give to enquirers a true understanding of Theosophy. The meetings held twice a week in the great Isis Theatre, San Diego, California, comprise part of this world-wide work.

What is the Aryan Press?

ANSWER—The Aryan Press was founded in New York in 1889, by William Q. Judge, for the purpose of publishing books and magazines about Theosophy. Its headquarters are now in Lomaland. It carries on the same work on a larger scale today under the direction of Katherine Tingley.

When did Mr. Judge finish his work?

ANSWER—Mr. Judge died on March 21, 1896. His work was not finished. He gave it into the hands of his successor, Katherine Tingley.

Did Mr. Judge know about Point Loma?

ANSWER—Mr. Judge told a few of his trusted pupils about the great educational institution that was to be later founded, in the Far West, by his successor. How true was his prophesy! How much all men owe him today!

The Friend of Little Children

[A tribute from the heart to this Teacher and Friend of little children]

WILLIAM QUAN JUDGE was born in Dublin, Ireland, April 13, 1851. When he was a very little boy people wondered how he had learned so much. In 1864 he came to America with his father. William Q. Judge, early in life, showed the perseverance and determination that were his to the end. No obstacle was too great for him to try to overcome. He could always rouse his will to do any task, however difficult. And everything he did, he did well.

When William Q. Judge was twenty-one he began to practise law in New York. Already he was a deep student of life. Already he longed to free the souls of men. Two years later he met his Teacher, H. P. Blavatsky. They went on together with their work for humanity. They did not try to help one country only. Their purpose was to help the nations of the whole world.

William Q. Judge was a Leader. He gathered a large body of workers for brotherhood. He did this by holding meetings and by publishing a magazine, *The Path*. He also wrote books about Theosophy; and he wrote many letters to people all over the world. For years he worked unselfishly. He received no pay, but gave to the work from his own earnings as a lawyer.

William Q. Judge was a hero. He stood up alone for what he knew to be right. He drew others to him by his earnestness.

Thousands came to look upon him as their truest friend and helper. But this royal worker had enemies. They tried to tear down his work for brotherhood. He upheld it with a strong hand. Their persecution caused his death, but they could not destroy his work. Those whom William Q. Judge taught to work for brotherhood called their beloved Teacher "the Chief." They also called him "the Exile."

William Q. Judge loved little children most of all. Like H. P. Blavatsky, he longed to found a great school where little children could be taught the true meaning of life. What he dreamed of could not be done in his time, but today, in the Raja Yoga schools established by Katherine Tingley at Point Loma and in foreign lands, his dream is at last being realized. And today these children of so many different nations, and in many countries, love to honor Wm. Q. Judge. For one of the lessons learned in the Raja Yoga Schools is gratitude to those who have served humanity. Raja Yoga children know how to yield from their hearts loyal homage to the true and brave. A STUDENT OF RAJA YOGA

Raja Yoga for Tempers

WHAT causes people to lose their tempers? I think it is selfishness, jealousy, not having your own way. But these things come from one principal cause, and that is—that the person who gets into a temper, surrenders to his lower nature.

What are the effects of getting into a temper?

When a person gets into a temper he makes himself unhappy. Those around him feel uncomfortable. Besides this, he gains nothing worth having.

Some children fly into tempers in order to get something they want, and sometimes they get it, for all grown-ups don't know what is best for children. They give them what they cry for, sometimes to keep them quiet, and sometimes because they think they show their love for them by

granting selfish and foolish wishes. But this never brings a child any real satisfaction, and does not help its temper any, either.

You can generally tell when a person is in a bad temper by looking into his face. It looks as though a bad fairy had come and driven all the beauty and happiness away.

It may seem a small thing to lose your temper, but if you think a moment you see the result may be very serious. Many poor discouraged people in prisons are regretting deeds that were done in a fit of temper. I once heard a physician say that a good many of the people in our insane asylums lost control of their minds by first losing control of their tempers.

What is the cure for a bad temper?

Self-control! When something irritates you, just stop—just stop—and think of the last time you let your temper get the best of you. Think how you regretted it afterwards. When you see a person in a bad temper it is a good thing to

leave him alone. It gives him an opportunity to think, and thinking will help him to turn and fight his own lower nature, instead of being like an ugly enemy to those around him.

Every time you give way to temper it means a defeat; every time you control it, a victory. No one can gain this victory for you, you have to gain it yourself—yourself.

Those children who know of Raja Yoga have a fine opportunity, for they learn to conquer their tempers while young, for Raja Yoga shows them how to understand their natures, and teaches them how to control the lower through the higher nature. If children had more knowledge it would be better; not the kind in books, but the kind that springs up in the heart from little seeds of love and self-control. A RAJA YOGA GIRL.

THE LITTLE KEY

"WHAT would you do," said the little key
To the teak-wood box, "except for me?"

The teak-wood box gave a gentle creak
To the little key; but it didn't speak.

"I believe," said the key, "that I will hide
In the crack down there by the chimney side.

"Just so this proud old box may see
How little it's worth, except for me."

It was long, long afterward, in the crack,
They found the key and brought it back.

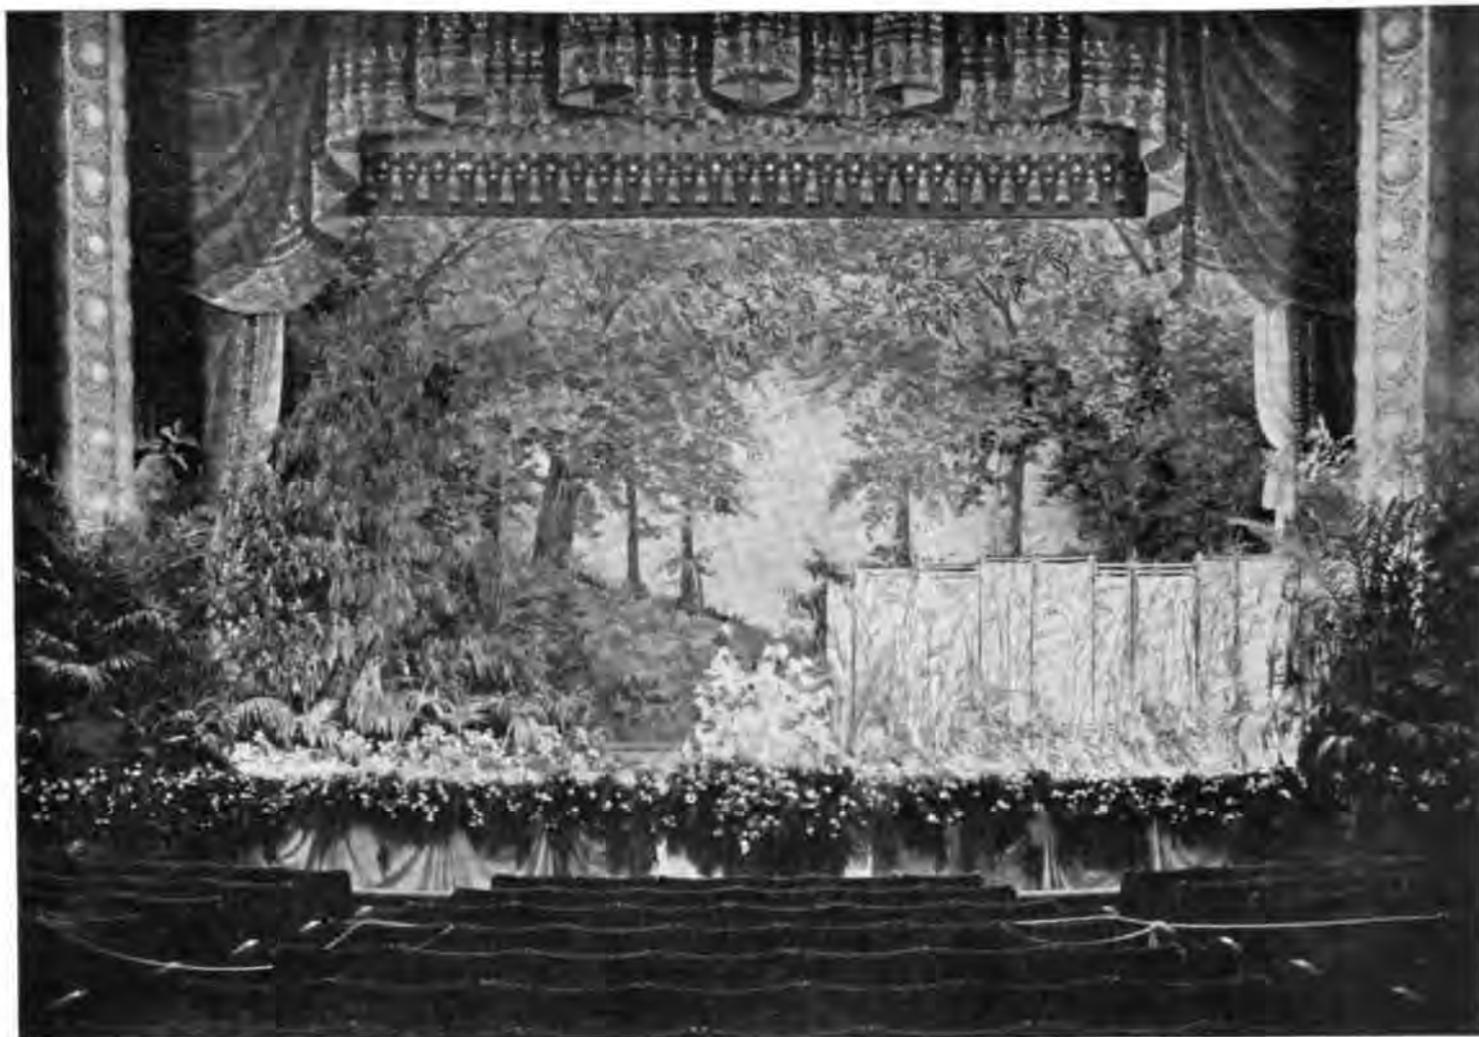

And it said, as it chuckled and laughed to itself,
"Now I'll be good, to the box on the shelf."

But the little key stopped, with a shiver and shock;
For there was a bright new key in the lock.

And the old box said: "I am sorry, you see,
But your place is filled, my poor little key."—Selected

THE THEOSOPHICAL FORUM, IN ISIS THEATRE

FOUR excellent papers, as well as a charming musical program selected from Wagner delighted and entertained the large audience which assembled at Isis Theatre last Sunday evening. The stage setting presented, as usual, a restful glimpse of Nature's decorations.

Miss Julia Hecht read an entertaining paper on "Reincarnation." In part she said, "The law of reincarnation shows us the justice in all that seems unjust and arbitrary, and is its own proof, for it leaves no unfilled gaps, no 'missing links,' but brings light into the darkness in which we grope and have groped so long. Has any human life yet been long enough to accomplish the task set before it by the soul? What is the standard, the ideal ever before man? 'Be ye perfect!' Can perfection be achieved in one short life? in seventy, eighty or one hundred years? Yet a world-teacher and helper gave that command. Was he one to make a foolish speech or tell an untruth? The law of reincarnation alone makes perfection possible. It declares that the soul inhabits many human bodies on this earth, our present life being but a link in the vast eternal chain. The death of our present body is merely a rest, which the soul must have. Is there anything strange or impossible in this? Is it as strange as many things we have been blindly believing for years?"

Little Margaret Hanson read a paper "About Music in Lomaland," from which a few quotations are made: "This morning, when I got up, I heard the birds singing. It was just about sunrise. It is so every morning, for all around our home are beautiful wild birds. They sing all day, too, and I believe that their music is the secret of their being so happy and so useful and so beautiful. I believe that the reason their singing is so beautiful is because they *love* to sing. To love to do things is one of the Raja Yoga secrets. . . . Music keeps the heart-light shining. Everybody knows that. Everybody knows that people who are sad or quarrelsome or unhappy cannot sing. When birdies are hurt or made unhappy by some cruel boy they stop singing. We never hear a bit of music from birds when they are not happy. And I believe really, that true music has to come from happy hearts."

"The Little People of the World," was the subject of a well-written paper read by Master Iverson L. Harris, Jr. In part he said: "It is

the voice of the multitude speaking in my heart which makes me determined to plead at every opportunity for the proper recognition of all the children in the world.

"Look at the variety of methods which are used for the education of children. Many of these methods are applied by lovers of children who are willing workers; but in all that is done, there is something lacking, and in the experimenting, thousands of children are sacrificed; that is, they lose their best opportunities. They grow up, following along the lines of despair, as thousands of others have done before them; and in years to come, after they have suffered and lost, they, too, will turn back and know little better how to work for children than their predecessors did. It is for this reason that every child who knows the value of Raja Yoga training, should aim to bring it to the attention of the world. Further, each child should become a living example of that system which holds the key to the real situation of the education of children."

The last paper of the evening was read by Dr. A. C. McAlpin, his subject being, "The Real Educators of the Age Must Be Theosophists." In part he said: "As most thinking minds are agreed that the present conditions are the logical outgrowth of the past, shall we not rightly conclude that the future will be the outgrowth of the present? We can then make the future just what we will. As the future depends so much on the children, is it not imperative that they shall have, at the earliest possible age, a true knowledge of life and its great purpose? Who but an unbiased, open-hearted Theosophist, versed in the profound meaning of the law of cause and effect, cyclic law, Reincarnation, the dual nature of man, brotherhood and compassion, can really educate a child, or even guide his mind aright?"

Theosophical Meetings for Sunday Nights

Public Theosophical meetings are conducted every Sunday night in San Diego at 8:15, at the Isis Theatre, by the students of Lomaland.

Theosophical subjects pertaining to all departments of thought and bearing on all conditions of life are attractively and thoughtfully presented.

An interesting feature is the excellent music rendered by some of the students of the Isis Conservatory of Music of Lomaland. Theosophical literature may always be purchased at these meetings.

Art Music Literature and the Drama

The Modern Drama—Wherein Lies Hope of Its Regeneration?

AND the latest is a new drama in which the infamous Borgia is the central figure! What is the matter with our dramatists now-a-days? Is there no inspiration for them outside of lives that are marked with cruelty, careers which are dissolute and licentious? The ancients had no such difficulty; they found ideals and high ones, and the greatest dramas of the world have been built around pure types. Have the ideals disappeared from our sky or have we moderns just put up mental sunshades and obscured our own view for a time? Where lies the difficulty—at the door of actor, playwright, manager or the public? Surely, if ever the drama waited for an apostle and a new evangel, it waits today.

For new plays are needed, needed as they never were needed before. Within the month one of our oldest and best known managers has said—and his words are but little more than an echo of opinions expressed on all sides by those best acquainted with the dramatic outlook today,—

It is strange that at the present time, when dramatic writers are so well paid, we get little good work. In the past, when pecuniary reward was small, there seemed to be no lack of good dramatic material. In fact, the smaller the prices in ancient days, the better the work seemed to be. Today managers are standing ready, with big purses in their hands, and they simply cannot get hold of desirable plays. The work is largely dilettante in character, much of it lacks thoroughness in preparation and most of it is destitute of ideas. What are we to do?

One paper reports that our best actors and actresses are fairly driven to desperation by the dearth of plays. What is the matter? If money won't procure them something must be wrong—to quote the opinion of the masses.

The difficulty lies, plainly, in the fact that managers are trying to insist on putting the cart before the horse. That which makes dramatic work immortal does not come when called, if the call be a sordid one. "Big purses" never yet invoked the Muses and never will. What we need is a higher general ideal, a new philosophy, in short. The ancients had just that. There were plays and noble plays in the old days and one proof that we are not wholly sincere in our lamentings over the dearth of great dramatic works is the fact that we do not revive the masterpieces of the ancients. Managers say that they fear to "risk them" on a public which wants the melodramatic and even the sensational and vulgar; and so it goes. Is it not possible that if some one should really dare to revive the great dramas of the ancients—as Katherine Tingley has revived the *Eumenides* of Æschylus and other mighty master-dramas—even "the public" might become inoculated with a longing for higher ideals and a door would at last be open through which the longed-for great modern drama might appear? The artist lives somewhere, surely, and the Soul forever waits.

STUDENT

HENRY D. THOREAU once wrote in his Journal:

I hate museums; there is nothing so weighs upon my spirits. They are the catacombs of nature. One green bud of spring, one willow catkin, one faint thrill from a migrating sparrow would set the world on its legs again. The life that is in a single green weed is of more worth than all this death. They are dead nature, collected by dead men. Where is the proper herbarium, the true cabinet of shells and museum of skeletons, but in the meadow where the flower bloomed, by the seaside where the tide cast up the fish, and on the hills and in the valleys where the beast laid down its life and the skeleton of the traveler reposes on the grass? What right have mortals to parade these things on their legs again, with their wires, and, when heaven has decreed that they shall return to dust again, to return them to sawdust? Would you have a dried specimen of a world, or a pickled one? Embalming is a sin against heaven and earth.

True is it that the dreams of yesterday become the realities of today; while the all unheeded prophesy of today becomes the living fact of the morrow.

The Revival of Interest in the Beautiful Gaelic Tongue

THE many do not realize the full meaning of evolving things until they burst, full-blossomed, as it were, into view. It is only the few who can see the effect within the cause, only the few who can reckon the power of a whole tide by the force of a single wave. But unto these—the few—it is plain enough that the day is near at hand when the world will be suddenly astonished to find that Ireland is something more than a land of peat-bogs and peasants; in short, that the Irish people, in their loyalty to all that was glorious in the past, in a rich and full revival of their ancient art and literature, may soon stand as an example to other nations.

One of the results of the Anglo-Norman conquest was the complete stifling of the art life of the Irish people. At that time, too, was given the death-blow to the higher possibilities of the Gaelic literature. From that time dates the decline of interest in the beautiful Gaelic tongue.

Today, workers who have at heart the best interests of the Irish people are endeavoring to restore and revive the best that has been lost. The

first step has necessarily been the establishment of industries and the teaching of manual training and domestic science, kitchen-gardening and, so to speak, scientific farming. That is, however, but preliminary. A revival of ancient Irish art is at hand and it is the aim of those most interested, to instruct students, not in foreign art, but in all the lore of ancient Irish art up to the point where its development was arrested by the Conquest. It is believed that by this means something new can be developed, something that under normal conditions of prosperity and peace would have been developed in Ireland several hundred years ago.

Yet art stands not alone on this program. In architecture, in literature, in music, the aim is to go back to the palmy days and take up the thread where it was broken centuries ago. There is

already throughout the island an intense general interest in the revival of the Gaelic spoken tongue. It is beautiful and very complete, and it is said that it is not uncommon to find peasants in certain districts who have a vocabulary of some three thousand words, about the number used by the average University man today.

STUDENT

THE six smallest violins that were probably ever in existence, were recently made in Germany. The largest is about two and a half inches in length, the smallest is not more than an inch long.

Although these violins are so tiny, their mechanism is based on accurate proportions. Each one is perfect in construction, with keys that turn, a bridge, "F holes," a sounding post, a tailpiece and strings.

The strings can be tuned, but the sounds they produce are so high up in the scale that we could hardly call them musical sounds.

The bows are as perfect as the violins, with real horse hair, a screw to tighten them, and all the other parts found on the usual bow. They are of course, merely curiosities, and not even musical ones.

ONE of the most prolific composers known to musical history was Alessandro Scarlatti, an Italian who lived about 200 years ago. Of his recorded works there are 115 Operas, 200 Masses and 400 secular Cantatas, besides an almost incredible amount of instrumental music, much of which is still unpublished.

It is said that German art lovers are becoming a little frightened over the prospect of finding the art treasures of their land transferred to the Metropolitan Museum of Art in New York. A definite step toward preventing this has been undertaken by the founding of a National Museum Association in Berlin, one of the objects of the Association being to secure the passage of a law similar to the one in force in Italy, forbidding the export of recognized art treasures to other countries.

DUTY

WORDSWORTH

STERN Daughter of the Voice of God!
O Duty! if that name thou love
Who art a light to guide, a rod
To check the erring, and reprove;
Thou, who art victory and law
When empty terrors overawe;
From vain temptations dost set free;
And calm'st the weary strife of frail humanity!

Stern Lawgiver! yet thou dost wear
The Godhead's most benignant grace;
Nor know we anything so fair
As is the smile upon thy face:
Flowers laugh before thee on their beds,
And fragrance in thy footing treads;
Thou dost preserve the stars from wrong;
And the most ancient heavens, through thee, are fresh and strong.

To humbler functions, awful Power!
I call thee: I myself commend
Unto thy guidance from this hour;
O, let my weakness have an end!
Give unto me, made lowly wise,
The spirit of self-sacrifice;
The confidence of reason give;
And in the light of truth thy bondman let me live!

No Man Can Act for Himself Alone

THE following story is, perhaps, familiar, but is worth repeating for the sake of illustrating a moral:

In a certain village there lived a great and good man. And the people said, "Go to, let us give this great man a gift." And they took counsel together and said, "Let every man take a bottle of the wine that our lord loveth well, and let him pour it into the great cask that is in our lord's cellar, that he may have abundance of the wine that he loveth."

Now the wine was very costly.

And there was a certain ungodly man, and he took counsel with himself, saying, "The wine is costly, and it goeth against my heart to diminish the store of gold pieces which I have laid up. Now, therefore, I will take a bottle of water and pour it into the cask, and it shall be that one bottle of water shall not be discovered among so much wine"

Now it came to pass that the great lord went down unto the cellar that he might taste the wine. And lo! the cask was full of water, yea, to the very brim. And he marvelled greatly.

People generally dismiss this story with a laugh, but to a thoughtful mind it is full of meaning; indeed, it contains the key to one of the mysteries of human life.

We find ourselves on the horns of a dilemma. On the one hand it is obvious that the single bottle of water would be negligible among so much wine. And yet what was the result?

The fallacy, in this and similar problems, lies in supposing that one man's acts are quite separate and disconnected from the acts of others. But are they? If our ungodly man had been a true logician, he would have reasoned thus: "If I put a bottle of water in, and no one else does, then, etc. But if I put in a bottle of water, my evil thought will infallibly influence others to do the same; whereas, if I put wine in, it will influence them to be honest also."

The fact is that the separateness of personalities is a delusion, and, if used as a premiss in an argument leads to a dilemma. How often does each one of us say to himself: "My little dereliction of duty will not matter." Yet if several people neglect their duty, the result becomes serious. The only thing to do is to do your own duty, however apparently insignificant the consequences of it may be. For they are only apparently insignificant; and apparently so because we have a wrong theory about the personality and its relation to the community.

In reality I *cannot* act for myself alone. While I stand hesitating between duty and neglect, other minds, connected intimately with mine, are hesitating; and their decision will be influenced by mine.

If I decide to take a short cut across a grass plot—just this once, and only I—I might just as well drive a squad of elephants across, for, sure enough, there will be a hard-beaten track in a few days. But, if I forbear and go around, my thought will stand there as a sentinel to turn aside the next intending delinquent.

If you are so very different from everybody else that there is no likelihood of anyone else acting in the same way as you choose to do; then, possibly, your individual acts do not matter. But, if your make-up is on the whole fairly similar to that of others, then any intention you may have is sure to visit the minds of your comrades also. Hence you are not a lonely culprit, but a conspirator. Your act will certainly influence the acts of many others; it may make or break the entire conspiracy.

Remember, then, that every action of yours, for good or evil, has a far-reaching effect, out of all proportion to its immediate visible result. It will turn the scale of countless wavering decisions. A penny dropped by you into a collection-box is many dollars, for the chink will be echoed by other chinks.

And, as our power of right action grows, so will our power as a center of influence grow. We may drift weakly along in the currents of impulse set in motion by other minds; or we may strongly withstand these currents and start new and independent currents for the right.

Oh! the power of an action and our limitless responsibilities and privileges! Should not the thought give us increased courage—that, when we resist, we resist for thousands; when we do right, we make life easier and brighter for unknown others? H. T. E.

FRIENDS IN COUNSEL

DEAR COMRADES: The joy and satisfaction shining in the faces of the residents, is a feature in the life of Lomaland that never fails to strike a visitor. This has sometimes occasioned much surprise. One most pathetic symptom of the joylessness of modern life is the desperate efforts made from time to time to compensate for the dullness of common existence, by trying to secure at least one day of pure and unalloyed ecstasy. These labored devices for forcing the reluctant hand of destiny are known as picnics and pleasure excursions. The daily routine is broken up, normal arrangements are dislocated, duties are dropped or handed over to inefficient substitutes and complicated plans are painfully contrived. This inconvenience is undergone, this extra work performed in order that a few hours may be passed in a delirious whirl of excitement to be invariably followed by the dull reaction of the sad succeeding days. In Lomaland though simple, little picnics are by no means unknown nor unappreciated, we find for the most part that the daily round and common task afford a steady even flow of satisfaction that we would not willingly exchange for an afternoon's excitement. Those who have learned to love the common sunshine and the twinkling stars can very well dispense with sky-rockets.

It seems to be a law of life that pleasure sought out for its own sake must always fail of its end. Pleasure and pain are like inseparable twins, and when pleasure comes to visit at our pressing invitation, he is always accompanied by his distressing brother. He who persists in the endeavor to make pleasure his constant companion must eternally suffer from the buffetings of pain which alternate unceasingly with pleasure's fond endearments.

There need be no monotony in daily life although our duty may consist of unromantic details in endless repetition. Of course if we confine our attention to the mere bodily actions a sense of sameness may arise; but if we try to live the life above the physical, each day should be pervaded by a freshness like the morning dew. The dewdrops glittering on the grass at sunrise, so hung and sparkled in the ancient days when what is now black coal waved green and beautiful as moss and fern, and yet we never weary of the dew. As intuition grows, we should see deeper into common things and find new meaning and suggestion in our oft repeated tasks. The tender ministrations of a mother to her child are never classified as "work," and if we truly loved our fellowman all services we rendered him would yield an ever increasing delight. Pleasure produced by special exertion resembles a cloudburst in the arid regions, but the joy that comes from duty faithfully performed is like the flowing of perennial springs whose murmur never dies away. STUDENT

THE RIGHT HAND OF BROTHERHOOD

AND if in thy life on earth
 In the chamber or by the hearth,
 'Mid the crowded city's tide,
 Or high on the lone hill-side;
 Thou canst cause a thought of peace,
 Or an aching thought to cease,
 Or a gleam of joy to burst
 On a soul in sadcess hurst;
 Spare not thy hand, my child:
 Though the gladdened should never know
 The well-spring amid the wild,
 Whence the waters of blessing flow. — George MacDonald

True reform has one beginning —
 The right hand of brotherhood.
 Would you help men out of sinning?
 Would you lead them into good?
 Would you teach that Christ has risen?
 Prove it by your deeds of worth.
 If you want to close the prison,
 Beautify the homes of earth. — Ellen Wheeler Wilcox

THEOSOPHICAL FORUM

Conducted by J. H. FUSSELL

Question Is there a royal road to Knowledge?

Answer (1) A certain writer contrasts two ideas as to the process of acquiring knowledge, which can be to some extent characterized by the terms Western and Eastern, in the following way. The former regards knowledge as divided into various branches, each of which is to be mastered by a process like going up a ladder. When the top of the ladder has been reached, the learner can come down and go up another ladder. This is the method of the plodder. The other idea regards knowledge as attainable in its entirety by a process like ascending a mountain top and obtaining a comprehensive view. This is the Oriental idea—that of illumination.

If it were possible to speak without being suspected of undervaluing patience and perseverance, those sterling and necessary virtues, something might be said in favor of the latter of these two ideas as to attaining knowledge. If the faculties *can* be increased and the vision clarified so as to make the attainment of knowledge ten-fold or a thousand-fold easier and more perfect, then why waste labor in plodding along with a primitive equipment?

This is the Raja Yoga idea. Train the whole nature, moral, mental, and physical, so as to remove impediments and render it pliable and of high temper; and then the acquisition of knowledge of any kind becomes easier. There is no need for so much drudgery.

We do not so much want to gain learning as the power to learn. Nor is there any known limit to the extent to which such power may be developed. There are faculties still latent in the Soul which cannot be unfolded in the chill atmosphere of selfishness, nor make their way to the light among the rank growth of prejudices and materialistic ideas. But let the warm atmosphere of Brotherhood thaw the whole nature, and these germs can unfold and reveal the higher possibilities of the human mind. E.

(2) It is thought by many that a royal road would be an easy one from which all obstacles had been removed, and to be traversed without effort. But what does *royal* mean? It means kingly and queenly. And who are truly kings and queens? The true kings and queens are they who lead, direct, work for their people, are their example in untiring energy, in devotion to the highest ideals, in the performance of every duty, and in all that goes to make up a noble life. And just so far as such a life is lived, even by one seemingly the meanest, does that one's life become royal.

There is a royal road to knowledge. Raja Yoga is this road, as its name implies, for Raja means *royal, kingly*, and Raja Yoga is defined as—to quote the words of Katherine Tingley—"the perfect balance of all our faculties, physical, mental, moral and spiritual." To acquire this balance requires effort and vigilance, unceasing, untiring, that the lower nature may be conquered, and the higher, the royal nature, may become manifest in every act of life. But after all, this is the easiest road, the

path of least resistance, for by following it we work with the Higher Law, and this is the only road by which one may attain completely the goal,—the highest knowledge. STUDENT

Question Why do Theosophists seek to learn specially of *ancient* religions?

Answer As an additional answer to this question which was answered in last week's issue, the following quotation from H. P. Blavatsky in *Isis Unveiled* is most valuable and suggestive:

There never was, nor can there be more than one universal religion; for there can be but one truth concerning God. Like an immense chain whose upper end remains invisibly emanating from a deity, . . . it encircles our globe in every direction; it leaves not even the darkest corner unvisited, before the other end turns back on its way to be again received where it first emanated. On this divine chain was strung the exoteric symbology of every people. Their variety of form is powerless to affect their substance, and under their diverse ideal types of the universe of matter, symbolizing its vivifying principles, the uncorrupted immaterial image of the spirit of being guiding them is the same.

. . . Let human brains submit themselves to torture for thousands of years to come; let theology perplex faith and mine it with the enforcing of incomprehensible dogmas in metaphysics; and science strengthen scepticism, by pulling down the tottering remains of spiritual intuition in mankind, with her demonstrations of its fallibility, eternal truth can never be destroyed. We find its last possible expression in our human language in the Persian Logos, the *Honover*, or the living *manifested* word of God. The Zoroastrian *Enoch-Veribe* is identical with the Jewish "*I am*"; and the "*Great Spirit*" of the poor untutored Indian, is the manifested Brahma of the Hindu philosopher. One of the latter, Tcharaka, a Hindu physician, who is said to have lived 5000 years B. C., in his treatise on the origin of things, called *Usa*, thus beautifully expresses himself: "Our Earth is, like all the luminous bodies that surround us, one of the atoms of the immense whole of which we show a slight conception by terming it—the Infinite."

"There is but one light, and there is but one darkness," says a Siamese proverb. . . Thus is it that all the religious monuments of old, in whatever land and under whatever climate, are the expression of the same identical thoughts, the key to which is in the esoteric doctrine. It would be vain, without studying the latter, to seek to unriddle the mysteries enshrouded for centuries in the temples and ruins of Egypt and Assyria or those of Central America, British Columbia and the Nagkon Wat of Cambodia. If each of these was built by a different nation; and not one of these nations had intercourse with the others for ages, it is also certain that all were planned and built under the direct supervision of the priests. And the clergy of every nation, though practising rites and ceremonies which may have differed externally, had evidently been initiated into the same traditional mysteries which were taught all over the world.

In order to institute a better comparison between the specimens of prehistoric architecture to be found at the most opposite points of the globe, we have but to point to the grandiose Hindu remains of Ellora in the Dekkan, the Mexican Chichen-Itza, in Yucatan, and the still grander ruins of Copan, in Guatemala. They present such features of resemblance that it seems impossible to escape the conviction that they were built by peoples moved by the same religious ideas, and that had reached an equal level of highest civilization in arts and science. STUDENT

Question What is meant by a Theosophic life? Please give a definition of one.

Answer I would say that a Theosophic life is one in harmony with the principles of Theosophy, actuated first by the spirit of Brotherhood; a life in which the constant endeavor is to seek the welfare of others rather than our own; to control the lower nature and follow the promptings of the higher; to seek to realize that the soul in all men is the *real* man and is in essence divine; to trust in the Higher Law, faithfully performing each and every duty, meeting the sorrows and the joys of life with equanimity, facing our trials with fortitude, keeping our hearts full of courage, hope and joy and dispensing these wherever we may be, thus helping to light up the dark places of the earth. To this we may add the words of H. P. Blavatsky: "To be more severe with ourselves than with others, to be more charitable towards the weaknesses of others than towards our own;" and finally, "To fear no one and naught, save the tribunal of our own conscience." STUDENT

"But imagine the same brain and body not in places of ease, struggling for good a part of life, doing their duty and not in a position to please the senses; this experience will burn in, stamp upon, carve into the character, more energy, more power and more fortitude. It is thus through the ages that great characters are made." WM. Q. JUDGE

Whom the Gods Love, Never Grow Old

MUCH antagonism has naturally been aroused to the statements that men cannot do good work after forty years of age, and that at sixty they ought to be chloroformed. These statements represent two fads which were aired by Dr. Osler, who is leaving America to become a medical professor at Oxford. The papers give lists of aged celebrities, ancient and modern, in all walks of life. These of course may be exceptions, but they are fairly numerous. Moreover, in view of the fact that human capacity is on an upward arc of development, exceptions become prophetic signs of what may one day be normal.

Those who are willing to concede to age greater ripeness and roundness may at the same time deny it the creative and original power. But even here the instances cited prove otherwise. Thus Leeuwenhoek discovered blood-corpuses, infusoria, etc., at 88; and Kepler announced the law of planetary distances at 59.

As a contrast to the views of Dr. Osler, a coroner's physician has been saying that men ought to live to 100 or 120, if nervous waste and careless hygiene did not cut them off before their allotted span.

He says that, according to Flourens' theory that an animal lives five times as long as it takes its bones to harden, man ought to live to 100. One hundred and twenty is probably the true period.

But, apart from the question of the duration of actual life, it may be said that, in a proper state, man ought to "die young"—that is ought to die painlessly without senility. The soul is eternal, and, in proportion as the man lives in the higher realms of his nature, will he share its immortality; while he who is the slave of his body will, with the body, grow old and feeble. It is generally considered useless to begin learning anything in old age; yet spontaneous enthusiasm often mocks this materialistic deduction, for some are endowed with an interior fount of life that acts from its own eternal energy and is independent of cold reason. S.

The Largest Diamond on Record

A DIAMOND has been found which exceeds in size all previously known ones. In the rough it weighs about one pound and six ounces, is of the size of an average man's fist, and looks like two teacups joined mouth to mouth. STUDENT

Recipe for Centenarianism

THE latest recipe for living to be a hundred is to eat "yaghurt," a special kind of curdled milk made only according to a Bulgarian recipe. It is said to be fatal to all destructive intestinal bacteria,

and favorable to the other kind of bacteria, the friendly ones. People breakfast on this preparation, which is described as resembling in appearance and flavor cream cheese gone bad. H. T. E.

Tone Reflector for Pianos

ON the list of inventions described is a "tone reflector" for pianos. It is simply a modified form of lid, which, instead of being flat, is made concavo-convex, the concave side being inside and carved in radiating ribs like a shell. The effect of this when the lid is open is to gather and reflect the

tones as the human palate or a sea-shell does; and it is claimed that even poor pianos can be made to send forth by this means deep and rich vibrations. STUDENT

Fractured Skull Treated by a "Realization of God's Allness"

THE papers report the case of a man who fractured his skull and was removed from hospital by his wife, a Christian scientist, after one week's treatment. She took him home and administered the following prescription: "An entire dependence on God and the works of Mrs. Eddy. Mental treatment, communion and a realization of God's Allness." The coroner interfered and sent around a physician whose services were compulsory. STUDENT

Extraordinary Theories of Life

"MONISM" is any system of philosophy which attempts to derive the multiplex universe from a single simple unit. An instinct of the mind compels us to do this. Scientific monism tries to derive all life from a unit of life—protoplasm, a vital atom, or what not.

But these scientific monists do not seem to see that the primary substance must be the most potent and endowed of all, since it is the container and producer of all. If atoms come together and thus form the universe, those atoms must contain in themselves all the creative and intelligent power which is manifested in that universe; for the hypothesis does not allow for any extraneous power that could influence the atoms.

This kind of monism is well exemplified in a book called the *History of Civilization*, by Julian Laughlin. The author is proficient in all the

branches of physical science, but should have been a poet as well, like Edgar A. Poe, when, like Poe, he would have found that his atom was God.

He gives an atomo-mechanical theory of the universe, according to which the unit is a free inactive atom. "At certain times," however, "an impulse to combine arises in these free atoms," and they forthwith do so, forming molecules, then protoplasm, and so on. This gives the whole business away. Almighty God, with all his creative power and inconceivable attributes, is smuggled casually into the machine under the disguise of "an impulse to combine." What, too, does the phrase "at certain times" imply and involve? What does it *not* involve?

We know that a house is made of bricks. But as an explanation the theory does not go far enough. We want to know something about the builders. And, if we dispense with these builders and say that the bricks built themselves, is it not clear that we shall need to endow those bricks with the same powers that the builders would have had?

But the author surpasses himself in his theory of the origin of the human race. It is of the same self-synthetizing kind, but gone madder than usual. Quoting from a review:

The author claims to have discovered, by dint of great research in the mythologies of the different nations, and by tracing back the discoveries, inventions and stock ideas of civilized life, the following facts: Man originated in the Garden or Orchard of Eden, between the Tigris and Euphrates rivers, from four tribes of monkeys then existing there, smaller, but in a condition similar to the present condition of the Gorilla, Chimpanzee, Orang and Gibbon. The skins of one tribe, whose descendants survive as Negroes, were black—another brown, another yellow and another white. From these tribes developed the white, brown, yellow and black races of today—all other colors and races being mixtures of these original four. The white tribe of monkeys was the most intelligent, and by some good fortune invented the bow and arrow, which made them masters of the forest.

Bow & Arrow Invented by Monkeys

A section then migrates to Egypt and evolves up till it "invents numbers" and everything else that humanity has.

It is a noteworthy conclusion, however, that "substantially all the ideas of the ancient world came from the Valley of the Nile. So did the great bulk of what is supposed to be our modern ideas." It is almost impossible to realize what the state of mind can be which can seriously propound such theories. But these philosophers keep their intellectual life in one compartment and their actual life in another. They are normally amiable and reasonable individuals.

This author is not so bad until he gets to origins. He should let those alone; they are not his strong point.

H. T. EDGE

A Temperate Corner in Alaska

ALASKA has many surprises in store for us. One of the most recently discovered is a little area west of the Lynn Canal, which rejoices in an extraordinarily genial climate, due, it is thought, to an unexplained warm current in the neighboring Pacific. Lynn Canal runs north from Juneau, not very far from Sitka, the capital, and is perhaps eighty miles long. Spring and summer are so warm there that settlers have already raised many vegetables, and some fruit trees of various kinds have been planted with every prospect of success.

A good deal of archeological interest attaches to the district by reason of the presence of a number of native Indians so far little studied, but giving evidence that their race once possessed a remarkably high degree of civilization. They are probably related to the Aleut Indians, who occupy the Alaskan Peninsula and the Aleutian Islands—a race having very interesting traditions. They relate that at one time the climate of their land was clear and warm; that their nation—which, they say, came from the west—was happy and prosperous; but that dissensions, war, and evils of many kinds, supervened. In consequence of their sins a very great flood was sent and destroyed the civilization and most of the people. After this submergence the land began to rise again and is now—they think—rising. Their grandfathers heard from their grandfathers that they used to find the traces on the newly risen shore of the ancient people.

Anyhow the Aleutian people's tradition runs very parallel with that inland Greenland race of whom a band were recently reported as having come to the coast telling a curious tale of their ancestry.

C.

Municipal Ownership in Scotland

AN American paper gives the following résumé of Glasgow municipal enterprise:

It bought and pulled down forty-six blocks of slums and built 1519 comfortable homes for working people. A three-room flat rents for \$5 a month.

It owns and manages seven model lodging houses, charging seven, eight and nine cents for lodging.

It built a "family home" for widows who have small children. Last year 110 widows and 217 children were lodged there.

It bought out the private water company and reduced the water rate from twenty-four cents per thousand gallons to eight cents.

It bought out the gas companies and reduced the price of gas to fifty-two cents per thousand feet. It spent \$12,000,000 and made a profit of \$2,000,000.

It has taken over the street car service, reduced the hours of the men, increased their pay, cut the fares in half and made a handsome annual profit.

It has established a public telephone system with a two-cent rate.

The paper then comments as follows:

Many reformers, impressed by the success of Glasgow in these various fields, urge her example as an argument for a similar extension of public functions in American cities. This seems a *non sequitur*. The conditions that have made municipal enterprise a success in Glasgow are not present in American cities. Note these things: First, Glasgow has an elaborate system of property qualifications for voting; the men who vote and control the management of the city plant are property owners and tax-payers; second, the citizens of Glasgow have a highly developed sense of public duty, of civic responsibility; the representative men of the city devote themselves with enthusiasm to the service of the city; third, the spoils system is absolutely unknown in Glasgow; the administration service of the city is entirely free from graft, bribery and jobbery.

Under the conditions that prevail in American cities any extension of municipal activities is dubious policy. The notion that we can improve our city governments by giving them more to do is against common sense and human nature. The first task for American reformers is to clean up the municipal administration as it stands. When we have secured decency, honesty and efficiency in the present service, then perhaps all these other things may be added unto us. STUDENT

Protection Versus Literature---The New Copyright Law

THE new copyright law is a good move as far as it goes; but it would be better if it went further. In the case of writers in foreign languages it removes the irksome requirement that they shall publish simultaneously in this and their own country. The foreign book is protected for a year so that its author may make up his mind whether it is worth his while, by publishing here, to effect a copyright. Pirate translations will cease to disgrace the market.

But in the matter of English books the case is unfortunately not altered. They must either pay a heavy duty on importation, or submit to a second printing in an American house. This mischievous—from the standpoint of literature—bit of protection is of course in the interests of our printers.

In the higher interests of our own people it is surely time to free art and literature from unnecessary shackles. STUDENT

The Rubber Industry

A CONTEMPORARY gives an interesting account of the collection and preparation of rubber in the Congo Free State and neighboring regions of West Africa, a trade which, apart from the human cruelties which attend it, is additionally fatal by reason of the fever-haunted districts where it is carried on. The numbers of those who return from the collecting expeditions are small compared with those who set out.

Rubber is the sap of certain trees and shrubs. More correctly, the sap is an emulsion in which flow myriads of minute globules of the rubber. This juice is heated in large vats, and when at a certain temperature poles are thrust into it. These return covered with the sticky rubber mixed with the albumen of the sap. The latter is coagulated by holding the pole in the smoke. This is repeated until a large mass of mixed rubber and coagulum is collected on the ends of the poles. The separation of the pure rubber from the mass is done at the manufactory.

There will be soon no need to go to this district, nor to give these natives so hideous an impression of our civilized methods. Rubber trees are being planted in many other places, and more than one equally valuable substitute, the product of other trees, are now known. And chemistry will probably soon make rubber or its equivalent synthetically. C.

Difference between a Living Language and an Artificial Code

Goju, goju, ni, kolegoj,
Dum ni junaj estas
Post plezura estanteo,
Post malgaja mal juneco
Sole tere restas.

SO sang in chorus an Esperanto club at one of its socials. The words are a translation of "*Gaudeamus igitur*."

Esperanto, or some similar system, may possibly become a success; but it is not a language—in the ordinary sense of the word. It is like shorthand, the telegraph, or any other artificial system of registering language. A language is not made; it grows. If we search back in the attempt to find how language originated, we find that one tongue is derived from another and we lose ourselves in the night of time. We cannot find the beginning; but in the process of modification, which one language undergoes in being derived from another, we can observe the laws of the growth of language, and from them infer by analogy the laws of its origin.

And what do we find? Not that a few learned people sit down in committees and intellectually devise word-formations and grammatical rules, but that the common people, in actual practice, introduce modifications into language to suit some unformulated instinct, necessity, or sense of fitness which they feel.

The fact is that language is not arbitrary. There is a genuine correspondence or causal relation between idea and word. A spoken word is a form of sound, and forms are the manifestation of ideas. A language grows around a racial mind as the substance of a flower builds itself up around the DESIGN in Nature's mind.

Hence we cannot devise a new language. But we may devise an international code that may prove very useful, as the telegraph code, the musical notation, and scientific nomenclature already do. STUDENT

Japan's Finances

IT is interesting that Japan had not the slightest difficulty in effecting her recent loan. Apart from her victories, the real reason was doubtless her increasingly flourishing industrial condition. She has never been in any danger of being financially crushed by the war. The December exchange of bank checks at the principal Japanese clearing-houses was 182 millions, as against 145 millions in 1903, and 125 millions in 1902. The postoffice savings-bank deposits reached in December a total of about 18 millions, as against 15 millions of a year before, and 14 millions of two years ago. And this in addition to the 140 millions subscribed by the Japanese people to their own government as an internal war-loan. Furthermore, during last year the export trade increased by ten per cent. on the amount of the preceding year.

The practical comment on these facts is not only the ease with which the loan was obtained, but the lowered interest exacted—4½ per cent. against 6. STUDENT

Gold in the Ocean

THERE is so very much sea-water in the world that, although it contains practically no gold, this nothing amounts to a good deal by multiplication. It is thought there might be about a grain of gold to the ton (English) of sea-water, which makes one part in sixteen million. Yet this would amount to two hundred tons of gold per cubic mile, and one hundred billions of tons of gold in the whole ocean. What a meaningless mathematical debauch!

But how to get the gold out? It is rumored that a company is formed in England to do this. Electrolytic methods have been suggested, on the strength of the statement that copper plates on piers have been found to accumulate appreciable quantities of gold. STUDENT

Coal Dust Prevents Consumption

A DOCTOR states that he has found that workers in anthracite mines are free from tuberculosis, the coal-dust which they breathe having a destructive effect upon the tubercle bacilli. Our ideas as to what is healthy and what not are in a constant state of flux. Coal-dust is a natural emanation and as such might well be less injurious than some of the emanations we produce above ground by artificial means. E.

Frontispiece---William Quan Judge

THIS week's cover-page of the NEW CENTURY PATH contains the face of Wm. Q. Judge, the second in the line of succession of the world's Theosophical Leaders. Mr. Judge succeeded to the Foundress of the Theosophical Society, Helena Petrovna Blavatsky. A successful lawyer, a brilliant writer, and a man of extraordinary insight into human nature, he was well fitted to carry on the great humanitarian and philosophic work of H.P. Blavatsky.

Brief Glimpses of the Prehistoric World

Archeology
Paleontology
Ethnology

Palaeolithic and Neolithic Man

THE excavations of the Metropolitan Subway in Paris are yielding more valuable records of one of the races which formerly inhabited France—what is called the Palaeolithic race. But, as usual, the archeologists are trying to fit the discoveries into current theories, instead of adapting the theories to fit the discoveries.

Near the tower of the ancient church of Saint-Germain-des-Prés, at a depth of twenty-eight feet, workmen found in the quaternary strata mammoth and rhinoceros teeth and flint tools of the Old Stone Age.

According to the idea that present-day Man has graduated uniformly upwards from "primitive barbarism," if not from the ape, scientists attempt to arrange the various records and relics found in a consecutive table; as, for instance, Palaeolithic, Neolithic, Bronze, Iron, etc. But the earth so far has been merely scratched here and there, and scientists have only secured, by way of materials for their classification, a miscellaneous assortment of odds and ends belonging to totally distinct races and epochs, and having no connection with each other, either chronologic or genealogic.

The Palaeolithic and Neolithic races are entirely unrelated, as H. P. Blavatsky, citing learned authority, shows. The older man was a most gifted artist, as is proved by his engravings on horns and bones; whereas the later man gives no signs of such taste. [Abbé Breuil, in summarizing these researches before the Academy of Sciences, mentions these excellent drawings of animals, as also the paintings and sculpture in low relief found on the cavern walls; and he has analyzed the work of these artists, and declares that not only were they accomplished realistic portrayers, but that they conventionalized designs for industrial decoration.]

The older man was not a cannibal; the later, and therefore, presumably more advanced, was a cannibal. There is nothing to show that the human race was more advanced in Neolithic than in Palaeolithic times. On the contrary everything goes to show that there have always been upon the earth (1) savages, (2) highly-civilized men, (3) fossils. The Australian aborigine uses today stone hatchets exactly like the Palaeolithic ones; the Esquimaux still engraves pictures with his knife-point; and if we no longer have petrified skulls, we at least do not lack of petrified brains.

H. P. Blavatsky says:

The relic of artistic merit reappearing in the Chipped-Stone-Age men is traceable to their *Atlantean* ancestry. Neolithic man was a forerunner of the great Aryan invasion, and immigrated from quite another quarter,—Asia, and in a measure, Northern Africa.

Ah, Modern Science! The homely beetle plodding industriously along the ground doubtless has his theories of the earth, derived from actual inspection and careful smelling of each separate particle. His is the *exam* method; he takes no risks; he will arrive some day if he does not happen to return on his tracks. But if a bird were to seize him and waft him through the air he would get a view of the world that would astonish him.

STUDENT

Mysterious White Races

AMONG the evidences for the truth of the anthropological teachings of H. P. Blavatsky are the persistent rumors of the existence of light-skinned races in the interiors of countries occupied by dark-skinned people. These rumors are too widely-spread, persistent, and mutually consistent, to be explained away.

A writer in *Chambers' Journal* says that:

The idea that in remote parts of the tropics, amid the dark-skinned races, there exist mysterious isolated white tribes bearing a strong resemblance to Europeans, has long possessed a curious fascination for the Old World.

The isolated white peoples almost invariably inhabit a mountainous region; they hold aloof from the surrounding races; they are seldom seen, and yet are definitely stated to be more civilized and better educated than the darker masses whom they avoid. Who they are and whence they came no one knows; native fables afford no explanation.

Yet so strong a hold has the idea gained that even at the beginning of the Twentieth century the possibility of the existence of a genuine white race is not

altogether scoffed at. It is less than two years ago that an American officer engaged in the operations against the Moros in the Philippines collected apparently substantial evidence relating to a mysterious white tribe in the island of Mindanao. The mountainous district in the centre of this island has never been explored, and even the coast is not well known. But along the seaboard many stories are told of the fierce white people who have their home in the forest-clad mountains of the interior.

Arabia, however, can with more reason boast of a white tribe. For years stories of such a race have been told in the Persian Gulf, and the Rev. S. M. Zwemer, an American missionary stationed at Muscat, alluded some time ago to "coffee-house babble" in Eastern Oman concerning a mysterious race of light complexioned people who live somewhere in the mountains, shun strangers and speak a language of their own.

This last was explained by an investigator as being the descendants of a portion of the Persian army which invaded Oman in the Tenth century. In Africa there are of course many accounts of such white races in the interior.

The writer in *Chambers' Journal* tries to sneer away these evidences. "Unfortunately for the romance of the world," he says, "it seems practically impossible for stories of this character to have the origins novelists would wish. The world is comparatively small today. The trail of the explorer is over every land." In fact he makes out that modern research has ransacked the world and most reluctantly discovered it barren of romance. But we take exception to the statement that the explorer has smeared his trail everywhere; there are still vast tracts totally unvisited, and others which have been merely crossed.

We may find an "unromantic" explanation for some cases, and by stretching the facts here and there we may make them fit our theories sufficiently well to "save our face;" but we cannot explain away universal testimony in this airy fashion. And besides there are all the other evidences for the Theosophical anthropology, which are mentioned from time to time in the NEW CENTURY PATH. It is the collective force of all this evidence that is so overwhelming.

Not a few anthropologists, however, are inclined to accept the evidence about these light-skinned people; but, as usual, they try to get some simple theory that will explain the whole thing, forgetting that there are sure to be complexities and ramifications innumerable in such a large problem as that of human history. They want to find some one white race which will account for all these legends. E.

Reading the Rosetta Stone

FEW people know the somewhat Sherlock-Holmes-like story of the deciphering of the famous Rosetta found in Egypt by a French engineer in 1799.

There were three forms of inscription upon it, the last being in Greek. This one stated of itself that it was identical with the other two, adding that one of the others was in the popular form of Egyptian, and the second in the hieroglyphic script used by the priests.

Casts of the stone were at once sent all over Europe, and for fourteen years the learned tried without success to disentangle the puzzle.

Then Thomas Young, the propounder of the wave theory of light, tried his hand. Among the royal names mentioned in the Greek portion, the most frequent was Ptolemaios. Another was Berenice. So he examined the signs in the Egyptian portions to find two which occurred in the same frequency. And these two happened to be surrounded in every case with an oval border:

He then sent a copy of his two ovals to Mr. Bankes, an Englishman engaged in work on some excavation at Philæ. On the walls of a temple some figures were sculptured, known from a Greek legend to be intended for Ptolemy and Cleopatra. Egyptian signs were carved above them, which Bankes surmised to be their names. One of these signs was identical with one of Young's ovals, and was therefore Ptolemy. Therefore the other was Cleopatra. In the three names which he now possessed, two must contain a "P," two an "L," and two an "R." The rest was easy, and so, little by little, the whole Alphabet was dissected out, with what vast consequences to science is well known. STUDENT

The Trend of Twentieth Century Science

Great Britain's Bathing

THOSE who are not fishermen or geologists must wonder why a portion of the North Sea should be called a *bank*—the now momentarily famous "Dogger Bank."

It is not a bank; but it was once an island. And before it was an island it was a low mountain or hill. We must go to geology for the history.

Great Britain has taken three or four dips under the ocean in the course of her career. In recovering herself from the last one she seems to have done more than she intended and come up too far. The whole of northwest and west Europe stood up out of the sea much higher than they now are—so high that what is now the North Sea was dry land connecting England with Scandinavia. Dogger Bank was a hill in that plain. Nor was there any channel between England and France. Neolithic man had only to walk across. And Ireland, England and Scotland were all one.

If soundings are taken in the Atlantic down the west coast of Ireland, England, France and Spain, it is found that a little way out into the ocean the depth, which out to that line is under 600 feet, suddenly becomes about 6000. This is the old coast line. It is close to Spain, crosses the Bay of Biscay, crosses the west mouth of the English Channel, and passes up west of Ireland and Scotland. Then it curves round to the east and joins Scandinavia.

But all this area began to sink again. The sea began to move into the English Channel so that at last only a strip of land ran between Dover and Calais. The plain that is now the North Sea began to be covered with shallow and finally with rather deep water. Wild animals that had formerly wandered across it between England and Norway found that they must make up their minds to stay either on one side or the other. Some who had less decision of character, adopted a middle course and unwisely remained on the Dogger Bank hill. But the sea finally submerged this and they were all drowned or died of starvation. Their bones often come up in the fishing nets.

The sinking seems to be still going on. Perhaps it is time for another bath. Great Britain may have had enough of our ("fifth") race. In immensely far-away epochs she has harbored Atlanteans and Lemurians, men of the "fourth" and of the "third" human races, as Theosophy classifies humanity in time. According to the same teaching there are races to come who, whilst they will be ourselves, will be as superbly in advance of us as we of the Paleolithic savage. STUDENT

The Two Ends of Infinity

ASTRONOMERS hope that the knowledge they acquire during the eclipse of next August may be to their science what the discovery of the X-rays, and, later, of radium, was to chemistry and physics. For as yet astronomy has not entered upon any such new epoch as have the two sister sciences.

Nor has the telescope made as much progress in its structure as the microscope. In the latter there have been two or three marked improvements. There is the lateral illumination of the slide, the observer's eye being thus freed from the glare of light coming up from below. There is the use of ultra-violet light, the light that causes certain substances to become fluorescent; the object under examination is impregnated with such a solution and from the invisible source of illumination hitherto unknown details of structure become visible. And lastly there is the new method of throwing the highly magnified image on a screen and then subjecting this to a second magnification. An amplification of ten thousand diameters is thus obtained,—sufficient to give an ordinary bacillus a length of two or three inches.

To set against these improvements of the microscope, the telescope has increased in size, and has allied itself with the camera and the spectroscope. Of late also, there has come into use a method of examining an object by certain rays only of its light: for example, in the case of the sun, those that come from incandescent calcium alone. The result is somewhat similar to what we should get in the case of the body if we

had in our cameras a sensitive plate which would only photograph one special element, say the blood system. We should have a perfect picture of that, clear of all other details.

The largest telescope hitherto made is the "Snow" instrument, now at work on Wilson's Peak in California. This is a reflector, with two mirrors respectively of the focus of 60 and 145 feet, producing solar images of 7 and 16 inches in diameter.

Now let us see what astronomers can do in the region of the almost infinitely great. Chemistry and physics are well on their way in the direction of the almost infinitely little and can talk of the ultra-atomic electric corpuscle with some imitation of surety. But perhaps it too may one day be found as complex as the sun, and even to be a home of living beings. STUDENT

Copper as a Water Purifier

THE Agricultural Department is about to issue a new bulletin confirming its former recommendation of copper sulphate (blue vitriol) as a disinfectant for foul or doubtful water. The proportion of one in twenty thousand, two hundred thousand, and even in some cases two million, is enough to destroy the algæ or minute forms of vegetable life. The sulphate would also be fatal to the germs of many diseases, cholera, typhoid and others. According to the bulletin, the mere keeping of suspected water in copper tanks would suffice to sterilize it in many cases.

Copper has a curious influence upon some diseases. It was noted that during an outbreak of cholera in Europe, the disease was not contracted by any of the workers in copper factories, and it forms one of the regular medicines for cholera in Hahnemannian practise. During the same outbreak copper plates were also worn by many people over the lower abdominal region—it is said with success as a preventative.

The metal does not appear to be poisonous in the amount recommended, though somewhat prolonged experience will be necessary to be sure of this. It is a normal constituent of certain fruits, for example the strawberry; and in the form of insecticide spray on grapes it is frequently eaten with the unwashed fruit.

The highest proportion recommended by the Department—1 in 20,000, is about one grain to a quart of water. The next is one grain in two-and-one-half gallons; and the last one grain in 25 gallons. Such quantities are of course quite tasteless. In no case would it be used as a routine measure, but only when organic matter was known or suspected. The presence of this may be determined by adding a drop or two of a solution of potassium permanganate solution. Dangerous water will quickly destroy the rich crimson of the permanganate. PHYSICIAN

Luminous Animals

SOME interesting studies have recently been made on the light of the glow-worm. It appears that it is due to a secretion produced from a certain gland in connection with the creature's nervous system, and therefore under the control of its will. This substance is a fluid to which the name of "noctilucine" has been given.

Several other creatures secrete it beside the glow-worm—the fire-fly, a species of centipede, one of the mollusks, the microscopic *Noctiluca Miliaris* which causes the phosphorescence of sea-water, and some of the polyps. It is also supposed to be produced by the decomposition of fish, in the decay of certain vegetables such as the potato, and very exceptionally by the skin of man.

Noctilucine examined spectroscopically shows a light-emanation about the yellow and green of the spectrum, and the light emitted is intense enough to affect a photographic plate. It is a white unctuous substance drying into scales, and the light is believed to be due to oxidation. The eggs of the glow-worm are covered with it, and they consequently remain luminous for some little time after they are laid.

The phenomenon of luminescence will not seem so remarkable when we recollect that all living beings and even crystals emit light continuously. The light of the glow-worm happens to fall within the poor little octave to which our vision-sense is at present confined. STUDENT

Should Crows & Hawks Be Destroyed?

THE question between farmers and ornithologists, as to whether or not crows and hawks should be destroyed, is still keenly debated. From what one reads about the controversy, the farmers, who are for shooting these birds, seem to have the most reason on their side. Their arguments are based

on what happens in their own poultry-yards and grain fields; whereas those of the ornithologists are based largely on examination of the contents of the hawks' and crows' stomachs. If it is true, as an Audubon society expert says, that the stomachs are found to contain mostly mice and insects, still the loss of a few chickens may mean more than the destruction of hundreds of vermin. It is a question of proportion.

But a farmer who is also a naturalist, and claims to have studied the birds in the living state instead of analyzing their stomachs, denies the fact that the hawks live mostly on mice. He recounts losses in pigeons and chickens from hawks; and says that, though his fields are overrun with mice, he has never seen a hawk swoop down on a mouse. As for the crow, he is such a notorious corn-thief that the ornithologists will be hard put to find in him enough virtues to compensate for his destructiveness in this respect.

E.

Humane Methods of Nature Study

Hast thou named all the birds without a gun?

Oh! be my friend! and teach me to be thine.—Emerson

WE are happy to note the advent of a method of study which renders possible this beautiful result. The system is extremely simple and has the advantage of furnishing more minute and exact information as well as being less wearing on the birds, than the shotgun analysis.

The plan is to take a small tent, a camera, and a note-book; erect the tent near the nest, hide inside, and wait. For very timid birds the tent may be painted with natural scenery or hidden by grass affixed; but with other species it is possible to simplify the problem by bringing the nest to the tent and fastening it where convenient. The concealed observer is thus enabled to enter into the secrets of bird housekeeping under perfectly natural conditions. Several books have been compiled from such observations and contain some curious facts, as, for instance, that the male of a certain species always alights on the right side of the nest; not on the left.

Some of the photographs were taken of perfectly free and fearless birds at a distance of two or three feet, revealing curious details of poses, actions, etc., never previously observed.

Certainly it is a long step in advance when even scientific examinations can be held without putting the witnesses to the torture. Possibly free testimony may prove to be even more accurate. N. L.

SOLACE OF NATURE

by WILLIAM CULLEN BRYANT

TO him who in the love of nature holds
Compassion with her visible forms, she speaks
A various language: for his gayet hours,
She has a voice of gladness and a smile,
And eloquence of beauty, and she glides
Into his darker musings with a mild
And gentie sympathy, that steals away
Their sharpness, ere he is aware.

over fifteen feet high at the hips. The estimated weight of the animal is ninety-four tons. It is Jurassic and is supposed to be 8,000,000 years old.

It was found in 1897 in the Bad Lands of Wyoming, not far from Medicine Bow, in a region where fossils are so abundant that they protrude from the soil like rocks. The animal was taken out in sections, each stage of the process being recorded by photography. The sections were encased in plaster and shipped to the museum. After this it took two years more to chisel off the rock from the fossil bones, and to fit together and cement the shattered bones. The articulation of the bones was a still longer and more difficult process, partly owing to their immense size and partly from ignorance of how to piece them. Other dinosaur skeletons had to be studied and lizards to be dissected. The missing parts were made up by casts from other skeletons or by modelling according to the available evidence for their shape.

The dinosaur is a huge lizard on four legs. The legs are thick and elephantine, the body thick, arched over the hind legs, and gradually tapering off in a thick trailing tail. The neck is long and the head singularly small, being scarcely bigger than the vertebræ, and flattened like a lizard's. The brain was small, even in proportion to the head, and far exceeded in bulk by the pelvic spinal substance.

The nature of the joints in the lower parts of the body indicates an aquatic habit, as they are heavy and slow-moving; while the upper articulations are supple, showing that they were used in the air. The creature was amphibious. He probably lived a very sleepy life, feeding his vast bulk on water-weeds. Owing to the size of the skeleton, a favorable opportunity is afforded for studying the elaborate and beautiful mechanism of the bones, which anticipate and far surpass every mechanical device known to engineers.

STUDENT

THE devotion to truth and freedom, in spite of personal motives, shown by our archeologists and paleontologists in their researches, is one of the saving graces of humanity in a sordid age. And though their theories may be narrow and inadequate, yet, so long as they faithfully record the facts, the theories will be amply provided for by minds fitted to that task.

The Brontosaurus

IN patience, skill and devotion to science, the paleontologists are certainly not deficient. After seven years of labor they have succeeded in mounting, in the American Museum of Natural History, New York, a complete skeleton of Brontosaurus, amphibious dinosaur of the order of Sauropoda.

This skeleton is sixty-six feet long and

WOMAN'S WORK

"Do not despise your situation: in it you must act, suffer, and conquer. From every point on earth we are equally near to heaven and to the Infinite.—Amiel

IT is a rare experience to meet a woman who will not, given just the right opportunity, unload her grievances at your feet. This or that is not as it should be; this or that circumstance keeps her from doing the great deeds she would otherwise perform; this or that event happened just in time to prevent the realization of her plans and then—if you have not by this time escaped—there may come a long harangue about the victim's own imperfections, her own weaknesses, her own inherited tendencies "which are so hard to overcome," etc., etc. Ye gods! Yet that condition—disease rather—is more general among women—and men, too—than one who has never studied human nature can possibly be aware.

Why will people look down when they might look up? Why will they persist in building huts when they might build palaces? Now, there is nothing wrong about being aware of the events—the calamities if you will—of one's personal life. The wrong lies in the fact of thinking that one's little personal world is the whole cosmos. It is no crime to have personal loves and longings, provided they are pure; the crime consists in considering them to be of more importance than anything in the universe.

The personal idea is what ails the world today. It is what is filling up our asylums and our "sanitariums for nervous diseases." It is keeping one-half of humanity mentally on the ragged edge and pushing the other half headlong over into the abyss. What is the remedy?

When Katherine Tingley said, "Once let women recognize their sisterhood, the divinity of their own souls, the great and common purpose of their lives, one-half their difficulties will disappear in the twinkling of an eye," she was not uttering a mere figure of speech. She pointed to the eternal truth that our alienists will yet acknowledge, that insanity has its root and cause in selfishness, in a sense of separateness from the rest of humanity. For the difference between sanity and insanity is simply the difference between centrifugal and centripetal forces. The sane, mentally healthy woman, she whose brain-mind is under control, is never the one to fling in the face of every passer-by her personal qualms or idiosyncrasies. She has more interest in the projects and plans and people *without* her little personal circle than in the one solitary individual within it. Her life is a constant giving, a constant expending, a more or less conscious expression of steady compassion.

What is the universal characteristic of a lunatic, or, to use the more fashionable term, a nervous wreck? It is a constant turning inward

■ **"THOU SLEEPEST, BRUTUS, AND**
 ■ **YET ROME IS IN CHAINS!"** ■ ■ ■

upon one's self. It is "I, my, me" perpetually and all the time and forever. "I" am persecuted and abused or not appreciated, or some-

thing. Every circumstance is related to "myself," never once related or adjusted to anything else—never—it would not do, for by such a course one might lose sight of "I, my, me." What wonder, with selfishness carried to such an extreme, the reason becomes hopelessly upset?

In a recent number of *The Lancet*, one of our most reliable medical papers, it is stated that insanity among women is on the increase, and that the forms it assumes today are becoming less and less curable. This is an entertaining prospect. What are we going to do about it? In the first place let us wake up and set ourselves straight mentally, in case we have not already done so. In the second place, let us acknowledge the cause of extreme nervousness, melancholia, hysteria, and the many forms of nervous diseases which lead straight toward actual lunacy, to be what it really is—the *personal idea*. Then let us set about eradicating that cause in ourselves. We can eradicate it in others afterwards.

No characteristic of Lomaland students has been more commented upon than their marvelous enthusiasm. Whence comes it? From a knowledge of the world's needs, the knowledge that the wise Teacher has not *given* them, but has taught them to acquire for themselves; from the innate strength and purity which has not been applied to their lives as one might apply a plaster, but which they have been shown how to earn for themselves by effort and conquest; from the knowledge of the world's mental unbalance and the burning desire to lead it back again into the pathway of sane life. The women students of Lomaland cannot sleep nor parley, they expend little strength in words, much in selfless deeds. Nor can they with clear conscience let others sleep, when all about their sisters are traveling the path that leads to the asylum and the grave. "Thou sleepest" is their anguished cry, "thou sleepest, yet the world is in chains."
 STUDENT

A FRIEND who has recently visited the leper colony at Molokai writes that one remarkable feature is the heroism often displayed by non-leprous wives. "Indeed, while some husbands not infected go there to dwell with their disease-stricken wives, the number of wives who do this is far greater. Yet they go, cheerfully, although well aware that a hideous and lingering death is certain to be their doom, sooner or later." A very high sense of duty and an unselfish affection must be the holding power in the character of these isolated people who are facing death daily.

Sadayatsuko, the Noted Japanese Actress

DURING the Paris Exposition of 1900, a troupe of Japanese actors, under the direction of Kawakami, presented various plays in the Japanese language, and aroused the keenest interest and approval of the theatre-going public.

Especially noticeable was the leading woman, Sadayatsuko, the wife of Kawakami. Endowed by nature with an exquisite beauty of face and form, she also possessed a peculiarly refined personality, charm of manner, and an incomparable grace.

Sadayatsuko's comprehensive understanding of the best in dramatic interpretation is so keen, that she renders clear to her auditors every phase of emotion she wishes to portray. A knowledge of the language is quite unnecessary.

Kawakami, her husband, is considered Japan's leading actor at present, and together they make a rare combination of two unusually gifted artists, both having the same power of picturing all they desire to, by means of pantomime and mobility of features. One wonders if the drama of the future will not be more on such lines, when soul will interpret to soul.

Sadayatsuko is the greater genius of the two. As though to complete the perfection of this dainty, gifted, rarely graceful actress, there is permeating all her art that subtle, poetic quality, which is the characteristic of the Oriental temperament. E.

MME. EUGÉNIE KONRADI might be called the pioneer of higher education for Russian women. It was she who presented a petition, signed by more than 2500 women, at a meeting of the first congress of naturalists, held in St. Petersburg in 1868, in which was set forth the absolute necessity of organizing regular courses of instruction for women on the subjects of the historico-philological and physico-mathematical sciences.

While the congress gave this petition its warm approbation, it was unable to take active measures to support it. However, the rector and faculty of the University of St. Petersburg acted energetically in 1869, when a similar memorial was presented to them, stating that the signers, now increased to 4000, desired to acquire such knowledge as would enable them to benefit, as teachers, not only their own immediate families, but society at large, and also assist them in earning a livelihood in other ways. The fame of this memorial spread all over Russia and even abroad. John Stuart Mill sent to Mme. Konradi a letter expressing his warm sympathy and approbation of the project. Other women interested in this movement were Miss Nadezhda V. Stasoff, Mme. Trubnikoff and Marya Bokoff.—*Ex.*

AMISS JOHNSTON of Washington has been honored by the French Government with the decoration of the "Palme Académiques." Only about twenty-five women in France have been similarly honored and but one other American woman wears the little purple ribbon of the order. The decoration was bestowed upon Miss Johnston in recognition of the value of her services as United States delegate to the International Congress of Photography, and also for her friendly offices toward France at the recent St. Louis Exposition.

THE commission which is reforming the Civil Code of Paris has recently taken up the question of marriage and has drawn attention to the fact that the word "love" does not occur in the existing regulations. According to the French marriage law "the contracting parties shall undertake to be faithful to each other and shall mutually protect and assist each other." It is probable that in the revised Code will be inserted the clause "The rights of the husband and wife shall be equal"—certainly a step in advance and auguring well, indeed, for the future.

A Gigantic Wooden Statue

IN the Japanese capital there is a gigantic image of a woman, made of wood and plaster, dedicated to Hachiman, the god of war. In height it measures fifty-four feet, the head alone, which is reached by a winding stairway in the interior of the figure, being large enough to comfortably hold twenty persons. The figure holds a huge wooden sword in one hand, the blade of the weapon being twenty-seven feet long, and a ball twelve feet in diameter in the other. Internally the model is fitted up with extraordinary anatomical arrangement which is supposed to represent the different portions of the brain. A fine view of the country is obtained by looking through one of the eyes of the figure. Japanese tradition says that during the time of the Teshomeng rebellion, in 1522, hundreds of cords of wood were piled around it and fired, but that the sacred object itself failed to burn or to even be scorched by the flames.—*Selected*

SADAYATSUKO
The Noted Japanese Actress

ODE

By Her Majesty the Empress of Japan

THE water placed in goblet, bowl or cup
Changes its form to the receptacle;
And so our plastic souls take various shapes
And characters of good or ill, to fit
The good or evil in the friends we choose.
Therefore be careful in your choice of friends
And let your special love be given to those
Whose strength of soul may prove as whip and spur,
Urging you ever to fair wisdom's goal.

This Ode, written by Her Majesty, was addressed to the young students of the School for Peeresses, Tokyo, Japan, of which Her Majesty is the chief patroness and in which she takes a deep interest. The English translation (quoted from a journal published in Tokyo, by T. Minami) was made by one of the students.

PHYSICIANS and poor law guardians look with alarm upon the rapid growth of flat-life in London, England. They are of the opinion that the monotony of it is directly responsible for many of the cases of insanity that have come under their notice. One is convinced that on women life in flats has a particularly depressing influence.

But a monotony of the most agreeable and physically invigorating surroundings drives other women to insanity, and hallucinations, if carefully traced to their breeding place, are found to grow strong and multiply in purposeless lives of whatsoever environment. There are many hard-worked women living in flats who, despite their surroundings, make their homes happy centres of activity, and feel themselves cut off from few means of enjoyment and from no opportunities for improvement. Flat-life, of itself, need not limit the mental outlook. It is in the women, and not in the life in flats, that we must look for the tendency towards lunacy. If not, how explain the numerous cases of lunacy and melancholia among royalty and the nobility—classes which are as far removed from the inconveniences of a cramped city flat as it is possible to imagine?

It is true that a house and a plot of ground offer more ideal and healthful conditions for home-making, but it is not difficult to see that women who are driven mad by the conditions of flat-life lack the poise that is needed to contend with conditions of life that may arise in any environment. When the deeper needs of the woman nature are recognized by women themselves, and meet a response from the wise, who know how to help, there will be fewer cases of insanity in all quarters. Nor will the philanthropists who are seeking to

alleviate these conditions find certain remedy anywhere save in a better understanding of human nature and a broader, more logical, theory of life.

STUDENT

THE permission granted to Mrs. Florence Maybrick to visit the prisons and reformatories of New York State, for the purpose of observing the methods and conditions therein existing, has perhaps never been given to one more keenly alive to the needs of prisoners. Mrs. Maybrick's fifteen years spent in English prisons must have opened her eyes to many things which ordinarily escape the attention of prison visitors. She has seen prisons from within. It speaks well for this much tried woman that her experience has kindled a sense of responsibility for the welfare of prisoners, that leads her to active effort in their behalf.

It is said that during every summer large numbers of women come from Poland and Silesia to work in the sugar-beet fields of Central Germany. They work in gangs, under a male overseer, receiving thirty-five cents a day and their board. In the autumn they return to their homes.

OUR YOUNG FOLK

William Penn

ON William Penn's seal was the motto, "Mercy and Justice," and the life of the great Quaker colonizer proved that mercy and justice were in his heart, and were what inspired his many noble deeds.

When William Penn was a young lad, on a visit to his father's estate in County Cork, Ireland, he first heard the preaching of the Quakers. He was a thoughtful boy and was deeply impressed by what he heard.

Penn went to study at Christ Church College, Oxford. Here his boyish nature showed itself in his love of field exercise, and he was well known for his skill in athletic sports. At Oxford Penn's interest in the Quakers was again aroused. At that time they were a despised and persecuted body of people.

They believed war to be wicked, and so would not fight for the king. Admiral Penn, fearing his son would join them, sent him to France. William Penn continued his education at the College at Saumur. He found time to study deeply into the early history of the Christian Church, and his religious views were broadened, so that no mere orthodoxy could express his ideals of God and of man.

When Penn returned to England he became a law student. A brilliant career opened before him, but he was not tempted by either worldly or selfish desires, and soon avowed himself a Quaker. From that time his life was given to indefatigable efforts in the cause of religious freedom.

His public assertion of his views led to persecution and imprisonment. While in prison Penn wrote several books; one of them was about *The Great Case of Liberty of Conscience*.

Among the Quakers Penn was recognized as a leader, and he was ever their loyal champion. He protested in speech and writing against the unjust treatment which they received. At one time, through his intercession, twelve hundred Quakers were released from prison, where they were in danger of losing their lives.

It was as proprietor and governor of Pennsylvania that the genius of William Penn was revealed. He established a just government, under which liberty of conscience was guaranteed, and persecution for religious belief was impossible.

William Penn was one of the few enthusiasts who were willing to grant to others the freedom he claimed for himself. Under his merciful rule the death penalty was abolished as a punishment for any crime except murder.

William Penn was humane and wise enough to consider the rights of the American Indian. There is no written record of the famous treaty which he made with them in 1682, but it lived in the hearts of the people and the compact was never broken. The Indians never shed the blood of a Quaker. By acts of simple justice and kindly friendship Penn maintained a brotherly relation with the Indians, and insured the safety of his colony. Under the laws of Pennsylvania the person of an Indian was held to be as sacred as that of a white man, and his rights were upheld.

In many ways William Penn was in advance of his time. He wrote, in 1693, his *Essay Toward the Present and Future Peace of Europe*. In it he prophesied a congress of nations in which each should be repre-

mented, and in which all differences should be settled equitably without recourse to war.

The spirit which animated this courageous pioneer in the cause of freedom is well expressed in his own words: "I abhor two principles in religion, and pity them that own them; the first is obedience upon authority without conviction; and the other is destroying them that differ with me, for God's sake."

Facts Worth Knowing

THEY are rebuilding the Campanile of Venice, to complete which will probably take five years.

A MASS of aluminum which weighs one pound is four times as large as a mass of lead weighing the same.

NEARLY all of the world's supply of platinum comes from a single district in Russia, a very little district with a very long name, Gorotiagodatski.

THE longest of the Alpine tunnels has been finished, the Simplon tunnel, which connects Italy and Switzerland. It was begun in 1898. Ten thousand men were employed, and they were needed, for there were many difficulties. One of these was the finding of an internal lake which poured forth geysers of boiling water. Then, too, the rock was hard, but they kept on. In Geneva there was great rejoicing and firing of salutes on the morning when the boring was completed.

GREAT magnets are now being used for lifting large masses of iron. The process is very simple and the results are marvelous. An electromagnet, energized by a current led to it through a flexible wire, can pick up an iron plate eighteen or twenty times its own weight, by merely being brought into contact with it, as easily as you or I would pick up a book. All the cumbersome chains connected with crane-hook work are done away with.

Much time and labor are saved and the process is safe and efficient. It is particularly useful in the handling of hot material, saving the strength and health of men. These lifting magnets are used not only in this country but abroad.

A REMARKABLE instrument, called the *hydroscope*, has been recently invented by an Italian. By it the bottom of the sea can be perfectly examined, something it has hitherto been impossible to do satisfactorily. The *hydroscope* is something like a huge telescope pointed downward instead of upward, and consists of a very complex system of lenses. Who knows but this instrument may yet be a factor in proving to the world the

existence of "lost continents," once above the sea, filled with great cities, the homes of mighty races of men—but now submerged, waiting until the right time comes for their secrets to be revealed?

THE lowest volcano in the world is in the Philippines. "Taal" it is called, and it rises from the center of a large lake, a lake so impregnated with sulphur that fish can not live in it. "Taal" was once much higher, but one day, while in a temper, she blew off her whole top! What remained is little more now than a gigantic crater, nearly two miles in diameter and the largest in the world. So much for a temper!

NEVER rail or taunt. The one is rude, the other is scornful, and both are evil.—Penn

PORTRAIT OF WILLIAM PENN AT 22 YEARS OF AGE

THEODORE ROOSEVELT, President of the United States, said recently:

I like to quote one of Washington's maxims: "Promote, as an object of primary importance, institutions for the general diffusion of knowledge. In proportion as the structure of the Government gives force to public opinion it is essential that public opinion should be enlightened."

Now, education may not make a man a good citizen, but certainly ignorance tends to prevent him from being a good citizen. The problems before us today are very complex but we can solve them if we approach them in a spirit of sanity and courage, a spirit which combines hard common sense with the loftiest idealism.

THE CHILDREN'S HOUR

The Raja Yoga Question Box

TWO souls, each trying to find life's harmony, and each telling life's story in his own way—both were workers for humanity.

1 Who was Bach?

ANSWER—Bach was born in Saxony in 1685. He was one of the greatest musical composers who ever lived. The Bach family had been noted for musical genius for more than a century.

John Sebastian Bach earned his living when only a little boy as a chorister. His compositions are wonderful and rare. He was the greatest organist as well as the greatest composer of his day. Musicians today look upon his compositions as models. His life was honorable, manly, tender and just.

2 Who was John Bunyan?

ANSWER—John Bunyan was born in England, near Bedford, in 1628. His father was a laborer. John received very little education. He did not understand his own nature nor the nature of others and he often went to great extremes. He was very religious, so far as he understood religion, and he began to preach when still a young man. His persecutors threw him into jail. While there he wrote the *Pilgrim's Progress*, which is not what he would have written had he lived in a wiser time. But for that time it was considered a wonderful book and the little poem on this page shows that John Bunyan knew something about the warrior spirit. But he did not know that life was joy. He made life sad and hard. That was his great mistake.

"Thought Seeds"

"It is raining," said small Margery in a very doleful voice.

"How splendid!" and Aunt Bertha walked to the window and looked out.

"I want to go out," and Margery's cross expression quite spoiled her pretty little face.

"How charmed the plants will be with their lovely bath, after all the dust and heat, and poor old Joseph will not need to water the garden tonight! Ah! Look at the dear little birdies having a bath in that puddle, Margery!"

This was interesting, and Margery's crossness disappeared as she watched. "Auntie, will the little fern trees like the rain?"

"I am sure they will love it," she replied. "Indeed they may, perhaps, imagine themselves back beside the waterfall as seeds again, if it goes on raining so hard."

"Do you remember," asked Margery, "about the story of the 'Thought-Seeds' that you said you would tell me some other day?"

"I will tell it to you now," her aunt replied.

"I'd like to see a thought-seed," said the little girl.

"Would you, dear?" and Aunt Bertha smiled. "They are hidden away in our hearts as seeds are in the ground, and they grow in the silence, but you may see the plants which grow from them."

"Margery's eyes grew round with wonder. "Can everybody see them?" she asked.

"Yes," Aunt Bertha replied, "when the fruit is bitter, people mostly cry or grumble and wonder where it came from, not knowing that it was the fruit of the seeds they planted themselves.

"Show me some fruit, please," asked Margery.

"This story is the fruit of some thought-seeds that you planted," replied her aunt. "If you had not listened to other stories I have told you, you would not have heard this one. Little seeds of interest and attention have borne this fruit; and then, too, when you plant a happy thought the fruit will be a cheering smile; and when you plant a loving thought the fruit is happiness. Right in your heart you feel happy, then, don't you?" Margery nodded.

"Selfish thought-seeds plant the seeds of ill-temper, and tears, and miserable feelings," continued Aunt Bertha. Margery sat very still.

"You can pull weeds up," she said at last.

"Of course you can, darling, and the quicker the better, for they have such a lot of new seeds and spread so quickly! Bad temper seeds always mean tears, too, and more bad tempers."

"How do you pull them up?" asked the little girl.

"How do you think?" asked her aunt. "When you are cross you smile instead, don't you?"

"I think," said Margery, slowly, "that is it, and then the crossness goes away."

"That is a warrior's way, dear little Soul," said her aunt, kissing her.

"Fight back to the light, however dark it may be, and Margery, the best way I know is to plant so many seeds of love and kindness and cheerfulness that there is no space left for ugly weeds to grow. Only the good, the beautiful and the true can thrive when our hearts are filled with the flowers of love, for they crowd the weed seeds out. Ah! The sun is shining again and the rain and the clouds have done their work and are gone! Let us go out into the sunshine!"

ETHNE

THE PILGRIM

A poem written by JOHN BUNYAN four hundred years ago

WHO would true valor see
Let him come hither!
One here will constant be,
Come wind, come weather:
There's no discouragement
Shall make him once relent
His first-avow'd intent
To be a Pilgrim.

Whoso beset him round
With dismal stories,
Do but themselves confound;
His strength the more is.
No lion can him fright;
He'll with a giant fight;
But he will have a right
To be a Pilgrim.

Not enemy, nor friend,
Can daunt his spirit;
He knows he at the end
Shall life inherit:—
Then, fancies, fly away;
He'll not fear what men say;
He'll labor, night and day,
To be a Pilgrim.

Fairy Tales and Fairy Pictures

MANY boys and girls love the fairy stories written for children by Hans Christian Andersen. They will like to hear this little story.

One of the grown-ups now living in Lomaland was often taken, when he was a child, to visit Hans Andersen in his pleasant home in Copenhagen. And while Hans Andersen, who was quite an old man even then, sat chatting with his friends, what do you think he used to do?

He folded a piece of paper very neatly, and then he took the scissors. Snip, snip would go the scissors in the paper. Presently the paper would be folded over another way. Again, snip, snip, snip, would go the scissors. By and by, after Hans Andersen had folded and cut the paper so many times you would hardly think there could be any of it left, he would lay down the scissors, and shake out a wonderful paper picture, just like fairyland. Behold ships, and swans, and storks, and flowers, and trees! And all just like fine lace-work. Hans Andersen had done it all with the scissors.

How delighted the children were! How eagerly they used to wait to see what Hans Andersen was putting into the paper picture! The grown-ups were interested, too. They said the pictures were just like one of Hans Andersen's fairy tales.

The children used to treasure these fairy pictures. But they could never keep them very long. They were so like a spider's web that they fell to pieces if they were handled ever so little.

I believe all the fairy pictures are gone now. But the fairy tales are left, and they can be read over and over, and will last as long as children love to read them.

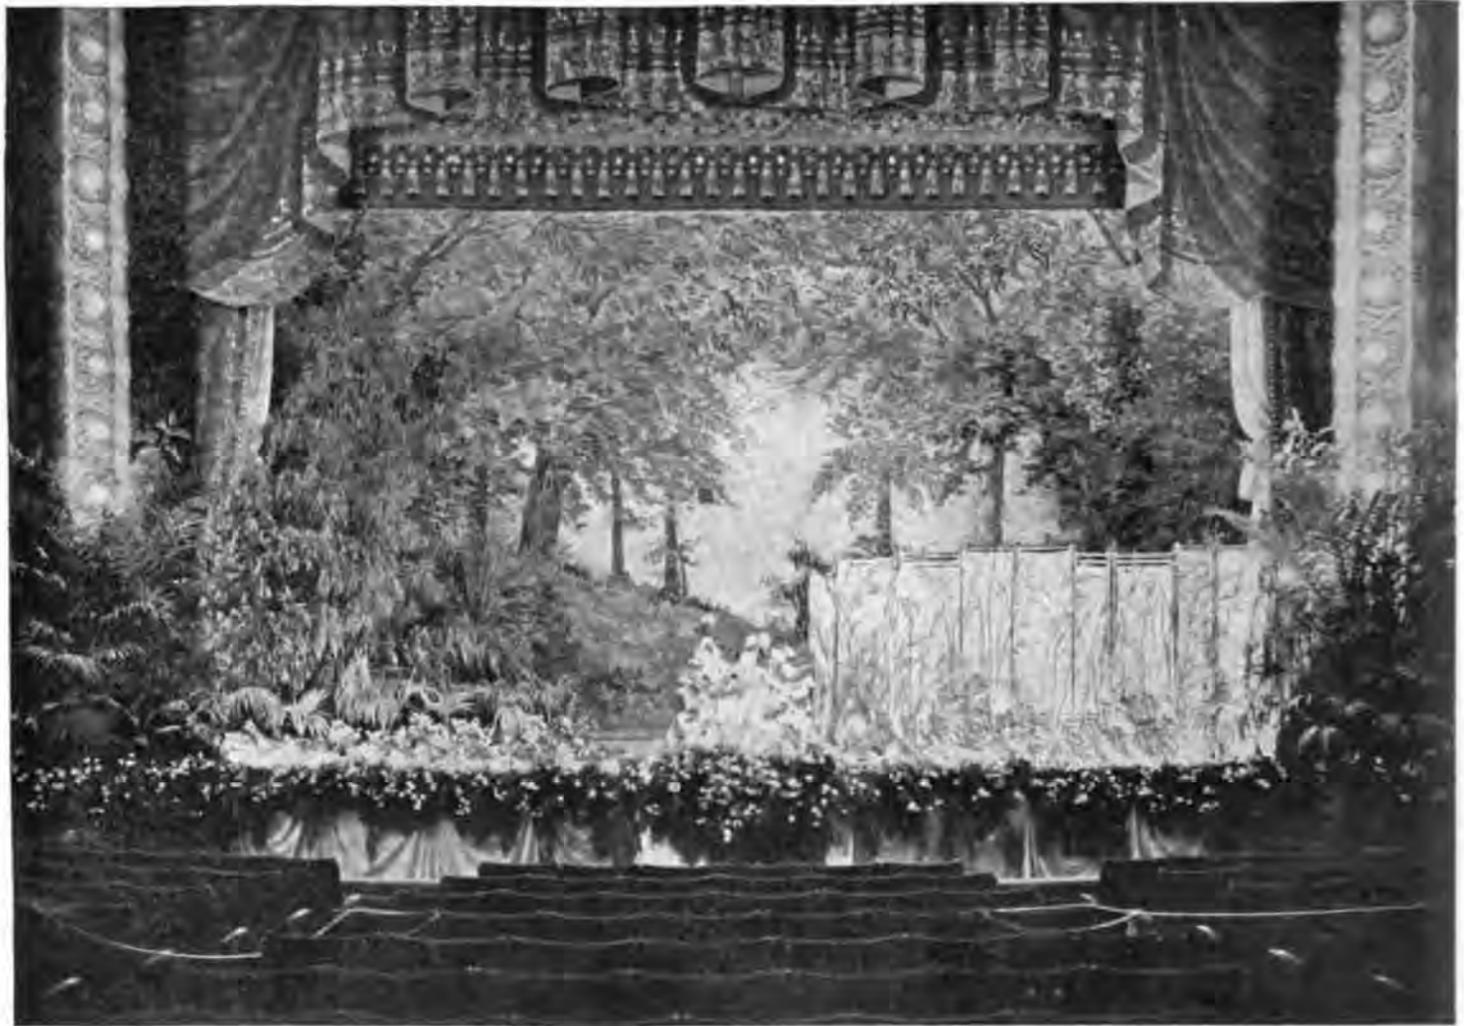

COUSIN MARJORIE

DEAR CHILDREN: Here I am in beautiful Ireland—for Ireland is very, very beautiful, especially in Spring and early Summer. I have been on a long tramp among the little farms in one of the sections where cloth is woven. One of the chief manufactures is the weaving of wool upon the little hand loom in the home. The weavers are the small farmers who work their land during the day and weave at night. The wool they use comes from their own sheep. Their wives and daughters spin and dye it and later carry the cloth on their backs over the mountains to the nearest village to sell to the merchants.

In 1841 seventy-two per cent of the people of Ireland could not read nor write. In 1901 only fourteen per cent were illiterate and today that could scarcely be said of five per cent. A LOTUS GROUP TEACHER

Isis
Theatre
San
Diego
California

THE THEOSOPHICAL FORUM, IN ISIS THEATRE

THE Universal Brotherhood meeting, conducted by Point Loma students, at Isis Theatre last Sunday evening, was a notable one, and most fittingly commemorated the Eastertide. The floral decorations, always beautiful, were more attractive than usual.

The musical program was unusually fine, including two selections from Wagner, rendered by students from the Isis Conservatory, a 'cello solo by Master Montague Machell, and two selections by the Raja Yoga Boys' Quartette.

A short paper was read by Master Montague Machell, entitled: "Eastertide." After painting a word-picture of the freshness and beauty of spring, with its sunshine and blossoms, he said: "Who could imagine that the dry dust could hold such treasures hidden in its seeming barrenness? Who could dream that the wild storms could call such beauty into life? How the fierce winds wrestle with the storm clouds, till they are forced to shower the priceless rain upon the thirsting land, and the sun's face is hidden till their task is done.

"Is it not so with man? There is such beauty hidden in the hearts of men, which seem to be burnt dry as the dust of the desert, yet needing only rain and sunshine to wake up to life again. Through the long seasons of the ages the world has withered, till the last traces of pure joy have almost vanished from the life of man; but the Eastertide of humanity is at hand, and we shall live to see the dead desert of man's life on earth burst into joy and beauty as marvelous as that which crowns the hills around us today."

Dr. Gertrude Van Pelt read a paper entitled: "The Resurrection." In part she said: "I am the resurrection and the life; he that believeth in me, though he were dead, yet shall he live; and whosoever liveth and believeth in me shall never die."

"Who is the mighty 'I' who spoke these words? Again it said: 'I am the light of the world; he that followeth me, shall not walk in darkness, but shall have the light of life.' Surely, it does not refer to the loving, selfless and great teacher who lived two thousand years ago. As if he foresaw that men might so belittle his words, he said: 'He that believeth on me, believeth not on me, but on him that sent me.'

"The same Voice spoke ages ago and said: 'Know me as the eternal

seed of all creatures; I am the wisdom of the wise, and the strength of the strong.' It spoke before time was, through the light of the stars which fill infinite space, through the all-pervading space itself. And the same voice has continued to sound all down the eternities each instant of time through every atom in all the universes. Life itself consists of the vibration of that ever-sounding tone. For all that is, always was. There has been no beginning, there can be no end.

"The Christos is in every heart, and the body is the sepulcher in which it is buried. The lower, undeveloped self is constantly crucifying its Lord, constantly weighting the stone of matter which lies heavy upon the sepulcher, making the task of the Lord of the body more difficult—indeed impossible—until this lower self, the everyday and earthly consciousness, begins to realize and cooperate with the Christos for freedom. When this happens, then a day comes when the stone is rolled away and the sepulcher is opened, and the Lord of the body steps forth free and glorious. Today, we commemorate all the resurrections which have made the glory of the past, and we herald the yet greater one of which we see the dawn. Each Easter morning now makes the event more clear, colors the horizon more brightly; outlines a little more distinctly the splendor of the picture. The springtime is the season when the hidden life bursts into bloom; so, also, there are places where the awakening begins. From the heights of Lomaland can be seen the glory in the heavens. There the soul is struggling to be free with a courage and determination born of many past failures; and nothing can stay its hand. The sepulchers will be opened. For we are at the dawn of a new day, and the light which shall burst forth when the soul stands revealed, shall light the whole earth and bring glad tidings of great joy and peace and good will to men."—*San Diego News*

Theosophical Meetings for Sunday Nights

Public Theosophical meetings are conducted every Sunday night in San Diego at 8:15, at the Isis Theatre, by the students of Lomaland.

Theosophical subjects pertaining to all departments of thought and bearing on all conditions of life are attractively and thoughtfully presented.

An interesting feature is the excellent music rendered by some of the students of the Isis Conservatory of Music of Lomaland. Theosophical literature may always be purchased at these meetings.

Universal Brotherhood Organization

Central Office Point Loma California

What Is Point Loma Life?

THE life of the students at the International Headquarters of the Universal Brotherhood and Theosophical Society at Point Loma, California, seems to arouse the questioning spirit so greatly in the minds of the hundreds of tourists who daily visit the headquarters during the season, that some become little more than animated Interrogation Points.

These Interrogation Points propound such searching questions to the unfortunate guides, that the just mean between courtesy and abruptness is not infrequently embarrassing to maintain. Hence, from time to time, such of these questions as can be seriously presented to the readers of the NEW CENTURY PATH will be answered in this page by different students at the headquarters. The following covers a certain ground often uncovered by our Interrogation Points:

SOME FALLACIES ABOUT THEOSOPHY

As Theosophy becomes better known, and is perceived by ever widening circles of people to contain the message of the ages, its enemies naturally seek with ever increasing eagerness to brand it with some epithet that shall be its ruin. But they seem unable to invent one with which we have not been familiar these twenty-five years and more.

THEOSOPHY AND "ORIENTALISM"

The most successful effort in this line is the word "Orientalism." "Theosophy is Orientalism"—that is to say, is Fatalism, is Pantheism, teaches the soulless inferiority of women, and the final negation of individual being and even consciousness. For in the minds of most people "Orientalism" means all those things. That Theosophy is, or teaches, the opposite of them all, these opponents know very well, but, till their hearers or readers wake up and demand truth and facts, the burden of the song will doubtless be unchanged.

"Orientalism" is of course a word with no real meaning. It no more indicates a system of thought than would the word "Occidentalism." The East thinks and teaches as diversely as does the West. But till people do a little study and investigation on their own account, they must take whatever is served out to them in the bowls they so humbly bring to those whom they still permit to pose as teachers. In the meantime we may point out two or three simple facts.

THEOSOPHY VS. FATALISM AND PANTHEISM

Theosophy is the contrary of Fatalism. Its doctrines point out that Fatalism could never stand a moment's chance of acceptance with a people who had not forgotten how to will; and that where the murrain of Fatalism has any prevalence it has been inoculated by men who were (and are) anxious to have at their feet a nation of spiritual slaves and mental cowards. It teaches that man is bound by nothing in the universe save by his own acts and by his own positive unwillingness to will to work out his own salvation. At any point in the chain of cause and effect he can insert new causes begotten by his own inner spiritual will.

As to Pantheism, Theosophy shows the universe not as being but as moving toward the Divine, the perfect. The Divine is the ever receding ideal toward which universal life and man forever move. The Light is forever seized, yet forever there is a *vaster Light beyond*.

As to the position of women, Theosophy teaches the verdict of history. The position held in any people by its women is the index of that people's civilization. The "Eastern" view of woman's place corresponds to the present condition of "the East."

THE QUESTION OF EXTINCTION

And as to the question of extinction, the very essence of Theosophical teaching, its key, declares unequivocally that human consciousness is destined to move on forever into a higher illumination, to lose nothing save its shadows and limits, becoming more and more radiant and finding joy in ever greater fullness. It loses individuality (!) *if* a mother does in love of her child; *if* perfect comradeship is loss of individuality; *if* the patriot statesman loses it in the love of his country; *if* teachers of humanity

lose it in love of men; *if* the musician loses it in love of his art: *in no other sense*.

These are the facts which should be held in mind by those who go for their understanding of Theosophy to its enemies. STUDENT

The History-Books of the Future

FOR those who have become sufficiently familiar with the teachings of Theosophy to have arrived at a profound conviction of their truth, the prospect of human history presented to their mind's eye is so vast and magnificent, and yet so simple and convincing, that the field of view of orthodox history appears microscopic and trivial beyond all belief. The awakening to the larger view is as complete and satisfactory as must be that of the butterfly when it emerges from its narrow living tomb and flits over the trees and flowers. The necessity of using current historical text-books is a constant source of irritation and exasperation to both teacher and pupil in a school where Theosophy is the guiding light.

Oh that we had Theosophical history-books! How would such books be designed? In the first place it would be necessary to give an outline of the general scheme of human history. Physical man has existed on earth millions of years. (Geologists can find us all the time we demand and to spare.) The last great race, the Aryan, appeared a million years ago. Every great race goes through a course like a spiral, having a downward arc followed by an upward arc. It is godlike when it first comes; then it wanders away from the light in its appointed pilgrimage through the realms of materiality; and then is redeemed and wins back its way to the light, made richer by long exile and painful experience.

Our race, the Aryan, is beginning to ascend that upward arc. Hence we shall find, on looking back through history, records and remembrances of a golden past, coupled with longings and anticipations of a golden future. We shall find voices telling in many tongues the same story of an Eden lost and an Eden to be regained. And, if we go back far into the past, we shall find knowledge and virtue *increasing* as antiquity increases. This will be the clue to our historical studies.

Many pages of the NEW CENTURY PATH are devoted to showing how this clue illuminates and explains all the known facts and discoveries which so sorely puzzle those scholars who have it not. With such a preface, our history-book would become not only clear and convincing, but ennobling and inspiring as well.

Then perhaps would come a section on the ancient Egyptians. They were the descendants of Atlanteans and Aryans combined. In the days of Herodotus they possessed 341 statues of kings that ruled over them, which carries back their history about 17,000 years, while their astronomical records carry it back much further. We are only slowly unraveling their history, as the results of archeology and the widening of general knowledge progress. They have left the remains of an architecture so vast and sublime that we cannot yet rise to an understanding and appreciation of it. They had sciences which to us are as mysterious and incomprehensible as ours is to the savages; but it is evident, from what we have been able to interpret of their inscriptions, that they understood and applied these sciences. Their religious symbology, which to the puny minds of past generations of scholars has seemed inartistic and superstitious, is the key to their vast knowledge of the laws of the universe and human life.

In short, the history-books of the future will no more dare to scoff at what is too lofty for the understanding of the writers. E.

For the Benefit of Enquirers

REGULAR weekly meetings of the Aryan Theosophical Society, established in New York City by William Q. Judge, the second Leader of the World's Theosophical Movement, are held every Thursday evening at 8 o'clock in Isis Hall, 1120 Fifth Street, San Diego, California. These meetings are intended to meet that large and growing body of earnest enquirers who desire to know more of the different tenets of the Theosophical philosophy. Students from the Universal Brotherhood Headquarters at Point Loma, California, conduct these interesting gatherings to which every truthseeker is cordially invited.

Students'

Path

HOMER

by HARTLEY COLERIDGE

FAR from all measured space, yet clear and plain
 As sun at noon, "a mighty orb of song"
 Illumes extremest Heaven. Beyond the throng
 Of lesser stars, that rise, and wax, and wane,
 The transient rulers of the fickle main,
 One steadfast light gleams through the dark, and long,
 And narrowing aisle of memory. How strong,
 How fortified with all the numerous train
 Of human truths, Great Poet of thy kind,
 Wert thou, whose verse, capacious as the sea,
 And various as the voices of the wind,
 Swell'd with the gladness of the battle's gloe---
 And yet could glorify infirmity,
 When Priam wept, or shame-struck Helca pined.

On Rounding-Out the Character

THIS phrase is familiar to students of practical Theosophy under the tuition of Katherine Tingley. It expresses the Theosophic ideal of growth, identical with Nature's ideal of growth. When a flower grows we see lines of development started in every direction; but, long before these are finished, new ones are begun, and again new ones, until the whole plant is growing in all directions and all ways. In contrast with this man begins at one end and finishes that first, and then goes on to the next. But the artist is an exception; *he* cannot paint a picture in that way.

We are all too prone to try to live our lives by exact rule and develop the details one by one instead of all together. We love to finish things up there and then, *because we are afraid* we shall not be able to finish them later. The habit of finishing one thing and then beginning another, and so on, has its advantages, and is the very thing for a careless, unmethodical person. Let such persons cultivate it by all means. But there are also people who have cultivated it too exclusively and become the slaves of this particular method of progression. It may not be the best; it rather reminds one of an artist beginning by painting one flower in a corner of the canvas, finishing it, and then going on to the next.

We often expect to attain a disproportionate perfection in small details, and are disappointed at failing to do this, forgetful that our average standard of excellence does not entitle us to such perfection, and that, even were we to attain it, the effect would be like a new patch on an old garment. True, we must ever strive for perfection, but not in such a way as to sacrifice the whole to one or two details. A touch here and there, a whipping up of all the laggard traits of our character, a rounding-out of the nature; this is to be sought rather than an overdevelopment of particular features.

We can work at one thing until we have to stop, and then turn to something apparently quite unrelated, confident that the two in reality supplement each other. Even traits of character which seem to be contradictory may thus be cultivated side by side until at last they are seen to be merely the opposite poles of some greater quality.

Thus the whole character is gradually rounded out and developed harmoniously on all sides, like a flower, and does not run into ugly excrescences.

STUDENT

Blavatsky

H. P. BLAVATSKY left no department, detail nor function of life unilluminated by the truth. This was her work, the divine purpose of her life; and she, knowing this, was faithful to Heaven,—its purpose; and to herself—her soul.

In performing this generous duty towards a whole world of indifference, ridicule and enmity, she neither expected to be, nor had she the time to make herself understood, even had that been possible.

Blavatsky was a Great Sower casting seed broadcast over a field that

considered itself already full, if not overstocked, with the like of what it ignorantly supposed she sowed. Busy at her allotted work, and knowing that its perils would shorten her time, she strode her lofty course disregarding of fences, bailiwicks, special preserves and those who possessed or usurped them.

Brushing these aside she opened all to the light, casting seed into every field. Some few were thankful, some annoyed, most were indifferent. But the preserve-keepers and usurpers were to a man, angered, outraged or malignant.

With human nature out of tune, careless or hopeless in its selfishness and self-seeking, it was but natural, under these conditions, that these results obtained. But are they not all sufficient evidence of the vital necessity for the coming of a Great Sower with wholly new seed? Do these things and conditions detract from Blavatsky, or emphasize her as a Sower, and the seed she cast as holy?

The soul-growth of thirty years in the world's life, proves the latter true. The resurrected soul of man, this informing soul which she rescued from crucifixion and awakened as she sowed, will rear aloft her monument of Spiritual Regeneration as the Spiritual Age she inaugurated rolls into the abyss of Time.

F. M. P.

Bucephalus

THE story of Bucephalus "(bull-headed)", Alexander the Great's famous charger, is that he subdued that spirited steed, which no one else had been able to tame, by observing that it was afraid of its own shadow and by riding it towards the sun. How often do we fail in self-mastery because we tremble at the shadow of our own personality made black and distinct by the sunlight of truth. We should turn away from this fascinated contemplation of our shortcomings and fix our eyes boldly on the ideal of light which we aspire to.

E.

FRIENDS IN COUNSEL

DEAR COMRADES: To follow the lines laid down by Nature is essential to success in any undertaking, and thus it is that in the Raja Yoga school the dramatic instinct common to all children is trained by practice in the art of acting. The cultivation of the glorious imaginative power of the child is largely neglected in current educational systems, and where a pupil shows this power in any marked degree it is more often suppressed than encouraged, yet the image-making faculty is potent to uplift a man to splendid heights of helpfulness and power. Ideals have their home in our imagination and as we feed them by our brooding thought and energize them by the will, so shall our lives be great. The golden rule of doing unto others as we would be done by in their place is almost useless as a guide for conduct without imagination as an aid, but by dramatic training we acquire the power of instantly throwing ourselves into the position of another and thus develop that swift intuition that will prompt us to the line of conduct best adapted to all whom we may meet.

Good acting requires before all that the mind be able to relinquish the tenacity of grip upon the personal idea. All individual memories and modes of thought, all tastes and preferences and even racial traits, must be cast off while the actor proceeds to invest himself with the mental drapery of his imagined part. Complete forgetfulness of self and the entire merging of the consciousness into that of the character assumed, mark the supreme actor. To thrill with an agony that is not personally ours, to exult in another's joy, develops sympathetic power and where the actor's deep desire is but to serve his fellow man, such exercise will take him far upon the path that leads to power.

Rightly to imagine the mind of a hero is to pave the way to being noble ourselves and even if we play the villain's part we may extract the honey from the weed. We learn to know the state of mind of one who pits his puny will against an ordered universe's law, to feel the sleepless terror of the man whose ears are ever on the strain to catch the barking of the hounds of Justice on his trail.

A man accustomed to represent diverse types of character might surely come by slow degrees to regard even his own personality as being merely one of a number of disguises assumed by the soul. Such habit once acquired would be of utmost value to the reformer, for while the foes of progress tore his character to shreds he would behold their onslaughts with the same composure as if he saw a group of mischievous young dogs at play with some old garment he was just about to cast aside.

STUDENT

FRAGMENT

SHELLEY

MAN is of soul and body, formed for deeds
 Of high resolve; on fancy's boldest wing
 To soar unweari'd, fearlessly to turn
 The keenest pangs to peacefulness, and taste
 The joys which mingled sense and spirit yield.
 Or he is formed for abjectness and woe,
 To grovel on the dunghill of his fears,
 To shrink at every sound, to quench the flame
 Of natural love in sensualism, to know
 That hour as blessed when on his worthless days
 The frozen hand of Death shall set its seal,
 Yet fear the cure, though hating the disease.
 The one is man that shall hereafter be;
 The other, man as vice has made him now.

THEOSOPHICAL FORUM

Conducted by J. H. FUSSELL

Question

Is it correct to use the terms "good Karma" and "bad Karma?" For instance, poverty, hardship and suffering, which ordinarily are regarded as evils, and from which men seek to escape, we know are often blessings in disguise and productive of the greatest good. Is not the use of these terms, therefore, misleading?

Answer

As ordinarily used from the standpoint of our personal desires, these terms do appear often misleading, for too often we desire what is neither good nor right. In a short article entitled, "Is Poverty Bad Karma," William Q. Judge answered this question as follows:

The question of what is good Karma and what is bad has been usually considered by Theosophists from a very worldly and selfish standpoint. The commercial element has entered into the calculation as to the result of merit and demerit. Eternal Justice, which is but another name for Karma, has been spoken of as awarding this or that state of life to the reincarnating Ego solely as a mere balance of accounts in a ledger, with a payment in one case by way of reward and a judgment for debt in another by way of punishment.

It has been often thought that if a man be rich and well circumstanced it must follow that in his prior incarnation he was good, although poor; and that if he now be in poverty the conclusion is that, when on earth before, his life was bad if rich. So it has come about that the sole test of good or bad Karma is one founded entirely on his purse. But is poverty, with all its miseries, bad Karma? Does it follow because a man is born in the lowest station in life, compelled always to live in the humblest way, often starving and hearing his wife and children cry out for food, that therefore he is suffering from bad Karma?

If we look at the question entirely from the plane of this one life, this personality, then, of course, what is disagreeable and painful in life may be said to be bad. But if we regard all conditions of life as experiences undergone by the Ego for the purpose of development, then even poverty ceases to be "bad Karma." Strength comes only through trial and exercise. In poverty are some of the greatest tests for endurance, the best means for developing the strength of character which alone leads to greatness. These Egos, then, whom we perceive around us encased in bodies whose environment is so harsh that endurance is needed to sustain the struggle, are voluntarily, for all we know, going through that difficult school, so as to acquire further deep experience and with it strength.

The old definition of what is good and what is bad Karma is the best. That is: "Good Karma is that which is pleasing to Ishwara (the immortal Self), and bad Karma that which is displeasing to Ishwara." There is here but very little room for dispute as to poverty or wealth; for the test and measure are not according to our present evanescent human tastes and desires, but are removed to the judgment of the immortal self—Ishwara. The self may not wish for the pleasures of wealth, but seeing the necessity for discipline, decides to assume life among mortals in that low station where endurance, patience, and strength may be acquired by experience. There is no other way to implant in the character the lessons of life.

It may then be asked if all poverty and low condition are good Karma? This we can answer, under the rule laid down in the negative. Some such lives—indeed many of them—are bad Karma, displeasing to the immortal Self imprisoned in the body, because they are not by deliberate choice, but the result of causes blindly set in motion in previous lives, sure to result in planting within the person the seeds of wickedness that must later be uprooted with painful effort. Under this canon, then, we would say that the masses of poor people, who are not bad in nature are enduring oftener than not good Karma, because it is in the line of experience Ishwara has chosen, and that only those poor people who are wicked can be said to be suffering bad Karma, because they are doing and making that which is displeasing to the immortal Self within.

It would seem, then, that unless the above meaning of the terms, good and bad Karma, is kept in mind not only by ourselves, but is also known to those to whom we are talking, it would be better not to use

them. But the important thing is, that whatever our Karma may be outwardly, we can by our attitude make of it what we will, either an opportunity or a burden. Mr. Judge has written somewhere to the effect that although we cannot alter the circumstances of our life, we can change our attitude towards those circumstances; we can meet them with fortitude, and make of them stepping stones, or, taking the opposite course, we can permit ourselves to be crushed by them. He said, too, "Rely within upon the Higher Self always, as that gives strength," and is it not plain that if we follow that advice, we have the key to make all our Karma "good Karma." STUDENT

Question

You say that Theosophy can be applied to all departments and problems of life. How do you account for the great difficulty that so many children of today, and adults, too, experience in their studies? What is the remedy proposed by Theosophy to this?

Answer

The remedy not only proposed, but now actually in operation, is Raja Yoga, which teaches an all-around control. Most of the difficulty we experience in learning and studying is due to want of command over our instrument. Wandering of the attention, discomfort, languor, confusion of thought, and so on, are the great obstacles. To remove these a general training of the will is needed and a general habit of discipline must be acquired.

Most of the obstructions come from an unruly body, which is sluggish, over-fed and otherwise indisposed and out of gear.

Therefore a pupil who is being instructed in these first essentials is using his time more profitably than if he plodded up many ladders of study with his feet loaded with the mire of slovenliness and inefficiency. The disciplined can do more in his odd moments than the other can in all his study hours. This is Raja Yoga teaching. H. T. EDGE

Question

What explanation does Theosophy offer for inherent racial ideas?

Answer

William Q. Judge, writing on the subject of heredity, says:

And lastly, the fact that certain inherent ideas are common to the whole race is explained by the sages as due to recollection of such ideas, which were implanted in the human mind at the very beginning of its evolutionary career on this planet by those brothers and sages who learned their lessons and were perfected in former ages long before the development of this globe began. No explanation for inherent ideas is offered by science that will do more than say, "they exist." These were actually taught to the mass of Egos who are engaged in this earth's evolution; they were imprinted or burned into their natures, and always recollected; they follow the Ego through the long pilgrimage.

All the great races of antiquity, the early Aryans, the Chinese, the higher American "Indians," the Egyptians, the Greeks, all have traditions of a Golden Age, when the Gods walked with men, and the rulers of the peoples were divine. And the teaching of Theosophy is that when this earth was first peopled, the infant humanity was taught by these Elder Brothers, and that again and again they send their messengers to strike the keynote of truth.

To go fully into this subject is impossible in the space of a brief answer to a question, and would necessitate reading and study on the part of the enquirer, especially of the writings of Madame H. P. Blavatsky. But this may be said that we have here a good illustration of what W. Q. Judge speaks of in one of his articles, as "the universal application of Theosophical doctrines"—in this case of the doctrine of Reincarnation or re-embodiment. This teaching does not apply only to man, but to races, worlds, and universes. In her great work, H. P. Blavatsky gives the teaching of the ancient Wisdom Religion, that when the humanity of this earth has attained that degree of development which is possible here and the earth shall have run the appointed course of its life, then just as the soul, the inner life force of the human being, builds for itself a new body, so does the "life wave," the soul of the world, build for itself a new world. And then those who had reached the perfection of evolution on the preceding earth prepare the way for the new humanity, whereas those who had not learned the lessons of life then, in that period of evolution, again return to take up the battle once more on the new earth. It is these perfected souls that become the divine teachers of the infant humanity, the divine rulers, the gods who walked with men, as all the traditions of the great races of humanity testify. And, as we learn from our Teachers, it is they who imprint upon, burn into, the minds of humanity the primal truths of life which ever remain, however overshadowed and distorted they may at times become, as inherent ideas in the race consciousness, and by virtue of which, or which stand as evidence, that we are both human and divine, i. e., divine souls in human form. STUDENT

English Notes

(From Our London Correspondent)

29th MARCH, 1905

“THE cry of the children” is touching the hearts of many people in England. Questions of political reform fail to interest. In their results they are so limited and ineffective. The subject of child-life, however, is one that may be dealt with apart from controversy. It is a unifying subject, and in dealing with it a new and higher patriotism is called into being.

These reflections are suggested by the “surprise visit” paid recently to one of our Council Schools in North Lambeth. The visitors were the Countess of Warwick, Sir John Goist, Dr. Macnamara and Dr. Hutchison. They wished to find out for themselves how many of the children attending this school came without breakfast that morning; also, how many appeared to be underfed.

I quote just one item from the report these distinguished visitors subsequently drew up:

“Standard II (56 boys)—Forty-five under-fed; 6 no breakfast that morning; 22 breakfasted free at school; 34 no dinner to go home to; free dinner tickets for 24, leaving 10 unprovided for.” Pretty much the same state of things prevailed in the other Standards both as regards boys and girls.

There is likely to be more heard of this surprise visit; but in passing it is useful to note that the four visitors are all interested in politics (so called) and each represents a different opinion in such matters.

But the heart of the nation is being stirred by the tragedies of its child-life. How can it be otherwise once the realization is forced home on a people that in their child-life lies the seed of a nation's weal or woe? “Suffer little children to come unto me,” was no vain speech of simple sentiment, for in it lies the secret of national success. The Spartan ideal of child-training from early infancy was based on a great truth, albeit its application in ancient Lacedæmon was perverted from the ideal of all-round training taught today in Katherine Tingley's Raja Yoga schools.

The Raja Yoga Institute just opened in London at 91 Avenue Road by Katherine Tingley, Leader and Official Head of the Universal Brotherhood and Theosophical Society is a big step ahead. Its promise of good for England, aye for Great Britain and Europe, will inevitably be fulfilled grandly. These Raja Yoga schools are absolutely non-political and non-sectarian. The highest ethics known to men are taught as realities to be followed in every walk of life, not as abstract ideas; while the whole effort of the Raja Yoga system under Katherine Tingley's direction is to bring about a balance, an equipoise, of the child's character, which will fit it for holding the noblest positions in society. It is an all-around training; it is a spiritual, mental and physical evolution of the young. No branch of modern learning will be neglected.

European Notes

(By Our Special Correspondent)

APRIL, 1905

IN ordinary times one would not attach great importance to the peregrinations of Royal personages. But these are not ordinary times, and it is interesting to note the movements of European Rulers—what is happening, or about to happen. To begin. The Duke of Connaught is in Spain, and rumor is busy, both there and in France, that his daughter is to marry Alfonso XIII. Anyhow, the youthful monarch is to be the guest of England within the next month or so, after being entertained by the French president.

Then, Queen Alexandra of England is in Portugal, and every one is delighted with her—as is natural. The German Emperor has followed closely in her footsteps. Finally, King Edward will shortly set out to meet his wife and accompany her to Denmark to the celebration of her father's birthday. There they will meet Queen Alexandra's sister, the Dowager Empress of Russia. Is there to be a League of Peace among the rulers of Europe as the result of all these meetings? They would assuredly find no obstacle in the attitude of the various European peoples. The war in Manchuria is an object lesson not likely to be soon forgotten.

Speaking of peace, the Italian people as a body are petitioning in favor of it. Signatures run into millions from all classes. Would not the commonalty in other parts of the world do well to follow the example of Italy? This would mean international concentration on the subject, no small advantage.

Another effort in the same direction is announced. I hear that there is to be an International Congress of Doctors to advocate peace. It is to be hoped that this meeting will really take place, for who is more fitted to paint the horrors of modern warfare than the medical man?

The death of Jules Verne is to have a graceful and touching celebration in France. The school children are subscribing for a tribute to his memory. He has linked imagination to science in a marvelous way. It is impossible to estimate the work he has done in emancipating youthful minds from the crude scientific concepts of a certain class, especially in France.

Yet his daring anticipations may, before many years have passed, merely illustrate once more the adage: Truth is stranger than fiction. The world is returning once more to the wonderland of Atlantean times. Jules Verne was not alone among the children of genius in sensing this.

It is said that English is spoken by over 135,000,000 people today, that it has displaced French as the language of diplomacy, and that it is fast becoming the accepted language of commerce. All North America, South Africa, Liberia, Australia, New Zealand, Samoa, Hawaii, most of Polynesia, and various small countries, speak it. With Spanish for South America, one could go everywhere with the two languages. T.

THE MYSTERIES OF THE HEART DOCTRINE

Prepared by
KATHERINE TINGLEY
AND HER PUPILS

*The Theosophical
book of the
Twentieth century*

Tells the story and the history of the Theosophical Movement Throughout the World; tells what it is and why it is — reveals the mystery of the Doctrine of the Heart.

The prices are \$2 in cloth and \$1.50 in paper, which barely cover the cost, for it is printed and bound, not gaudily, but with such carefulness and thoroughness of art and craft as to make it unique among modern edition books.

Meteorological

UNDER the heading of "Light on Old Egypt" (poor, dear well-meaning old Egypt), a paper quotes a learned authority on the subject of Egyptian medicine. Among other matters lending themselves to comment, the following statement is noteworthy: The priests

who embalmed the bodies of men and animals would have "an opportunity of learning something about anatomy." They might even find out a little about the circulation of the blood. But surely this is expecting too much, since we ourselves did not know it until Harvey found it out.

It is clear, we learn, that medical science was cultivated in Egypt and had advanced considerably.

The Egyptians passed on their suspicions about the blood to the Greeks, and so knowledge grew until at last Harvey revealed the truth.

This viewing of all the universe and all time in the light of our own little local culture—this standing on tiptoe to pat the head of Pharaoh—reminds one of the annual criticisms by *The Tailor and Cutter* on the Royal Academy pictures, which criticisms are strictly limited to buttons and seams.

Modern culture comprises a varied and somewhat precise knowledge of details belonging to different ramifications of the tree of knowledge.

Knowledge a Process of Accumulation

It is by no means comprehensive or homogeneous; it is extremely miscellaneous and diverse. Knowledge is regarded as a process of accumulation, and learning as a number of different paths diverging in all directions.

According to an older and higher view, knowledge is like the attainment of a summit of enlightenment from which one may descend at will along any of the radiating avenues of science.

Occidental knowledge has been accumulated bit by bit, mostly within very recent times; and it represents the total, up to date, of what various investigators have been able to collect and sort. Such of the fundamentals of geometry and mathematics as have descended to us from the ancients, have been carried to a great pitch of elaboration. Chemistry, Physics, Biology, etc., have also been investigated to a fine point of detail. We have a vague and unsettled structure of theory to connect these details with each other; and the whole goes to constitute what is known as modern culture and science.

So accustomed have we grown to this particular set of ideas, that we are apt to forget how purely local and racial and temporary it all is. The particular lines along which we have studied are only a few out of many possible ones, and their choice may be described as fortuitous. Our particular methods and ways of thought are equally limited and fortuitous. There is nothing final or absolute about our knowledge at all.

Limit to Our Ways and Thoughts

Let us ask, then, is it in any wise likely that races of men who lived thousands of years ago, under totally different conditions and with totally different temperaments, would follow the same lines? And if we should find that they did not, would that justify us in assuming that they were ignoramuses?

It is only quite lately that modern thinkers are beginning to realize that our knowledge is merely a knowledge of details, and that, as far as essentials and fundamentals are concerned, we are as ignorant as ever. They are even calling in question the basic assumptions upon which our science and our very mathematics are based.

It is at least a tenable hypothesis that the ancients had a knowledge of those fundamentals which we lack. They may have stood on a summit of enlightenment which would give them a commanding outlook upon the whole field of knowledge. To them the facts we have so laboriously accumulated may have been in part mere vulgar details not always worth while descending to.

Master Keys Will Unlock All Doors

A person possessing this kind of knowledge would probably not have at his fingers' ends all the details of (say) chemistry; but, if he ever had occasion, for some practical purpose, to know such details, he would be able to master them all in a very short time.

All this is tantamount to saying, after H. P. Blavatsky, that real knowledge implies the possession of certain "master keys," or fundamental principles, which will unlock all doors.

Is it rash to suggest that ancient races may have possessed knowledge in its higher form; and that, if they did not know all we know, it was only when and because they did not think it worth their while? Before answering, let us not forget that an ancient Oriental race has just shown us, that when a special need does make it worth while, it can quickly learn enough modern science to outmatch us at our own game.

And perhaps the Egyptian may have known enough about medicine and the body to make dissection and the cataloguing of details unnecessary.

STUDENT

The New Campanile at Venice

IT is pleasant to learn that the work of restoring the Campanile at Venice is steadily going forward. The work is necessarily slow, for the difficulties are very great. More than three thousand piles, twelve feet in length, had to be sunk into the marshy ground, fixed by a thick bed of specially prepared cement. This foundation is reckoned to

Some Views on XXth Century Problems

An Easy Way With Great Men

PROFESSOR EMIL REICH'S recent article *The Bankruptcy of Higher Criticism* says a number of good things that it was time to say. It is a defense, against modern historical belittlement tendencies, of the great-man theory or view of history. Certain great characters stand out from ancient history and even pre-history. If their achievements pass the standard of human possibility which the modern historian in his wisdom has erected, by some means they must be got rid of. One way is to make their names generic, covering several people as a sort of title; another way is to assume that the work of several people has become credited to one man, as in the case of Homer; but when the period is remote enough, an easier way is to regard him as a personification of the sun, moon, or even a wind. "The philologist who all his days has never seen a personality, cannot bring himself to believe that institutions like the Spartan State are of the making of a single man. Thus Lycurgus has been dissolved into a myth. Theseus and Romulus have survived through more than five-and-twenty centuries only to be ruthlessly murdered by a pack of philologists." Among Biblical personalities, Joshua and Joseph are both the sun: Joshua because he is the son of Nun which means fish; and does not the sun at the spring equinox issue from the constellation of Pisces? Joseph because he entertained his brethren at noon, and because he dreamed that the sun, moon, and eleven stars bowed down to him.

Professor Reich quotes these arguments from a learned historian, and asks why because by dint of plodding insistence "a philological pedant in some obscure German town" has succeeded in spelling out some Himeritic inscription should he be considered a luminous exponent of ancient history?

The rest of the article, dwelling upon the close resemblance of the myths of the Masai, a people of East Africa, to those of the Jews, argues against either being a derivation of the other, or the latter from the Babylonian; argues that all the nations with similar legends, Babylonians, Assyrians, Jews, Masai, and others who may be hereafter discovered, had them from a common source antedating any of them.

It was part of the life work of H. P. Blavatsky to show that all the religious legends of all peoples were the more or less distorted and partial presentations and symbolizations of eternal truth taught to primal man and never wholly lost or forgotten; and it is only in Theosophy that the reconciliation and correction can be found. In respect of Semitic legends Professor Reich takes a step on the same line. STUDENT

"The Yellow Peril"

THE "Yellow Peril" bogey has now called science and statistics to its aid. A contemporary calls attention to the falling birth-rate of most civilized countries.

But in Japan the birth-rate is rising—in the last decade from 26.8 to 32.7. Moreover the Mongol can live under conditions impossible to the Caucasian. "The question then arises: What may be expected to happen if the Caucasian races . . . continue to multiply with ever-diminishing speed, while the Yellow races continue with unabated speed?"

To which we may reply: What are you going to do about it anyhow? Is not the spirit prompting all such writings, whether the writers are conscious of it or not, this: Here is a race full of vigor, promise and genius; we are going down hill; therefore, ere it is too late; *let us combine and crush this insolently brilliant newcomer*—? It is the policy of pinching and hazing and sending to coventry pursued by the dullards of the class when the new boy shows more ability and industry than themselves.

But the writer tries to administer some comfort to himself by an invocation of Herbert Spencer. That philosopher maintained in his *Principles of Biology*, that the higher the evolution-point reached by a species or race, the less its fecundity. The same amount of vital energy is consumed in making one of a high type as many of a low. Thus we can flatter ourselves that our falling birth-rate is due to our rapidly progressing evolution, unless we care to look for other causes.

No one really imagines that the falling birth-rate is due to any such cause! Mainly it is voluntary, yet without implying that self-control which alone would warrant us in this mutual congratulation over our "higher type." And so much of it as is not voluntary is due to the squandering of vitality in dissipation.

The only possible way to "meet the Yellow Peril," if any way is needed, is to cultivate and realize in practise nobler ideals of national and international and individual life, to make *Brotherhood the chief factor in conduct*. Then our vitality will be equal to any demands made upon it, including the production of a new type of manhood and womanhood.

While one in ten of the people is on or over the extreme poverty line, while scores of thousands of children are at work in factories, while self-interest is almost universally the first law of life among us, while our patriotism is of the shouting kind, while civic and political offices are so largely sought for what can be got out of them, so long are we failing to stand by the ideals we have ourselves declared a century ago. STUDENT

An Interesting Relic

THE pastor of a Manhattan church has had to face the charge of heresy from the Iowa Classis of the Reformed Church in America, on the ground that he quoted with reprobation this extract from a Scotch theologian:

The godly husband shall say amen to the damnation of his wife; the godly parents shall sing hallelujah at the passing of sentence of death against their only child; the godly child shall approve the damnation of his wicked parents—the father who begat him and the mother who bore him.

In reply he says: "If the Iowa Classis endorses that type of theology as the Theology of the Reformed Church in America today, I am ready to step out of my pulpit tomorrow. I would rather break stones by the roadside than preach such a caricature of the love of God."

Contact with civilization usually proves the speedy extinction of savage races. The process does not seem so speedy in the case of savage beliefs. Factories of the crudest religious thought are still to be met with, offering as useful modern furniture quaint stuff whose proper place is the archeological museum. C.

Poisonous Patent Medicines

IN Maine at any rate, the law seems to be no respecter of persons. Even the Governor has to come to discipline. A store of which he is part owner was recently raided by the sheriff, and a large quantity of a patent medicine seized on the charge of containing much alcohol. On the same basis a number of other stores were also raided and relieved of reserves of so-called medicines. Maine is of course particular about alcohol, and pretended remedies of which the dose is half an ounce or an ounce may easily constitute bye-paths across the regulations of that State.

The public do not know that there are large numbers of these preparations which owe their popularity, and the temporary sense of well-being which follows each dose, to the presence of alcohol, cocaine and morphia. Of course these do nothing but harm; but the patient looks only at the hour and thinks he got worse in spite of, not because of, the concoction. H.

An Object Lesson in Hypnotism

THE boy hypnotist at the Everett school has not had long to wait for imitators. The craze has spread to the other schools of the city, and the police have at last been asked to interfere. One hypnotized boy has stabbed another, and others are attempting to get some of the girl students under their control. There are classes in the study and practise of hypnotism every night, and the minds of some of the scholars are, it is said, already so enfeebled as to be beyond recovery.

This case will do as a fair example of what is coming upon us. Let us hope it may be a marked enough example to prompt and adequate legal enactment. But the adequacy to avert a cumulative calamity depends upon its application to *medical and scientific experimenters* as much as to the laity. The prohibition must be total. STUDENT

Brief Glimpses of the Prehistoric World

Archeology
Paleontology
Ethnology

The Mighty Ancestors of the Ancient Greeks

IT is customary to regard ancient Greek civilization as the climax of a period of ascending culture. We are told that the Greeks brought art, philosophy, etc., to a pitch of perfection previously unknown.

But in the light of Theosophy this view is completely reversed. The Greeks were the mere remnant of a greater and more cultured nation. The more recent discoveries in archeology go to bear out this view.

The priests of Sais said to Solon, according to Plato:

You are unacquainted with that most noble and excellent race of men, who once inhabited your country, from whom you and your whole present state are descended, though only a small remnant of this admirable people is now remaining.

This race was "the latest seventh sub-race of the Atlantean Race, already swallowed up in one of the early sub-races of the Aryan stock, one that had been gradually spreading over the continent and islands of Europe, as soon as they had begun to emerge from the seas. Descending from the high plateaux of Asia, where the two races had sought refuge in the days of the agony of Atlantis, it had been slowly settling and colonizing the freshly emerged lands. The immigrant sub-race had rapidly increased and multiplied on that virgin soil; had divided into many family races, which in their turn divided into nations. Egypt and Greece, the Phœnicians, and the Northern stocks, had thus proceeded from that one sub-race." (H. P. Blavatsky.)

The Fourth Race, having reached its climax and run its course, passes on its knowledge to the Fifth or Aryan race; and this latter, having been thus started, then begins to run its own cycle through stages first descending and then reascending. Thus the Greeks had traditions of the pristine glory of their race when it first received its impetus from the Atlantean race, traditions preserved in the myths of divine and heroic ancestry.

We also find in the Greek mythology, as in other mythologies, legends of great fights with dark foes and of victory over them, which are supposed by learned authorities to be poetical accounts of the victory of day over night and other celestial phenomena. But, continuing the quotation from Plato:

These writings [mentioned to Solon by the priests of Sais] relate what a prodigious force your city once overcame, when a mighty warlike power, rushing from the Atlantic sea, spread itself with hostile fury over all Europe and Asia.

This warlike power, everywhere mentioned in tradition was the degenerate Atlanteans who, instead of progressing like the rest of their race, had chosen the path of evil. They had waxed mighty, but they were beaten. Their still more degenerate descendants are the low races found scattered on Pacific islands and in the interior of continents; races supposed by scientists to be *ascended* from apes!

STUDENT

Edward Everett on Ancient Civilization in Wisconsin

JUST at the time when renewed efforts are being made to survey the prehistoric remains of Wisconsin, there has come mysteriously to light a letter which Edward Everett once wrote on this very subject. It was found in the form of a newspaper clipping between the leaves of an old book, and dates 1879.

Mr. Hyer, to whom the letter is addressed, had in 1837 written an account of some of the earthworks in Wisconsin, and had gone so far as to conjecture that in them he had actually located the mysterious city of Aztec tradition, Aztalan, and to give that name to the earthworks. Aztalan however is clearly shown by the traditions to have been the original home of the Nahuas; it signifies what they recollected of the great centre of civilization whence they migrated. It must have been one of the great empire cities of the Atlantean race, and could *probably* not be located on any tract of land now above the ocean.

Writing to Everett on this subject, Hyer received a reply, in which Everett expresses his great interest in the remains and the hope that they will be preserved. The most notable remark he makes is this:

Whether, finally, the tribes found in North America by the first European settlers are degenerate and broken-down remains of more improved ancient races

which preceded them (an opinion which has found advocates) are questions. . . .

In a paper (the *Minneapolis Journal*) there is a description of "Aztalan" near Lake Mills, on the Crayfish River, Wisconsin. It is an ancient enclosure which archeologists find it hard to classify. It was clearly not made for defence, as it is commanded by the rising ground immediately behind it. The enclosing walls are 700 feet in width and 1500 long, and the river completes the enclosure. Within and without are mounds, round, truncated, and oblong; and just beyond the enclosure the ground rises abruptly twenty feet to a plateau. On the brow of this is a row of round pyramidal mounds, three to twelve feet high.

This is said to be the only brick-walled town-site found in this country. The bricks are not rectangular, but are irregular kneaded lumps of glacial yellowish-red clay.

Surely, with the traditions of the Nahuas and the evidence of these mysterious structures, scattered all over the continent, there is enough ground for the belief that these early races *were* descendants of an "improved ancient race;" especially when such a theory fits in with the conclusions as to human antiquity generally, derived from other sources. E.

What Are Savages?

NOTHING that is low can "evolve" to something higher unless by the influx of something higher than it. Consequently the theory of evolution demands that we postulate such an inflowing power. As ice will remain ice until heat enters and melts it, and as water can never turn to vapor until some external power loosens its bonds, so no form of life can change and grow unless the life-soul enters it.

The theory that civilized humanity merely evolves upwards from the savage will not hold water. Where do we ever find savage races on the up-grade? Do they not invariably remain stagnant, or rather tend to die out? Savages are relics, not origins.

When a more or less uncultured race does begin to progress, it is always through the influence of some other race which has had its period of civilization and whose scattered members pass on their energy and knowledge to the later race. We shall not see the African Bushman or the Polynesian savage "evolve" as such, though it is more than likely they will lend their blood to new races which shall have derived from other sources the seed of progress that has been handed down.

There have probably always been on the earth civilized races and savages side by side, and anthropologists often find civilized bones of one date and uncivilized bones of another date, and infer that all mankind was civilized at the one time and uncivilized at the other, thus reaching a wrong conclusion as to the history of humanity.

STUDENT

Subterranean Dwellings of Prehistoric Race in Ireland

REFERRING to an interesting find of subterranean dwellings of "primitive man" in County Antrim, a writer says that it probably establishes the presence at one time in that part of Ireland of a race which occupied a great part of the European continent before the appearance of the earliest Celt. This is undoubtedly true, the race being that scattered degenerate offshoot of the Atlanteans which first occupied not only Europe but other continents too, and then were superseded by the incoming Aryans. The surmise too is correct that the Lapps are the living representatives of this race, though doubtless still further degenerated. The stories of fairies and magicians are also attributed to this ancient race, though whether the people themselves were of such minute stature as to be the actual fairies referred to may be doubted. Nor is it enough to say that "by a very general tendency the younger races regarded the elder as steeped in all sorts of supernatural lore;" for even superstition must be founded on truth, and no one would invent wizards and magic had not such things once existed. The degenerate Atlanteans preserved some knowledge of the powers which their ancestors had abused. Note that the attribution of higher powers to ancestral races is admitted to be a "general tendency;" but why infer that it is fallacious because it is general?

STUDENT

The Trend of Twentieth Century Science

The Nebulous Hypothesis

THE nebular hypothesis is again the subject of attack, this time by a university professor, whose grounds are that it fails to chime in chronologically with geology, that the earth's motion does not fit the sun's rotation and that photographs show us nebulae being formed not in accordance with theory. Part of the earth was glaciated when it was hot, and animals crept about in what is alleged to have been molten rock.

It is very evident that the different branches of science theorize each from its own scanty data regardless of the others, so no wonder their results do not fit. We must enlarge our ideas as to the extent and grandeur of creation, and gain an increased respect for the awful sublimity of the universal plan, and harmonize the different sciences, before we can reach a concordant result. Instead of rushing precipitately to theory, with an impatience that surely little befits calm, cool science, we must pigeon-hole our data until we have collected a respectable quantity. And it will be absolutely necessary to call in a few poets and artists to lend wings to our speculations and yeast to our soggy "scientific imagination."

The nebular hypothesis is based on sublime truth, but done to death as usual and harnessed to terrestrial mathematics. The same with stratigraphy and the other ologies.

But the amusing part of the present controversy is that, on the strength of the professor's having said (possibly in irony) that there was more truth in the Biblical story of the earth's origin than in the nebular theory, a paragraphist has affixed the caption, "Bible Account is Verified." That Bible account lies low and waits its turn while its competitors rend each other. In the temporary absence of better, it becomes the truth. But the *symbolical* summary of cosmogony that lies veiled in the early chapters of the Bible is no more in competition with science than a treatise on harmony is in competition with a manual on organ-building. It is not on the same plane. STUDENT

The Senile Earth

MARK TWAIN once made a calculation of the length of the Mississippi as it had been, and as it would be. In rounding corners the river ultimately eats them away and so shortens its length by so much annually. From these data Mark Twain, reasoning scientifically, found that some thousands of years ago the Mississippi stuck out like a fishing rod miles over the Gulf of Mexico; whilst by the lapse of an equal length of time ahead of us it will have shortened itself down to a few miles.

The predictions of astronomy and geology occasionally remind one of Mark's calculations. We are taught how long it will be before the sun burns itself out; when the moon will fall into the earth, and so on.

The latest of such relates to the earth's magnetism. A geologist has been examining the earth's magnetic values for the period of 1843—1885, and 1890—1900. It turns out that there is a diminution in certain places not compensated elsewhere. From this it is deduced that the earth's magnetic moment is shrinking annually at the rate of one two-thousand-four-hundredth part. In 3200 years we shall therefore have none at all.

Surely figures covering a half of one of the countless centuries of the earth's life are only their own warrant and cannot be made a basis for any deductions whatsoever. How can you say anything about the course of a road a thousand miles long if you are only given ten feet of it to examine? The deduction may have only been that of the newspaper report, but the public read it as official science. STUDENT

Man and His Planet

THE physical influence of man on the planet he inhabits is a subject to which little or no attention has ever been given.

It is generally estimated that the earth's population is about one thousand millions. Taking a hundred pounds as an average weight, this means fifty millions of tons of living conscious substance, conscious with the consciousness of a thousand million thinking souls.

Without stopping to calculate accurately, it may be guessed that each of these persons absorbs his own weight of air, earth, and water every two or three weeks. How many millions of years that has been going on we

do not know. Nor can the hypotheses of science tell us.

It has never been shown that an atom that has once formed part of the body of man differs, or does not differ, from one that has not. One would certainly suppose that in the subtler degrees of its being, those concerned with the finer radiations it receives and distributes, it *has changed*, *has advanced* nearer to organic life and consciousness.

Has man more than once, or many times, eaten and drunk and breathed his whole planet? We do not know; its whole crust, probably. We do not know the first facts about man's age. We have but scratched the crust in our search. There may be countless epochs whose traces of him lie deeper. Continents have risen and sunk many times.

But can we have ever eaten the interior? Who knows what may be the circulation between the central and those layers just beneath the surface? And again it is those layers that through all ages have been continually volcanically ejected to the surface. And through all ages, water percolating inwards, has carried the extreme surface a greater or less distance inward; carrying it also to the bottom of the sea, perhaps there to be swallowed by earthquakes, shaken to the depths where melting heat prevails, and so once more into the currents to and from the centre. It may indeed be that man *has eaten* his whole planet!

But the distribution of forces? Man's body is an electric battery whose currents are largely aroused and directed by his mind. And there must be a constantly changing electric field about every one of us, a thousand millions of us, changing with every feeling and thought. STUDENT

Is the Moon Still Alive?

FOR some years past Professor Pickering has been making a study of the surface of the moon, and he finds that on the whole there is a good deal going on there.

It appears that there are some very active volcanoes. One crater formerly had a diameter of between four and seven miles. This it has reduced to three-quarters of a mile. In another place a new crater has appeared; and the floor of the crater Plato is constantly busy altering its arrangement. And during the last ten years a crescent shaped bank six miles long by one or two broad has upheaved itself.

Other changes appear to be due to the deposition and melting of hoar frost. One crater in particular whitens itself every (lunar) night, and darkens in the day. Of these curious changes, hoar frost is the most likely explanation.

The third class of changes the Professor regards as due to the growth and decay of vegetation. Periodic growths of dusky matter appear in one of the craters, after a short time vanishing, only again to appear.

There is no reason to doubt that with increasing perfection of our telescopes we can soon come to certainty on these matters. STUDENT

Electric Physiology

THE reduction of physiology to terms of electricity goes on rapidly. The electrical conditions of the body change ceaselessly—from instant to instant, with every thought and feeling. Electricity seems to be the link between body and mind, the swift hands by which the conscious player plays his instrument. The study of electrical changes as related to mental and emotional changes is therefore one of the branches of physiology—in some respects the highest.

Some novel work in this field has recently been done by a Swiss experimenter. He has been investigating the resistance offered by the body to the electric current in various people, at various times of the day, and in various mental conditions. The normal resistance is about 3000 ohms, nearly the same as is offered by 260 miles of ordinary telegraph wire. It varies with every emotion and sensation; with the entrance of a stranger into the room, the falling of light upon the eye, the attempt to listen to a sound, or the presence of an odor. It lessens in states of low health, after smoking, and in persons who drink.

Nothing can as yet be deduced from these results which will help us in the employment of electricity in medicine. It is not going very much too far to say that we do not yet know how to use the subtler powers of electricity in the treatment of disease. PHYSICIAN

Floral Beauty Passing All Belief

THE spectacle of the wild flowers in Lomaland this spring is indeed one never to be forgotten. Down on the undulating plain above the sea-cliffs there is one continuous carpet of a splendor and richness that passes all belief. Every wild-flower—and the different kinds are countless this year—has blossomed in the most prodigal profusion and vividness. The variety of colors seems to add new tints even to the rainbow. The number of different kinds of yellow, orange, and red; the varieties of pink and purple; the rich blues;—every moment the eye is greeted by some new color. And then the endless combinations of two or three colors together in one place yield effects which one would like to spend hours in pondering over.

Here is an expanse of gold that looks like the face of the sun himself and inspires us with his glowing energy and joy, until overpowered we turn to some shaded nook where a harmony of tenderer hues induces a quieter mood. Every quality and attribute of the solar majesty is here revealed, and we realize faintly how limitless are the resources of beauty which those beams can evoke from the bosom of earth.

These dazzling gems are set in a mosaic of green and brown such as only the earth of sunny climes can produce. And over all there is a glow and an iridescence so delicate that it eludes us as we look and seems to be ethereal rather than of the earth. STUDENT

The Seedless Apple

THE Spencer seedless apple (see *NEW CENTURY PATH* recently) has been introduced into England with great acclaim. As stated, it bears no blossoms, and therefore cannot, theoretically, bear any fruit. It produces a small cluster of green leaves like a disorganized bud, and therein forms the fruit. There is a stamen and a small quantity of pollen. As there is no flower, the codling-moth does not attack the tree, and so the fruit is free from the grub of that insect. Hitherto the few occasional seedless apple trees have failed to reproduce seedless trees; but the Spencer variety reproduces its own kind by budding and grafting.

It is a curious fact that when these apples are grown near ordinary apples, occasional seeds will be found in the fruit; but they do not belong to the apple and are found in any part of the fruit, even near the skin. They are due to chance pollen-grains from the other trees.

The seedless apple is a very prolific bearer. It is expected to be a

Lomaland Photo and Eng. Dept.

MONTMORENCY FALLS, QUEBEC, CANADA

great success in England; and, though there is at present only one kind, it is anticipated that other of the leading apples may in time be added to the cult. STUDENT

Bird-Guests in Lomaland

EVERY year the birds in Lomaland grow tamer, as they find they are never molested and that their presence is courted. One is hatching its eggs at the tent-door of one of the Nature writers to the *NEW CENTURY PATH*. The nest is at the eaves, between the two canvas roofs, about four and one-half feet from the ground. E.

How the Plants Have Responded to Their Opportunities

THE plentiful rains this season have enabled the wild plants to develop them-

selves with an easy freedom impossible for several years past, and the manner in which they use their blessings is almost as varied as though they were human.

Some have developed an amount of leaf-growth quite out of the ordinary; others have "doubled" their usually simple flowers, or greatly increased their size and number. Yet others have gone wild in an ungoverned rankness of growth, and some have prospered judiciously and evenly.

NAUGHT MADE IN VAIN

by HARTLEY COLERIDGE

LET me not deem that I was made in vain,
Or that my being was an accident
Which Fate, in working its sublime intent,
Not wished to be, to hinder would not deign.
Each drop uncounted in a storm of rain
Hath its own mission, and is duly sent
To its own leaf or blade, not idly spent
'Mid myriad dimples on the shipless main.
The very shadow of an insect's wing,
For which the violet cared not while it stayed
Yet felt the lighter for its vanishing,
Proved that the sun was shining by its shade.
Then can a drop of the eternal spring,
Shadow of living lights, in vain be made?

Several species have seemed to put everything into the increased size, number and perfection of their seeds, even at the cost of lessening their usual stem growth. Other species have more than enough to enable them to attain perfection and are using the surplus in experiments with new colors and petal forms.

The relative number and vigor is also significant. Some sorts which are usually very much in evidence are this year quite subordinate; while others, usually very retiring, have been so encouraged by the climatic favors as to become quite conspicuous, and in some cases even dominate their habitual tyrants.

Thus is demonstrated the truth of the proverb that poverty and plenty reveal the soul. N. L.

Eucalyptus Farming in California.

FROM Escondido it is reported that a rancher is making arrangements to plant fifty acres of eucalyptus, on the conviction that the eucalyptus is the most profitable thing that can be grown, and requires less care than anything else. With a ranch of such trees once well started and paying, would there not be an excellent opportunity, for any one not minding trouble, to develop the industry by studying the different kinds of eucalyptus and discovering new uses for their products? The variety of species that have been successfully grown in California by some experimenters is very considerable. STUDENT

"Service! Service!"—Kundry

GURNEMANZ—"Yea, under a curse she still may be

That of her sins she may be shriven
From former life yet unforgiven,
Seeking her shrift by such good actions
As advantage all our knightly factions.
Sure she does well in working thus:
Serves herself and also us."

LIKE a troubled spirit rushes Kundry, the wild woman, on to the scene, bringing in her hands the Arabian balm to ease the sufferings of the wounded knight, Amfortas.

In her other aspect as the beautiful enchanting woman, Kundry has been the unwilling instrument of power by which Klingsor, the black magician, has overcome Amfortas the Keeper of the Grail, stolen from him the sacred spear, and inflicted the fatal wound. Now Kundry, freed from her magic sleep, penitent, by humble service to the Knights of the Grail, expiates her sins.

Thus does Wagner depict the duality of woman's complex character in his drama, *Parsifal*. Kundry, the one woman throughout the drama, is the embodiment, alternately, of the woman who ensnares and deludes man, then in remorse serves him, and finally is the means of his redemption, being herself redeemed by his redemption.

Truly an analytical study of womanhood.

One's first impression is—what a singular creation of character is this Kundry of Wagner! Surely no woman was ever like to this one. Then as the second thought widens out, we see more clearly and we comprehend that Wagner pictured in one alone, Kundry, the whole enigma of woman as he sensed it. A student of the ancient Eastern philosophies, as well as the later Greek, Wagner has combined all types of the feminine, so far as possible, into one woman. In this light only, can the problematical character of Kundry be understood. Whether Wagner saw truly is another matter; man is prone to endow woman with attributes to his own liking.

It is said that Wagner had in mind for years a study of the Christian tragedy—with the serious purpose of making it into a drama; also that he once gave utterance to the idea, thereby shocking a lady friend, that

The Woman in Parsifal

THEME OF THE BELLS OF MONTSALVAT

GURNEMANZ; High stands the sun now;
Let me to the Holy Feast then conduct thee;
For---an thou'rt pure,
Surely the Grail will feed and refresh thee.

PARSIFAL; what is the Grail?

GURNEMANZ; I may not say;
But art thyself Thicketo ordained,
By thee the knowledge shall be gained.

And lo!
Methinks, I know thee now aright:
No way leads to its holy height,
And no man e'er could tread it hither,
Save whom Itself had guided hither.

PARSIFAL; I scarcely move---
Yet swiftly seem to run.

GURNEMANZ--- My son, thou seest
Here Space and Time are one.

"The prophet of Nazareth, loved by the sinful Magdalene with earthly love, might be made into a stage picture of touching beauty." This idea has been carried out in the last act of the drama, *Parsifal*. When Parsifal returns from his wanderings in search of the Grail, Kundry recognizing him as her Redeemer—for she has known this to be the truth since he resisted her magic spell in Klingsor's garden—hastens to

show him her love, and gratitude, for her deliverance from the evil powers. While Gurnemanz bestows the blessing of the Holy Order of the Grail upon Parsifal, Kundry brings water from the spring, bathes the feet of Parsifal and dries them with her hair. Parsifal's first act after receiving the rite is to bend over the kneeling Kundry, pour water on her head and say—

"I first fulfil my duty thus;—
Be thou baptized,
And trust in the Redeemer."

Kundry sinks to the earth weeping passionately—and Parsifal continues,

"This tear of thine the dew of blessing showers,
Thou weapest, see, how smile the flowers."

There is a sweet touch of human nature in this; Parsifal wishes Kundry to fully share in his own sanctification.

in his own sanctification.

This all bears a striking resemblance to the Last Supper, the Nazarene and Mary Magdalene. To many of the Christian faith, this scene is the one jarring episode in the drama. To others, it is an opportunity made use of by Wagner, to portray the idea he had in mind; symbolizing the sinful woman, changed into the repentant, purified one, as represented in the dual nature of Kundry.

Wagner was not alone in his conception of the love existing between the Nazarene prophet and the Magdalene, for this same idea is quite noticeable in the Passion Play at Oberammergau, although we do not know that it has been before remarked. It is the Magdalene who understands the motives and actions of Jesus at all the critical times, and she is the last one to receive his glance of affectionate regard, at the final parting

from his mother Mary and friends. In neither case is there the slightest hint of the man being swerved, or lowered in any degree, by the woman's charms. He is the Redeemer, and becomes that because he has known and resisted temptation.

But the great soul that has achieved longs to bring other souls up to his level, and the redeemed man must also redeem woman. The one naturally follows the other. Wagner pictures this thought very beautifully at the final Initiation of Parsifal, when Gurnemanz the Teacher has blessed Parsifal, and invested him with his own Grail mantle. Parsifal takes the sacred spear and, together, he and Kundry follow Gurnemanz solemnly up the heights of Montsalvat to the Grail Hall. Parsifal enters with Gurnemanz alone—but later, when he ascends the altar to receive the Grail, Kundry enters, makes her way through the body of Knights until she reaches the steps of the altar, where she remains while Parsifal goes through the form of receiving the Grail. As the Grail is taken from the shrine and Parsifal receives it in his uplifted hands, in exaltation, the glowing light from the Grail envelopes Parsifal and all, in its fiery glow, and Kundry falls slowly to the ground, lifeless. Thus does Kundry receive her Initiation.

What a boon will come to humanity when all men and women understand the true meaning of the Grail. Now woman, single-handed, has to make her fight for release from the magic sleep which is holding womanhood as a whole in its stupor. And if, as too rarely happens, some great woman soul does reach the heights, she stands alone, apart from the remainder of the race.

But what a glorious battle will it become when men and women stand side by side with one thought and one purpose, to make the Grail, which represents all that is purest, noblest, most beautiful in life, a living truth. What is the touchstone which will awaken men and women to this knowledge? Theosophy declares it to be Compassion. E. C. S.

A YOUNG Indian Princess from Muskogee, Indian Territory, who has been studying music in New York city for some months, says she has always had a desire to bring the beauties of the Indian folk-songs before the American people, and that she is going to plan to do it, on her return to her home. She also intimates that if a talented composer could come among the Indians and write down some of the beautiful little Indian ballads, so common among them, the American people would hear something vastly different from the present style of popular music. It is to be hoped that her laudable desires in this direction may prove successful of result—and the old folk song of the Indian be preserved. E.

Of all the families in America, only eighteen per cent employ domestic help. Thus the great majority of wives and mothers do their own household work. Small wonder that the "American woman" is evolving into a remarkable type. Who can predict what her future may be with such rare opportunities for development?

Lucrative Trade in Meteorites Due to a Woman's Wit
A NOTABLE instance of the value of a woman's intelligence in thinking of things which did not strike the masculine mind, is that of Mrs. Kimberly of Kansas, who is responsible for the very lucrative trade in meteorites which has made her husband rich and

Lomaland Photo and Eng. Dept.

REPRODUCTION OF SCENE FROM FIRST ACT OF PARSIFAL AS PRESENTED UNDER WAGNER'S DIRECTION AT BAIREUTH

Kundry on the left. In the center is the wise old teacher, Gurnemanz, relating to the young esquires the fall of Amfortas

cleared away the mortgages from many Kansan farms. The story of these meteorite sales is briefly as follows: In 1890 Dr. Snow of the State University heard of rich meteorite finds in Kiowa county, and sent an agent down to buy them for the Museum. The agent however arrived just too late, as Kimberly, the farmer who had obtained possession of the meteorites, had sold them to an agent for New York speculators. The Doctor managed, however, to secure Kimberly's services for future finds.

No profit would have resulted to the farmers had not Kimberly's wife, who had read about meteorites, realized the value of the stones which her husband was bartering as curiosities for a trifle. She quietly bought them back and saved them up until the professors and speculators came into the field.

Now farmers have ploughed some fields as many as three times over in search of meteorites, and have reaped profits which have lifted their mortgages.

The largest found weighed one hundred and sixty-eight pounds, and yielded large profits both to the finder and to Dr. Snow, who sold it to a New York museum. Twenty-five to thirty meteorites have been found in Kiowa county, and were sliced and polished and sold to collectors. Other counties have also yielded well. One farmer cleared several hundreds by exhibiting a stone, and then sold it. As much as \$1500 has been offered for a single specimen. H.

POEM

by JOHN GREENLEAF WHITTIER

THIS poem was written by Mr. Whittier while he was a guest at the Asquam House. A fair was being held in aid of the little Episcopal church at Holderness, and people at the hotel were asked to contribute. These lines were Whittier's contribution, and the ladies in charge of the fair received ten dollars for them. They were written in an album now in the possession of a niece of Whittier's Philadelphia friend, Joseph Liddon Pennock.—S. T. Pickard

FORGIVE, O Lord, our severing ways,
The separate altars that we raise,
The varying tongues that speak Thy praise!

Suffice it now. In time to be
Shall one great temple rise to Thee,
Thy church our broad humanity.

White flowers of love its walls shall climb,
Sweet bells of peace shall ring its chime,
Its days shall be all holy time.

The hymn, long sought, shall then be heard,
The music of the world's accord,
Confessing Christ, the inward word!

That song shall swell from shore to shore,
One faith, one love, one hope restore
The seamless garb that Jesus wore!

Asquam House, Holderness, N. H., Seventh Month,
25th, 1883.—From the December Atlantic Monthly

A FRENCH newspaper, *The Gaulois*, is authority for the following words, reported to have been said by Queen Alexandra when interviewed at Marseilles:

Queens must do all in their power to prepare their children for the exalted positions which they will be called upon to occupy. It should be their task, however difficult it may seem, to comfort the afflicted and unhappy. That is the best and sweetest part they can play, and for myself I have no wish to play any other.

In the troublous times in which we are living it is impossible not to be affected by the dissatisfaction of the masses, which is in many ways natural enough. Believe me, if the social problem ever can be solved, it will be by reason of the goodness of women, by mutual love and a common reverence for the right, for justice and charity. Your talk, as men, is of war, but we women speak always of peace—peace in every nation, peace between all nations.

The secret of Queen Alexandra's great popularity with the masses lies in her perfect womanhood. M.

THIS spring the performance of Sophocles' *Antigone* is expected to be given in Athens in honor of the Congress of Archeologists. The leading rôle will be played by a young Greek woman of great talent, though still an amateur. Archeologists from all over the world will attend.

OUR YOUNG FOLK

The Magic Cloak

THERE is an old, old legend—written in curious characters, they say, in an old, old book—about a magic cloak which once was brought from fairy-land to King Arthur's court. The messenger who brought it proclaimed that this cloak was destined for the maid who was loveliest and fairest. All the maidens of the court tried it on, for it shone as the stars shine on a clear night and its beauty was rare beyond words to tell. Yet none could wear it.

Somehow—it was a magic cloak, you know—it had a strange way of revealing the imperfections of each maid who tried it on. One after the other hastily threw it off, saying: "No, it doesn't fit, after all," and those who had most desired it were the first to cast it aside—all except the waiting Genelas. She was slight and young and had waited patiently for her turn to come, unnoticed by the others who had been longer at court. She threw the cloak about her shoulders—lo! it fitted her exquisitely and no imperfections were revealed. The reason was that, so pure and sweet and innocent was Genelas, she had no imperfections to hide.

Isn't this old tale, boys and girls, symbolic of the cloak fashioned for the wearing of humanity out of that new-old philosophy brought back again to men by Helena P. Blavatsky? Today we call the magic cloak of its weaving, Raja Yoga. O, how many have seized upon it, thinking to claim and wear it—and how quickly and surely did it reveal their imperfections! But when they cast it aside many—very many—did not say, "Lo! I am imperfect; I must change my ugliness into beauty and then the cloak will fit." Ah, no, only the few said that. The many said, "It doesn't fit and it is an ugly cloak, after all," and threw it aside.

But the few have bravely learned to make themselves over and are stepping out of their imperfections into that path that leads to perfection, wearing this magic garment of Raja Yoga. Truly it is a magic cloak which can only be worn by those who are really pure and sincere in their lives. It can only be worn by those in whose heart sounds, clear and strong, the key-note of unselfishness. It can only be worn by boys and girls whose good resolves are not thwarted by some selfish desire. How about yourselves, boys and girls all over the world? Does this magic cloak fit you? If not, why not?

WHAT you call "Christian duties" were inculcated by every great moral and religious Reformer ages before the Christian era. All that was great, generous, heroic, was, in days of old, not only talked about and preached from pulpits as in our own time, but acted upon, *sometimes by whole nations*.

DUTY is that which is due to Humanity, to our fellow-men, neighbors, family, and especially that which we owe to all those who are poorer and more helpless than we are ourselves. This is a debt which, if left unpaid during life, leaves us spiritually insolvent and moral bankrupts in our next incarnation.—*Helena Petrovna Blavatsky*

"THE DREAM OF HELENA P. BLAVATSKY BECAME A REALITY"
(Children of the Raja Yoga School. The Raja Yoga Academy in the distance)

IF we had money we should found schools. . . . Children should, above all, be taught self-reliance, love for all men, altruism, mutual charity, and, more than anything else, to think and reason for themselves. We would reduce the purely mechanical work of the memory to an absolute minimum, and devote the time to the development and training of the inner selves, faculties and latent capacities. We would endeavor to deal with each child as a unit, and to educate it so as to produce the most harmonious and equal development of its powers, in order that its special aptitudes should find their full natural development. We should aim at creating free men and women, free intellectually, free morally, unprejudiced in all respects, and, above all things, unselfish.—*Helena P. Blavatsky*

UNCLE FRED

Truths Worth Remembering

(From the writings of Helena P. Blavatsky)

PEOPLE hate only the things they fear.

THEOSOPHY is the quintessence of duty.

IT IS easier to say a thing than to act accordingly.

THE human heart has not yet fully uttered itself.

OF the two unpardonable sins, the first is Hypocrisy.

EACH must acquire wisdom by his own experience and merits.

NO Theosophist has ever spoken against the teachings of Christ.

HE who would be a true Theosophist must bring himself to live as one.

To feel compassion without an adequate practical result is not altruism.

WE would have all realize that spiritual powers exist in every man.

THE Spirit in man—the direct ray of the Universal Spirit—has at last awakened.

TRY to realize that progress is made step by step, and each step gained by heroic effort.

THE age of crass materialism, of Soul insanity and blindness, is swiftly passing away.

THE "struggle for existence" applies to the physical, never to the moral plane of being.

WHEREVER you are, you are a centre of force, and it is your own fault if you are useless anywhere.

RELIGION in the true sense is a bond uniting men together—not a particular set of dogmas and beliefs.

No man is required to carry a burden heavier than he can bear; nor do more than it is possible for him to do.

IT is only by the close brotherly union of men's inner SELVES that the reign of justice and equality can be inaugurated.

WE stand at the parting of the ways, where the one path leads down the acclivity to the dark valley of ignorance, and the other climbs upward toward the pure celestial level of being.

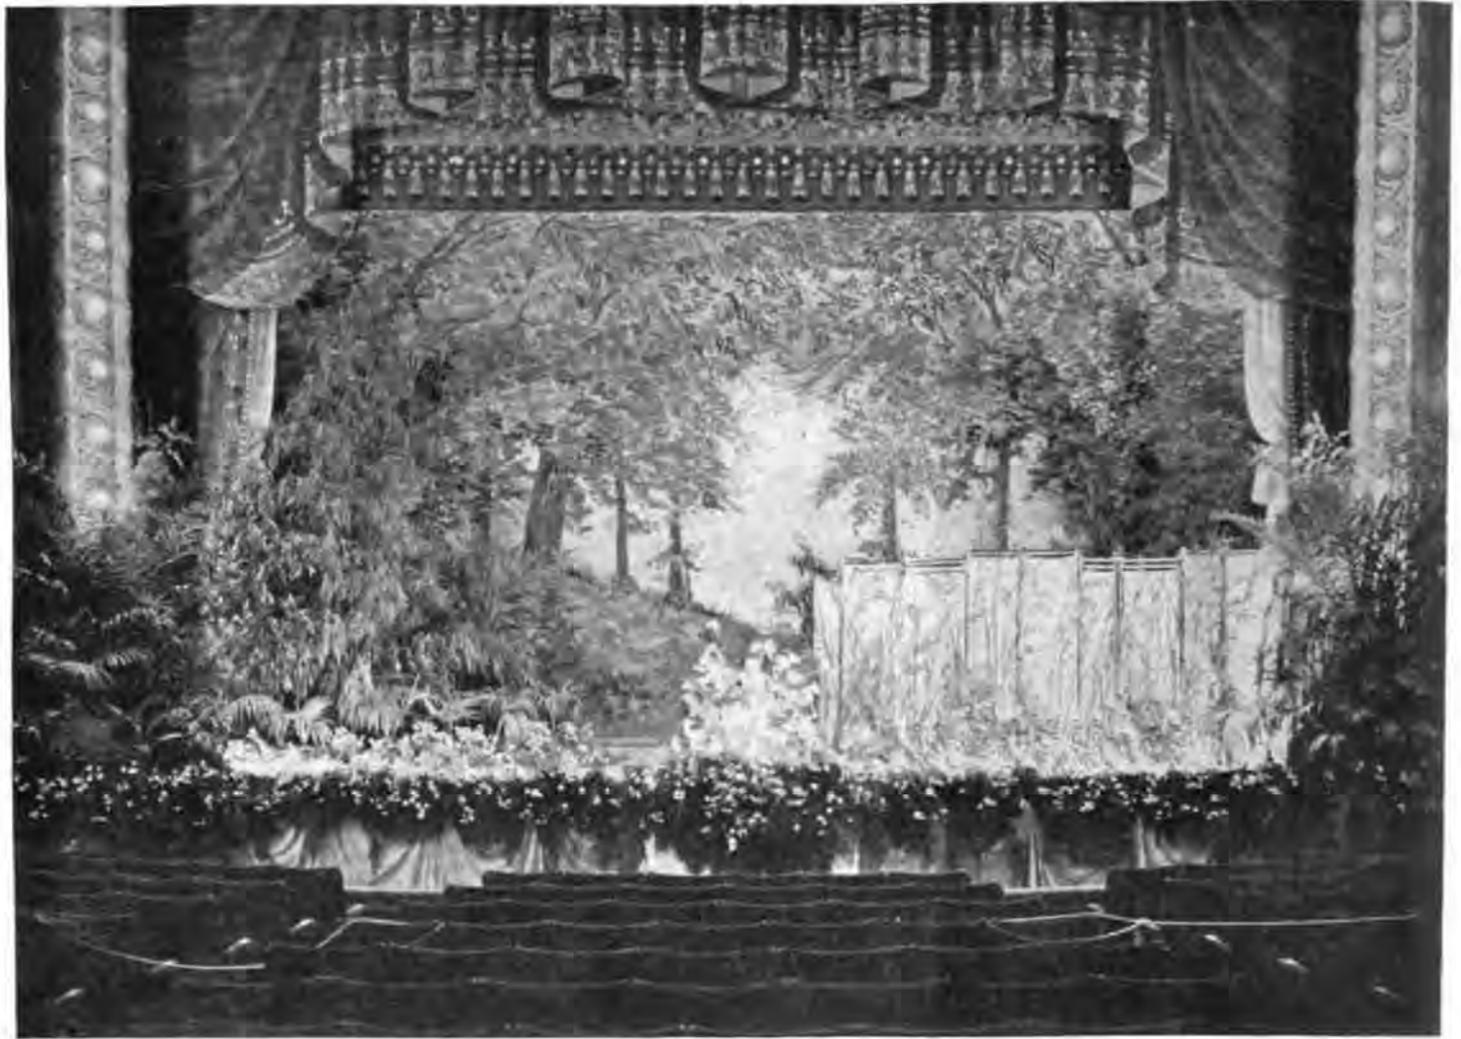

I TELL you, friend, life has nothing better than the consolation and happiness of the deep affection for things and people we have loved from childhood. This kind of thing can never die; it will have eternal life in eternity.

OUR philosophy teaches us that the object of doing our duties to all men and to ourselves the last, is not the attainment of personal happiness, but of the happiness of others; the fulfilment of right for the sake of right, not for what it may bring us. Happiness, or rather contentment, may indeed follow the performance of duty, but is not and must not be the motive for it.

ONE little period passed without doubt, murmuring and despair; what a gain it would be; a period, a mere tithe of what every one of us has had to pass through. But every one forges his own destiny.

Isis
Theatre
San
Diego
California

THE THEOSOPHICAL FORUM, IN ISIS THEATRE

THREE papers by Point Loma students and several musical numbers of exquisite beauty, combined to make a program of rare merit at the Universal Brotherhood meeting at Isis Theatre last Sunday evening.

Miss Edith White read a paper entitled: "The Real Educators of the Age Must Be Theosophists." From it we quote: "The real educators of the age must be Theosophists in the profoundest sense; they must be of the type of those who have realized something of their divine nature, and who see the spirit within the letter. Their life must be stainless; and they must deem example to be more powerful than precept.

"Duties must be performed steadily and courageously, pain and sorrow met bravely, and their lives will be devoted to the benefit of all humanity. Such has been the example set at all times by great teachers and it is absolutely necessary that those who would be educators in the true sense, must stand out and with courage live the life. Brotherhood must not be talked about only, but lived."

From a paper on "Law," by Miss Julia Hecht, we quote:

"A great, unalterable, universal law, just and impartial—the law of cause and effect—explains the why and the wherefore of all that befalls us; 'what thou sowest, that shalt thou also reap.' It would not be possible to sow seeds here, and find that we had to go to some other planet to reap the harvest. But why is it not possible, or probable, nay, even most probable, that we should return here to earth to reap and sow again many times?

"In our daily life we see that experience teaches us to do things well; why should not we, as souls, need time and experience for our soul-life? To become perfect, we surely need much time. Why should not we, as we become more perfected, be able to trace the joys and sorrows of today to their source in former lives? We are told, too, that this divine law of 'cause and effect,' is wise and just and 'moves to good,' tending to bring order out of chaos, good out of evil, joy out of pain."

"Practical Theosophy and the Influence at Point Loma," was the subject of a very entertaining paper by Mr. W. Ross White. In part, he said:

"Can any one deny the influence of the great Center of the Universal Brotherhood Organization, having regard for its practical, its educational,

its humanitarian work in various countries? Its practical work is known everywhere, and is attracting the attention of the thinkers and workers in all parts of the world. Most people would like to do something for the bettering of conditions generally, but the trouble is, they have gotten out of the habit of doing so. Through long years the idea that laymen, so to speak, should concern themselves only with the grosser side of life has gained remarkable credence. In some manner we have been led to believe that a wide gulf separates things terrestrial and things celestial, and that we should leave the latter for the consideration of those who make it their profession to square the circle of spirituality and furnish us a creed to fit, just as one would secure a dress pattern from stock. This has led us to stand in superstitious awe of those things that should concern us most vitally; that is, an understanding of our own natures and our relation to our fellow men.

"Just here the practicability of Theosophy asserts itself, for its educational work is well known, and its humanitarian efforts drew the approval and support of the American Government on the memorable occasion of the Cuban war, and is now a matter of history.

"Is it not indubitable proof of the influence of the Center, when we consider that the membership of the Organization comprises people in every walk of life—people who have joined for the most unselfish of motives—I ask, is not that sufficient proof of its influence? And considering the stupendous and magnificent work already done and still being prosecuted at Point Loma, can we not truly say that Theosophy, practically applied, is indeed a revelation to the peoples of the earth?"

"Who would have thought, even one decade ago, that there would be today so many activities in connection with the movement, and especially activities conducted by unsalaried officers? It would have scarcely been accounted possible.

"So much already having been accomplished, is it not reasonable to infer that, in the near future, Theosophy will prove itself to be the only philosophy capable of uplifting the human race, and of bringing real life and joy—yea, the very consummation of happiness to long-suffering humanity?" The answer must be, "Yes."—*San Diego News*

Art Music Literature and the Drama

The Musical Atmosphere of Lomaland

IN accord with the fact that music is the great harmonizing power in human life, it is significant to note that the first activity started by the Universal Brotherhood at Point Loma was musical work, and that it has ever since been an all important feature.

Musicians have gathered here from all parts of the world. They have here made the wonderful discovery that it is possible for musicians to work together in harmony on many beside musical lines; that they have other great interests in common beside music; and that they may work out the great problems of life "in tune" with each other as souls, not merely as performers on some instrument. We here realize that there is building at Point Loma a musical atmosphere of an entirely different nature than can be found elsewhere, though we may search over the whole earth.

Lovers of music crave what they call a "musical atmosphere," and many think they must go abroad to find it. But is it possible for an atmosphere to be genuinely musical, when the lives and characters of the musicians are unregulated and discordant? Something more is needed than practicing or singing "in tune." It is necessary to be attuned physically, mentally, and morally to express the highest in music, and only true manhood, or true womanhood, can attain to really great musicianship.

What would the world think of a musical atmosphere in which each is striving to regulate his whole life according to the highest moral law? At Lomaland the students, even the youngest, have the support of a united effort in this direction. They are striving not only to take command of their musical faculties, so to speak, but of all the faculties of the whole nature. He who takes hold of himself, and puts his best efforts into the performance of all his daily duties, making a success of every undertaking, has gained the strength and power to excel in any particular line of work. The musicians here, in instructing the Raja Yoga children, see that their possibilities and achievements in musical work are of an infinitely higher quality because of their broad general education, which gives them a rare balance and flexibility; and because they are taught self-control and right action in all the details of their young lives.

It is generally conceded that, as a rule, musicians are irritable and eccentric,—“hard to get along with”—“erratic,” they are often called. But an altogether different spectacle is presented at Point Loma, where musical work is always done with the ideal of working together in harmony on all lines. It is just this all-round culture and discipline that is needed, in addition to special musical training, in order to develop perfect musicianship, and make the whole life beautiful, joyous and harmonious.

The general musical atmosphere of this beautiful place is not deprived of its divinity and inspiration by effort for personal aggrandizement, nor by motives of petty vanity. Then, too, there is not the strain of being obliged to cater to a pupil's whims, for the sake of pecuniary returns. The freedom from these conditions enables a higher quality of work to be done, and creates an atmosphere in which each individual can become a better musician, and each musician, a better man or woman. For the whole nature is developed, and the whole student reaps the joy of life.

Here indeed is a musical atmosphere which is sweeter, purer, nobler, and more infinite in its possibilities than any which has hitherto been believed possible. The world of music has never been without unselfish individual workers, but what it needs today is the inspiration of the united effort of many along the highest moral, as well as musical, lines. JULIA HECHT

A Royal Tribute to a Royal Musical Worker

FEW live to celebrate their own one-hundredth birthday, as is the case today with the musician Manuel Garcia. It has been a surprise to many to learn that the Garcia centenary, recently celebrated in London, was held in a medical, instead of a musical, building—the rooms of the Royal Medico-Chirurgical Society—and that among those met to do this man honor were some of the greatest of modern physicians and surgeons.

Garcia is as gratefully known to physicians because of his invention of the laryngoscope as to singers because of his marvelous method. The son of the great tenor Garcia, the brother of two of the greatest singers of this century, Maria Malibran and Pauline Viardot, the teacher of Jenny Lind, and Madame Marchesi, Garcia stands musically as one of the most remarkable men who have ever come from Spain. Yet medical men at his recent centenary came from all over the world to do him honor, and at the meeting addresses were read by the delegates from many countries, even Australia and Japan. It was just fifty years ago that

Garcia read before the Royal Society—itsself represented by delegates—his paper entitled “Physiological Observations on the Human Voice.”

Garcia's discovery of the laryngoscope was the direct result of his efforts to place the art of voice-building on a scientific basis. He believed that it would be possible to explain tone formation, tone color, as it were, and the modulations of the voice, scientifically. While he did far more than he dreamed for the medical profession—even creating a new and special branch of surgery—he did far less than he hoped to do musically. While at first believing that a scientific knowledge of anatomy and of all the physical details connected with voice culture was of primary importance to teachers of singing, he later abandoned the notion, believing that something higher must be called upon, something that could not be weighed or measured or dissected; something so infinitely above the physical that it could not be called even by Greek or Latin scientific names. PSALM OF THE WEST—FRAGMENT

by SIDNEY LANIER

AND he sank on the grass of the earth as a lark on its nest,

And he lay in the midst of the way from the east to the west.

Then the East came out from the east and the West from the west.

And, behold! in the gravid deeps of the lower dark,

While, above, the wind was fanning the dawn as a spark,

The East and the West took form as the wings of a lark.

One wing was feathered with facts of the uttermost Past,

And one with the dreams of a prophet; and both sailed fast

And met where the sorrowful Soul on the earth was cast

Then a voice said: Think if thou lovest enough to see,

But another: To fly and to sing is pain: refuse!

Then the Soul said: Come, O my wings! I cannot but choose.

And the Soul was a-tremble like a new-born thing.

Till the spark of the dawn wrought a conscience in heart as a wing.

Saying, Thou art the lark of the dawn; it is time to sing.

LAMENTATIONS are frequently heard about the fact that the art of conversation has become a lost art. Well, perhaps it has. If that is the case it may be because most of us have nothing to converse about. We have lost our interest in purely literary themes and the topics that held Burke and Reynolds and Sam Johnson and Coleridge for hours would not hold the average one of us, now-a-days, for five minutes. There is too much stirring, too much within, too much without; and yet, over and under all our push and busybodyness, is an irritating sense of vacuity.

Plainly, we shall have to wait for a new philosophy to set men talking with the relish and zest that conversation held in Plato's time. The *Symposia* of old Greece were not perfunctory affairs. They were alive and vibrant with the light that flooded in upon men's souls. Those were days when men were interested in questions of the soul and immortality and of their own divinity and of the destiny of the human race. Have we lost our hold on these high themes—or on ourselves and our own motives?

Perchance it is a good thing that the gentle art of talking has passed into the silences for awhile, as a stream passes under ground to reappear later on, purified. The present period of withdrawal and silence, which so affrights some of our literary critics, may be a veritable gift of the gods themselves, giving opportunity for something worth while to germinate and, in its own season, and own way, to come forth. Universal Brotherhood Organization

Central Office Point Loma California

The European Theosophical Crusade of 1905 --- A Reminiscence by a Crusader

SINCE the advent of Universal Brotherhood in 1898 as an organized and public body, events of the utmost importance to humanity at large have happened with a rapidity and distinctness that are most startling. The Hague Conference with its aim at international peace, the wonders of wireless telegraphy linking distant peoples together by the mere use of the ordinary elements of earth and air, titanic struggles of nations to rid themselves of the encroachments of self-interest and legalized though unnatural bonds that ages of distrust have permitted to grow around them—all these events indicate the pivotal point to which humanity seems to have reached. May it not be that from such a point the great human family shall rise to a power and place in the universe to which it has never before attained? We think so and we believe that only by the power of love, the effect of brotherliness, can this be.

THEOSOPHICAL LANDMARKS RAISED

It is with some such thought as this that one recalls many of the happy incidents of the recent European Crusade of the Universal Brotherhood and Theosophical Society. In the old days when a pilgrimage was made it was not unusual to erect a cross as a landmark showing where the pilgrims rested for a short time on their sacred way. So the brief resting places of the Crusaders in Holland, Sweden and Germany are marked by indelible signs and indications of International Brotherhood. At each town there was a gathering of members of the Universal Brotherhood from the North, South, East and West. The harmony that prevailed in the meetings was unique and whether it was in the upper room of Groningen joined with the boys' and girls' clubs, or at the commodious halls of the Centre at Stockholm, in the quiet students' room at Helsingborg, or around the festive board at Malmö or Berlin, or in the quaint old noble's quarters at Nürnberg, each place indicated the determination of the members to make Theosophy a living power in their lives. Thus there is a unity of purpose which is the remarkable characteristic of all Universal Brotherhood centres throughout the world—the same steady devotion, the same trust, in every place visited.

NATIONAL TRAITS

At the same time each nation presented its own peculiar traits of character—Sunday showed the earnest religious atmosphere which pervades Holland, and the costumes of its peasants in certain towns are quaint and very suggestive of the conservative yet strong character of this people, who, one would think, would be true to death in their friendship once it was thoroughly established with either persons or ideas.

In Germany the precision of action and the rules and regulations of life which are more or less the effect of extreme intellectualism, are everywhere manifest. An example of this was noticed in the requirements of the authorities for the police for permission to be granted before a public meeting could be held in some cities. Individualism and independent thought do not seem so possible there as in neighboring countries—yet

there is a strong devotion to ideals and an *esprit de corps* in many classes of the community which will one day tell greatly in favor of Universal Brotherhood—to an extent not realized today. Germany will be a Theosophic stronghold in days to come.

Sweden may be described as the home of the great Scandinavian race. Here as in very few countries one may note the diligence of the community as a whole to provide for the general welfare and happiness of all. A remarkable instance is the almost general use of the telephone. Seen in the winter time one is struck with the feeling of large-heartedness that pervades all ranks of society—the turban-like caps of skin or fur, the calm, well-moulded features, the stalwart figures, well-clothed, all bespeak a kingly people. The climate and conditions of life may have much to do with the formation of such characteristics, but close contact in every-

day affairs reveals still more sterling worth. One goes into a Swedish home where the rooms open one upon another without the intermediate door with which the Englishman is so familiar at his home—this gives the effect to a stranger of a real welcome on entering a Swedish "Castle." The same feature is noticeable in many American homes. But the charm of the family salutation to the host and hostess at the conclusion of a meal is perhaps the most striking to the reserved and unemotional Britisher. The air of peacefulness pervades the country from end to end; not the inactivity of idleness but the quiet activity of each one doing his own duty.

And is it not in the doing of one's own duty that lies the perfect safety of action for both an individual and a nation? Surely it is thus only that humanity can rise from its present miserable selfish surroundings and conditions. It is the key in action to the portal of realized Universal Brotherhood.

HELPERS AND WORKERS

One cannot conclude this record of reminiscent thought without an affectionate reference to the helpers the Crusaders met with on their tour. In Holland and in Germany the light of Theosophy is kept aflame by the constant tending of earnest, fearless and devoted workers, ever ready to sacrifice time, money and work for the furtherance of

our movement. In Sweden there is a host of students, some of them old warriors dating from the early days of H. P. Blavatsky, whose every thought and action breathes Brotherhood. Dr. Zander of Stockholm is as a father among the people; and Dr. Erik Bogren and Torsten Hedlund are most worthy and true brothers, of whom we may say that their constant devotion to our Leader and their readiness to sacrifice life in the cause of Brotherhood, are an inspiration to any beholder. Dr. Bogren in his profession one of the busiest of men, was yet quite prepared to interrupt that work to assist in the success of the Crusade in Sweden, which he effectually did.

We cannot all contribute to the same extent, but it is the privilege of the humblest member in every country to do his best, and it is that best which enables the Leader to bring a cosmos out of the chaos of men's thoughts and ideals which prevail over everything else in the world today. CRUSADER

DESTINY OF AMERICA

BISHOP BERKELEY, 1686-1753

THE Muse, disgusted at an age and clime
Barren of every glorious theme,
In distant lands now waits a better time
Producing subjects worthy fame:

In happy climes, where, from the genial sun
And virgin earth, such scenes ensue;
The force of art by nature seems outdone,
And fancied beauties by the true:

In happy climes, the seat of innocence,
Where nature guides and virtue rules;
Where men shall not impose for truth and sense
The pedantry of courts and schools:

There shall be sung another golden age,
The rise of empire and of arts;
The good and great inspiring epic rage,
The wisest heads and noblest hearts.

Not such as Europe breeds in her decay:
Such as she bred when fresh and young,
When heavenly flame did animate her clay,
By future poets shall be sung.

Westward the course of empire takes its way:
The four first acts already past,
A fifth shall close the drama with the day:
Time's noblest offspring is the last.

A Hopeful Sign

IN turning over the pages of the current magazines, we find many indications that the taste of the reading public is changing, slowly perhaps, but surely, in the direction of a deeper interest in humanitarian problems. One of these indications is the increasing frequency of narratives of personal experiences amongst the suffering and struggling poor. One man has taken passage as an emigrant, or has lived the life of a tramp or of a beggar. A lady has bought a donkey and cart and sold garden truck, whilst another has entered as a factory hand and lived amongst the working girls of East London or New York.

We may be quite sure these stories are attractive, otherwise the editors of the magazines would not print them. In other words, *they pay*.

And yet twenty years ago such experiences were unthought of as matters of general interest, nor perhaps would the average reader have done more than merely glance at them. Now, they are read by thousands of people,—who moreover find an ever increasing interest, more fascinating than any fiction, in these dramas of human life, so close to their doors in reality, so far away in the fancied separation which caste and creed have woven in the human mind. May we not hope that this is one evidence of the thin end of a wedge which the Twentieth century will drive into the heartless indifference of modern civilization.

If these experiences should happily result in awakening in the hearts of even a few persons, that glow of active sympathy which brings about the dermination to help, then the writers will have accomplished a noble mission. And one step forward will have been taken towards the formation of the ideal State or body politic, and towards the establishment of true religion.

What is the ideal State? Surely it is that in which the health of the body, mind and soul of every human being contained within it, is the concern of each of its members, not in pretence—but in very deed and truth.

What is true religion? St. Paul defined it as comforting the afflicted, and keeping one's self unspotted from the world.

If we are inclined to think that the world is becoming better,—less materialistic, more spiritual, more humane, yet the voice of the pessimist is ever heard in the land. He tells us of "graft" in the offices of our

National Government, of bribery and corruption in our State Senates and Assemblies, and in our municipal affairs. He recites the selfishness of trusts and corporations, the moral degeneracy of the idle rich, the slavery of children in factories and mines. He points to the statistics of divorce, lunacy and crime, and he tells us that little can be done or hoped for, to counterbalance all this terrible load.

Nevertheless, the fact remains that all these stand *disclosed*, facing the attacks of the phalanx of human progress,—the awakening to reality which is before us in the Twentieth century. Half a century ago the facts which the pessimist now recites so glibly, were just as true but comparatively unknown. Wherever known they attracted very little attention, beyond the smile or the wink of the transgressor.

In these latter days they are becoming revealed, are coming more and more to light. They are becoming publicly discussed wherever men do congregate. The searchlight of public opinion is being brought to bear upon them.

If these things are so, then we can well believe that there is a battle ahead of us which is worth the fighting. It is one in which we may freely put forth all our strength—for it is a struggle to free humanity from the forces which have long enslaved it. Now is the time to choose which side shall be ours.

E. V.

FRIENDS IN COUNSEL

DEAR COMRADES: The word imagination is most commonly employed to stand for unreality and misconception, and this widespread misapprehension of the godlike faculty of mental creation sufficiently indicates the use we make of the faculty ourselves. In fact, we seldom use imagination with deliberate attempt, we rather suffer it to act, the sport of every passing fancy and desire. Vagrant thoughts invade the mind and clothe themselves at our expense and feed on our vitality, and while they hold their revels, we look on and placidly regret our want of mental control. We are assured by those whom we may term the experts in mental dynamics, that mastery of mind may be acquired by practice and the absence of desire. The ceaseless current of the personal desires is that which causes the perpetual picture-making of the mind that ceases only with our death.

The student having once acquired the power to stop this wearing oscillation of the mind would have abundant thought power to devote to plans sketched in outline in our minds by the Higher Self. Splendid castles now suspended in the air could then be brought to earth to dwell in. We never need to hesitate for want of molds in which to pour our minds. A stately Temple hovers over the School Grounds, and while a nucleus of the great seat of learning has consolidated and is actively at work, it is but as the merest fraction of the glorious whole the future has in store. There is besides a boundless field for the imaginative powers in the illimitable spread of Raja Yoga Schools throughout the world. Such mental exercise accompanied by willing service is potent and causative, for as we strain our gaze into the future time we do not merely speculate on what may be, but are actually helping to determine what shall be.

May we not almost assert that every great reformer's work is the triumph of constructive imagination? First he withdraws his mind from private interests and proceeds to use the force thus saved by vividly conceiving those reforms on which his heart is set. By constant brooding over his ideal he infuses it with life and substance so that other kindred minds perceive it too; and thus is formed a band of earnest colleagues whose *impersonal* desire is poured into their common enterprise. Their vision takes at last a solid form and comes to be a blessing in the lives of men.

The image-making faculty in most of us is like the flag that flutters at the vessel's masthead and in aimless flapping does but wear its substance out; but the imagination of a man of power is like the sail below that stiffens to the breeze, and rigid with the wind's propulsion, drives the vessel on her way.

ANALYSIS can never regenerate the peoples. Analysis is potent to dissolve; impotent to create. Analysis will never lead us further than the theory of individuality. . . . Association is synthesis; and synthesis is divine; it is the lever of the world; the only method of regeneration vouchsafed to the human family.—*Mazzini*, from Essay on "Faith and the Future"

THE WILL IS FREE

THE will is free:
 Strong is the soul, and wise and beautiful.
 The seeds of godlike power are in us still;
 Gods are we, bards, saints, heroes, if we will.—*Matthew Arnold*

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question What is the difference between Theosophy and Christianity, and why are the churches so opposed to the former?

Answer The difference between Theosophy and Christianity is a difference not of kind but of degree. The teachings of Christianity are based upon the living truth: the teachings of Theosophy are a more profound, exhaustive and universal statement of the same truth.

Theosophy, which literally means "soul-wisdom," was the wisdom of the ancients and it is the parent of all religions. From time to time great souls have appeared among men, bringing back this vision of the sacred truth which, revealed to the pure in heart, is veiled from the selfish. In different ages these messengers have brought good tidings to India, to China, to Persia, to Palestine and elsewhere. It is part of the wisdom of the world's Saviours to speak in language best suited to their hearers; but the same spiritual truths fell from the lips of Krishna, Buddha, Confucius, Zoroaster and Jesus Christ.

The *Gita*, as a type of devotional book of the Orient, shows the beautiful and mystical language in which a comprehensive philosophy of life is presented to the poetic, introspective, meditative mind of the Hindu. The Christian Bible, with its teachings in parables and in simple statements of the ethics of right living was better adapted to the less subtle, more materialistic and literal interpretation of the Jewish mind of that day. Jesus' disciples were told that there was milk for babes and meat for strong men, but there were many truths which they were not yet able to bear. Interpreted in the light of Theosophy the Bible is cleared of the apparent contradiction of passages which are made the bases of manifold creeds and sects.

The Theosophical law of Brotherhood as given by Confucius reads: "Thou shalt not do unto others what thou wouldst not have others do unto you." Five hundred years later Jesus repeated the law in the Golden Rule. The identity of spiritual meaning of Confucius and of Jesus is at once apparent. The inconsequent difference in wording is typical of the superficial differences in the lettering of the law, which has separated men and incited unspeakable religious wars, when by mutual tolerance in the spirit of the law they might have united in a campaign against the common enemy of sin and suffering. Religious persecution, which assumed that the persecutor's method of loving his neighbor was the only right way, naturally failed to convince the persecuted of the law of love.

One might ask the inquirer what kind of Christianity is meant as differing from Theosophy. Does he refer to Baptist or Methodist or Episcopal or Congregational or Adventist or Unitarian or Catholic Christianity? The various sects are separated by superficial differences born of emphasizing or of misinterpreting some fragment of the Christian message of peace and good will. That the churches have sacrificed truth for theology is evidenced by the diminishing congregations and the miscellaneous means employed to interest and hold the people. A standard topic of church conferences is how to induce people to go to church. The surface symptoms of religious indifference and non-attendance lead to the oft repeated query whether the modern citizen is not outgrowing the need of religion. Looking more deeply, however, it may be noted that the busy, restless, seeking, alert, unsatisfied modern mind in this period of transition has indeed outgrown the theologic husks but is seeking the living truth as never before.

At this time when the theologic army seems to be subtly demoralized by its own indifference, it is peculiarly *apropos* that Theosophy should be spread broadcast to the world as the only means of including and uniting all sincere worshippers in the work of brotherhood. Its teaching that all forms and symbols are less than the reality symbolized, shows clearly that the vital point is not *how* to love one's neighbor but *how much*.

The Theosophical law of Karma Jesus taught by saying that, "With whatsoever measure ye mete, it shall be measured to you again," and not

one jot or tittle shall be abated until the law be fulfilled. The apparent injustices on every hand are sufficient proof that the law is not fulfilled in *one* life where men reap what they have not sown and sow what still remains unreaped at death.

This inflexible justice which Jesus taught, points to the Theosophical doctrine of rebirth, which was current among the Jews at that time, being taught by the Christian church for the first 500 years, A. D., and which explains many puzzling passages of the Scriptures.

The attention which Theosophy gives to deeper knowledge extends into researches of man's nature which the Galilean fishermen were not prepared for, but which Jesus frequently referred to in open or in veiled terms. A knowledge of other planes of life can give reasonable, scientific explanation of the miracles which, to the average Christian, are past finding out.

Theosophy is Christianity writ large. It takes no truth away from any believer, though it eliminates many pet errors. It enhances the beauty and dignity and meaning of the best in all beliefs, for it comes not to destroy but to fulfill.

Ecclesiasticism opposes Theosophy from an instinct of self-preservation, being subconscious of having failed to deliver the message which is the only reason for its continued existence. For centuries it has told but a part of the story, filling even the child's mind with a belief in his natural depravity and calling men worms of the dust whose salvation depended upon the physical sacrifice of another. Today an awakening age rejects these superstitions and turns to hear the story of Christ's humanity and man's divinity which provides every soul with opportunity to work out its own salvation. The Theosophical teaching of the divine origin of man and his ultimate perfectibility, even as the Father in Heaven, was upheld by St. Paul in saying: "Beloved, now we are the sons of God, but it does not yet appear what we shall be."

And there is hope that the jealous clinging to a distorted and unsatisfying truth which has largely lost its hold upon the public mind will ultimately prove a deeper devotion to the greater truth which awaits acceptance.

LYDIA ROSS, M. D.

Question How far is Nature influenced by man's work?

Answer In discussing the relation of man's work to Nature's work—in using the terms "artificial" and "natural"—a student of Theosophy will remember that, as such, his point of view gives him a different light on the subject from that in which it is ordinarily viewed. The intelligences and energies, which act in Nature are part of the universal energy and intelligence; and so is that which manifests in man. Thus man is himself one of the agents which go to make up "Nature" in the wider sense. Ever plastic and obedient, Nature will obey man's will, as well as the more universal will. But, as we know, woe betide the individual who uses his powers unintelligently (selfishly) and thereby *abuses* Nature!

But let us suppose that, instead of individual and injudicious torturings of Nature, men under the harmonizing law of brotherhood were to use their combined will and intelligence in the work of intelligently moulding Nature, helping her, coöperating with her. Then why might not she be ready to yield new bounties from her plenteous bosom, and take the new forms suggested to her or evoked from her by her kindly assistants?

Nature must be largely dependent upon the behavior of the mass of humanity dwelling on the earth at any given time. In an age of coarse materialism she might become shy, withdraw from view some of her more gracious aspects, and retract some of her subtler potencies. This would explain why ancient peoples found things in Nature which we no longer find there; why her various powers may have revealed themselves to reverent and perceptive eyes in visible form and given rise to what we are pleased to call natural mythology.

Perhaps too the ancient races knew how to avail themselves of the powers of Nature in working those constructive marvels whose traces in the cyclopean ruins cause us such wonder. Our science is a mere stabbing and bleeding of Nature, drawing her life-blood, involving her destruction.

STUDENT

THE Theosophical ideas of charity mean *personal* exertion for others; *personal* mercy and kindness; *personal* interest in the welfare of those who suffer; *personal* sympathy, forethought and assistance in their troubles or needs.—*Helena Petrovna Blavatsky*

Henry James in America.

KEEN interest will naturally be felt by Americans in the record of Mr. Henry James' impressions of this country, which he is now revisiting after an absence of twenty-five years.

Henry James was born in New York City in 1843. As a lad of twelve he was taken abroad, and spent four years at school in France and Switzerland. He entered Harvard at sixteen, and remained in America for ten years. The rest of his life, with the exception of one short visit, has been passed in Europe, chiefly in England.

Mr. James has been a prolific writer since his literary career opened in 1866. He is the author of between thirty and forty novels and long stories, and besides writing sketches, a life of Hawthorne and one of Story, he has contributed to the periodicals articles on the topics of the day.

Mr. James' art as a writer of fiction has thus been developed in an European environment; his maturer work is far removed in point of time from the influences of his native land, so that in the setting of his novels we may expect to find England and the Continent depicted as if by one whose birthright warranted the vivid perception not only of the situations possible in the complex society of Europe, but of the alluring charm of these tradition-rich lands, which have long been in familiar relation with the hand of man.

It is worthy of note, however, that in these novels the characters which are most individual and interesting are American.

Mr. James' skilful portrayal of his fellow-countrymen in Europe leaves them before us with all their freshness of aspiration, their buoyant energy, and their readiness to see truth and beauty. His keen comprehension has grasped a certain indomitable and lasting quality in their natures, which remains unshaken in the complex situations of the old world. He shows us Americans, the clear depths of whose natures the civilization and culture of Europe have failed to reach or stir. The psychological turmoil which has led them to seek more complex conditions may become more agitated by European life, but the voice from the past that shall give to Americans the highest educational impulse, or the standards of general culture most necessary to their idealism, would seem not to have spoken in any European tongue.

The close of the first article in the series that is to give us Mr. James' own story of his impressions of America revisited, still finds him in the Eastern States. Quaint old Gramercy Park easily recalls the memories of childhood; crossing the ferry to New Jersey suggests the whole panorama of busy New Yorkers in nightly *villeggiatura*. The costliness of what Mr. James aptly terms the "ingenuous palaces" on the Jersey coast, gives to him no suggestion that they are a permanent or deeply essential expression of the needs of Americans. The impression of inordinate quantity left by the New England orchards in Sep-

tember, and of the attitude of standing in wait revealed by adjoining states, is followed closely by the realization that the abandoned farms speak of attempt that has met defeat.

Mr. James' American readers are prepared for his appreciation of the wealth of types and characteristics presented to a sojourner in that broad area of human development, the United States. They are prepared also for his sense of the transitory nature of much that is objective in American life. But they now look to him also as an acute observer and a clever artist, for the vision and portrayal of some of these finer influences and deeper workings of American human nature, which have their home in the idealism and will, the fruitful and artistic expression of which shall yet be seen on American soil.

STUDENT

In Europe

(By our special correspondent)

April 10th, 1905

THE Bible saying, "Go to the ant, thou sluggard, consider her ways and be wise," has hitherto been interpreted ethically. But a

French doctor, M. Clément of Lyons, has thrown quite a new "light" on this proverb. Why is the ant so strong, so tireless? Because it secretes *formic acid*! Dr. Clément has been experimenting upon men with this acid with surprising results. An increase of physical strength by *five times* is among the results declared. Formic acid as administered by the doctor strengthens the voice to a remarkable degree. It is useful in all cases where tonics are prescribed. It may cure paralysis. It acts immediately. Finally there are no harmful reactions from its use. (!)

The new prescription can do almost too much apparently. Perhaps the practice of Brotherhood by men may cause them also to *secrete* something as powerful as formic acid, instead of receiving it from the doctor's hands. We are only just beginning to tap the resources of human nature. As that nature becomes more harmonious in its action it seems by no means unlikely that sealed reservoirs of energy will be burst open as it were, and we shall literally go on from strength to strength and never feel tired, never be sick. Our ailments, after all, are *disorders*. So perhaps it may be well to leave formic acid alone, and to go on studying the ant in the old-fashioned way. No one can say what untold horrors may result from the doses and serums of animal origin.

Talking about *strength*. A Japanese official of high rank has recently been interviewed by the correspondent of a French newspaper on the subject of Japanese recruits. The correspondent was astonished to learn that these could be turned into soldiers by *two months'* training. The explanation of this lay in the fact that the Japs are a nation of *athletes*. Has not Aryan civilization something to learn here?

I just note the following from *Le Matin*: "The Italian Government has convoked a conference for May 28th at Rome, with the object of establishing an International Institute of Agriculture, and also of inviting the Governments who approve of this project, to appoint delegates."

The Rights of Man

THE agitation of the question as to the morality of the business methods employed by the great trusts, raises the fundamental question of the rights of man. What is the basis of what we call our Rights?

At a first glance we see that the old "law:" "Might is Right," is the one that is actually accepted, while all sorts of schemes are devised by those, who are the victims of this law, to mitigate the suffering caused by its application.

It is evident that all so-called rights are based on the power to gratify a desire, for a right that cannot be exercised can scarcely be called a right; it is but a desire lacking power to achieve its gratification.

Will and desire govern the lower nature, and in that kingdom or state, Might certainly is Right.

But in Man is also a higher principle, Wisdom; and this wisdom teaches Man that when the strong tyrannize over the weak and use them as a means of establishing a power or Right for the pleasure of the strong, then the whole community suffers and gradually deteriorates; and moreover it is seen that in time the weak, who are many, will combine and become the strong by reason of numbers and a united purpose. Then comes revolution and discord and the whole community suffers in

Strong & the Weak Parts of One Whole

another way, and a new tyranny of the strong is established on precisely the same basis as before: Might is Right. But wisdom teaches Man that the strong and the weak are both parts of one whole, and that if one suffers all suffer sooner or later, not being separable from one another, but mutually interdependent.

Therefore, wisdom teaches that it is expedient for the good of the whole that the strong shall protect the weak and help them to develop strength, in order that the whole community may be strong and prosperous. This is the law of compassion or "feeling in common," and this is the basis of social life, in which the first principle is consideration for others. This is the basis of all true morality and courtesy and all social virtues.

But this inner unity is not recognized by the intellect alone; it requires the awakening of the heart to make it active, for the brain-mind alone is purely egotistic and unable to recognize the greater Self which is the common Self of the whole race; and for it, the intellect, Might is Right. The higher law of Brotherhood does not deny the lower law of force, but illuminated by wisdom, and the perception of the real unity

The Strong Guardians of the Weak

of all, it makes the strong the guardians of the weak, and helps the weak to grow up into strength. This it does by teaching them that they too have might, or rights, if they will but have faith in themselves and their real unity; it teaches them that they are divine, and can rise out of their weakness and be strong. It gives hope and freedom; it is the liberator, and the redeemer. The tyranny of the strong is caused by ignorance, and by its offspring selfishness. It does not recognize the inner bond that links all into one great family, and so seeks to rule the weak while keeping them in their weakness and ignorance, and by crushing them into submission, not understanding that by this, the whole community, themselves included, thereby suffers, deteriorates and dies, if not saved by the destruction of the power of the tyrant.

The higher Law cannot be overridden by the lower, and it works ceaselessly to readjust the wrongs caused by man's attempts to live according to the law of his lower nature. When man wakes to wisdom and works with the higher Law, then peace and prosperity come to all, and also happiness, which is man's Right, for the higher Law is the law of the eternal fitness of things, which is harmony, or Brotherhood.

R. W. MACHÉLL

Progress of Geography

IF the world is not all explored, our knowledge of it is at any rate progressing rapidly. The state of geography fifty years ago is shown by reference to the London *Universal Gazetteer* for 1855.

According to this authority all northern Asia is described roughly as "Russian Tartary," and the deserts east of the Caspian Sea are called "Tartaria." The Hindu Kush Range is not marked on the map, and the Caucasus is found due north of the Caspian. There is also a chain of mountains starting from Russia and running without a break to Behring Straits. Australia is a perfect blank except for a few coast settlements; the eastern half is called New South Wales and the western New Holland.

In Africa the "Mountains of the Moon" stretched from near Cape Verde on the west to Abyssinia, central Africa was Negroland, and equatorial Africa was Lower Ethiopia. In America "Independent Countries" stretches from Alaska to the source of the Mississippi, and Chicago, St. Louis, and San Francisco are not marked. In South America the Argentine was part of the Republic de la Plata, and all south of Buenos Ayres was called Patagonia.

In those days Europe was bounded on the east by the river Don, and the Volga and Urals were in Asia. "Germany" was the present Austrian Empire, and what is now Germany was separate principalities. Turkey stretched to the Austrian and Russian frontiers and there were no Balkan States. Japan is described as a "small country with a fanatical

population, peculiarly impervious to European ideas." Turkish dominion included all the north coast of Africa as far as Morocco. Central America was "Guatemala"; Brazil was an empire, and Columbia contained 1,300,000 square miles.

STUDENT

Japan and Her Pupil

THE transition between ancient and modern methods of manufacture has to be made with great care in China. The equilibrium of supply and demand is very delicate there. Millions of hand workers live on the extreme verge of starvation. The introduction of a machine to do in a day what fifty of these people do in a week, would mean the immediate starvation of most of the fifty.

Fortunately the solution of the problem is in the careful hands of the Japanese who exactly understand the difficulty, and indeed are yet dealing with it in their own country. They are slowly introducing machines into China which are transitions towards western apparatus. Crude enough not to do too much work, these machines yet enable the individual worker to achieve considerably more than he did.

Japan understands China, and the West does not. She watches, and to a great degree controls, the Chinese home markets, and she may be trusted to work wisely and carefully with a people whose interests are so closely—and to be ever more closely—bound up with her own. C.

The Origin of "Yankee Doodle"

THE origin of national airs is always an interesting study, and sometimes they are found to come from a far source. Whence our "Yankee Doodle"?

From Schwalm, a district of the old province of Kur-Hesse, in Germany, it is now affirmed. The tune is "derived from a military march played by the Hessian troops" in our war of the Revolution. The chief recruiting office for the enlistment of these troops was at Ziegenhain, in Kur-Hesse. Johann Lewalter has been studying the countryside music of the districts of that province and was struck by the resemblance in form and rhythm of some of the country dances, to "Yankee Doodle". Last year, at the "kirmess" of the village of Wasenberg, when our tune was played, the young men and girls naturally swung into a true "Schwälmer" dance, he says, as though the music had been composed for it.

So he thinks the links of connection are nearly, if not quite complete.

But the other, and more usual, account of the tune is that it is old-English, in use in England before the time of Cromwell and in America long before the Revolution. It certainly sounds old-English. STUDENT

Letting Daylight into Africa

THERE appears to be room yet on the earth for persons who desire to stretch their elbows. The Government of Cape Colony has decided to throw open for settlement the great desert of Kalahari, lying west of the Transvaal in South Africa. It is nearly as large as two Frances, or France and Germany together; and is not a desert but a well rained plateau. There are a few nomadic wild men, but the settlers would practically have it to themselves. Large salt-pans exist, evidence of old lakes, but only one survives, Lake Ngmai, and one river. The other water courses are periodic.

Little by little Africa is passing into modern life. She has only been discovered, so to speak, about half a century, and to say that you propose to go there to live, even in the now populous southern corner, still has a flavor of self-exile about it. But another century or two may tell a very different story. STUDENT

Food Protection in Paris

IT is stated that in Paris the consumer who suspects that his food or drink is adulterated may take it to the municipal laboratory and have it analyzed free of charge; and that, if need be, the city undertakes the prosecution of the offending dealer, who is not only punished but is liable to have a notice of his conviction posted in his window.

This most salutary ordinance might well be copied elsewhere. It is perfectly marvelous how "intelligent" people allow themselves to be poisoned year in and year out with chemicals and rubbish in their food. What may one infer as to the general character for carefulness of such a people? We either trust the dealer or else we trust an inspector, but there seems little reason for trusting the one and not the other! STUDENT

Work at Panama

DIGGING of the Panama canal is now going ahead at an accelerating rate. During the last month 128,000 cubic yards were excavated, as against the maximum of 25,000 ever attained in a month under the French régime. To a great extent the old French tools and engines are being used; there has not been time as yet to replace them with modern American substitutes. Indeed, the engineers say that not for eight years, not till within two years of final completion, will all the necessary machinery for full power work be installed. For example, new steam shovels of the 70-ton type are being shipped to the Isthmus as fast as they can be turned out in American shops, which is about one in two weeks. Not less than 120 are necessary, which means a period of five years before all are assembled.

It was in 1881, twenty-four years ago, that the first French cuttings, under de Lesseps, began. Seven years was his estimate of the time required, and his enthusiasm bred a confidence that enabled him to command any loans he named. Then the reports began to be suspicious and discouraging; more and more loans were demanded, replied to more and more sluggishly. At last came the celebrated investigation. By the end of 1888, the period set for completion, the whole scheme had fallen through, and work was stopped. Another futile beginning was made in 1894, but in a few months that also fell through. Will anything happen on this, the third attempt? The last possibilities of ingenuity seemed at one time to be in play against its commencement. STUDENT

Evaporated Labor

AN instructive lesson in the costliness of modern warfare comes from Great Britain. She is about to sell thirty-one obsolete, ancient, time-worn, decrepit, ruined battle-ships. At least those are the adjectives which will rise in the reader's mind when he hears of the sale.

But he will be quite wrong. The *Galatea* was built in 1889, two others a year earlier, another in 1878. Battle-ships become obsolete more and more quickly, and from the standpoint of a war-office are mere junk, when to a layman's eye they have every aspect of new and formidable fighters. But the war-office judges, while the layman merely pays. Money thrown on the sea in the shape of battle-ships is very soon money thrown into the sea. And then there is nothing to show for it; vast quantities of human labor have evaporated with hardly a trace.

The same is true of all war matter. Yet to make it, and pay for it, most nations keep themselves in the acutest strain of poverty.

STUDENT

Cuba's Treasury Surplus

THE commercial condition of Cuba is eminently satisfactory. As Mr. Burton points out, the American Congressman who has been touring Cuba, the Cuban treasury has the largest surplus proportionate to its revenue and expenditure, of any nation.

We do not think there is any need for anxiety on that score at present. Though there are elements in Cuba whose work is by no means for Cuba's good, though there are wires being pulled there whose other end is a long way off—not only in America but in Europe—yet the spirit which held her up in her long struggle will not fail. There are Cubans who know the dangers and who know their countrymen; and they will see to it that all necessary education will be done where it is needed. STUDENT

The Suez Canal Monopoly

THE Suez canal is owned by a company in which Great Britain is the largest stockholder. It is a monopoly of a very profitable kind for the stockholders, for its concession has still seventy years to run and provides that there shall be no competing canals. In 1904, \$22,500,000 was paid in tolls by 4257 ships. Great Britain pays more than half of these tolls. E.

Frontispiece --- William Quan Judge

THIS week's cover-page of the NEW CENTURY PATH contains the face of Wm. Q. Judge, the second in the line of succession of the world's Theosophical Leaders. Mr. Judge succeeded to the Foundress of the Theosophical Society, Helena Petrovna Blavatsky. A successful lawyer, a brilliant writer, and a man of extraordinary insight into human nature, he was well fitted to carry on the great humanitarian and philosophic work of H.P. Blavatsky.

Some Views on XXth Century Problems

An Initiation in Crime

IN the largest and best theatre of a flourishing city on the Pacific Coast a vivid kinetoscopic exhibition is now a great attraction, particularly to the young people. It is a sort of drama, and is in three acts. The first represents a negro in the performance of a murder; the second, an infuriated mob hunting the murderer; third is the burning of the negro at the stake.

The show is incomplete; it needs the mimic reproduction of the groans of the murdered man and the hoarse imprecations of the roasting negro. But even as it is, it will do very well as an education of the small messengers and newsboys who throng to see it. In a few years the results of this education will be fully manifest. The few days or weeks of this seed-sowing will produce an incredibly rich harvest. But unfortunately no one will connect the fruit of a few years hence with the present semination.

We are informed that the young people go home in great excitement, talk of it for days, and recommend their comrades to go also and get so deliciously horrified.

It is no metaphor to call the pictures seeds. Future acts are their slowly ripening fruit. The seeds may lie in the mind for years, out of sight, forgotten. But they do not die. The delirium of a fever will uncover them. The mind lets go of nothing; particularly in childhood is it storing every sort of chance impression. How often is not a cultured mother horrified at the stream of obscenity or profanity coming from a little child's mouth during the unconsciousness of an illness! The child's mind had stored the expressions from the street corners, often unknowingly to itself.

But there is nothing unknown or secret about *this* storage; it is done as it were to the sound of a trumpet; the child's whole emotional nature is aroused, its character colored forever by pictures like these. It knows about murder and man-hunting and man-roasting, for it has been to them, taken part in them with all the reality that a child's vivid imagination confers upon any pictures that awake its interest. It will now hunt the newspapers for more of the same food, and as soon as possible attend prize-fights. The mental setting of future crimes is now ready; imagination has little more to do; given the necessary temptation and opportunity, and the machinery moves.

Every one knows all this, the moment it is said—knows it in its elements. The same principle is involved as when a lie, repeatedly told, is at last believed; as when a lot of hysterical girls, catching the infection from each other, successively go through the same contortions. Mental pictures have life, and until they are dead, until that life is slowly absorbed from them by other and stronger ones, are ceaseless instigators to action. It takes some men the effort of years to absorb into nobler mental forms the life that haunts the evil pictures of their youth. When we have learned how to safeguard the minds of the children by day and night, have learned in fact to meet and discharge the duty asked of us by their souls, then and not till then will a new race grow up in our midst. Mainly this shielding is the work of the mothers, but how many are awake to its need?

A Sermon in Granite

ON the Cordillera of the Andes, between Argentina and Chile, 14,000 feet above the sea, now stands a colossal statue of Jesus Christ, looking out over the two countries which have thus magnificently put their aspirations on eternal record. The granite pedestal bears this inscription: "Sooner shall these mountains crumble to dust than Argentines and Chileans break the Peace which, at the feet of Christ the Redeemer they have sworn to maintain." On the other side is written: "Peace on earth, good-will to all men."

Never can any man in either country look up and see this symbol of an international ideal without a touch of light upon his mind, without a stir in his heart of something higher than his common thought. In-sensibly it is moulding the consciousness of two peoples.

There are plenty of statues of Christ. But not one appeals to the

imagination as does this one. They were made by men who thought of Christ as the leader of souls into *another world*. This points to an *ideal present world* where Brotherhood shall reign. It is a grander symbol than the other, contains all the best and worthiest of the other. It turns men's attention away from the thought of individual salvation, which may easily be but a manifestation of supreme selfishness—to that of their eternal link as brethren of one life and one destiny. And under the sunlight of that feeling, the mind begins to open to all other truth. Indeed it cannot, except with that starting point, open to *any* high truth. All the hideous conceptions of God that have disgraced theology have come from men whose hearts had never stirred with love of humanity. He who would conceive of Christ must try to make his consciousness correspond with that of Christ; he must develop that love of mankind which prompted and sustained the whole work of Christ. Not otherwise can there be any beginning of religion. All those teachings about Christ which throw men in on themselves in the search for *their own* salvation, are false and anti-religious. We feel our self in selfish impulses; when it is the unselfish impulses, the compassionate group, that are felt as self—then we have religion and the spirit of Christ. All other light will follow.

The Promise of France

A CONTEMPORARY points out that France, though a wealthy country, has few millionaires. There are only ten Frenchmen with more than \$19,000,000; only 100 with more than \$10,000,000; only 14,000 with more than \$193,000. There are as many farms in France as in the United States, which is fifteen times larger.

Statistics are not always useless. They sometimes enable us to get a picture of the consciousness of a nation, viewing it as a unit with a place in the scale of evolution different from that of other nations.

It is evident then that France, as a unit people, is not dominated by the wild lust for money.

There are other pointers. France proposes to diminish her naval expenditure; and she has reduced the term of compulsory military service from three years to two.

Many observers of our own times believe that humanity is nearing a great change, a great accession of light. At the end of the Eighteenth century, the same thing seemed imminent. It was through France, then, that the way to the new era seemed to lie. But the promise was quenched in blood; for the time it failed. Do not the indications suggest that France, comparatively free from the money lust, inclined to peace, and markedly holding out the hand of friendship to more than one other nation, may among other western nations be the one where the new light will come first as its most responsive and prepared field?

Our Length of Days

ACCORDING to Dr. Schofield, who has recently given us a table of longevity, the most unfailingly successful prescription for living long is: Become a clergyman of the Church of England. Those who do not want to live quite so long may become dissenting ministers, who stand second on the list. Then come farmers and land workers, grocers, lawyers (curious, since they often lead very sedentary and also anxious lives), drapers, coal-miners (you can evidently spend eight hours a day in darkness without harm), watch-makers, artists, shoemakers, bakers, clerks, druggists, green-grocers, tailors, doctors, butchers, painters, musicians, cab-drivers, sweeps, publicans, metal-miners, bankers, barkeepers. Sellers of alcohol, it seems, close the list, but why should bankers be at that end?

The list may easily be taken for more than it is worth. "Musicians," for instance, would include high rank composers, and the hacks who play accompaniments at bar-room concerts. If you *will* take up music, be a high rank composer; then you may live as long as a clergyman, or at any rate a dissenting minister. Among professions, if you do not feel called to the church (fewer and fewer do now-a-days, according to recent laments from theological quarters, in spite of the length of days), take law, not medicine.

Hall of Columns, Karnak

THE temple of Karnak at Thebes is the most stupendous of all the Egyptian ruins. Its chief beauty is the Hall of Columns, 170 feet long and 329 wide, supported by 134 columns, the largest of which are nearly 70 feet high and 12 in diameter, and the rest over 40 feet high and 9 in diameter. The illustration shows the principal avenue in this forest of pillars. The Hall was built by Seti I., 19th Dynasty, and the magnificent and elaborate sculptures made partly by him and partly by his son Rameses the Great. The walls are also elaborately sculptured both inside and out with scenes representing the mighty exploits in war of the kings. The effect of this scene is sublime beyond anything else in the world; for the rows of columns seem endless every way, and as it is impossible to get any but a near view of them, their size is most impressive. It is a puzzle to modern engineers how sufficient force was brought to bear in the destruction of the roof. Nine of these columns fell down in 1899. STUDENT

HALL OF COLUMNS, KARNAK, EGYPT

Hasty Assumptions About Dwarfs

HASTY generalization, lack of the sense of proportion, riotous imagination, unbridled speculation;—these are the too frequent failings of scientific people when they have found a fact. A learned writer in the *Quarterly Review* has been making the most of the evidence that dwarfs once lived on the British Isles.

There are subterranean dwellings, too small for ordinary men; stone-built towers, known as *burghs*, in Scotland, said by tradition to have been built by dwarfs and containing passages too cramped for full-sized men; traditions of dwarfs elsewhere in Europe; the pigmies in Africa. These things prove that there once were dwarfs in Europe as there now are in Africa. But why jump to the conclusion that there were *nothing but* dwarfs? Why hypothecate a "race of dwarfs" and make it world-wide? And why, above all, drag in all the mythology of elves and fairies and pixies and nature-spirits, and every possible connection in which the word dwarf can be used, and weld them all into a solid theory?

Of the very various Atlantean remnants who were scattered over our continents after the sinking of their own, there to degenerate until the incoming Aryans superseded them, some were dwarfs. Others again could engrave stones with consummate art; others made rude stone hatchets. There were in fact races of all degrees and kinds, as now. H. P. Blavatsky instances the extraordinary mixture of races in modern Africa, and wonders what the archeologist of the future will say when he finds their bones and pots. First, he will find, perhaps, a pigmy, and infer that the whole human race at that time was pigmy and dub it the

pigmy age. And then he will find a fossil silk hat and his theories will be all upset. What a lot of different "ages" he could make out of the remains of Arabs, Copts, Berbers, Zulus, Bushmen, English, Dutch, Negroes, and so on.

Hear Sir Harry Johnston's opinion:

Other dwarf races of humanity (than the Kongo pigmies) belonging to the white or Mongolian species, may have inhabited northern Europe in ancient times, or it is just possible that this type of pigmy negro, which survives today in the recesses of inner Africa, may even have overspread Europe in remote times. If it did, then the conclusion is irresistible that it gave rise to most of the myths and beliefs connected with gnomes, kobolds, and fairies.

A curious mixture of narrow possibilities and absolute certainties. But that "just possible" is the weak link in the chain that renders the "irresistible conclusion" superfluous.

Archeologist in Timbuctoo

TIMBUCTOO, that unique and anomalous outpost of the desert, where innumerable tribes, Arabic, Berber, and

Ethiopic, meet for battle and barter, is a promising field for the pick-ax of the archeologist. Its known history goes back to the Eleventh century, and it was a powerful city under Moslem rule and a noted gold mart. The place has been left high and dry on its scarp by the drying up and deflection of the water-courses that formerly irrigated the lowlands. But the ruins attest its former extent and opulence. A French officer recently made some excavations of some mounds in the neighborhood and found tombs of some of the ancient rulers, containing the remains of women and captives who had been buried with them, and also pottery and bronze work of superior excellence. STUDENT

Light-Skinned Race in Eastern Turkestan

IN connection with recent remarks made on this page about the universal testimony to the existence of mysterious white races in the interiors of continents, the account of a Russian explorer in Eastern Turkestan is interesting.

He declares that in the great Tarim desert, north of Kashmir, he has discovered a "mixed Caucasian and Mongolian" race ruled over by a family of purely European appearance and customs. He describes a town like a medieval European town, in an oasis near the Khotan river, with 3000 population, of European features. They spoke a Turkish dialect. The chief of the community and his family are described as typically European, and as saying that their ancestors came from the West.

These accounts of the existence of such races are too persistent to be all false; and they form a link in the chain of evidence for the true teachings as to the past history of humanity. STUDENT

The Trend of Twentieth Century Science

The Pair of Opposites

SUPPOSE it is required to divide a circle into two portions having equal areas and forms, but that the circumference of each portion shall equal the circumference of the whole.

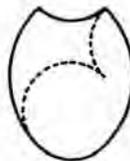

The simplest solution of the problem results in the delineation of an old symbol which was common to Oriental nations and still retains its philosophic meaning. Of recent years it has become known to the people of the United States through its adoption as a trademark by the Northern Pacific Railway.

It has symbolized all of the extremes in Nature; light and darkness; heat and cold; male and female; motion and rest; and the thousand and one other antonyms which are in common use. As a cosmic symbol it also shows either an involving or evolving, according to the manner in which it is drawn or viewed. It leads to the forming of another symbol which is not in use at present, but which may be found to have some merit when its potentialities are studied. Like the first problem, the circle is to be divided into portions having equal areas; the circumference of each portion is to equal that of the whole; but the divisions are three in number instead of two.

The dual symbol will be recognized as the only simple and practical way to cover a sphere, as every baseball player knows, and Mr. Sam

Loyd has shown that the symbol offers the only method of cutting a circle so that the pieces will form two eggs, "horse-shoes," as he called them.

Making the Desert Bloom

THE new spineless cactus evolved by Luther Burbank may enable us to solve a little problem. Of what use to the plant are the spines? They are modified leaves, and what we call the leaf—the broad oval plate—is the greatly swollen stem. If the cactus, in order to live in regions where there is little or no water, has reduced its leaves to spines with a view of checking evaporation—then it will be grateful to Mr. Burbank for showing it how to get rid of them altogether. And they will not reappear.

But if it had a use for its spines, if they were points which, becoming electrically charged, attracted the floating molecules of dew, then the plant will be restless and dissatisfied without them. They will begin to reappear, and after a certain number of generations they will be present in full force again. So in a few years we ought to know the use of the obnoxious cactus spine.

This artist in vegetation is still at work on his invention. He wants to produce a cactus that will thrive in any part of the United States. The amount of wealth he will thus bestow upon the world can hardly be calculated or overestimated. The deserts will become cattle pastures. A cheap and pleasant food both for animals and man, requiring no care or cultivation, will be everywhere obtainable.

The United States government has another plan for making arid wastes valuable as pasture without irrigation. An alfalfa has been found that will grow with as little moisture as the sage or any other desert plant. And from Southern Russia will be imported a blue-grass even more nutritious than the blue-grass of Kentucky. It needs no water, grows luxuriantly in the hottest weather, and does not dry up.

In these things we are at the beginning of a new era. Looking a little way ahead and including in our view the ever multiplying inventions for saving labor, adding to wealth and making time ever more productive, it is easy to see that the question of the reason of poverty, of the right of poverty to exist, will be more and more urgently and ominously asked.

The struggle for life, as respects man, need not be. It is not in the scheme of things; it is of man's own doing. STUDENT

The Louisiana Mound

A RECENT paper to the Geographical Society of Washington discusses the "Natural Mounds" of Louisiana. Three theories were mentioned: that they are due to gases from decaying vegetable matter; that they are sand-dunes about clumps of low vegetation; that they are old hills of the white ant, or of the leaf-cutting ant. The writer gave the second and third as the most probable.

But what about a fourth: that they are prehistoric human remains? This would be surely the most reasonable, placing them in line with the thousands of mounds scattered all over the country which are known to be of human origin. Was the writer unconsciously touched with a little of that qualmishness which visits certain minds when they are called upon to face the fact of man's vast antiquity on the planet? Since when did the elephant cease his placid waddlings through the continent? Some of the mound-builders knew him well, and made a mound very skilfully in his image!

Yet we do not wish to be disrespectful to the powers of the ant. The leaf-cutter does great things here and in Cuba, and the white ant still greater. The intelligence of either, and their social formation, are considerably in advance of those of the lower human races.

And the united efforts of large colonies do make surprisingly human-looking mounds nearly as extensive as those of Louisiana. If the animal kingdom was arranged in terms of intelligence instead of anatomy, the ant would easily be at the top, running a close race for that place with the bee. STUDENT

Rain and Its Contents

HOW great a fertiliser is rain, apart from its value as water, is not generally known. During one week's recent rain over London, the atmosphere was washed clear of nearly four thousand tons of solid matter.

Of this amount, about half was soot, and one-tenth was sulphate of ammonia. Bacteria in general were also cleared out.

These figures apply to the area of London only. Great manufacturing cities fill the air above them with soot, sulphates, nitrates, organic matter and germs. These are continually blown over the neighboring country and thrown upon the land by rain. Ultimately they return again as food to the people. One wonders how much of the mineral surface of the earth, and how much of the planet's water, has not formed many times part of the bodies of men—to say nothing of plant and animal? STUDENT

Creatures That See by Their Own Light

IT appears that deep-sea creatures, living in lightless depths, who need light to guide their movements after prey, make it. They either secrete a special phosphorescent mucus all over their bodies, or they have luminous organs. Of these organs there may be one or several; and in some cases they are very complex, almost telescopic and consisting of a cup-shaped reflector with a concentrating lens in front of it. The phosphorescent material is between the reflector and the lens. Light is thus focussed along the creature's path, and sometimes, from other similar organs, all around it. And the enormous eyes are thus enabled to see as clearly as is necessary. The eyes have no iris diaphragm, but a very large lens so as to greatly magnify small near objects. The clear cornea in front of the lens is faceted, and the facets set at such an angle with each other that their many images fall upon the same spot on the retina. They are thus enabled to make the very utmost of a very small illumination. Where eyes and illuminating apparatus are entirely absent, the creature leads a sedentary life so that it has no need for such luxuries.

The phosphorescence would appear to be a specialized and extreme case of that invisible light which, as is now known, all living creatures—animals and vegetable, and even mineral—emit. And the luminous organs are only still further specializations and localizations of the same. STUDENT

EVANGELINE'S LAND—FRENCH WILLOWS AT GRAND PRÉ, NOVA SCOTIA

In Evangeline's Land

During the French occupation the rich lands of Grand Pré were recovered from the sea by dykes built to keep out the Fundy tides. These "Arboiteaux" were constructed of willow-reeds and earth.

Some of the willows sprouted and grew into trees, but the "Saxby Tide" of 1869 destroyed all but a few, of which these are the representatives. Seen from the railroad, these willows form the most interesting link with the old Acadian farmers and the "Forest Primeval." STUDENT

Life-Energy in Trees

Science has discovered another link in Nature's endless series of compensating forces. It has found that the movement caused by the wind helps the trees to pump their sap up to the high branches and that the trees themselves act as conductors to convey electric energy to and fro between earth and air. STUDENT

Insect Individuality

THE common wasp, or yellow-jacket, belongs to a class of insects of which there are many varieties. Some of these live in communities and appear to be actuated by a common consciousness like that of the beehive, whilst others live solitary lives and exhibit remarkable individuality of character.

The wasps which live in communities build their nests of paper, which they manufacture from the woody fibre of decaying brushwood. Each comb has only one layer of cells facing downwards, instead of being double and perpendicular, like the wax cells of the honey-bee. The eggs are held in the cells by a sort of glue, until the heads of the young larvæ are grown large enough to keep them from falling out of the cells. The young wasps are fed on the juices of plants chewed up with the remains of insects, a remarkable contrast to the ambrosia of pollen and honey with which young bees are fed.

The solitary wasps are of many varieties, having each well marked characteristics which are most in evidence by the way in which they provide for their young. Some burrow in wood, others in sand, others deep in the earth. At the bottom of the burrow a store of food is deposited

and the egg is laid upon the food. The bore is then closed up and concealed, the parent insect occasionally visiting the place to see that all is well.

The individuality of character shown by the insect in this work is very remarkable. One wasp is always in a hurry and apparently has two or three other engagements awaiting her; another displays the greatest artistic care in her work and goes about it slowly; whilst a third of the same species will be careless and slovenly so that the work is badly done.

The preparation of the larder also shows every kind of variation in practice. One wasp captures a spider which she hangs upon a neighboring twig whilst she digs a hole in which to lay it, leaving her work from time to time to go and see that no foraging ants have seized her quarry. Another digs the hole first and then goes out to catch her spider. Sometimes the required spider is not easily caught. He is lurking in a cranny well concealed, and will not come out. Then the cunning wasp has been seen to blunder with apparent carelessness into a weak corner of the spider's web, and as soon as the spider ran out to see what was the matter, he was seized and carried off.

Sometimes when a hole has been dug in the earth, a stone is carefully laid in the mouth of the hole and earth is laid over it, whilst the wasp goes out in search of the toothsome caterpillar which is needed to nourish the larva. After the caterpillar is brought, the earth and stone are removed and the grub is dragged into the hole after which the egg is laid and everything is replaced.

Dr. Leland O. Howard tells us the most curious fact of all. He says: "When the burrow is complete, the female wasp has been observed to use a stone as a tamping iron to pack the earth into the mouth of the burrow." So insects are found to use

STUDENT

UNIVERSAL HARMONY

IF thou art worn, and hard beset
With sorrows that thou wouldst forget;
If thou wouldst read a lesson that will keep
Thy heart from fainting, and thy soul from sleep,
Go to the woods and hills! No tears
Dim the sweet look that Nature wears.

—Longfellow

I'd rather be
A Pagan suckled in a creed outworn,
So might I, standing on this pleasant lea,
Have glimpses that would make me less forlorn;
Have sight of Proteus rising from the sea,
Or hear old Triton blow his wreathed horn.

—Wordsworth

Look how the floor of Heaven
Is thick inlaid with patines of bright gold:
There's not the smallest orb which thou behold'st
But in his motion like an angel sings,
Still quiring to the young-eyed cherubins:
Such harmony is in immortal souls;
But, whilst this muddy vesture of decay
Doth grossly close it in, we cannot hear it.

—Shakespeare

improvised tools!

THE thousand voices of silence are more wonderful to me than many of the sounds that yet enchant my ear. The music that lies beyond the power of hearing, music of sky and cloud and flower. The golden sunset, the early dawn, the perfection of a summer day, star-spangled darkness, do not these hold an everlasting harmony that sound is powerless to convey?—Extract from "Silence," by Nora Conway

The Work of Athena

"Fight and weave! I myself will answer for the course of the lance and the colors of the loom!"

THE words of the Greek Athena, who presided over industry as well as war, come to us through the ages in one of the old Greek poems. Today they have still a meaning and a message.

Says Ruskin: "The first sign of Athena's presence among a people is that they become warriors." Athena was to the Greeks the goddess of their ideal, patroness of the arts, beloved of the Muses, bringer to the earth of beauty, yet, above all, a warrior, fearless, compassionate. The air was her home, yet the earth was her abiding-place—as long as the children of men cried out in their despair for help.

There have been in all ages wars of selfish conquest, which have left the earth wasted and men bowed. There have been also wars of compassion, holy wars, waged for freedom's sake. It is these of which Athena has ever been the Leader—for Athena was and yet is, a Presence that has never utterly forsaken humanity, as the sun shines ever, though at times obscured by clouds.

The proof of Athena's presence among the old Greeks was that they became warriors and the warrior-spirit is the sign that she is again calling to her own, today. Her wars are those that *must be fought* ere humanity shall stand once more in the light. To the Greeks they were fought on the outer field; to us they are fought, chiefly, upon that inner, reddened battle-tract of feeling and of thought which lies within the boundaries of the human heart. For Athena was to the Greeks what the Christ is to the modern world, a Presence that calls men out of their selfishness and bids them fight the battles of the soul. And today, those who can look about, see plainly that the stone has been rolled away from the sepulchre and that the Christ-spirit is once more come forth.

It may seem, at first thought, that there is little connection between this ideal and the building up of a people's industrial life. Yet, in the real sense both are arcs of the same circle.

After the wars that devastate and alarm and crush, we need look for no upbuilding, for the Leaders of such wars contact souls only to fetter them. But the wars that are waged for sweet liberty, what are they other than a clearing of the ground, a tearing away of debris, a clearing of space for the foundation of a New Order? Not until after the clearing can come the building of The New—a structure, verily, though hands may not touch it nor eye behold. *It is the New.* And then

GREATER than stars or suns,
Bounding, O soul, thou journeyest forth;
What dreams of the ideal?
What plans of parity, perfection, strength?
What cheerful willingness for others' sake to give up all?
For others' sake to suffer all?—Walt Whitman

comes Athena's service as foundress of an industrial life. Her Warriors are not dismissed. Around the citadel still stand the guardsmen, lance in hand, for it is as difficult to keep a high point gained as it is to gain it in the first place. But within the citadel Athena places the loom, calls about her the maidens, and bids them work.

The dream of many of those who have, through war, striven to unify men and preserve nations, has been, first, to clear away obstructions and then to build up an industrial life among the people. Many attempts have been made, unsustainable, spasmodic, destined forever, it would seem, to ultimately fail. The arm that bore the lance grew weary or, perchance, the hand upon the shuttles waxed indolent.

When the Woman's Exchange and Mart—now of Lomaland—was founded, there were those who said, "Is this Theosophy? What have burlap, and kelpies and embroideries and seamstress-work to do with the Higher Life?" And plaintively queried others, "By *this* prescription does one reach adeptship—on the pathway of the shuttle?" When the Department of Silk Industries was organized there was heard the feeble plaint, from those who had already placed themselves without the ranks, "Mulberry trees—hundreds of them—and silk worms! Must we then *work*?"

Today how plain is the proof of the wisdom that started this industry! How the veriest child can read in the rich full life of Lomaland, the higher meaning of a true, industrial life!

Today, in Lomaland, are being revived many of the ancient and forgotten crafts, the lost arts, the industries that, but for the impulse at this centre, would have passed out of the world to stay. Work, honest work, has brought into life a new joy and has revealed to the students a new secret. A new industrial life on many lines is already established, its influence permeating everywhere, its example an inspiration to those who deplore the sordidness of industrial life in the world. In Cuba great industries will be started, in Spain, in Ireland, in forsaken India. They will be the resting-place for that moral lever by which all humanity is to be lifted,—and that, ere long,—out of the present apathy into a knowledge of its own Divinity and the warrior-life. Without these Theosophy could be little more than a theory, for head and heart and hand must work together or the rounded—the real—life will not be built. The fact that this new and higher industrial life has been here established is proof that Theosophy has come not to play into men's caprices but to meet their needs. "Fight and weave" has ever been

OUR YOUNG FOLK

The Raja Yoga Festival in Cuba

DEAR YOUNG COMRADES ALL OVER THE WORLD: You know how travelers do—how on a long journey, as they pass each mile-stone, they will look back at the one just before and even the one before that. You know how, as the number of mile-stones left behind grows and grows, the traveler's heart grows lighter and his courage stronger; he looks ahead with more confidence and he walks on with a firmer step.

It is just that way with the grown-ups—and the little ones, too—at Lomaland, who are helping from this Centre the wonderful Raja Yoga work being done in Cuba. How eagerly we look for the letters sent us by the workers there, for every one records a victory—sometimes many victories!

Now, Brotherhood boys and girls all over the world have heard much of the Cuban Raja Yoga work, but so many other things have just insisted on being printed that not much has been said about it in these columns, of late. But last night's mail brought in news that you must share with the workers at Lomaland. And I think as you read what is coming that you will feel, as we do, like travelers passing another great mile-stone; and there may come to you, as there comes to us, an urge to look back just a little and catch one more glimpse of the mile-stones that have been passed.

How far away seems the time when the Cuban Raja Yoga work was begun! The first mile-stone was passed when Katherine Tingley went to Santiago de Cuba with her workers, at the close of the war. That was six years ago. But so much has happened since then that it seems like six centuries. Well, that mile-stone we call the "First Cuban Crusade." Thousands and tens of thousands were helped and oh, how great was the need! How

terrible was the sickness, the starvation, the awful, awful suffering of those souls! It was then and there that Katherine Tingley found a friend of humanity in the Mayor of the city, Emilio Bacardi, a noble patriot who today recognizes Raja Yoga to be a saving power for his land and whose children—now students in the Raja Yoga Academy there—will have opportunities even greater than he has had to benefit the world.

Cuba's friend made quiet plans to help the children of Cuba, for her heart went out to them. And so it came about that after awhile there was the "Second Cuban Crusade" sent to Cuba, when over forty children were brought to Lomaland to be educated, destined to become helpers of their country. That was another step; and then came such a miry, hard, lonely place along that road that the Raja Yoga workers and their Teacher were traveling. What an awful record it is when we read about it—the jealousy and hatred that sprang up in the hearts of a few who wanted to use the Cuban people for their own selfish purposes, and the terrible persecution they began against our unselfish workers!

But after a time that was passed, too, and the last mile-stone along the

miry part of our way we call the "Gerry Persecution." You all remember about the "Eleven Cuban Children" who were sent here by their parents to be educated—for many of them had brothers and sisters already in the Lomaland school—and of how they were stopped and imprisoned at Ellis Island by some of those curious fanatics, until released by the wise and just action of Commissioner of Immigration Sargent of the U. S. A. government, to whom Katherine Tingley appealed for an investigation of her school.

Then came the establishment of a Raja Yoga Free School in Cuba and another mile-stone was left behind. It is that to which we all looked

back last night as we read over the letters and it is an account of an entertainment given by this Raja Yoga School of Santiago de Cuba, in celebration of the second anniversary of the establishment of the Raja Yoga Schools in that island, that we want to share with you. How I wish you could read Spanish! But here is a close translation and that is the next best thing. The first article was written by one of Cuba's famous men, a brilliant writer, who has been in newspaper work for many years and who is today corresponding not only with the chief papers in Cuba but with the great journals in many parts of the world. This is what he says, as translated from the article in *La Independencia*, Santiago de Cuba, April 14, 1905:

Last night we were agreeably surprised by one of those splendid festivals in which the children take the principal part, as the pillars of our citizenship of tomorrow, and the base and support of the family of the future.

To the exquisite courtesy of our kind-hearted friend and companion of the press, Señor Dr. Frederico de Arce, we owe our introduction into that Temple of Ethics, called "The Raja Yoga School," of this city, which is a branch of the International Brotherhood League,

whose headquarters are at Point Loma, San Diego, California, U. S. A., and of which Katherine Tingley is the Foundress.

They are celebrating the second anniversary of the founding of this school. Our pen does not suffice to even outline as it deserves this symbolic festival. All the nations of the world were there represented by their respective flags.

Against the background of flags was represented the realization of the beautiful dreams of the wise men, the brotherhood of all nations and of all races, constituting the family of nations, as it were, the Society of altruistic humanitarianism, in the zeal for lofty cosmopolitanism which was initiated by the philosopher Jesus Christ from the Sinai of Right called Golgotha.

The numbers of the program of this simple festival were executed with such perfect precision, that they were the clearest example of the spirit of discipline which reigns in that institution.

Behold here the high ideas of the New School; of those educators and teachers who see in the child the promise of the man, and in the man, the hope of humanity; who build and prepare the consciousness for the great struggle towards the attainment of the high purpose for which man was created; the School of Liberty well understood; non-sectarian; the school which defends with vigor its independence of all religious dogma, of all political dogma, of all economic dogma, of all scientific

EMILIO BACARDI AND D. F. ORTIZ OF SANTIAGO DE CUBA, WITH A GROUP OF RAJA YOGA CHILDREN, ON THE VERANDA OF THEIR LOMALAND HOME—DECEMBER, 1902

THE CHILDREN'S HOUR

dogma, of all literary dogma; in short, its freedom from dogma of any kind.

This is what the Raja Yoga School is and this is what it should be!

In this School of new ideas, the feelings and the will are educated, not in religious dogma, nor in any moral, political, scientific, nor literary dogma which might engender an exclusive fanaticism, but in the development of the good and the beautiful, and in those things which bring into practice a broad tolerance, under the wide horizon of the aspirations, which are forces not intended to be put at the service of fragile systems, but rather intended to demonstrate the efficacy of the immutable laws of Nature.

Last night we left this great School with our soul overflowing with emotion. Exactly as we said in the "creed" of our humble publication, exactly as we had dreamed it, we saw last night the flags of all nations brought together in close union, in reciprocity, as if the free interchange of ideas and of products among all men were already a beautiful reality.

There we found the flag that we love forming part of the harmonious whole. Why should there always be a furtive tear in the midst of the ecstasy of the soul?

The head teacher, Mr. H. S. Turner, in whose charge that sanctuary of truth and righteousness has been placed, ought to feel more than satisfied with this work. In the name of the various newspapers that we represent in this city, we are proud to tender him our felicitations. (Signed) AMIAMA GOMEZ

And from the speech which follows, you may judge for yourselves, boys and girls and tiny tots, as to whether or not Cuban young folk appreciate Raja Yoga. It was delivered by Fernando Orpi, pupil of the Raja Yoga School at Santiago de Cuba, on the occasion of the celebration of the birthday of William Q. Judge and the second anniversary of the founding of the first Raja Yoga School in Santiago de Cuba:

WILLIAM QUAN JUDGE

[Translation from the Spanish]

"Two years ago today the Raja Yoga School was opened, and this, its second anniversary, is most memorable to us, for we remember that this was the day on which the benefactress, Katherine Tingley, came to the help of the Cubans. So also ought our families and friends to feel grateful to Mrs. Tingley, and proud to see that their children are gaining a perfect education, so that they may be true defenders of our fatherland, that they may become honorable men and women, loyal to their duty.

"But besides all these things, we must remember that today also is the anniversary of the birth of William Quan Judge, the predecessor of Katherine Tingley, he who truly worked for Raja Yoga and for us; he who on some nights held meetings in New York without any one's attending except himself; he who delivered his speeches to empty seats and, when it came time for him to leave, went home without having gained anything—apparently. He did this many nights without having one person in attendance at the meetings, but he knew that all that he was doing would in the end bring good results.

"He said that the formation of schools must of necessity produce good results for all the nations. Later he began the formation of Lotus Groups in all parts of the world.

"Before his death he left the Society he had helped to form, and of which the International Brotherhood League later became a department, in the hands of Katherine Tingley. Some years afterwards Katherine Tingley founded the Raja Yoga School at Point Loma; later, the one here; and since then, others, in many parts of the world.

"This noble-minded man, the same as does a farmer, planted the seeds in American soil, and in Cuba you have some of the fruits from the seeds planted by Katherine Tingley, our benefactress, who was chosen by Mr. Judge to lead the Theosophical work after him.

"What a lesson in patience for all of us is this example offered by William Q. Judge, whose picture you will find as the frontispiece of the NEW CENTURY PATH that you have. And I repeat that today is a very memorable day, because it is the anniversary of two things; the birth of William Quan Judge, Humanity's true friend and helper, and the formation of the Raja Yoga School founded in Santiago de Cuba two years ago by the Leader of the Universal Brotherhood Movement and the Foundress of Raja Yoga Schools throughout the world—Katherine Tingley."

The following is the program given at the celebration of the birthday of William Q. Judge and the second anniversary of the founding of the Raja Yoga Schools in Cuba,—April 13th, 1905:

1. Violin Quintet.
2. Primary Class Exercises.
3. Violin Solo Mazurka, Dancla
Enrique Rivas.
4. Reading of "Progress of Brotherhood" (Second Club Boys' Paper), Esperidio Santiestaben.
5. Violin, (a) Esperidio Santiestaben,
(b) Fernando Orpi and Enrique Rivas.
6. Girl's Military Drill.
7. Violin Quartet, Austrian National Hymn with Variations.
8. Singing Girl's Club.
9. Reading of "Raja Yoga Century" (First Club Boy's Paper).
Luis Vasquez.
10. Violin, (a) Roglio Roger,
(b) Francisco Berenguer.
11. Boys' Military Drill First Company.
12. Speech, "William Q. Judge," Fernando Orpi.
13. Distribution of NEW CENTURY PATHS with Mr. Judge's Portrait as Frontispiece.
14. Violin Quintet.
15. Flag March, Girls.

But we are not yet through with mile-stones. We really ought to look back to one which marked a great triumph for Cuba—the occasion when Mayor Emilio Bacardi with Señor Ortiz, editor of *El Cubano Libre* visited Lomaland and the Raja Yoga School. That was some three years ago. How well I remember their visit and the great meeting held in their honor in Isis Theatre, with some of the most distinguished people on the Coast in the audience! It was as if two nations had met with a real handclasp of Brotherhood.

And how well, too, I remember the words spoken by Señor Bacardi at that time. He said among other things:

During the past few years, years of strife and sorrow, Cuba has received the hand of fellowship from America and on the very eve of that bloody conflict, the first voice of brotherhood came from the city of San Diego, America. This is a fact. Is it strange that it should have established a bond of fellowship and brotherly love between the two cities? It is indeed the truth that all men are brothers, no matter what their religion or their political creed. Within all this is that great brotherhood of humanity. We may all be brothers and yet we may have favorite brothers. It is in this latter and special sense that San Diego and Santiago seem to me truly brothers.

You have taken the children of Cuba under your care and have surrounded them with love and protection. I wish that I might have the whole of my nation with me tonight—they are truly so in spirit—in order to witness the reception you have given to their representative.

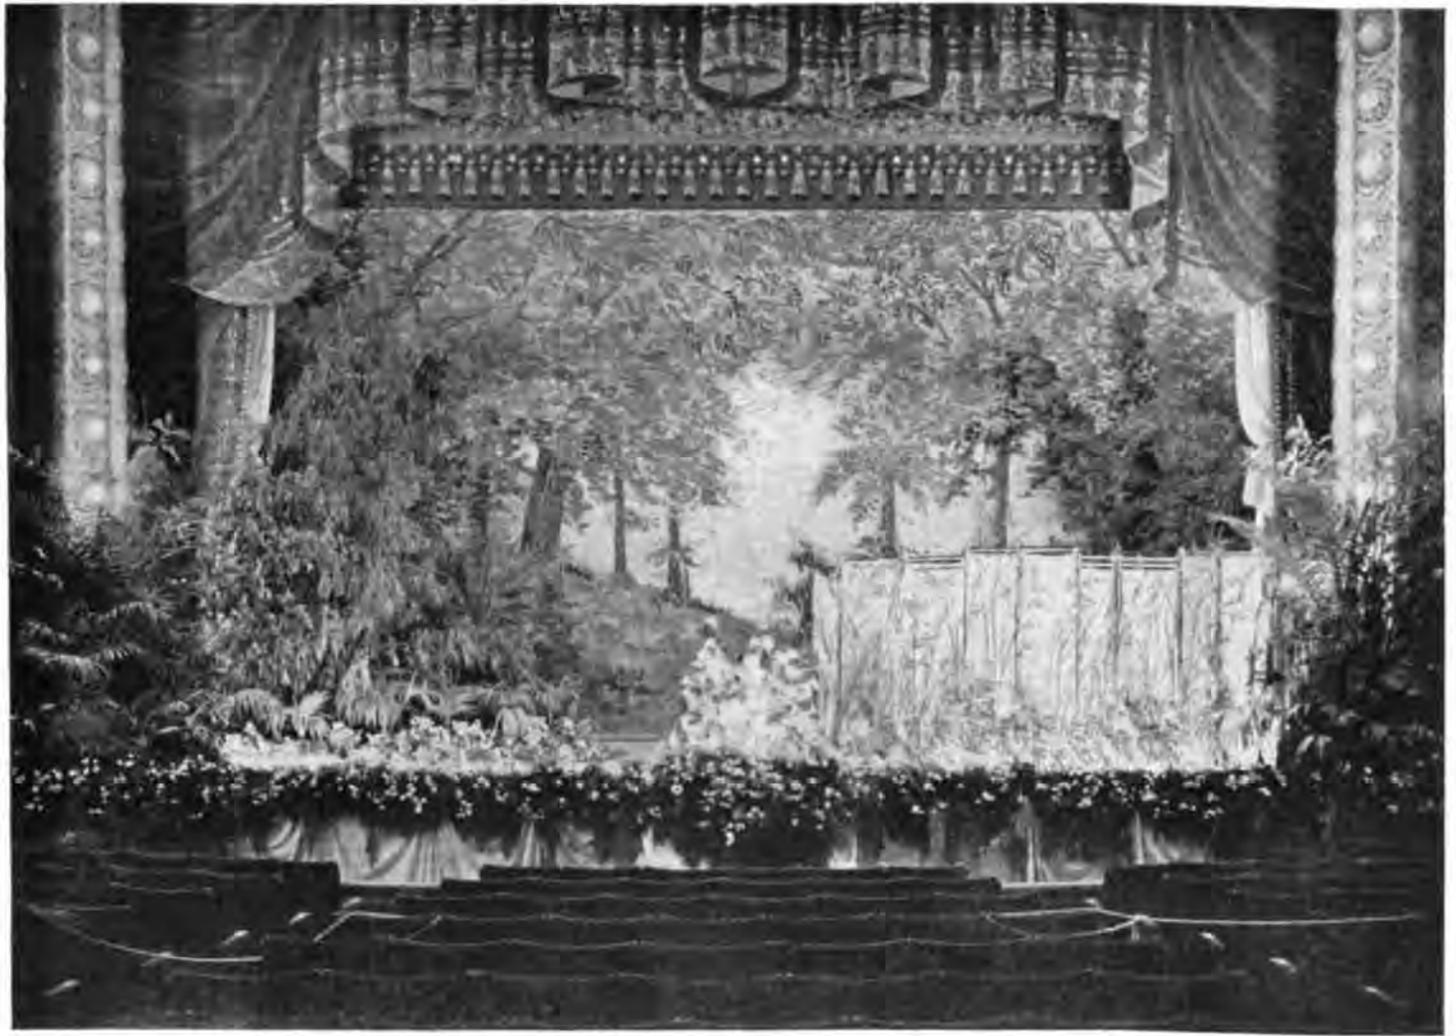

And the words of his comrade, Señor Ortiz, younger brother of the noble patriot, Fajardo Ortiz, whose recent death plunged all Cuba into mourning and whose picture recently appeared in the NEW CENTURY PATH:

I represent the oldest Cuban newspaper, the one which is most especially Cuban of them all. It was born in the mountains and in the midst of strife. The Cubans had no country that they could call their own. That paper was founded and was devoted to the education of the people. As a newspaper man, of course, I was the first to receive the news of the persecution of Mrs. Tingley and the detention of the Cuban children in New York, and I started out as soon as I heard this sensational report, for I well knew there could be no truth in it.

How glorious are these words! How easy it is to see now the reason of the faith Raja Yoga workers have in the Cuban people, the trust in their possibilities. If the newspaper accounts quoted on this page give one something of the secret, how much more is contained in the letters that came with them—from teachers as well as pupils—and which we have not space to print. Do you wonder, as she looked them through, that the Editor said, "Yes, we will give up the pages this week to the Cuban Raja Yoga work, and the children and young folk all over the world shall share this joy with us." THE THEOSOPHICAL FORUM, IN ISIS THEATRE

AT the regular weekly meeting of the Universal Brotherhood, held at Isis Theatre last Sunday evening, two excellent papers were read; the musical program included, beside several other delightful selections, two violin solos rendered by Mr. Bland.

The first paper was by Miss Edith White, and was entitled: "The Comfort of Theosophy for Our Elders." "Who," she said, "in looking back over his life has not wished at some time or another that he had either done or left undone some act in the days past? To some, the deep regret of a lost opportunity is an ever present grief. To many old age comes as an enemy instead of a friend, but should this be so? In ancient times old age implied wisdom; the old men and women were wise with the garnered experience of a well spent life and became the teachers of the young. Would not a philosophy of life which removed all fear of death, and showed the possibility, nay, the certainty, of new opportunities to make good our past errors in thought and action, come as the balm of Gilead to the aching hearts of many of our elders? What a relief to the discouraged and disheartened to feel that they will surely have 'another chance.'

"Does not a great deal of the sorrow of mature lives come from a sense of injustice? So many people feel that what happens to them, and theirs, is unfair. There is very little idea in the western world that our misfortunes are our own faults.

"Since Theosophical teachings and a Theosophic life point to Universal Brotherhood and its practical realization by humanity, should there not be a feeling of joy in the hearts of our elders who hear these glorious truths, that next time they return to earth they may aid in carrying on the good work, even though but little time is left them now? Would not such an unselfish aspiration be the greatest comfort with which to face the Great Change, called 'Death'?"

"The Folly of Regret," was the subject of a paper read by Mr. S. G. Bonn. The speaker pointed out how modern thought is largely the outgrowth of the past. We readily concede the fact of physical heredity, but seldom examine humanity as a whole, from the standpoint of heredity of thought and feeling. Scientists, while studying physical heredity,

overlook the more destructive and unhealthy mental contagion. "Take, for instance," he said, "that most engrossing occupation of human beings—the art of being sorrowful. Our ancestors regarded the manifestation of misery and sorrow as one of the higher virtues. Even our own Puritan forefathers seemed to have regarded earth as a 'vale of tears,' and to have measured a man's sanctity by the amount of gloom which he could spread about him. Their God was a God of wrath and vengeance—trial and sickness were visitations of Providence; to be happy was to be worldly; to smile on the Sabbath was an unpardonable offense.

"True merit is stability of character, and nothing can be helpful or valuable as an asset of our moral life, which tends to weaken this stability. Yet sorrowing does weaken the character. The evil which is not recognized as such does the greatest harm. One reason for our failure to avoid evil is that we do not understand its nature. To gain a true knowledge of human emotion, we must have a true knowledge of man himself, and the great law by which he is governed. This places man in his true position as a divine being, arbiter of his own fate, master supreme.

"Regret, remorse, repentance, are emotions that rack the soul with sighs and moans, and defile the blood with poison. They turn the mind into an asylum for ghosts and demons. Regret is the digging up of a dead sorrow. Let the dead past stay dead. If you are conscientious, you will do your best to remedy the evil. Surely, no amount of mourning can do more.

"Let us turn again, and yet again, from our ordinary personal selves, realizing that we are gods who do not die. Let us remember that we are souls, with power to rise from the mire of mere animal enjoyment, and sit on the throne on high."—*San Diego News*

Theosophical Meetings for Sunday Nights

Public Theosophical meetings are conducted every Sunday night in San Diego at 8:15, at the Isis Theatre, by the students of Lomaland.

Theosophical subjects pertaining to all departments of thought and bearing on all conditions of life are attractively and thoughtfully presented.

An interesting feature is the excellent music rendered by some of the students of the Isis Conservatory of Music of Lomaland. Theosophical literature may always be purchased at these meetings.

Art Music Literature and the Drama

Olympia's Works of Art—Their Incomparable Majesty and Beauty

SITUATED at the base of the hill of Drouva, Olympia, Greece, overlooking the valley famous for its never-to-be-forgotten Olympian Games, stands the building newly erected for a Museum.

The first view of Olympia is, to American eyes, rather disappointing, as the area of the celebrated Olympian fields is so small compared with our great American spaces. The Museum is within easy walking distance from the modern hotel. The observing student will notice, as he steps upon the portico, two columns which are reproductions of those found in the ruined temple of Zeus. Many rare pieces of sculpture, and fragments which have been excavated from the ruined temples, are in the inner hall, which is of the same dimensions as the old temple of Zeus.

One of the most interesting glimpses of this hall is the one here pictured. Standing in the center, on a part of its original pedestal, is the renowned "Niké" of Paeonius. The fragments have been restored so far as possible and, although the remains are badly defaced, many of the parts being lost, yet, the figure bears an incomparable beauty, grace, and airiness of pose that fascinates the beholder.

In the smaller room beyond is a still more perfect figure, the exquisite statue of Hermes, the work of Praxiteles. One wonders where those old Greek artists procured the models for these masterpieces. The perfect form, the finely-shaped head, and the marvelous expression depicted on the face of Hermes as he gazes down on the youthful Dionysius whom he holds on his arm, are indescribable. The beautiful Parian marble retains its delicate tints, gilding and rose color are still discernible on the sandals, as well as on the mantle thrown over the arm.

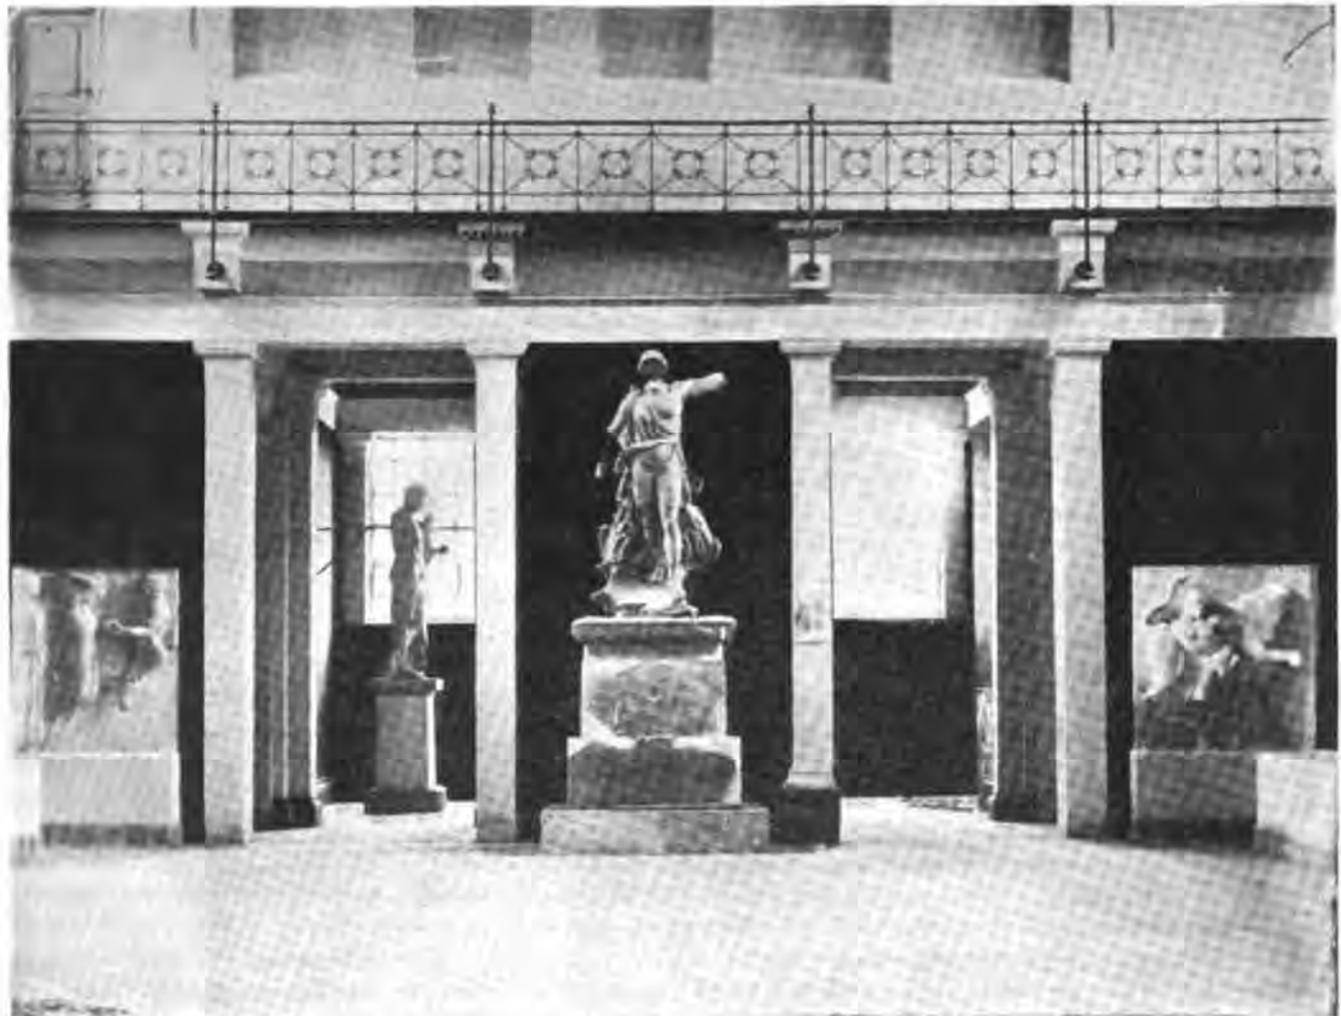

As one turns away from these works of art one cannot but realize that the ancient Greek did have the secret of "The Beautiful." With such thoughts in the mind, on passing out again to the portico, the whole modern atmosphere of the present Olympia, which is not a town, but merely a group of houses, fades away. One can picture the adjacent hills and valley covered with clusters of tents, outside of the sacred enclosure, brilliant with the color, life and excitement of the heroes assembled there, with their retinues, to celebrate the sacred ancient festival of the Olympian Games.

E. C. S.

IT is recorded that even in Mendelssohn's day musicians used to speak of the music of "old Bach" and his "Passion Music" was known to most of them by name only. It had not been heard for something like one hundred years. But one day Mendelssohn and his friend Devrient, while looking over this masterpiece, became enthusiastic over the idea of giving it once more to the public. They talked it over with

their teacher, one of the best known musicians in Berlin, but only after considerable argument were they able to secure his promise to cooperate with them in producing once more the "Passion Music." Almost without help they persevered, securing soloists and the chorus and double orchestra demanded by the score. Mendelssohn conducted and his friend Devrient sang the part of "Christ." The performance, given twice in the year 1829, took the musical world of Europe by storm and today how much Bach's memory owes to the young Mendelssohn could scarcely be told.

A CORRESPONDENT tells of an interview he once had with a priest, regarding music. On examining him as to the musical characters in his breviary and antiphonal, Mr. H— found the priest wholly ignorant as to notes, indications of pitch, and musical characters generally. For that matter, the notation was about the same in his breviary as in those

A GLIMPSE OF THE INTERIOR OF THE MUSEUM AT OLYMPIA, GREECE

used four hundred years ago, but the priest said the only thing that bothered him was to see how they could expect a man to sing two notes at once!

IN LONDON it is reported that large violin classes are being organized, and instruments provided on the installment system; and that an estimate places the enrollment of children in these classes at 100,000. So, if we do not have music, we shall at least have plenty of noise; a new horror added to civilization. Now, in addition to the piano and Sankey's hymns, every home will have its one or more cheap violins with instruction thrown in.

THEODORE THOMAS earned the gratitude of music lovers by one thing if no other, his insistence that the public should revere the genius of Johann Sebastian Bach. The Thomas Orchestra, under his direction, played Bach persistently, a service often too little appreciated.

Hit the Mark

(From THE PATH, Vol. v, page 185.)

"Having taken the bow, the great weapon, let him place on it the arrow, sharpened by devotion. Then, having drawn it with a thought directed to that which is, hit the mark, O friend,—the Indestructible. OM is the bow, the Self is the arrow, Brahman is called its aim. It is to be hit by a man who is not thoughtless; and then as the arrow becomes one with the target, he will become one with Brahman. Know him alone as the Self, and leave off other words. He is the bridge of the Immortal. Meditate on the self as OM. Hail to you that you may cross beyond the sea of darkness."
—Mundaka Upanishad

ARCHERY has always been in vogue, whether in nations civilized or among people of barbarous manners. We find Arjuna, Prince of India, the possessor of a wonderful bow called Gandiva, the gift of the gods. None but its owner could string it, and in war it spread terror in the ranks of the enemy. Arjuna was a wonderful archer too. He could use Gandiva as well with his right as with his left hand, and so was once addressed by Krishna in the *Bhagavad-Gita* dialogue as "thou both-handed." The bow figures in the lives of the Greek heroes, and (just now) the novelist Rider Haggard is publishing a book in which he sings the praises of a bow, the bow of war possessed by Ulysses; when war was at hand it sang its own peculiar, shrill, clear song, and the arrows shot from it hit the mark.

Archery is a practice that symbolizes concentration. There is the archer, the arrow, the bow, and the target to be hit. To reach the mark it is necessary to concentrate the mind, the eye, and the body upon many points at once, while at the same time the string must be let go without disturbing the aim. The draw of the string with the arrow must be even and steady on the line of sight, and when grasp, draw, aim, and line are perfected, the arrow must be loosed smoothly at the moment of full draw, so that by the bow's recoil it may be carried straight to the mark. So those who truly seek wisdom are archers trying to hit the mark. This is spiritual archery, and it is to this sort that the verse from the *Mundaka Upanishad* refers.

In archery among men a firm position must be assumed, and in the pursuit of truth this firm position must be taken up and not relaxed, if the object in view is to be ever attained. The eye must not wander from the target, for, if it does, the arrow will fly wide or fall short of its goal. So if we start out to reach the goal of wisdom, the mind and heart must not be permitted to wander, for the path is narrow and the wanderings of a day may cause us years of effort to find the road again.

The quality of the bow makes a great difference in the results attained by the archer. If it is not a good bow of strong texture and with a good spring to it, the missiles will not fly straight or with sufficient force to do the work required; and so with the man himself who is his own bow, if he has not the sort of nature that enables him to meet all the requirements, his work as a spiritual archer will fall that much short. But even as the bow made of wood or steel is subject to alterations of state, so we are encouraged by the thought that the laws of karma and reincarnation show us that in other lives and new bodies we may do better work. The archer says too that the bow often seems to alter with the weather or other earthly changes, and will on some days do much better work than on others. The same thing is found by the observing Theosophist, who comes to know that he too is subject from time to time to changes in his nature which enable him to accomplish more and to be nearer the spiritual condition. But the string of the bow must always be strung tight; and this, in spiritual archery, is the fixed determination to always strive for the goal.

When the arrow is aimed and loosed it must be slightly raised to

allow for the trajectory, for if not it will fall short. This corresponds on its plane with one of the necessities of our human constitution, in that we must have a high mental and spiritual aim if we are to hit high. We cannot go quite as high as the aim, but have to thus allow for the trajectory that comes about from the limitations of our nature; the trajectory of the arrow is due to the force of gravity acting on it, and our aspirations have the same curve in consequence of the calls of the senses, hereditary defects, and wrong habits that never permit us to do as much as we would wish to do.

Let us hit the mark, O friend! and that mark is the indestructible, the highest spiritual life we are at any time capable of.

WILLIAM BREHON
(William Q. Judge)

Does Our Knowledge Entitle Us to Criticize the Ancients?

IN criticizing ancient or foreign ideas, there is a most important point that we usually overlook. We tacitly assume that we ourselves are in possession of the knowledge we deny in them. For instance, in criticizing Plato's philosophy, we assume that our own metaphysics are entirely satisfactory and conclusive.

But we forget how very artificial our systems of metaphysics really are, dealing as they do with mental conceptions peculiar to our particular class of mind and largely dependent upon language. What practical value have these elaborate systems? Have they not always ended in the conclusion that the springs of human conduct and the obligations of moral law rest on foundations which cannot be analyzed? What learned Kantian was ever better equipped either for practical life or for intellectual discovery than anybody else?

Can we then reasonably depreciate Plato because he did not indulge in this kind of mental dissipation, or pat Aristotle on the back because he to some extent did?

If we calmly examine the extent of our own knowledge, trying hard not to assume that all those learned books which we have not read contain settled knowledge and recognized truth, we may discover that we have not so very much to show after all. Religion—rudimentary, fragmentary, unstable; philosophy—heterogeneous, con-

fused, unpractical; science, practical certainly, but limited in its sphere. On social, moral, and general questions affecting human conduct and welfare, a ludicrous jumble of immature guesses. Our "civilization" with its particular social and political structure, its habits, its appliances, its cities and institutions, and so on—all this is just one kind of civilization. The one in which Plato lived was another. Perhaps Plato, if he could have walked prophetically into our civilization, would merely have walked out again. He might have regarded it as an improvement; or not.

This is our outfit. We may know more about geography than Plato (?) and more about machines. But we certainly are not qualified to criticize him or anybody else on matters relating to soul-science. It would be better if we would try to understand him.

For the Benefit of Enquirers

REGULAR weekly meetings of the Aryan Theosophical Society, established in New York City by William Q. Judge, the second Leader of the World's Theosophical Movement, are held every Thursday evening at 8 o'clock in Isis Hall, 1120 Fifth Street, San Diego, California. These meetings are intended to meet that large and growing body of earnest enquirers who desire to know more of the different tenets of the Theosophical philosophy. Students from the Universal Brotherhood Headquarters at Point Loma, California, conduct these interesting gatherings to which every truthseeker is cordially invited.

NOW!

by C. MACKAY

THE venerable Past --- is past;
'Tis dark, and shines not in the ray:
'Twas good, no doubt --- 'tis gone at last ---
There dawns another day.

Why should we sit where ivies creep,
And shroud ourselves in charnels deep?
Or the world's yesterdays deplore,
'Mid crumbling ruins' mossy hoar?

Why should we see with dead men's eyes,
Looking at WAS from mora to night,
When the beauteous NOW, the divine TO BE,
Woo with their charms our living sight?

Why should we hear but echoes dull,
When the world of sound, so beautiful,
Will give us music of our own?
Why in the darkness should we grope,
When the sun, in heaven's resplendent cope,
Shines as bright as ever it shone?—Selected

When to Wait

MORE and more, as the student of life progresses, must he learn when to keep still.

From time to time, in his silent moments, in the energy of mornings or in the peace of night-time, the light of spiritual life burns high in the heart, mounts into the brain and awakes all the pictures there and all the centers of action. Each of them claims from the new energy the action that belongs to it, be it poetry, invention, speech, writing, or what other. A thousand avenues of activity, all tempting, suddenly open out.

Let him now wait, keep silent in lip and thought, stop the pictures and the desire for action, holding the light in the heart and doing only such things—but all such things—as are strict duty. With time and patience, duty will broaden out into all that belongs to him to do, which is his true work waiting always for him to grow to the measure of it, and in which he will find all the creative joy that tempted him along the thousand by-paths of action. But in them he would have wasted power. Now, if he will let the heart hold and direct it, it will become inexhaustible.

The world has known poets, real poets, who should not have been poets, inventors who should not have been inventors, men of action who should have stayed quiet for long and got (by waiting) their fuller message—not merely its advance thrill. How to wait is a great art; nor is the waiting idleness, nor is it void of helpful radiation to humanity.

But ambition and desire move to action when as yet there should be none. Their only cure is self-surrender to the light in the heart. STUDENT

A Lesson for the Day

ONE morning, the student sat in his tent, searching for the lesson for the day, his eyes fixed upon the long streak of sunlight which fell across the floor. As he gazed at it, he suddenly became aware of the stillness of all around save for some faint sounds of which he had been barely conscious, and which seemed to flow in as a chorus of benediction.

A little bird was chirping its song to the listening air. The ocean with its deep undertone, now rising, now falling, like a great organ, seemed to intone its message of peace and power; whilst, in the far distance, faint notes of music floated down at intervals from where the children were adding their tribute to the great harmony.

How many, many weary hours, in other days, had he bemoaned the past, little knowing how he would one day realize that all had been ordered by the law, that he might learn to know the truth. Now he

knew his grieving had not been because of evil done to the great whole, but because *he* in his ignorance and unimportance had been the doer.

And of the future—there was no need to care. The great One of whom he was a part was mighty in the justice and majesty of his law. So “not a hair of his head could fall without the knowledge of his Father.”

All that was needed was to see that the present was worthy of his privilege. He must take care every moment that there should be no aimless thought or deed,—but that all should be governed by his vow of service and surrender to the will of the Ancient of Days.

As thus he mused a scarcely discerned message seemed to pass over his inner thought.

“Launch your bark! Launch your bark! Cut adrift from the shore of personality. Do not fear. All fear is for self. Do not doubt. All is provided for.”

STUDENT

FRIENDS IN COUNSEL

DEAR COMRADES: Much has been said of the advantage of an active mind and the habit of following a train of thought with logical coherence; but do we think sufficiently about that power by which the mind can be controlled to absolute quiescence at our will? The Soul above us tries incessantly to make its impress on our mind and flash its swift, decisive judgments for our use; but if the mind has not been trained to silence how can we ever hope to hear the still, small voice that issues from the inner world?

It must lie within the experience of most of us that all the great decisions of our lives are made for reasons that we cannot adequately formulate, or give in explanation to our friends. Our pathway in life's journey brings us to the parting of the ways. We do not know which path to choose. The problem presses for instant solution, but the mind is tossed with conflict and unrest. All our attempts to strike the balance are without avail until at last the torture of suspense becomes unbearable and from the mind distracted with uncertainty, goes up a cry for help. The brain lies quiet in its mute despair. A moment's silence supervenes. Then like the lightning flash descends the quick response that cannot be described. The Soul itself has spoken the sure decisive word. But is communication only possible in these rare moments of extremity, or may there be an intercourse unbroken between Soul and mind that would ensure success in everything that we undertook?

Deep students of life's mysteries assert that such enduring union is to be attained and that a perfect blending of the mind with the all-knowing Soul, would supersede the labored action of the brain and make slow logic a superfluous thing. The pupils who go out from this academy will know a little of this “royal union,” and will have the devious pathways of their lives lit by the constant shining of their unseen guide. The problems of the moment will be solved as they arise, and while the great majority of human kind pursue their way with doubtful, hesitating tread, these will march forward as the soldiers do who trust implicitly the general's word. The Teacher of Nazareth must have had this truth in mind when he advised his followers to make no preparation for defence when brought before the courts; but that it should be “given them in that hour what they should speak.” They were required to cultivate a childlike receptivity to the voice of their “Father in secret” and to “shut the door” to all the noisy clamor from below.

The power to listen to the Higher Self demands however more than mere passivity, for while we must be open to receive each breath of influence from above, an active, positive control must be maintained upon the forces underneath. STUDENT

THIS being understood, human research recommenced; men began to perceive that the aim, the function of existence, must also be the ultimate aim of that progressive development which constitutes existence itself; and that, therefore, in order to advance rapidly and directly towards that aim, it was first necessary to determine with exactitude the nature of that progressive development, and to act in accordance with it. *To know the Law, and regulate human activity to the Law:* such is the best mode of stating the problem. . . . We must ascend to the conception of *Humanity*, in order to ascertain the secret, rule, and law of life of the individual, of man. Hence the necessity of a general co-operation, of harmony of effort,—in a word, of *association*,—in order to fulfil the work of all.—*Mazzini, Essay on “Faith and the Future.”*

THE SPIRIT AND THE FLESH

H. L. BRIDGMAN

INTO this glorious world I came,
The free-born of the wind and flame,
I bound to me for good or ill
A body self to do my will.
Though he was frail and prone to rest,
I snatched him from his mother's breast,
And bade him serve me. What would you?
I had a great king's work to do;
Wrong to make right; comfort to bring
To those in trouble sorrowing.

I needed one both swift and strong;
Great was the road, the journey long,
Yet this my slave was weak and lame;
Faltering at my behest he came:
So, when his strength was almost gone,
I took the scourge and urged him on.
Yet hurry as I might to keep
The minutes' pace, both food and sleep,
My slave must have. Impatiently
I saw the glorious hours pass by.
(I could not leave him, for we must
Have hands of dust to work with dust.)
At last he fell and would not rise,
He called me with imperious eyes,
And bade me pause.

This small white room, this cot of snow,
Ministering forms that come and go—
I crouch here listening for his breath,
And with my hands I hold back Death,
My work neglected and undone.
If he but beckon swift I run
This worthless self of mine to save,
How hard they toil who serve a slave!—Selected

THEOSOPIHICAL FORUM

Conducted by J. H. FUSSELL

Question Theosophy proclaims the rule of Natural Law, where the orthodoxies of the world declare divine Fiat. How, in this light, does Theosophy explain Repentance, Baptism and Salvation?

Answer Christian orthodoxy says "we must repent and be baptized before we can be saved." It states the natural order correctly and it is literally true—under natural Law. The word "penance" is derived from "poena," meaning pain. In a growing entity there must exist harmony of Life and Function in all its parts to insure development to complete maturity. In the physical body of the child, should a lesion occur, there are set at work immediately dissolvers of injured tissue with which to replace the lost, and the pain experienced is the wrench which accompanies the effort to restore a state of harmony. This process must take place before growth can continue, else would result atrophy and death. The analogy is perfect, and in the mental and spiritual natures where a lesion occurs through a selfish (evil) thought or deed, the inevitable is that a readjustment to a state of harmony must take place, with its accompanying pain (repentance) before natural growth can continue in the portion of the nature where the lesion occurred. Now, to be baptized (behind the symbol), meant to be immersed in, to be given knowledge concerning Law. Water has for ages been the symbol for physical nature, and fire for spiritual nature. Hence it is that to baptize with water symbolizes teaching the baptized the laws governing physical life, and to baptize with fire implies giving knowledge concerning spiritual life. Pences in some department of our nature make pretty nearly a continuous performance for most of us, in our short-sighted mediocrity, and in the part affected, growth is temporarily inhibited. These discords also obscure our perception of the divine nature within us, the unchangeable self, the real I, and growth to this recognition is the object of life. Not until we are through with penances, and know of the laws governing our being will we recognize and obey the behests of our higher nature. Then we will have gained Salvation, wholeness, for then only will we have attained to such wisdom that we will act in complete compliance with Divine Law which comes to us only through the avenue of the Higher Self, and naught but constructive forces can emanate from us, thus indicating the perfect stature. A. C. M.

Question How may we exhaust the law of Karmic action?

Answer For an answer to this question I would suggest to the enquirer to study the *Bhagavad Gita*, one of the key-notes of which is the right performance of duty; to quote from it,

Wherefore perform thou that which thou hast to do, at all times unmindful of the event, for the man who doeth that which he hath to do, without attachment to the result, obtaineth the Supreme.

It is better to do one's own duty, even though it be devoid of excellence, than to perform another's duty well. It is better to perish in the performance of one's own duty; the duty of another is full of danger.

Whoever in acting dedicates his actions to the Supreme Spirit and puts aside all selfish interest in their result is untouched by sin, even as the leaf of the lotus is unaffected by the waters.

But the whole book should be studied, and will be found to be a mine of priceless wealth.

Another way in which the answer may be put is that as we learn to become workers with the Higher Law, and co-workers with Nature, do we attain freedom and, in the words of the question, "exhaust the law of Karmic action." But the first step, be it always remembered, is the faithful performance of duty. Through this, the Karmic results accruing will be such as will be more and more conducive to higher progress, until we learn to work wholly with the Law, and attain the highest freedom, and the divine power of helping Humanity; for, should we not be making a mistake to strive to "exhaust the law of Karmic action" as an end? Is it not rather our part, in accordance with our divine natures, to seek to help our fellow-man? If we do this, we may trust the Law to bring us what is good and those opportunities which are best. We shall not have to think about exhausting the law of Karmic action; all that will take care of itself.

STUDENT

Question According to Theosophical Teachings how far do you consider the making of plans desirable, or is it held that they hinder growth?

Answer The *Bhagavad Gita* teaches us to abandon anxiety and speculation about the result of a work, and to place our interest on the actual doing of the work. This is not merely a lofty saying, it is a piece of practical wisdom. For if we have a definite end in view, a thought-out plan, it is certain to be too narrow and paltry. Our imagination is too feeble to conceive a plan big enough and broad enough to be worth our execution. Our life-forces, welling up from an immortal soul, are too exuberant and manifold to be limited by our little plans.

Hence our little plans do not come off; and no wonder; and well for us and the world that it is so. But we call this the "irony of fate" or "His hand," as if there were any need to look so high for an explanation of so simple an effect.

To work towards a thought-out end is to limit, or rather to hamper, our growth. The end for which we live is too vast for our imagination to formulate. Plans are essential, but they are only temporary; we steer for them as a mariner steers for a point on the shore; to persist in the same direction would be to court a wreck.

If we use all our faculties in the right spirit, the plan will become manifest as we go along, and it will be far different and much better than any we could have proposed. Look back on your past, and you will see that, but for "accident" or "luck" ("good" and "bad"), you would have been still sleepily plodding around some narrow circle.

The purpose of the Soul must inevitably be achieved and our little desires and plans be frustrated sooner or later. It is better to learn wisdom and acquiesce as much as possible in the process. One could say with the poet, "Lead, kindly Light!" recognizing that the Light is no theological deity, but our own Divine Soul.

STUDENT

WITH right knowledge, or at any rate with a confident conviction that our neighbors will no more work harm to us than we would think of harming them, two-thirds of the world's evil would vanish into thin air. . . . We stand bewildered before the mystery of our own making and the riddles of life that we will not solve, and then accuse the great Sphinx of devouring us. But verily there is not an accident in our lives, not a misshapen day or a misfortune, that could not be traced back to our own doings in this or another life.—*Helena Petrovna Blavatsky*

Mr. Carnegie on Brotherhood

A RECENT speech delivered by Mr. Carnegie at Northampton, Mass., is quite a remarkable declaration of his ethical beliefs. Certainly, no one truly loving his fellows can take exception to the statements contained in the following press clipping; one can but feel a warming of the heart at the innate nobility of the thoughts voiced. Mr. Carnegie's great gifts have the added fact of being unconnected with sectarian interests. Education on broad, sweet lines and the betterment of the standard of the community generally seem to be Mr. Carnegie's splendid aim. The following is the press clipping above referred to:

The question is always before us: "Is man retrograding or advancing; is he becoming purer, nobler; is he devoting more and more of his time and means for the benefit of his fellows, and thinking less and less of himself; is the idea of brotherhood increasing—the knowledge that we are all members of one great family only playing with somewhat different toys?" The answer to that question is seen all around us, and especially in these Home Culture clubs, in which our friends may be considered one, if not the foremost, of the pioneers. It is through such means as these that the reign of democracy becomes firmly established and extended; the American idea of equality, independent birth, of wealth, or even of education.

What a man was by birth used to be the ruling consideration, and is so in some countries yet, but constantly growing less important; wherever our tongue is spoken it is rapidly vanishing. It was displaced for another test—what a man owned, and the millionaire was ennobled, for the rule of those that stood upon birth, the first test, has always been that enormous wealth should be drawn into their ranks. This alliance of birth and wealth is being displaced in our day by what a man knows, a fit successor in the march of progress and an infinitely higher and juster standard than either birth, rank or wealth. It is not, however, what a man knows that is to be the final step; in the future the question is neither to be how a man was born, how great his wealth, nor even what he knows but how he serves his fellow men. Here is the true, the final aristocracy which never can be displaced—not what he does for himself, but what he does for others, will be the standard by which man is judged. Wherein has he sacrificed self; wherein has he benefited others; what good seed has he planted for posterity; what trees bearing the golden fruit do we owe to his planting and care, and the cause of the widow and fatherless, wherein has he searched it out?

Toward this ideal I think that we are marching more directly in America than in any other land—first, because we have less distance to march and fewer obstacles to overcome in that march than older lands. Our forefathers established in this country a government of the people, any man's privilege every man's right, and declared not the royalty of this or of that family, but it knew and dared declare, in Burns' celebrated words, the "royalty of man." It is upon this platform that we all stand, the highest in the land, the President being in the largest and deepest sense, beyond all other men, the greatest servant of his fellows.

This is glorious democracy. Starting from this plane, good roads lead direct to everything that tends to bring about the brotherhood of man, the establishment of

the true ideal—that of character and of service, the test of a man's position among us being the performance of his duties as a citizen, and the extent to which he has labored, not for his own selfish ends, but for the good of others, the only passport to position, precedence and public esteem. Not even under what form he has worshiped God, which troubled the early Puritans too much, but how he has served man is to be the test in the days to come, and Franklin's axiom will be accepted—the highest form of worship of God is service of man. Man will dwell less upon Heaven our home and more upon the duty of making home a Heaven here on earth.—*New York Tribune, April 13, 1905*

More Curious Properties of Numbers

ON the same principle as "Properties of Numbers" (NEW CENTURY PATH, January 1st, page 17):

17			equals 1
27	equals 128	equals 11	equals 2
37	equals 2187	equals 18	equals 3 ² !
47	equals 16384	equals 22	equals 4
57	equals 78125	equals 23	equals 5
67	equals 279936	equals 36	equals 6 ² !
77	equals 823543	equals 25	equals 7
87	equals 2097152	equals 26	equals 8
97	obviously		equals 9
107	equals obviously		equals 10
117	equals 19487171	equals 38	equals 11
127	equals 35831808	equals 36=9=144=12 ² !	
137	equals 62748517	equals 40	=4=13

P. S.—Note that all where result is original number squared come to 9 on first addition, &c. Yours, P. V.

Craftsmanship Ruined by the Money Motive

SIR W. B. RICHMOND, who decorated the interior of the dome of St. Paul's Cathedral, says:

I think the fault of the English workman is the English employer. Treat him as your friend and as one who is working with you and not against you, and you will get anything you want out of him. Let him feel that he is not a slave, working to fill your pockets with gold, but that he is an integral part of your own mind, without which you could not bring your work to a conclusion.

In short, money takes all the life and soul out of work. Let all workers, whether designers, directors, or craftsmen, be fellow members of a guild, engaging in work and art for its own sake—for the love of creating noble creations—and the proper incentive will be present. Under present conditions of employment, the workmen are too often like an army of mercenaries driven by the compulsion of necessity to do work in whose result they have no concern or interest. In Lomaland where wealth is not the motive, we are reinstating arts and crafts in their proper and pristine freedom and dignity. E.

How Our Race Has Struggled Up

THOUGH it is truly necessary at this time to decry the too exclusive devotion of science to material comforts, it is well to remember that Western humanity owes very much to that same practical devotion to the bettering of external conditions. Without the enormous improvements introduced into human life by science and the related branches of culture, we should not be now in a condition to profit by the higher science and culture now dawning upon the world.

In the Fourteenth century the poor man had scarcely any food; and, with garden-stuff practically unknown, fruits non-existent, meat scarce, and grain hardly cultivated, it is difficult to see what he lived on. And when we add to the fact of his impoverished blood the fact that he lived in a state of indescribable filth, we no longer wonder at his plagues and

pestilences. Mud huts with no chimney and dirty straw on the floor were their dwellings. Thomas à Becket was considered extravagant because he had the straw changed every day.

As late as the reign of Henry VIII we find Erasmus saying of the English: "The floors are commonly of clay, strewed with rushes, under which lie unmolested a collection of beer, grease, fragments, bones"—etc.

What with this and the dense ignorance that prevailed, Western civilization was indeed for long in danger of perishing. Great then must be the stamina which is in this race that it could have produced the Elizabethan Age, the Modern Age, and—what lies beyond the veil of futurity. The strength of the old heroes has been handed down untarnished and will see us through many another and more glorious awakening.

The Hand versus the Machine

IN a recent bulletin of the Bureau of Labor, a chapter is devoted to the revival of American handicrafts. There are several organizations whose aim is to find markets once more for such hand-made products as the bedcovers and table-cloths woven by the mountaineers in the South, the cottonades woven by the Arcadian colony in Louisiana, and the Abnake rugs made in some old farm houses in Maine. Things made by machinery can never have the individualising touch possessed by things which owe their birth to the hand. The worker can not only put some character into them, but his own character grows by the work, by the attempt to evolve something new and achieve every detail faithfully.

A writer in *The Arrow* pleads the cause of the American Indians in this matter. She thinks that a sympathetic training and encouragement would ensure the revival of their old handicraft industries whose products are now rather curiosities than regular assets of our home furniture. The tribes simply took whatever lay to their hand. The Indians of the plains did elaborate embroidery with porcupine quills on deerskin. The mountain tribes made baskets. The Navajos made blankets, and the Pueblos pottery. There is no reason why they should cease to do so. They have the sense of color and form in full measure, and if a regular market were found for their work, the latent memory of the races might revive a school of art which long ago reached a forgotten climax.

STUDENT

Ambidexterity

SIR W. B. RICHMOND, the English painter, has spoken on the value of ambidexterity in art, recommending that it be inculcated in young students. He said that Landseer had been known to draw the profile of a stag with one hand and a horse with the other simultaneously, and instanced the ambidexterity of Spartan soldiers and Japanese artists.

The ability to write with either hand is of obvious advantage in case of accident to one hand; and it also enables the writer to use his pen at a crowded table when there is not room for him to use his right hand, or to write when the lamp is on the wrong side.

The practice of using the right hand all the time is largely a habit indulged thoughtlessly. A little watchfulness over our own movements will show us many cases in which we might just as well use the left. In this way we should give the left hand a chance to learn, which it sadly needs, poor member, pampered and crowded out as it is by its masterful fellow, and given all the leavings and easy jobs to do.

It would be interesting to note the remoter effects, on our constitution and on our mind, of such an important change of habit; for of course there would be such effects on account of the sympathetic relation between all parts of our make-up. It is no mere jest to surmise that we might become less lop-sided in our judgment, less one-legged in our habits, less one-eyed in our ideas, and generally more all-around and more evenly balanced.

Yet there is a fundamental and inalienable distinction between right and left, which geometers have perhaps not sufficiently studied. Our two hands, even though they should be of exactly identical shape and size, would still have this essential difference. Let those disposed to deny this put their right glove on their left hand and convince us. And so it will not do to go to extremes and regard the two hands as absolutely similar and interchangeable—exact counterparts in every sense. The two sides of the body are not alike as regards the arrangement of the internal organs. E.

How an Island Was Formed

A new island has recently been formed near Japan, three leagues south of Iwojima in the Riu-Kiu Archipelago. Last November frequent explosions were heard and smoke began to rise. In December the outlines of an island became visible. It is only 4,800 yards in circumference, but boasts a peak 240 feet high and a boiling lake. H.

Indian Grievances

THE Winnebago Indians of Nebraska have at last protested against the frauds and injustices which they claim to have been systematically practised against them by certain government agents. Their protest takes the form of a petition, which charges the agents with collusion with powerful rings of speculators during the last quarter century.

"On our feeble resistance," says the petition, "an occasional inspector was apparently sent to our aid, but they never came to see or hear us, but were always received and entertained by the speculators who were whitewashed, while we were ignored and blamed in their reports. We realize that it would not do to look too deep into our troubles for fear of a public scandal. Too many respectable citizens have secretly washed their hands in our blood.

"They brand us as lazy and shiftless. We beg to state that we are neither, but simply discouraged and heartbroken. What can we do if everything is taken from us, being without means and without rights to defend ourselves? Those who are paid with our money to protect and civilize us, are scandalizing and degrading us with their corruption. The whiskey that has made beasts of us Indians was set up by the speculators protected by government officers, and the saloon-keepers and the boot-leggers were only too glad to get us in their hands."

The petition further asserts that members of the tribe were required to sign blank papers subsequently filled in to their disadvantage; that checks coming to them were taken away to offset immense and padded bills, and that their accounts were falsified. And finally that moneys coming to them from government were handed over in block to speculators. The commissioner of Indian affairs, we are told, "will inquire into the matter." What more could one wish? C.

In Santo Domingo

MOST interesting indeed are the anomalies and eccentricities and inconsistencies developed in those regions where Nature's seething caldron is evolving a new race out of a medley of old materials. Quite refreshing it is too to anyone who may be a little tired of monotonous conventionalities.

Such a spot is Santo Domingo, an account of which has appeared in the *Boston Transcript*. The inhabitants are all kinds from pure Negro to pure Castilian; for hither came in Columbian days Spaniards and Italians; later came buccaneers, the riff-raff of every European nation as well as gentlemen adventurers; and still later Americans, Syrians, and a few Chinamen. All these meet cordially in social intercourse at grand society balls.

There are people with black skins and Caucasian features, and white people of Negro type. "You see beautiful children, with dusky faces but blue eyes and hair as yellow as that of any Scandinavian princess." At Constantia, a little town in the centre, the people are ruddy, blonde, and blue-eyed, showing no trace of the Negro. This place is 7000 or 8000 feet above sea-level and snow and ice are known, although it is tropical.

The mixture of customs is equally singular. Fine modern public buildings jostle Negro huts; the telephone-bell is within hearing of barbaric simplicity; children play naked up to the age of seven or eight amid college-educated "swells." There are many magnificent churches, begun by the Spaniards, roofless and with trees in the aisles. "Pigs, goats, and naked children revel in blissful ignorance where the ancient Spanish architect planned the feet of reverent worshippers. Public buildings and a new slaughter-house are being provided while yet the streets of the city are in places impassable for carriages."

A very good account is given of the character of the Dominicans. Rich or poor, black or white, educated or savage, they are uniformly polite. They may be sharp dealers in Yankee business in the city; but that is only the game. You can trust them personally with your purse. Your safety is equally guaranteed, for you may travel anywhere without fear, even in the depths of the forest—at least so they say.

There is little vitality in the mixed breeds and consumption and leprosy are frequent. Nature eliminates the non-essential, and time will show what the race of the future on this island is to be. STUDENT

Mukden and the Manchus

WHEN the war is ended and Mukden has resumed the quiet of centuries—three centuries, to be exact—it may become something of a resort for the wealthy holiday maker. For it is a beautiful city with fine buildings, broad streets, and shops full not only of eastern old-world products but of modern as well. In the middle is the Imperial Palace, built by the present dynasty, the Manchus, who in 1625 supplanted the ancient rulers of China, the Mings. Here are portraits of all the Emperors, priceless Manchu manuscripts, volumes to the number of 80,000, and jewels and relics innumerable. At least these things were there, but there has been the Boxer insurrection, and since then a prolonged Russian occupation.

Around the Palace is a wall; then comes the main part of the town; then another wall, a majestic structure 60 feet high with a road on the top and pierced by eight gates tunneling through it; then the city's outskirts; and lastly a mud wall. Within a few miles are some superb tombs of dead Manchu monarchs.

Manchuria, of which Mukden is the capital, is protected by a mighty dragon who lies under ground. He is 700 miles in length, and his tail is covered by a low range of hills close to the city. On the tail is a magnificent pagoda. The head is underneath the sacred White Mountain. The pagoda is separated from the city by a very beautiful park in which is the tomb of the first Manchurian Emperor, the conqueror of the Ming dynasty.

Historically nothing is known of the origin of the Manchus. The race's own account of itself is this: There were three virgins born of heaven, who dwelt under the shadow of the White Mountain. One day whilst they were bathing in a lake, a magpie or raven flew from above and dropped upon the clothes of the youngest a blood-red fruit. This she ate, and soon after gave birth to the first of the Manchu race. The symbolism must be obvious to any real student of mythology. The Garden of Eden episode may help in its understanding. But it does not tell us much history, and the fable may be an echo of an earlier. If we could only get a sight of those manuscripts! But probably we should have to go to Europe for some of them. STUDENT

Gold from the Sea

AS to the reported enterprise of extracting gold from the sea, the U. S. Consul at Nottingham, England, has collected the rumors—for they are no more—on the subject. These are to the effect that Sir William Ramsay, the discoverer of argon, has sanctioned the new process of extraction, and that a company, which is anonymous, has been quietly acquiring foreshore to the extent of some fifty miles for the purpose of obtaining a supply of clean sea-water. As there is only about four cents worth of gold in a ton of water, it is obvious that the difficulty turns upon making its extraction simple and easy enough to pay for the machinery, chemicals, labor, etc.

At various times there have been a number of propositions advanced in solution of this problem. Whilst some of them have been scientifically correct and theoretically possible, in practise they failed. Others have come from people who were resting a moment from squaring the circle. H.

A Satisfactorily Falling Revenue

ENGLAND appears to be reforming in the matter of alcohol. For the fiscal year just closed, the consumption of beer and spirits was less than for fifteen years past, that is since 1890. The Chancellor of the Exchequer makes no lament about the falling duties. The productive power of a nation is inversely as its consumption of—that is, poisoning by—alcohol, directly as its taxability on other products. Coincidentally, the revenue for the last year is \$12,000,000 ahead of the estimate. The Chancellor thinks that the money saved by the people on alcohol is spent in outdoor amusements. If that is true and continues true we shall hear less and less about failing physique. STUDENT

Frontispiece—Helena Petrovna Blavatsky

THE cover-page of the *NEW CENTURY PATH* this week shows the well-known face of Helena Petrovna Blavatsky, Foundress of the World's Theosophical Movement.

Her work and teachings have startled thinking men by their depth and scope in a humanitarian and philosophic sense, while their characteristic feature is that they bind all men together in an absolute Brotherhood of Humanity.

Some Views on XXth Century Problems

Sops to Conscience

SOME years ago a noted business man propounded the view that you might justifiably be as selfish as you liked in making money providing that you were benevolent in the spending of it.

It is only a modern form and defense of the medieval practise of building a church in old age to atone for a long life of crime and bloodshedding. It is the idea that by a dose of medicine tomorrow morning you can remove the effects of a debauch tonight. This "benevolent spending," and the church, and the dose of medicine, are merely other crimes that cap the list. The Divine Law cannot be humbugged. The years of selfish work, of conscienceless grasping, have woven a long black thread into the web of social life. Every fiber must sometime be removed by the man who wove it in. Through the years of the weaving, many, even thousands may have been reduced to starvation, and knew to whom their misery was due. Many may have taken to crime as their only remaining resource. Rivals may have been exasperated at the duplicity they had to meet. Honest men may have been forced into dishonesty, meeting trick with trick. And from all these people secondary trains of consequence affecting yet others, branch out in every direction. In the meantime the man's own nature is hardening as he disregards these visible effects of his own acts, and the appeals of his own conscience.

And then he hopes to pay the whole bill by founding a college or a library or making a donation to a Sunday-school!

If the law of Reincarnation were better understood, such men would know that in another life they would have to live in the world of their own creation, to meet all the resentment they had aroused, to suffer that which they had made others suffer, to be themselves victims even as they had victimized, till the whole pain-driven nature had melted into recognition of the suffering it had previously caused for others, into recognition and into compassion. And from the deeds thence flowing there would be rectification of the evils that had been done. STUDENT

The Lost Words of Christ

A LOS ANGELES pastor has been telling his people that the Gospels, or rather the sayings and parables of Christ, have an esoteric as well as an exoteric meaning. He points out that the presence of the esoteric meaning was insisted upon by the most eminent of the Church Fathers, Clemens, Justyn Martyr, Origen and others.

Paul also makes frequent reference to it.

But the highest authority of all is Christ himself, who said to his pupils: To you—as distinct from the people—it is given to know the *Mysteries of the Kingdom of Heaven*.

Is it too much to say that all knowledge of that esoteric meaning is lost? And—if we are to trust John, who tells us that the spoken teachings of Christ were exceedingly voluminous—the great bulk of Christ's words are also lost. May there not be a connection between these two losses and the darkness that was about to settle upon humanity and has been upon it ever since? The outer life may be vivid enough, vivid in pleasure and pain, vivid in thought; but the flame of the inner life has burned so low that most know nothing of it; and of the rest, only one here and there knows of it otherwise than by faith.

But the cycle of that darkness is nearly over. When men begin to suspect that there is an inner life possible for them, higher and lit by a more unclouded sun than the life they know and in which they suffer, they will begin to search for it. And this inner search may act as a secret force bringing from its hiding place of centuries the record of the lost teachings of Christ; now, when newly found, to be understood as they could not have been through the Dark Ages. Had they stood in the open they would have met the fate of the teachings we have had—would have been encrusted and hidden and well-nigh killed with dogma and sectarian conflict. May it not have been part of the plan of the great Teacher of the West that his profounder words on life should wait till humanity was readier to receive them? Surely the hour for their emergence cannot now be very distant from us. STUDENT

Decay of Family Religion

A METHODIST conference has expressed alarm over the decay of family religion which is blamed for the decline in the interest of the conference. Sunday papers fill the place of family religion.

Veneration of ancient ideals is essential for humanity, but we cannot get along forever on our Semitic tradition. We must learn to venerate an older past and mightier ancestors, and to anchor our characters to truths that lie even deeper in human nature. STUDENT

Early Rising

PROFESSOR MARCH of North-Western University thinks that proverbs expressive of the advisability of rising early or with the sun are now obsolete. They were made, according to him, to suit the days when as yet the problem of artificial lighting had not been

solved. He forgets that life stands in an essential relation to sunlight. Science is now finding out that from the moment that objects, animate or inanimate, are exposed to sunlight they begin storing energy in various forms, to be subsequently expended as action of some kind. Even the woolen blanket which has been a little while in the sun yields something quite perceptible to the man who lies on it at night. To be asleep in bed when the sun invites one to a banquet of his energy does not seem a very wise policy, and the mistake will hardly be corrected by a prolonged exposure several hours later to the artificial glare of gas flames and globes.

We have everything upside down. We fill the stomach at night when it is entitled to rest, and roll heavily out of bed in the morning to refill it when it is still full of the half-digested, half-fermented products of last night's meal.

Those who observe themselves, and whose health is not too far gone, will find that close to sunrise there is a natural moment of waking. It may be but a moment, and is usually utterly disregarded. But if it is seized, and the fumes of last night's gas, wine, food, coffee and tobacco not allowed to narcotize the will, the consciousness of the whole day will be in a new and higher key. A finer health will begin to come back, and a way opened for the regainment of the sensations of perhaps long-gone youth. Less food, particularly at the last meal, will soon be required and one important step taken towards a new harmony with nature. It is between that moment and the moment—often two or three hours later—of rising, that the seeds of many diseases take root. PHYSICIAN

Immigration and Other Problems

RELIABLE forecasts of this year's immigration show that our population will by Christmas have received in that way an increase of a million and a half—nearly double of the 1904 figures. And by studying the 1904 figures we can see how this enormous

army will be constituted. Last year the contingent of Russians, other Slavs, Huns, and Italians, amounted to nearly half a million. We count these together because they are mostly undesirable, uneducated, undersized, the products of generations of semi-starvation and misery. There were also 26,000 Asiatics, mostly from Japan, of a much higher order of intelligence, and though small in physique, in no way degenerate.

Of other nations, Norway, Sweden and Denmark sent us about 50,000; Greece 11,000; Spain and Portugal a few thousands; Ireland 36,000, Germany 46,000. All these we can welcome. Nor would there be so much reason to complain of the rest if on their arrival they were properly distributed. We have vast areas of our country unoccupied, every worker on which would be adding wealth to the whole whilst supporting himself. But they do not go there. It is to the crowded cities that they throng, adding to the sum of vice, degeneracy and misery year by year.

It may work out well, after all. It will force us more quickly and urgently to confront a problem that must in any case be sometime solved—the problem of the cities, behind which stand several others. And until they are solved, wealth may accumulate, our world power and world possessions may grow; but we are building on foundations which are not merely insecure, but certain to give way. STUDENT

Brief Glimpses of the Prehistoric World

Archeology
Paleontology
Ethnology

The Vocal Memnon

THE illustration shows the two colossal statues of Amenophis at Thebes. They are forty-seven feet high and each is hewn from a single block of hard rock. The figures face East, looking towards the Nile and Thebes. Behind them are the temples of Medinet-Habu, and the Ramesseum; and to the left or north lies at a distance of several miles the famous temple of Deir-el-Bahari, built by Queen Hatshepu, up against the rugged cliffs of the Libyan Mountains. Crossing over a spur of

STATUE OF MEMNON AND ITS COMPANION AT THE TIME OF THE HIGH NILE

semi-circular hills, one enters the renowned Valley of the Kings.

The figure to the left as they sit facing the East, is more battered, having been broken and afterwards repaired. It is the one known as the "Vocal Memnon." The Greeks regarded it as a statue of Memnon, who was the son of Eos (the Dawn), a king of Ethiopia, and who fought in the Trojan war. Zeus conferred immortality upon him.

This statue, when gilded by the rays of the sun, gave forth a musical sound, the greeting of Memnon to the sun. It has many Greek and Latin inscriptions graven upon it, the testimony of visitors to their having heard the voice of Memnon.

While pedants are disputing as to whether Amenophis was Memnon, and how the vocal sounds were produced, we may be content (with the Greeks) to appreciate the symbolism of this figure and its prototype. The Soul of Humanity watches patiently through the long night of materialism for the dawn of another day of light. See the fine illustrations of this in *The Mysteries of the Heart Doctrine*. H.

Notes on the Alaskans

ALASKA offers every inducement to the ethnological observer. Its people are, to most of us, practically unknown; but research would seem to indicate an anterior relationship between the Alaskans and Asiatics. Under the instruction of the Greek church they have advanced considerably, both morally and intellectually, on the lines of modern civilization; but the Presbyterian faith is fast superseding the former. Together with the Indian schools established by the Government, these teachings are gradually bringing the natives to a higher standard of manhood and eliminating the various beliefs and superstitions that existed heretofore.

Notwithstanding this, however, the totem poles remain. They are indured with eternal interest and will ever arouse the curiosity of the stranger and invite interrogation as specimens of archaic art and as representing one of the most remarkable of aboriginal traditions.

Each tribe of Alaskans adopts an animal, bird, or plant as its totem; and the natives believe that a proper veneration of this symbol will secure their tribe protection. Thus one tribe may adopt the bear as its

totem, and its image will be handsomely carved upon divers poles, and painted with bright-hued paints if these are procurable. The belief is that the tribe having this totem will be immune from the attacks of the bear. However, if calamity should overtake a member of the tribe, it is presumed that he aroused the ire of the totem and received his just deserts.

Totems change with succeeding generations, and occasionally a pole is erected to a departed parent, a chief, or some other dignitary. Visitors to the Cen-

tennial Exposition will notice a huge pole, of which the topmost totem is a large raven, head downward. This pole was given to the Alaskan Commission by Yennate, a member of the Thlingit tribe. It was carved in honor of his mother, a member of the Raven tribe.

The significance of the totem is obvious. A brown bear, totem of the Kokwonton tribe to which Yennate's father belonged, is under the raven. Below the bear is the figure of an Indian holding a cane, in representation of the woman's brother, a noted Indian doctor and sorcerer. This unique genealogy may only be interpreted by a member of the family.

The totem poles, sixteen in all, are from two different tribes living on Prince of Wales Island. At an old village called Tuxekan, four were obtained. Another was presented to the commission by Chief "Tom," a Thlingit of Klawack. The very large poles are from the Hydeth villages, Sukwan, Klinkwan, Onhonklis and Kasaan. All of the poles together, with an enormous dugout war canoe, were loaned by the natives, but must be returned to them at the close of the Exposition. The totem pole is as sacred to the Alaskan family as is the old family Bible to an European. E.

Who Built the Cyclopean Architecture of Peru?

REGARDING ancient America, the Abbé Brasseur de Bourbourg, the learned writer on Central American antiquities and translator of the ancient Quiché scripture, the *Popol Vuh*, says: "Traditions whose traces recur in Mexico, in Central America, in Peru, and in Bolivia, suggest the idea that man existed in these different countries at the time of the gigantic upheaval of the Andes, and that he has retained the memory of it."

H. P. Blavatsky, quoting this, adds that paleontology and anthropology agree in assigning man just such an antiquity. And yet ever-cautious history is still fumbling tentatively among the millenniums!

At Cuelap, in Peru, there is a Cyclopean erection, the ruins of which consist of a wall of wrought stones 3600 feet long, 560 broad, and 150 feet high, in a solid mass. On this mass was another 600 feet long, 500 broad, and 150 high. Such remains are frequent; and, as H. P. Blavatsky says: "A most suggestive fact is the startling resemblance between the architecture of these colossal buildings and that of the archaic European nations . . . simply explained by the derivation of the stocks, who devised these erections, from a common center in an Atlantic continent." This will one day be proven true. STUDENT

The Trend of Twentieth Century Science

Daring Speculations of the New Astronomy

IN this Twentieth century men of science are becoming a little bolder than formerly in the use of the "Scientific Imagination," and new discoveries and ingenious explanations crowd in so quickly that there is hardly time to sift and record them. A spirit of liberation from the materialism of Nineteenth century scientific orthodoxy is permeating modern thought. In the rush of theories few will stand the test of time, but it is significant that sometimes true conclusions are reached though the argument may be based on partly false or incomplete grounds.

Professor W. Pickering of Harvard observatory, is credited with a brilliant idea, gained from the study of the reverse motion of Saturn's recently discovered ninth moon, Phœbe. He suggests that the planets have turned upside down, "keeled over," as he calls it, or are in process of doing so. When Saturn, for instance, in some far distant age, was "reversed," the ninth moon was whirled off; thus it travels in the direction the planet rotated then, *i. e.*, from right to left (as seen from the Sun), but when the ringed planet "keeled over" to his present position the rest of the Satellites were thrown off and of course revolve in the opposite direction. According to this novel idea Jupiter is near the end of a period of inversion, and the other planets are in various stages of the process.

But there are some difficulties in accepting this theory in full. It seems unlikely that Phœbe alone should have been whirled off during the earlier condition, while the eight larger moons should have been separated from Saturn since, and at nearly the same time, *i. e.*, when Saturn had reached his present angle of inclination, and before he turned over appreciably again. The systems of Uranus and Neptune give no support to the theory, for the paths of their Satellites, and, it is almost certain, the direction of their own daily rotation, are nearly at right angles to the plane of their journey round the sun; so if those planets are tipping over it would seem as if the orbits of their Satellites, like those of Saturn and Jupiter, were following suit, instead of being left behind. Of course we do not really know that any of the Satellites were thrown off their primaries at all: there may be some *entirely different origin*.

However this may be, and it is certainly a fascinating speculation, the teaching of Theosophy is that the Earth is subject to a certain law, not yet familiar to science, which actually does produce *periodic changes of its inclination* causing strange vicissitudes of climate. Proofs of great climatic changes we find in the sub-tropical fossils of the North and South polar lands.

These changes of the earth's axis have been one means, amongst others — volcanic, seismic, etc. — of keeping a healthy succession of varying conditions of climate, and distribution of land and sea. When the earth's axis lay half way over and the polar axis was horizontal, so to speak, the action of the tides in wearing away the coasts and the drift of the ocean currents must have been very different from the present. Human-life conditions then would appear very strange to us.

The ancients knew of this "keeling over," for when Herodotus was in Egypt the astronomer priests told him of it, saying that in past ages the ecliptic had cut the equator at right angles. It is mentioned by other writers also. In the *Book of Enoch*, a very ancient Scripture, Noah is reported as saying, in reference to the deluge, "The earth labors and is violently inclined;" and there are other passages explicitly mentioning it. In the *Secret Doctrine*, H. P. Blavatsky gives many geological and other evidences supporting these traditions, and she shows that these changes harmonize with critical periods in the archaic history of mankind, when nations and races had run their courses and new cycles were opening; for

"God fulfils himself in many ways,
Lest one good custom should corrupt the world."

R.

A Lemurian Table-Land

PROFESSOR AGASSIZ has just submitted to the National Academy of Sciences, of which he is president, the report of his six-months cruise in the official deep-sea sounding boat Albatross. He has discovered an immense volcanic plateau in the Pacific Ocean, of about 2,000,000 square miles area. If the reader will take a map of the Pacific and look for Easter Island, the Galapagos Islands, and the Low Islands, he will have three points on the circumference of this plateau. Drawing a

line around them he will get some idea of its extent. The nearest point is about 600 miles west of South America. The equator and the Tropic of Capricorn include most of the tract between them, a segment of it lying north of one and south of the other. Easter Island, the Galapagos and the Lows, are elevated peaks of the plateau, standing out of the water. The surface is purely volcanic, bearing no life. Save for these Islands it is flat and lies about two miles beneath the surface. All around it the ocean floor slopes quickly to a depth of four or five miles.

It is evidently a high table-land of the great continent of Lemuria which once bridged the Pacific and whose highest peaks are the islands which dot the ocean from South America to China and Australia. On this continent, according to the teachings of Theosophy, physical humanity took its origin, passing through many phases of civilization, though of a kind of which we can form little conception. According to the same records the remains of all these were almost utterly wiped out by enormous volcanic action. Then the continent as a whole sank. But Easter Island and one or two more still bear witness to that immensely distant human period. Their giant laval statues, their mighty platforms and quarries, have defied time and the winds and the waters and doubtless tell us something of the manner of men who made them. We must hope that some suboceanic earthquake may one day break the crust of Professor Agassiz' plateau and throw within range of the dredger something more to guide us in a study of that vanished life.

STUDENT

Why Plants Bloom

A GERMAN scientist has been studying and explaining the blossoming of plants. This is his illumination of the matter.

A previous student had arrived at the conclusion that at a certain point in its growth a plant must produce some substance irritating to the cells, the effect of the irritation being that blossoms are produced instead of foliage. The blossom is in fact a kind of abscess or cancer! Moreover it is a purely mechanical reaction to this "irritant." So far all is satisfactory.

Now we have only to determine what this "irritant" is. A third German student very opportunely ascertains that in the sap of the Japanese cherry-tree, just before it blooms, is an increased quantity of sugar. "Conformably to this inference" he finds "that all the peculiar phenomena of the formation of blossoms may be traced to an increased formation of sugar in the sap, and thereby explain themselves precisely."

We find a large quantity of bricks accumulated on the side of the street. Shortly after, they have disappeared, and a new house stands there. What is the cause of the phenomenon of the appearance of the house? Manifestly "all the peculiar phenomena of the formation of houses may be traced to an increased formation of bricks on the street, and thereby explain themselves precisely."

This is the stuff served out as science. To say that the life of the plant aims at the flower and fruit as its highest expression, is to use words which such expositors of nature's ways cannot understand. They have not come in sight of the problem which they profess to expound. STUDENT

Anaesthesia by Electricity

A FRENCH physiologist has made an application of electricity to surgery which may prove a greater boon to humanity than the invention of chloroform. He has found that an apparently natural sleep, with the additional phenomenon of anaesthesia, may be obtained by the passage of a galvanic current through the brain. A Faradic or induced current has no such effect; nor has a constant galvanic current; it must be interrupted. Dr. Leduc interrupts it at a rate of about 150 to 200 per second. He begins with a minimum of strength, raising it gradually through several minutes to as much as fifty volts. One pole is placed on the forehead, the other somewhere down the spine. Power of motion is first lost, and then feeling. The heart is unaffected, but respiration may become a little difficult, recovering itself, however, directly the current is stopped.

This condition only lasts as long as the current. As soon as that ceases the return to consciousness is complete and with no morbid after effects. There remains only a feeling of refreshment as after natural sleep. STUDENT

SONG IN SPRING

by LIZZIE TWIGG

PRIMROSES pale in the hedgerows are peeping,
Madly the torrents are laughing and leaping,
Gladly the earth now awakes from her sleeping,
For Springtime, sweet Springtime, is here!

Throstle and merle in the woodlands are singing,
Blossoming hawthorns their branches are swinging,
Messages glad all the breezes are bringing,
For Springtime, sweet Springtime, is here!

Dark days are past, dear, and over us beading
Azure and white in the bright skies are bleeding,
Flowerets to heaven their incense are sending,
For Springtime, sweet Springtime, is here!

Songs that were hushed once again wake to singing,
Hopes that were hid in our hearts are now springing;
Music and mirth through the whole earth are ringing,
For Springtime, sweet Springtime, is here!—Selected

Loquat Blossom

THE loquat or Japanese medlar, *Eriobotrya japonica*, of the tribe of *Pomeae*, of the order of *Rosaceae*, is one of the foreign fruits acclimatized in California, of which specimens are cultivated in Lomaland. The fruit is the size of a small plum and the color of an apricot, grows in small clusters, and has four or five large bitter seeds in place of a stone; it is very sour. The loquat in California observes peculiar times and seasons; it blossoms in November or December, and fructifies in April.

H.

Flower of the Night-Blooming Cereus

CEREUS *grandiflora* is a spineless cactus of California, belonging to the numerous group cereus, of which there are 150 species in South America and the West Indies. The bloom is surpassing in beauty and fragrance. The outer petals are tinged with pink and the rest of the flower is of the purest white wax. The flower hangs from the edges of the leaves (or leaf-stems as they really are) by long curved tubes.—(See, for a description, the NEW CENTURY PATH, vol. viii, no. 7)

The Birds' Testimonial

ON Point Loma the birds have learned something new. Of course, they know that to build a nest in any accessible position near a public school would be sheer madness; it would certainly be destroyed if the boys found it. But the birds have learned that Raja Yoga boys are so different that there is nothing to fear. Consequently there are many nests in the Raja Yoga Academy grounds and the boys find great pleasure in watching the birdlings grow. The parent birds are not distressed when a crowd of boys gather about the nest, because they know that no harm will be done, while it is very likely that there will be some worms left by the nest for the family if they are very small, or left in their craws if they are large enough to swallow without their parents' help. There are several nests on the playground; one of them in the honeysuckles at the edge of the foot-ball field. It is there in real danger of accidents, but the boys have been so careful that no disaster has yet occurred. The birds also appreciate the protection which the boys try to give them

LOQUAT BLOSSOM

THE SPELL OF SPRING

by SAMUEL MINTURN PECK

BE it born of sweetness,
Be it born of light,
Of fragile incompleteness,
Child of morn or night—
Be it left of all that's fair, its nameless charm to me
Lies in the promise that it holds of lovelier things to be.

I feel it in the fragrance
That comes before the flowers
In the breeze's vagrancy
Through the dreamful hours;
And oftentimes it wooes me, and sets my pulse a-thrill,
When first I catch with happy heart the bluebird's herald trill.

The little clouds whose whiteness
But makes the skies more blue—
Unto their tender brightness
It lends a softer hue.
Yes, earthward, skyward, seaward, no words can ever sing
The mystic, indefinable, the wondrous spell of Spring.—Selected

against hawks and evil butcher-birds (loggerheaded shrikes), which kill the bird-babies just for sport.

Several families of orioles and mocking-birds have moved into the neighborhood and will help to drive away such pestilent bullies, because every bird hates the butcher-birds with their discordant squawks. By such confident friendliness the song-birds give their testimony that Raja Yoga is good for boys and makes them kind and trustworthy.

N. L.

Crow Courts

THE *Denver Republican* tells some anecdotes of courts of justice held by crows, rooks, and storks. The fact that crows and rooks hold these courts is well known. According to one authority, courts of crows are very common in the Shetland Islands. A hill or field being selected, the session commences. There is no apparent distinction between judge, jury, witnesses, counsel, and executioner, each bird being all of these functionaries. After very much cawing, the whole court falls upon the prisoner and pecks him to death, and then disperses. The same thing has been observed with rooks.

The stories of storks have a comical as well as tragic aspect. One, related by Bishop Stanley, states that a man at Smyrna took some eggs from a stork's nest, replacing them with hen's eggs. When the young chickens appeared, it was more than the male stork could stand. He left, and after some days returned with other storks, who formed a circle around the defaulting mother, adjudicated the case, and executed her.

A similar story from Berlin tells of a stork hatching goose's eggs, and being tried by 400 birds and executed by one of them—presumably the injured husband! STUDENT

The California Poppy Thrives Under Cultivation

An item has been going the rounds of the press to the effect that the California poppy or *escholtzia* does not thrive under cultivation, and that the blossoms are smaller and less beautiful than in a wild state, and so forth. This statement, if made by a Californian, must have been made on very limited observation. There are thousands of gardens where cultivation has brought these flowers to a diameter of five or six inches, with colors beyond description, so warm and rich as almost to bear mixing with roses. Y.

FLOWER OF NIGHT-BLOOMING CEREUS

IN these days of rapid progress, when army and hospital nursing has evolved to a systematic, perfectly-conducted department of the medical service; when the thoroughly trained nurse goes to her important duties equipped with every one of the latest and most approved appliances and necessities that modern invention can supply—the picture which the pioneer in this noble profession, Florence Nightingale, affords, is most inspiring.

It is hard to be a pioneer—yes—but it is also good to be a pioneer. Can we think for a moment that Florence Nightingale would have exchanged her glorious work on the Crimean Peninsula, when her coming was to weary, dying, neglected soldiers, like a starry vision, even with all its privations and suffering, for service in the latter day Red Cross Society with all its grand opportunities for good? We believe not.

This was the condition at Balaklava when Dr. Russell wrote to England for assistance:—“It is now pouring rain—the skies are as black as ink—the wind is howling over the staggering tents—the trenches are turned into dykes—in the tents the water is sometimes a foot deep—our men have not either warm or water-proof clothing, they are out for twelve hours at a time in the trenches—they are plunged into the inevitable miseries of a winter campaign, and not a soul seems to care for their comfort or even their lives.” Ample supplies had been furnished, but *that fatal happening*, the cause of so much misery, even in our own day, *mismanagement*—reveals all. Balaklava presented at that time a condition of filth and disease that the world has probably never seen since, and it is hoped never will again. Fever, rheumatism and diarrhoea, were carrying off the soldiers in such numbers, that for a few weeks the army could scarcely be kept alive. Such was the situation when the appeal for help went to England. “Night brings out the stars,” the soul was ready to answer the call, and Florence Nightingale whose life seemed to have been a preparation for this particular crisis, responded to this cry for help. She started at once for the Crimea, with a corps of assistants, many of them were well-born ladies of wealth and education, like herself. Imagine this slender, fragile little woman arriving at the scene of war and finding thousands of sick and dying soldiers needing her services. It was enough to have shaken the staunchest nerve. But genius

✻ The Pioneer of Nurses ✻

SEE the gates of Life and Peace open before you, if you have but faith and trust to enter in. But none can enter alone, each must bring with him the sad and sorrowing. None can cross the threshold alone, but must help to bear the burdens of the overburdened, must aid the feeble steps of those who are discouraged, must support those who are bowed down with sin and despair, and as he sends out the radiation of his own joy and strength which he receives from his own aspirations and devotion to his own Higher Self, joy and strength and power shall enter into the lives of those others, and together they shall pass through into Life.—Katherine Tingley

surmounts all obstacles, and Florence Nightingale was the genius of nursing. Order soon appeared where before chaos had reigned; cleanliness, fresh air and light, where before were gloom and filth. Indefatigable, untiring, in her service, no labor was too great, no call for her assistance unheeded. Is it any wonder that the thousands of sick soldiers learned to love even her shadow flitting by?

The pioneer of any work marks out the path for others to follow, and in the profession of nursing, woman seems to be peculiarly the natural leader. Her intuition, tact and sympathy are the factors specially needed for this work. Because of this the woman's work was then necessary to save the situation at Crimea. The stand that Florence Nightingale took regarding disease was for that day, strikingly original, thus,—“Disease is not an evil, but a blessing; it is a *reparative process*—an effort of nature to get rid of something hostile to life.” Her prime cure for all disease was fresh air, believing the basis of many diseases to be foul air. Now—these ideas are so prevalent that it seems as though they must always have been known.

In the science of healing, the nurse has been quite as important a figure as the physician. The two must necessarily work in harmony; the most successful physician is the one who combines with his medical knowledge the care and watchfulness of the nurse, and the same may be said of the superior nurse. Doctors as well as patients at the Crimean war yielded the palm to Florence Nightingale, for her heroic and invaluable services in that never to be forgotten crisis, and a grateful country donated fifty thousand pounds which Florence Nightingale used to establish an institution for the training of nurses.

What greater service can woman render to humanity, than she gives in her capacity of nurse? With wars on the one hand, disease on the other ready to attack—there is no occasion for any woman to pass one moment of ennui, wondering *if there is not something for her to do in the world*. The opportunity is always here, or there. True we may not all be Florence Nightingales, but women such as she are surely an inspiration to other women; they ascend the heights to show the way and give light to the mind seeking for unselfish service.

Let us be grateful for our pioneers. Many have the strength to follow who would not have the courage, the trust, the devotion, to lead. PALMA

OUR YOUNG FOLK

Tent-Life in Lomaland

HAVE you ever lived in a tent? Do you know what it is to be awakened by the song of birds—to begin the day's work when nature begins hers? Those who know nothing of this have yet to experience some of the sweetest joys of life.

You who live in the crowded city just imagine yourselves for a moment transported to one of the delightful little tent houses in Lomaland. The sun rises, clad in robes of purple, rose and gold, over the eastern mountains. You feel that nature is working, even though silently, and you can lie still no longer. You step out upon the little vine-covered porch. You take a deep breath of the breeze, which after blowing over miles of water, comes to you laden with the odor of wild flowers. If you are strong you will be tempted to run down the steep path and take a plunge in the sea, oh—so early, while the tall cliffs are still casting long shadows over the water.

But let us look inside one of these little tent homes. How simple and artistic everything is, and how convenient! Here is a solution for our most difficult problems of housekeeping. All work can be done before breakfast. There is no cooking save in the refectory near by. How quickly do those who are ill and tired find strength and rest! Then, too, what an opportunity this tent life offers to artists and students of all kinds! What an opportunity to the woman who is tired out by domestic duties! Here she has time to enlarge her views of life and fit herself to better serve her family.

And what a life it is for the young folks—sea-bathing, tennis, basket-ball, all kinds of athletics, long walks over the hills among an endless variety of wild flowers, wonderful things to be found among the rocks and caves on the seashore! And, best of all, there are the daily lessons that nature teaches, which sink deep into the heart like seeds, and are never forgotten, but are sure to blossom forth later on in joyous living.

Visitors coming from all parts of the world, who catch a glimpse of the life at Lomaland, often say: "No wonder you make life richer and more beautiful—living in such a place." Don't you think that life would become sweeter and truer, living in this simple way—*anywhere*? I do. But only in this wonderful climate is such a life possible the year round. How fortunate we students are!

And Tent Village itself—how big, and splendid and comfortable and homelike it all is! In some respects it is like a big, big family hotel—I mean the kind in which one really feels at home—and in other respects it is not, for no hotel can make possible a life so close to Nature. Tent life! Why, to my mind there is nothing in the world so fine as living in a tent, unless, to be sure, there are too many disadvantages. And disadvantages there are, of course, in the kind of tent-life most people know about. But it's different here. No wonder people come here from many parts of the world, and find in these tent homes a real resting place—people who are tired out with the world's noise and hurry and selfish whirl, people who love Nature and beauty and things that are generous and pure and true! A STUDENT OF RAJA YOGA

THE largest arch of masonry in the world is now in the course of construction at Plauen, Saxony. It forms part of an aqueduct and will measure nearly three hundred feet from base to base.

THE oldest game in the world is "fox and geese." It is found in some form or other among nearly all people. It is played all around the Arctic Circle.

A GLIMPSE OF TENT VILLAGE—OPPOSITE LOMA HOMESTEAD

"TIS as easy now for the heart to be true,
As for grass to be green and skies to be blue,
'Tis the natural way of living."

Eastertide

A paper read by a Raja Yoga boy at Isis Theatre, San Diego, on Easter Sunday, 1905

EASTERTIDE, the Springtide of the year, the festival of flowers that Nature gives so generously and so graciously, turning the parched wilderness into a magic garden!

How beautiful it is! How the scorched earth bursts into freshness and fragrance, singing its sweet color-song, its golden harmony, on every hill and hollow. The Soul of the world has risen from the tomb, for it is Eastertide.

What joy it is to gaze and wonder at the beauty of it, to gather the wild blossoms and twine them into garlands and crown the heads of those we love, as we would crown the hearts of all the world with joy and beauty. The sunshine and the rain have called the flowers to life again.

Who could imagine that the dry dust could hold such treasures hidden in its seeming barrenness? Who could dream that the wild storms could call such beauty into life? How the fierce winds wrestle with the storm-clouds, till they are forced to shower the priceless rain upon the thirsting land, and the sun's face is hidden till all their task is done.

Is it not so with man? There is just such beauty hidden in the hearts of men. They may seem to be burnt dry as the dust of the desert, yet they are needing only rain and sunshine to waken them to life again. Through long ages the world has withered, till the last traces of pure joy have almost vanished from the life of man; but the Eastertide of Humanity is at hand, and we shall live to see the desert of man's life on earth burst into joy and beauty as marvelous as that which crowns the hills around us today. Shall we shrink from the storms that must come—even though they wring red rain drops from the war clouds, and wreak destruction in their violence?

After the storm comes the sunshine, and from the suffering shall spring the flowers of human love, as has not been since the last Eastertide which we know as the Golden Age. The flowers already are budding—only a few here and there as yet—and we call them

"Raja Yoga Blossoms." We know that soon they will spring up everywhere, like the wild flowers on the earth, and make life beautiful again.

But when this time comes we shall know how to guard against the drought that for long ages has withered the hearts of men; for we have a Teacher, who has brought back to us the secret of true husbandry, of true Heart Culture; and we mean to spread the knowledge of this mystery throughout the world, so that nevermore shall man be left without the light of true wisdom, Heart Wisdom, that brings joy and Brotherhood.

This is Raja Yoga—and it will bring the true Eastertide.

MONTE MACHELL

Facts Worth Knowing

THE largest vessel that has ever been built is the new steamship, the "Baltic"—not a war vessel either. She has eight decks, can accommodate more than three thousand passengers and four hundred crew. When fully loaded she draws so much water that she cannot sail over the bar of New York harbor.

THE prospects are that the huge, armored battle-ships will be supplanted by torpedo-boats. Two hundred and fifty torpedo-boats can be produced for the cost of a single modern battle-ship. But what for, *what for*? Just to kill people with? Queer world, isn't it?

THE CHILDREN'S HOUR

The Raja Yoga Question Box

THE art of printing was first discovered in China, by Foong-Taou, a learned statesman who lived in the Tenth century.

1 Who was Gutenberg?

ANSWER—John Gutenberg was born in Germany in 1397. He was the first to introduce printing in Europe. He succeeded in making moveable type.

John Fust, a rich goldsmith, helped him by providing him with money for his experiments. Gutenberg's greatest work was the publication of the *Biblia Latina Vulgata*. It was finished in 1455.

2 Who was Peter Schoeffer?

ANSWER—Peter Schoeffer was the assistant of Gutenberg and Fust. He made

many improvements in printing. He beautified the shapes of the letters, and discovered a better composition for the type. In 1455, Peter Schoeffer was a student in Paris. He was a fine penman, and made ornamental letters and designs for books and manuscripts. This was called illuminating.

3 Who was Caxton?

ANSWER—William Caxton was an Englishman born about 1410. He introduced printing into England. Caxton spent some years in Flanders, and there learned about printing. He set up a press in Westminster Abbey, and published the first book printed in England. That was in 1477. Caxton died in the year in which America was discovered.

My First Day in School

DEAR CHILDREN: I am one of the tiny tots of the Raja Yoga School. You only have to look at the picture to see how well and happy I am. We just can't help being happy in Lomaland. I live with a group of little comrades. We have such fine times doing everything together and helping each other and our teachers all we can. We play out in the sunshine most all the time and learn lessons from the birds and flowers.

Around our home is a garden with all kinds of beautiful flowers; and behind the house, right down to the ocean, the hills are covered with wild flowers—oh! millions of them. And you should hear the birds! Such numbers come that I think they must have a way of telling the other birds about Lomaland and how no one ever harms a bird or robs a nest here. There are little houses put up in the trees for the birdies to build in, and pans of water set about for them when they get thirsty from singing.

But the real reason we are so happy is Raja Yoga. You know about Raja Yoga, of course. Well, that is the wonderful secret. It teaches us how to be right inside. That is the way to be happy. I believe it is the secret all the people in the world are trying to find out. It is so simple I wonder how they ever missed it—or forgot. Raja Yoga teaches us that we only have to let the Heart-light shine through our whole being and we cannot be unhappy any more. We have to get full of Heart-light so that we fairly shine—like the little fire-flies you see summer evenings—and then the wicked fairies of selfishness, which never like to be where it is light, will skip away. We are trying to hurry up and grow big so we can tell more people this Raja Yoga secret. We want everybody in the world to know about it.

Have you ever tried just trying to smile and be shining in your heart instead of being cross? Sometimes when we begin to feel naughty, our teacher only looks at us and we know we *can* feel happy. And when she speaks, something in her voice *knows* we can and we begin to shine. If you were in our school you would believe there were many good fairies helping the little ones to chase away cross looks. And there are. They are the children's heart-fairies. All children have them. Raja Yoga teaches us how to work with them to make smiling faces and happy looks. PAULINE

SEE, HOW BIG I AM!"

Messenger Pete

"MESSENGER PETE" was a wise fellow, and quite a marvel of intelligence, as you shall hear. He loved his home and country, and knew about time and distance, and had ability to persist, with power to relate cause and effect. "Messenger Pete" was a carrier pigeon.

It happened one day that Pete was sent away over land and sea, to a distant country, eight thousand miles from home. But no sooner was he landed than he made his escape and found his way back to the ship that brought him from America. But alas! One day it steamed up to continue on its way to Australia! So Pete, all undiscouraged, "took to his wings" and flew homeward over the water toward America.

As good luck would have it, when he reached the middle of the Pacific Ocean almost exhausted, he overtook a sailing vessel, the *Lucy Belle*, homeward bound to San Francisco. The sailors called him their "Mascot"—that means something that brings good luck, you know—and gave him food, and treated him

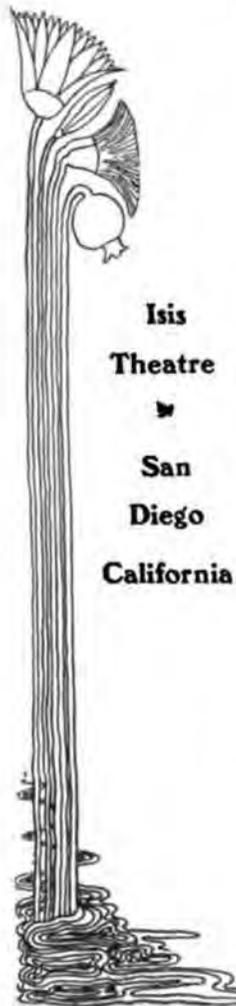

kindly. When they landed in California, Pete was identified by the tag with his name and number, which was fastened to his leg.

The sailors thought him so clever to work his way home across the ocean, that they were sure he would know how to finish the journey overland, so they wrote Pete's story and fastened it to his leg, and started him off. Imagine the surprise to the people who sent him away, when little Pete fluttered in one morning and joined his comrade pigeons at their breakfast of corn, wheat and crumbs, as quietly as though nothing at all unusual had happened!

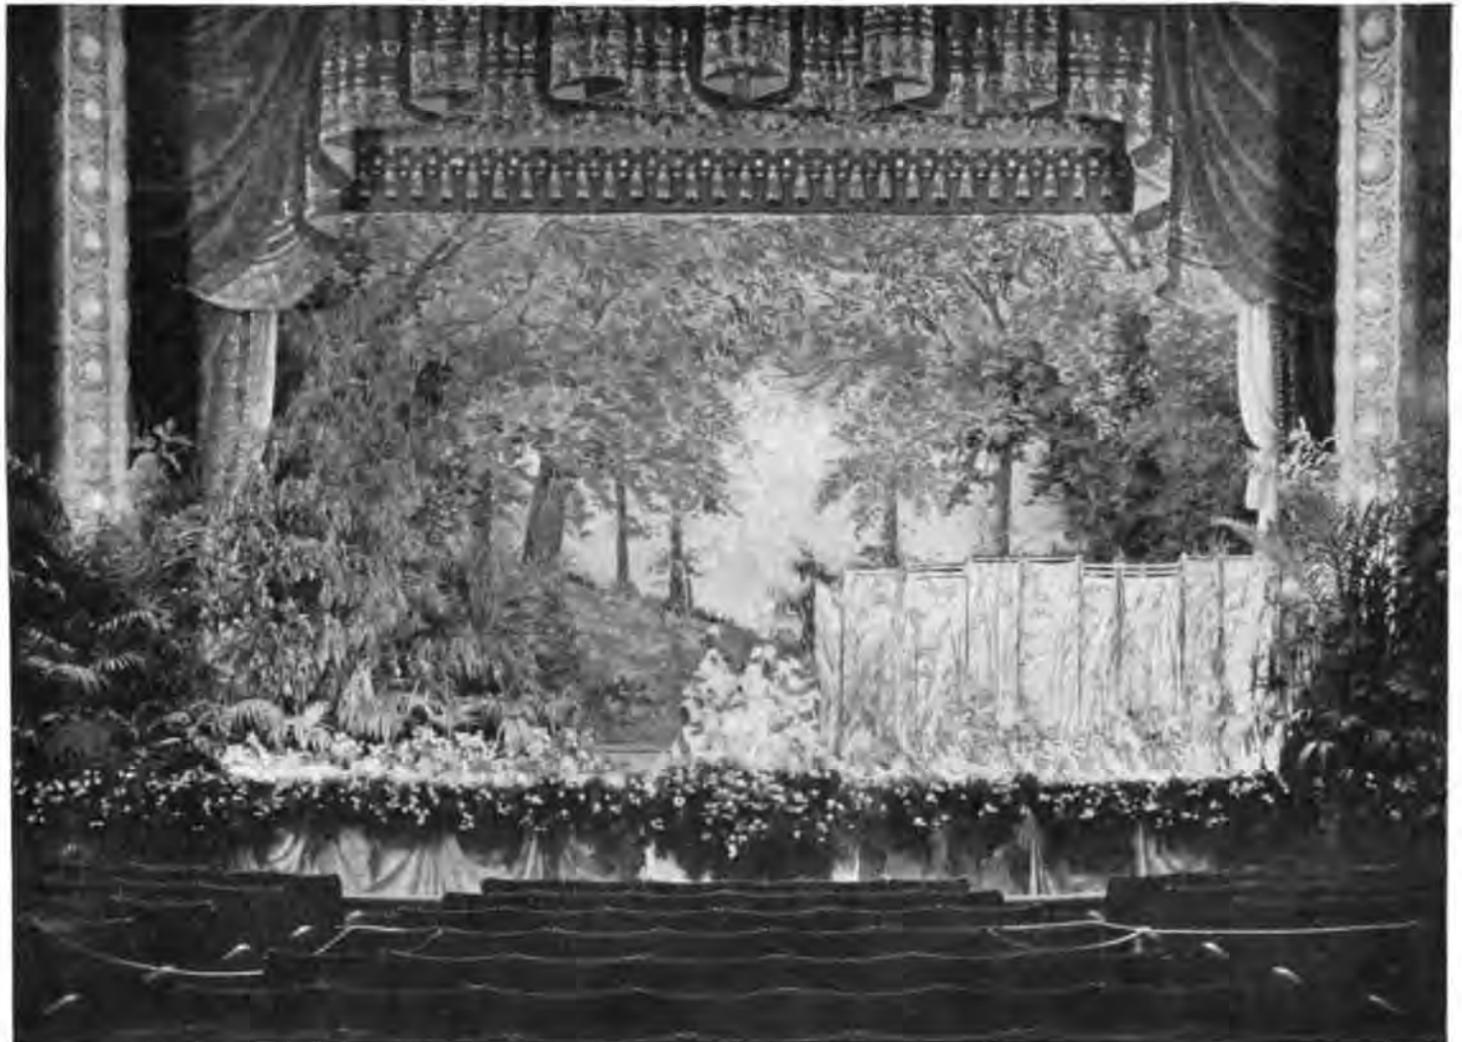

E. W.

DEAR CHILDREN: Did you ever hear of a pet eagle? A friend who lives at a distance tells me of one which a gentleman near her home took care of, after finding it badly wounded. Some cruel huntsman had shot it. At first the bird was kept in a small cage, as one of his wings had been injured and of course he couldn't fly about, but later when he regained the use of his wing they built a cage about twelve feet square and invited Mr. Eagle to make his home in the Court House park. Finally his kind-hearted friends decided to open it and let him fly. The eagle flew away, but in a few hours returned, and now although he has entire liberty, he refuses to leave but comes night after night to the park for his dinner.

THE THEOSOPHICAL FORUM, IN ISIS THEATRE

THE regular meeting of the Universal Brotherhood at Isis Theatre, last Sunday night, conducted by Point Loma students, included two very good papers and a musical program of rare excellence.

The first paper, "The Influence of H. P. Blavatsky's Work on the Present Century," was read by Miss Elizabeth Bonn. In part she said: "There is no doubt in the minds of those who have studied H. P. Blavatsky's life and mission, that the influence of her work for the uplifting of humanity has been enormous. Just thirty years ago she was instrumental in founding the Theosophical Society, and from the seed she then planted has grown the immense Universal Brotherhood Organization of today, with its practical message of hope to the world. To those who are trying to make Theosophy a living power in their lives, H. P. Blavatsky stands forth as one of the world's greatest teachers, a courageous, heroic figure, a noble woman, who laid down her life in daily martyrdom, because of her great love for humanity. Perhaps there has been no figure in history more traduced and slandered than H. P. Blavatsky, and why? Because she was brave and loving enough to tell us the truth. She was a Light Bringer and threw the electric rays of the old Wisdom-Religion—Theosophy—upon our aforesaid limited and narrow views of life, focusing them, now here, and now there, upon the dark spots of our boasted Nineteenth century civilization.

"What a task was that of H. P. Blavatsky's! and how grandly she performed it! Her mission was to revive the almost lost knowledge of our divinity and to form 'the nucleus of a Universal Brotherhood.' Our gratitude grows as we better understand what she accomplished.

"Do we not find the ideas of 'unity' and 'brotherhood' in the air today? Are not more people now-a-days daring to think and act for themselves? Are not frauds and shams being exposed on all sides? Is it possible to have Light and Darkness at the same time? Is it not rather a question as to the power and strength of the light, which shall rule?"

"H. P. Blavatsky came as a being from another sphere and let the sunlight of her light and teachings pierce the misty curtains of our illusions upon Nature and Man, and today we are facing a new and brighter era in human thought and life because of that heroic action."

Mr. W. Ross White read a paper entitled: "Environment and Spiritual Progress." "How frequently," he said, "we delude ourselves with the idea that, if our environment or our race, or the age into which we have come, were different, it would be so much easier for us to make spiritual progress.

"If we work unselfishly in our environment of materiality we shall most assuredly attain to spirituality. We are in our conditions and surroundings for a just reason and for a divine purpose. The reason is within ourselves as results of our past, and the purpose is the evolution of the soul or the unfolding of our spiritual nature. There is no condition so gross, so barren, so limited, that it cannot, by pure aspiration work for good, that it cannot by effort bring forth precious results, as the base metal, by the purifying action of fire can bring forth pure gold. It is for us to make a study and practice of the divine alchemy whereby everything relative to our lower nature, in our heredity or our environment as well as our passions and desires, may be transmuted into a corresponding something on a higher plane. The formula is a simple one. The word 'altruism' will express the whole of it. Brotherhood alone can lead us through the dense materiality of the age, and out into the light and freedom of spirituality, and it can do so just to the extent that we put into practice our highest conception of it.

"Growth and progress, which mean momentary change, inward even when not outward, are in the order of our evolution, and woe be to those who would hinder its course! Every effort opposed to law is self-destructive, and selfishness in the end must die. Brotherhood is a part of the ultimate law of Nature, and through brotherhood alone can we hold our place in evolution."—*San Diego News*

Theosophical Meetings for Sunday Nights

Public Theosophical meetings are conducted every Sunday night in San Diego at 8:15, at the Isis Theatre, by the students of Lomaland.

Theosophical subjects pertaining to all departments of thought and bearing on all conditions of life are attractively and thoughtfully presented.

An interesting feature is the excellent music rendered by some of the students of the Isis Conservatory of Music of Lomaland. Theosophical literature may always be purchased at these meetings.

Universal Brotherhood Organization

Central Office Point Loma California

H. P. B. and White Lotus Day! *The Meaning of White Lotus Day*

A thousand memories of our old Teacher crowd in on us as that day comes round. She could never get to the work that lay closest to her heart, the work for the children. That, she knew, must come later, when the jungle had been cleared, when Theosophy had gained a hearing, when in a few she had awakened a fire of unselfish devotion that could not be extinguished.

She had to find a few who had intuition enough, who had latent memories near enough to the surface, to understand and accept her teaching of humanity's far distant golden past and therefore appreciate the possibilities of its future; who would believe her when she said that that future need not be millenniums away but could indeed be almost *now*.

But it must be the children who shall lead the way, who shall be taught to find in themselves the long-hidden golden light, who shall be humanity's realized tomorrow, in their turn the teachers of children yet unborn.

She spoke of another consciousness waiting in all men to be allowed to come forth, swift, clear, compassionate, discerning, the royal consciousness which we have allowed to get overveiled in flesh. And now the flesh-self is almost all we know of ourselves, its desires and pains and maladies and final failure.

But in the children that other is easily unveiled. So before H. P. B. died she willed that from her death onward we should once a year, on May 8, rededicate ourselves to the carrying out of this chiefest part of her work. Each anniversary is another flame lit in her memory.

And now the work is in flower. In many lands children join with their teachers in commemoration of the planting by H. P. Blavatsky of that tree whose fruit has been placed in their hands.

First, and even during H. P. B.'s lifetime, "Lotus Circles" were established by William Q. Judge—groups of little children meeting weekly, taught in simplest fashion the truths of life and brotherhood. They sang them, enacted them in little plays, wove them into games, talked of them, until they became very part of themselves. Thus as they grew older—for it is fourteen years since H. P. B. died—they could become in their turn teachers of other and younger children.

And so the work went on, after H. P. B.'s death being taken into the strong hands of her successor, William Q. Judge, and by him further advanced. This Lotus Group work was greatly enlarged by his successor, Katherine Tingley, who introduced many new features, placing it under the capable superintendence of Mrs. Elizabeth C. Spalding. But by the Lotus Groups the children were reached only one day in seven, although from the very beginning of her connection with the Theosophical Movement, from her previous large experience among poor children, Katherine Tingley had looked forward to and worked towards the carrying out of her plans for the complete training of the young. It was she who originated in the Western World the Raja Yoga system, which though in principle as old as the ages, had long been forgotten and had not before been adapted to modern Western life, or the training of children.

Thus a new note has been struck in humanity's life. Both H. P. B. and W. Q. Judge had looked forward to the time when the world's children should receive their birthright of soul-knowledge, and had prepared the way, breaking the molds of mind, ploughing and harrowing the fields of thought, sowing the seeds of a new philosophy of life, bursting the barriers of superstition and materialism; but it was left to Katherine Tingley to originate, plan, and set into operation the means by which this birthright of the children might again actually be theirs. And it is by the Raja Yoga system of education, founded and established by Katherine Tingley, that this glorious hope of noble manhood and womanhood is now being actualized in the lives of the Raja Yoga School children.

It was in the year 1900, at Point Loma, that for the first time the Raja Yoga Schools were established by Katherine Tingley. At first the nucleus was small; but it has grown steadily, and there are now upwards of two hundred children of all ages from extreme babyhood. This school has become the mother and type of others—in Cuba, England and elsewhere, one other just started in the Californian metropolis, San Francisco—conducted according to the same plans formulated by Katherine Tingley for the Point Loma original. And many others, in other places and countries, are in process of foundation.

The symbol of the Lotus, a very ancient Eastern symbol, is the symbol of the teaching given to the children. It is said that deep in the heart of this flower there exists ready formed, the plant that is to be, root and stem and leaf and future flower, minute but all perfect. It is perfect even though the containing parent flower be deformed or diseased. Give the little seed in the heart of the parent its right conditions, and the embryo will expand into its visible perfection.

And so with humanity, according to Theosophy. In the heart of us all is the seed, capable of flowering into the perfect man or woman of Divine Nature's intention. It is the deeper self.

If we older ones are too set in habits, too full of desires demanding attention, desires whose gratification does but yet further dim and cloud our minds, if our minds are too full of the useless—it is not so with the children, absolutely not so with the infants. These things that prevent the maturing of the perfect soul-flower in us, can in them be stayed and denied entry. Just as perfect physical regimen will prevent the appearance of hereditary taint, so will perfect mental regimen prevent the growth in the mind of those habits and desires which maim and tie and twist the flower of the spiritual heart. The child can be taught to feel itself on the side of the heart light in all the conflicts with the lower forces in its nature; too often we take sides with those lower forces and yield—if we do yield—to the higher voice and urge, only with strain and reluctance. The child can be taught to rejoice in victory, to move from victory to victory till the lower self, vanquished again and again, gives up the fight and utterly joins the higher. Comparatively few older people know that by a few right actions done against the resistance of the lower nature, with the mental attribute or feeling of *being oneself the higher*, a swiftly growing habit is formed and the joy and peace of victory comes to crown the effort from the first. This is easily taught to children and is the key-secret of the Raja Yoga training.

"Raja Yoga" means *the Royal Union*, union of one's self with the pressing, urgent, fighting force for good in every heart. And the consequence of Raja Yoga is that the child's mind grows clear and swift in action, able to do in an hour what another child can only do in a week. It is not disturbed in its action by the intrusion of desires for this or that useless or injurious pleasure. It has pleasure always from an inner source; every right action is pleasant to it.

A useless desire, gratified and thus seemingly at rest, continues to be as weighty a clog on swift mental action as an overfull stomach remains for hours a clog on swift physical action. The Raja Yoga child's "mental stomach" is never in that state. So the forgotten secrets of Raja Yoga are that "moral training" can be made to yield to the child the continued joy of triumph; and that it means *mental and physical* health as well as *spiritual* health and beauty. Only those who have been associated with children who have for years been practising Raja Yoga can know how clear, how full of ideas and intuitions, how rapid and strong in their working, are the minds of such children. Every day, as they move towards manhood and womanhood, do they become more and more fit, in their strength and purity and modesty, to go forth and show to others the way along which they themselves have been led. They are the world's future teachers and examples. Is it too much to say that when some of them in their turn become mothers and fathers and can lead children of their own along the same path, a new race will have been born in the midst of humanity? And that through this race the rest of humanity will find its complete redemption?

It is for this that the painfully passing millenniums of time have been preparing. It was for this that H. P. B. worked, towards this that her plans pointed, that we might keep this ideal in mind that she asked those who loved her and should hereafter come to love her to hold "White Lotus Day" as a festival and mark it with a little ceremony. She would have been living now *if her strength had not been worn down in the protection of her work against the unfaithful and treacherous at her side, and against the enemies of any sort of human progress*. But she has triumphed; nothing can now stay her work, now in the hands of Katherine Tingley, not even the efforts of those who use her very name and the name of Theosophy in cover for the grotesque mixture of jugglery, psychism and false Orientalism which they offer as the wisdom of the ages.

HERBERT CORYN

In Honor of H. P. Blavatsky

SINCE H. P. Blavatsky's death, it has been the custom for all Centers connected with the Universal Brotherhood and Theosophical Society, to pay tribute to her memory on the anniversary of this sacred day.

At the International Headquarters at Point Loma, California, this 8th of May, White Lotus Day, was especially recognized. The older members and the children united in heartfelt tribute to H. P. Blavatsky. A memorial meeting was held, in which both the elders and the children took part.

In this event there were marked evidences of a new beginning for all her faithful followers. Truly it is, that although dead, "yet she speaketh," for her Heart-Work rendered in sacrifice and suffering, has left its impress upon the lives of those who trusted her. This has become a living fire of energy and love for all peoples of the world.

The work of this noble woman unfolds like the Lotus Flower; and no matter how many storms rage against it, it still cometh up in the night of silence, and blossoms. P.

TRUE MERIT NEEDS NO PRAISE

SAADI

THE scent reveals the musk, and not
What the perfumers say,
Nor need one speak his skill in aught,
For 'twill itself bewray.

A gem, though fallen into mire,
Keeps still its precious worth,
And dust, though blown about the sky,
Came none the less from earth.

SOW SEEDS OF BEAUTY

WRITTEN

NOW is the seed-time; God alone,
Beyond our vision weak and dim,
Beholds the end of what is sown;
The harvest time is safe with Him.
Yet, unforgotten where it lies,
Though seeming on the desert cast,
The seed of generous sacrifice
Shall rise with bloom and fruit at last.
And he who blesses most is blest;
For God and man shall own his worth
Who toils to leave as his bequest
An added beauty to the earth.

We Must Trust in Our Soul

IN our despondency we lack faith in the unexpected. Events are always ready to shape themselves in new forms and change our entire situation and outlook.

In a certain novel there is the following situation. The hero and heroine are in a most hopeless fix. The hero does not see how things can ever get straightened out, and tries to resign himself to a life of despair. But the heroine, being very young and not burdened with a strong masculine intellect, says: "Things *must* come right; our lives have been changing rapidly in the last month or two, and they will change more yet."

Does it not strike one as being eminently unreasonable on the part of that hero, to imagine that a drama, wherein the events have been rapidly working up to a climax, should suddenly stop still in the middle? And is there not obvious reason in the idea of the heroine that the same good forces as precipitated the crisis will carry events through to a successful conclusion? And so it turns out in the story. The unexpected happens.

This teaches us a lesson in daily life. We are too prone to regard situations as fixed, forgetting that events are fluidic, always changing. Most of us plan for the future as though it were rigid, as though all the factors in our life were invariable. The result is that, when the occasion arrives, our plans are out of date and do not fit.

We try to calculate the future on the assumption that the factors which make up our present will remain the same and unchanged. But this is evidently not true. Our personality will have become altered, for one thing; so will the personalities of other people. There will be new combinations in that unseen future; some things that now are will have ceased to be; and other things, now undreamt of, will have come into existence. How then can we possibly calculate with any approach to accuracy? Not by ordinary mathematical logic, certainly; it is question of higher mathematics, dealing with variable quantities whose rate of variation is unknown.

The stream of events is fluid, and we cannot chalk out a course on it. No use to make a rigid plan out of materials that are changing shape like clouds in a sky. The most we can do is to broadly sketch out our future in faint erasible lines that can be altered or filled in at any moment.

This amounts, after all, to yet another way of stating the old maxim that our duty lies with the present. The future is indeterminate, but it is determinable—determinable by our present acts.

In the light of these reflections, what becomes of anxiety? We may seem to be steering direct for a rock, but before we reach it, the rock

will have melted and changed; the scene changes all the time, as our point of view changes.

We do not trust sufficiently in the power of good motives and pure will to mold events for weal. Instead we prefer to rely on our puny foresight and vacillating purposes!

Fortunate indeed it is for us that our higher faculties do work unceasingly for our good, and that our feeble fractious strainings do not avail to undo that work. The result is however that we go through our life kicking and struggling like a naughty child, when we might just as well go obediently, seeing that go we must in either case.

All people of course recognize that there is this higher purpose guiding us in despite of our resisting will. But there is no need to jump at once to God as an explanation of this guidance. It is merely an unrecognized part of our own nature that does it (though that part is God-given), the seeing eye and calm purpose of the soul within. These higher faculties we all have, but we must trust them and learn to see with them and act with them instead of resisting. Then life would be so much easier and happier for us all.

H. T. E.

The Proper Spirit of Courage

The Path that leadeth on is lighted by one fire—the light of daring burning in the heart. The more one dares the more he shall obtain. The more he fears the more that light shall pale—and that alone can guide.—*Voice of the Silence*

THE word courage itself implies action from the heart, and to "take heart" and to "take courage" are synonymous terms. The heart quality of courage seems to be imbedded in the consciousness of the race. A coward is called "chicken-hearted" and a brave person "lion-hearted." Indians have been said to eat the hearts of conquered heroes to make themselves more brave. We certainly add to our courage and strength that of every enemy we conquer *in ourselves*, virtually eating its heart.

The proper spirit of courage is not foolhardiness, nor courage to do wrong, which is simply turning a deaf ear to the voice of conscience, and acting for the selfish nature. The true spirit of courage is a heart quality as are also compassion and wisdom, and the three go together forming a trinity. Courage wisely directed by compassion is most desirable and necessary in our dealings with others. It will enable us to do aright what will help another even though it may be painful to ourselves, and hard to perform because of the liability of being misunderstood and considered disagreeable.

So often we fail to have the true spirit of courage through a selfish fear of not being pleasing to others. The proper spirit of courage is utterly unselfish, and if we have this spirit we shall not only face our faults and weaknesses and endeavor to correct them, but we shall be willing to acknowledge our mistakes to others when this is necessary. How many in the world's history, having put their hands to the plough, have turned back from their opportunities to serve Humanity who might have returned and taken up their work in a better way than ever, if they had had the courage to acknowledge their wrong and put it behind them, thus freeing themselves from that which had hindered them from doing their best.

Without the proper spirit of courage we shall never win our freedom from the enemies of our own household, nor turn their strength into better channels. Without it we cannot take the stand and do the work that will help humanity most.

BANDUSIA WAKEFIELD

THERE is a chemistry of the mind as well as of the body, but as a rule men lack that compelling energy of *soul light* that of itself forces the mental contents to pass the flash-light of Intuition and become transformed into those high forms of knowledge that men call Wisdom and Spirituality.

The consciousness of no human being need remain a mere picture gallery of theoretical intentions for future striving and possible attainment. Rather should it reverberate to the living song that arises from Nature's laboratory of ever active forces which never cease building her beautiful forms of life. Such a living activity in the mind of man is his true heritage and rightful stage of existence—not this life of lesser desire and thin-woven intellectualism, wherein things are merely *looked at* and not contacted in themselves. The faculties of the mind and the thoughts they fashion are great, but the man who *uses* the faculties, and *evolves* the thoughts, is greater than these—therefore to be the all Powerful Soul is the summit of human evolution.

STUDENT

I WOULD NOT LET ONE CRY!

THE veil is rent
Which blinded me! I am as all these men
Who cry upon their gods and are not heard.
Or are not heeded—yet there must be aid!
For them and me and all there must be help!
Perchance the gods have need of help themselves.
Being so feeble that when sad lips cry
They cannot save! I would not let one cry
Whom I could save! —*Light of Asia*

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question In what light do you regard the following, which has been often advanced as distinctly contrary to, and a refutation of, the doctrine of Reincarnation advanced by Theosophists?—"It is appointed unto men once to die and after that the judgment." Is not this a plain statement that man has only one life on earth? What interpretation do you place upon it?

Answer 2 In further answer to the foregoing question, found in the NEW CENTURY PATH for April 16th, 1905, the following extract from a letter written to a friend seven years ago is submitted:

MY DEAR GENERAL: In regard to your Scotch friend's conundrum about Reincarnation as affected by *Heb. 9: 27*, there is much to say—but it does not bear so much on this verse as on the whole scope of the Epistle. I think there is hardly another book in the Bible where the unity of theme is so thoroughly maintained as in this book of *Hebrews*. It is addressed to the Hebrews alone, and deals only with the single question of the superiority of the Christian dispensation over the Mosaic, or of the relative rank of the Christ as compared to the angels, to Moses, and to Aaron and the Aaronic priesthood. The writer first shows briefly how the Christ is superior to the angels; then how he is superior to Moses; and then in the bulk of the book how he is superior to Aaron and the hereditary priesthood of his sons.

It is no new supposition that this verse is a denial of Reincarnation. Even Dr. Adam Clarke takes it so, but I think thoughtlessly, for Dr. Clarke usually is more clear-sighted. It is incredible that so close a reasoner as the writer of this epistle should go out of his way to buffet a man of straw, more especially as this interpretation destroys the force of his argument. Notice the connection between verses 27 and 28: As it was appointed unto the men . . . so also the Christ . . . etc. The argument up to this point had contrasted the Jewish priesthood and the Christ; and here "the men" are the Jewish priests, whose expiations were temporary and in themselves fruitless (*Ch. 10: 4*), and did not affect the judgment, while the Christ is the divine mediator, whose one offering need not be repeated, and whose next coming shall be, not "without sin" as translated in verse 28, but "without a sin-offering," which is the correct translation. In the Greek of verse 27 the article is used before "men" and also before "Christ," as I have translated it.

It will help us to understand the context to remember that the word translated "testament" should be rendered "covenant," as it usually is in this book. In verse 16 of this chapter, the word "testator" is a mistake of the translator; the Greek word is an adjective, and King James' men supplied the wrong noun. A covenant was not valid without the death of the "appointed"—that is, the selected victim by whose blood the covenant was sealed, as were the covenants of God with Noah and Abraham. In those times, among Jews and Gentiles alike, covenants were generally made binding by a sacrifice; probably the tradition of writing agreements with the devil in blood is a survival of this practice.

So far the most approved exoteric view of the text is given; a hint will enable you to trace the correspondence on esoteric lines. The Aaronic priesthood with its offerings and ceremonies is on the plane of personality; the Christ is the higher Manas [the divine Mind], crucified by descent into matter. At his next coming (is there not a hint of Reincarnation here, in verse 28?) he will remain on the Manasic plane, where all are one, as shown in the seventeenth chapter of John's gospel.
G. A. M. (Wisconsin)

Question How do the teachings of the "Vedanta" in daily life differ from those of Theosophy?

Answer First as a part differs from the whole. It has often been said that Theosophy is not Christianity, nor Buddhism, nor Confucianism, nor any one religion; and to this it may be added that Theosophy is not Vedantism, nor any one system of philosophy. The Vedanta is one system of philosophy, specially adapted to one phase of human development, and to certain conditions of life. It is an Eastern system, adapted to the peculiar conditions of the Oriental, with his long line of heredity and ages of Oriental life and metaphysical training. But it is not adapted to the conditions of Western life, nor to our civilization and training, which for two thousand and more years have been along very different lines from those followed for almost untold ages

in the East; and neither by physical nor mental heredity, nor by training, are Western, i. e. European and American peoples, fitted to take up these studies on the Oriental lines.

Certainly there is much that is good and true in these Oriental systems, just as there is in all the great religions and philosophies of the world, but each one only presents a phase. And although the basis of what is true in them is Theosophy, it must be plain that to acquire the deeper and complete knowledge of life, and to learn to apply this to all the facts and problems of everyday existence, we must study more than a phase; and surely one would not go to that which would teach only a part, which would give only a one-sided view of life, but to that which will give a basis and an explanation for all the conditions of life, Eastern and Western, and a key, not simply to one religion or philosophy, but to all.

In other words, shall one go to the fountain head of knowledge and wisdom, the source of all truth, or to one of the innumerable streams which have from age to age flowed out from that primeval fountain to a particular people, suited to a particular time and particular conditions?

Shall one go for light to the source of light, the One White Light, or shall he be content to keep in one ray of that light and know but one of the colors when the white light contains all colors? Surely if we desire the light, if we desire the truth, which will illumine and make clear our lives, wherever and whatever they may be, we shall find that which may be universally applied only in the fountain head of all, in the Wisdom Religion—Theosophy.
STUDENT

Question Is it not possible for an average individual to abstain entirely from so-called voluntary sin?

Answer Surely it is possible for man to abstain from sin; otherwise the words of all the great Teachers of humanity have been a deceit, and the hope held out by them has been false. But this is unthinkable; we know that these Teachers spoke truly, and that they too have trodden the path we now tread, and have conquered the weaknesses we now face. And the teaching of them all has been, that man has the power, by virtue of his innate divinity to overcome, to rise above all imperfection and to become perfect.

But such a man who does overcome, who does rise above "voluntary sin," ceases to be an average man, as the world goes today. The power to do this lies to the hand of the average man, to the hand of every man, but once he begins to exercise that power, and to call upon the power of his own divinity, and to claim his birthright, he thereby ceases to be an average man.
STUDENT

Question Please state what is meant by the intuition. Is it not something vague and unpractical?

Answer Intuition is unquestionably the highest form of human perception. It supersedes all reasoning processes, and grasps and knows the innermost facts of life, like a flash light that illuminates the mental depths and reveals the causes of external events.

It would seem that in ordinary mental activity the different faculties work more or less separately, and seldom together, hence harmony or balance is absent. This condition of unbalanced mentality throws off a series of *detached* ideas that ultimately lead to mental chaos and absence of rightful control. The intuitive process is the opposite to this. The several mental faculties move together in balanced action, and cause all ideas and feelings to combine in those higher forms of knowledge that realizes facts instead of appearances. In such higher forms of knowledge the lower perceptions become changed in appearance and character—just as chemical forces and elements are transformed when combined in new forms of natural life.

The difficulty encountered when striving to develop the intuition arises because of clinging to *forms* of thought that bear no possible relation to the higher classification of human perception. To unite and harmonize the contents of the mind in a higher state of being demands the changing of the present mental form, for the thoughts and feelings must be free from those desires that now bind them together, so that they may be readjusted round the higher desire that burns overhead as an ideal.

This outreaching of the mind and heart does not carry us away from ordinary life into metaphysical regions of abstract lifeless form. Rather does it press the mind more closely into the so-called commonplaces of life. We really gain increased understanding of the indissoluble connection between the external events of life and those undercurrents that bind all men into a brotherhood.

It is in fact intensely practical in the highest and strictest sense. STUDENT

English Notes

(By Our London Correspondent)

April 10th, 1905

ONE Saturday afternoon, several summers ago, I spent an hour or two in wandering over Hampstead Heath before going on to 19 Avenue Road. Its wonderful beauty was quite a discovery, for I had not been near the spot for about forty years. If it were only a bare platform from which to behold London, it was worth visiting; but Hampstead Heath is interesting for its own sake. I wandered on and on, finding at each step something to delight the eye, and at last reluctantly turned to the path which, as I guessed, would bring me somewhere near my ultimate destination. There was still some distance to go however, and soon I found myself in Belsize Park, a suburb of London where many artists dwell. Here was fresh pleasure. Most of the houses had a character of their own, and the hilly nature of the district gave additional effect to this. Ultimately I reached the upper end of Avenue Road.

It is near that upper end that the new European Headquarters are established. I have not seen them yet, so can say nothing. However this curious fact is worth noting. A project is on foot to attach a "Garden suburb" to Hampstead. A number of earnest people who have striven for years to make the lives of the very poor more hopeful and beautiful, are trying to bring about a combination of rich and poor in this garden suburb at Hampstead.

Brotherliness is the keynote of this scheme, in which nature and art are to be combined as they have never before been combined among Londoners.

And close at hand, apparently, will be *the Headquarters in England of the Universal Brotherhood Organization!*

W. J.

When Was Coffee Discovered?

NOBODY knows how coffee was discovered, but there are all sorts of stories and legends as to the origin of its use. 875 A. D. is the earliest date recorded. Another account attributes the discovery to one Hadji Omar in 1285, who experimented on the berries when he was starving in the wilderness, and, making known his discovery in Mocha, was canonized for it. Again in an Arabic work of date 1566 it is stated that the knowledge of coffee was brought into Arabia early in the Fifteenth century from Abyssinia where it had been in use from the remotest antiquity. The Mahometans employed coffee as a preventive of drowsiness in religious ceremonies, but it was violently opposed, as being an intoxicant, by the conservative priests.

In the Sixteenth century coffee was used in Constantinople and in the Seventeenth coffee-houses were established in London. In the Eighteenth century the French introduced it into the West Indies. STUDENT

Salvation While You Wait

IT is quite impossible to criticize some church notices; the truth is so very much stranger than any possible fiction. The following is an actual specimen clipped from a newspaper:

— Temple. A great revival of old-time religion is arranged for, run on non-sectarian lines. The best workers have been secured. Mr. Blank, as directed by the blessed Holy Ghost, will be chief commander. Entertainment can be secured at reasonable rates. Many blood-washed saints over Indiana and adjoining States will be in this great battle. People who are in earnest, wishing to make a sure thing of heaven, don't miss this good chance of getting full salvation. For further particulars write, etc. H.

"Royal" Sport

A CERTAIN European nobleman has erected in his game preserve a monument to commemorate the shooting by his sovereign of his fifty thousandth cock pheasant. It is in marble and porphyry. There are extant inscriptions of Asshur-izer-pal to the effect that, in a single hunting expedition into the deserts of Mesopotamia, he slew 360 lions, 257 wild cattle, and thirty buffaloes, and captured an immense number of ostriches, bears, and hyenas!!! E

Ancient Fasting Law Still in Force in England

IN England fasting is not merely a religious ordinance. It is a law of the realm prescribed under penalty. Edward III enacted the law, and it is still printed in the latest edition of the Statutes Revised. Hence any American going to England ought to know that any person eating "anye manner of fleshe after what manner of kind or sorte it shal be ordered, dressed or used, in any daye in the time comonly called Lente shal forfeit tenne shillings of lawfull money of Englande;" and that he is liable to "ymprisonment by the space of tenne dayes." To avoid this he should "obteyn licence of our Sovereign Lord the King, his heirs or successors." E.

Longevity of Authors

A PAPER gives the following list of American authors who lived or are living to a good old age. Dr. Weir S. Mitchell has just written a new novel at 75. Whittier and Mrs. Stowe died at 84, Dr. Holmes at 85, Bryant 83, Irving 76, Longfellow and Emerson 73. Julia Ward Howe is 86, Edward Everett Hale 83, Moncure D. Conway 72, Mark Twain 68, Howells 68; most of these are still actively at work. Whittier and Holmes did some of their best work after 75. All of this goes to prove that the more refined our mind, the more active our best thoughts, the longer we live. Sloth and materiality are death. Dr. Osler's theory is like a sieve: full of nothingness. STUDENT

All profits arising from the business of the Theosophical Publishing Co. are devoted to Humanitarian Work. All who assist us in this work are directly helping the great cause of Humanity.

THE MYSTERIES OF THE HEART DOCTRINE

Prepared by
KATHERINE TINGLEY
AND HER PUPILS

*The Theosophical
book of the
Twentieth century*

Tells the story and the history of the Theosophical Movement Throughout the World; tells what it is and why it is—reveals the mystery of the Doctrine of the Heart.

The prices are \$2 in cloth and \$1.50 in paper, which barely cover the cost, for it is printed and bound, not gaudily, but with such carefulness and thoroughness of art and craft as to make it unique among modern edition books.

Reunion of Hu- man Races

IS it not our business to seek to reunite scattered elements which once belonged together but have become separated? Are we not builders, synthesizers, blending once more what has been disunited?

There is a passion for analysis and subdividing in the modern world. It is a characteristic of human nature in these latter ages. Religion splits up into sects and sub-sects distinguished by their differences; science crumbles into a heap of ologies; the professions divide into specialties; craftsmanship gives place to the "division of labor." Everybody with an idea starts a new movement on the basis of that idea, instead of falling into line as part of a homogeneous system.

In Lomaland we are reuniting the scattered elements of human life, reconciling apparent antagonisms, blending contrasts.

One thing that has become split up into heterogeneous fragments is the Human Race. Not to go too far back, let us consider the last great human wave, the Aryan Race (not necessarily identical with what various ethnologists may denote by the term Aryan.) Into how many and how various fragments has this been broken? We have the Latins, Teutons, Celts, Slavs, Hindus, Iranians—all with different and, as some say, irreconcilable, natures. Some of these are trying to accentuate the points of disagreement and fan the flame of en-

The Magic Wand of Brotherhood

But in the new order of ages that is upon us the magic wand of Brotherhood and the ancient keys of Theosophy are to evoke an unsuspected harmony, like some mighty chord resounding through earth and marshalling the chaotic atoms into forms of beautiful order.

We take races, and instead of searching out their irreconcilable differences and trying to keep them apart, we find in each the very quality needed to supplement the others. Under any other sway but the broad benign sway of Theosophy these qualities would clash. But here there is room for all—need for all.

Then there are representatives of older races, in America, in Asia, Africa, Polynesia. All these have been long waiting for a destined reunion—their legends speak of it. Surely it is a glorious and entrancing ideal to contemplate and watch the fulfilment of. Each race has such fine qualities, which we see in the eyes and features, and admire; what *must* humanity have been before all these excellences separated and each sub-race went off alone with its piece! Nothing to what it will be when they reunite, for every quality will have been strengthened by long trial.

Blended Into One Harmo- nious Life

The solar ray has split up into separate colors, and no race is large enough to have more than one tint. Some have one virtue, some another; humanity's present notion of the scope and possibilities of life is too meagre to accommodate more.

In Lomaland we have blended into one harmonious corporate life elements never before found together. In the Raja Yoga School we find altogether new and richer combinations of character. This is just the beginning of what is to be a reuniting, in this Golden West, of the scattered children of Earth's great family.

Archeology traces our derivation from a parent stock and everywhere seeks amid diversity for the primal unity—in the past. Let us also seek the unity that is to come.

H. T. EDGE

Is Education a Culture or a Manufacture?

THERE seems to be largely a reaction against our too scientific and utilitarian educational methods. Prominent educators and writers are expressing their conviction that these methods are turning out much poorer material than before.

Education should stimulate all the faculties and let them unfold generously, each in its own direction, until a many-sided, broadly-developed culture is produced. We should not expect to be able to forecast the result of anybody's mental growth; that depends on the nature of the seed we are cultivating.

The mistake we make is to try to produce certain uniform patterns of culture, as if we were manufacturing machine-made goods. But a human character is not so much inert clay or iron to be wrought up into any design; it is a plant, which we can cultivate indeed, but not coerce.

Let us take the case of a young mind, abounding in latent and sprouting faculties, but harnessed and goaded by the fixed idea of a profession and examination in prospect. He drops every enterprise to which his ardent mind naturally turns, and spends all his time on the one or two things called for by the examination. Result: he loses all the other subjects, and does even the special subject less well than if he had spread his interests and divided his attention more.

Our forefathers must surely have known something about education, and we shall find that some of our improved notions are only youthful fads. They went in for training the attention, the memory, the judgment, and so on, by solid all-around study, without any very rigorously defined end in view except that of imparting culture and capacity. They cultivated the mind and let it grow. But we are madly impatient about results. Some definite narrow object is ever in view, and the growing energies are harnessed thereto. The idea is to get through so many books

of this, and reach such a standard of that; to finish one subject and then begin another; to know "just exactly what use it is going to be to me" (or else I will not condescend to devote my valuable time to your misguided instruction!)

An enthusiastic teacher with a genuine interest in human nature will water any seed he may find, and be ready to pitch his books into the fire any minute if they get in his way. He will change about and give a touch here and a touch there. He will abominate all grooves of thought and be always breaking up and combining anew. In a word he will be a gardener, not a manufacturer.

Oh! who that respects youthful humanity would go and deliberately lop off the young sprouts of enthusiasm and speculation to make the unfortunate child fit in between the absurd covers of a text-book? Text-books should be cast into the crucible of instruction, there to be melted down and used for what they are worth, and the dross ruthlessly discarded. They are made to be used, not to fetter and shackle.

The ideal for education is the same as that followed by the Leader of the Universal Brotherhood in Lomaland; to break up the narrow moulds of human thought and prevent all fixed habits and prejudices from forming, so as to allow the real energies of character room to develop. Students in Lomaland have to thank that Leader for relieving them of a few incrustations and showing them where their life-principle was situated.

This is the ideal in education; and the old grind and routine of our ancestral dominions, which we laugh to scorn, fulfilled it better than the modern machine-made kindergarten, technical and practical methods and systems.

We do not of course advocate a return to those old methods, which probably erred as much *in one extreme* as the modern ones do *in the other*. But an experience of both should have shown us what are the lines of common sense and how we may learn a little from every system by garnering the grains of truth and rejecting the chaff. STUDENT

Latin-American Difficulties

CHILE and Argentina have sworn eternal peace, but between Chile and Peru there is a chronic irritation that may at any moment inflame into war. In 1879 they had a little fighting about something, and Chile was victorious. To mark her victory she annexed a bit of Peru known as Tacna. But she promised to return it in ten years if a plebiscite of the district, taken at the end of that period, should show that a majority of the people desired Peruvian rule again.

About 1890 the plebiscite was duly taken and it appeared that the people did decidedly wish to return to their original allegiance.

But Chile refused! She had found in this ten years that Tacna yielded much nitrate, and two of its coast towns were excellent for shipping. So this chronic trouble has remained just under the skin ever since, and now it seems to be getting acute and dangerous. Neither of them can really afford to fight. Chile is wealthy, as Latin-American republics go, but her debt is nevertheless *per capita* thrice that of the United States.

If these peoples would make a United States of South America, lots of their troubles would disappear—more than the new ones that would nevertheless undoubtedly loom up. A.

The Scandinavian Triad

IT is pleasant to note that the Swedish parliament has approved the suggestions of the Crown Prince for bettering the relations between his country and Norway. Norway has long wanted a separate consular service of her own. There are certain difficulties in the way, but none of them can offset the importance of close friendly relations between two nations so naturally united as the Swedes and Norwegians. The Scandinavian people has a great past and a great future, in literature, poetry, art and achievement along all lines. As she stands outside the dissensions of the rest of Europe, so, surely, should she stand above all possibility of internal dissension. The full promise of her destiny is bound up with her unity. H.

The Simplon Tunnel

THE Simplon Tunnel, though the longest in the world, being twelve and a half miles, and in spite of the difficulties with the hot springs, and other minor matters, has taken only six and a half years to construct. The much smaller Mont Cenis Tunnel took over fourteen years, and the St. Gothard over nine. STUDENT

Candy, Chewing Gum, and Missions

SOME items of our national expenditure make curious reading matter. A Chicago divine has pointed out that we spend \$700,000,000 a year on jewelry and plate, \$178,000,000 on candy, \$111,000,000 on chewing gum (!), and only \$7,500,000 on foreign missions.

There is something to show for the jewelry and plate; let that pass. But the candy item? Well, there is something to show for that too, come to think of it. Namely: artificial teeth and fillings; rheumatism and all other uric acid diseases; and a generation of children trained to self-indulgence in matters of food and by consequence to self-indulgence in nearly all other matters.

As to the poor \$7,500,000 for foreign missions, the Chicago preacher remarks, "No wonder that the world lies in sin." It might continue to "lie in sin" even if the amount were increased. For the places that lie deepest in sin *are not those to which foreign missions are sent*.

There are better ways of spending even a little \$7,500,000. What about *home sin*? In England they have recognized that a good deal of this can be cured by curing the hideous congestion of the worse parts of cities. They are going about it by creating what are called Garden Cities. So also in France. There is a Garden City Association there, in charge of a sum of \$2,000,000 for improving the condition of the working classes. A Garden City is built on a predetermined ideal plan, every house having its garden, the streets in circles one outside the other separated by park spaces, and the industrial portions collected in a certain area. In the first English Garden City the pretty homes rent for but \$1 a week. Other European nations are taking up the plan.

Instead of adding to that \$7,500,000, we would suggest the subtraction from it of say \$2,000,000 so as to place ourselves on a level with France in practical care of the removable sin at home. STUDENT

A Nation of Poets

THE Japanese seem to put a touch of poetry into all they do. They live with their imaginations active. The ceremony of the launching of a ship they perform with a most charming bit of symbolism. There is no breaking of a champagne bottle (a beer bottle has been proposed for the christening of the battle-ship St. Louis!) over her bows. Instead, they liberate a flock of birds. A cage containing a number of songsters is hung at the bow. At the moment of the launching, as the ship glides down to the water, the cage is flung wide open, and the garland of birds disperses in song. It is supposed to be the spirit of the ship freed for its flight on the water as the birds for theirs in the air. And they say too, that as the sylphs of the air welcome the freed birds, so the water spirits—undines, with us—welcome the freed ship.

If we could only use our imaginations like that! Think of the inauguration of a mayor or a city attorney attended by the liberation of a bird; or the crowning of a new commissioner of works with Broom leaves to indicate the clean sweeping he will do! C.

Gathering of the "Elect"

A CURIOUS instance of one of the by-ways of religious crankism is that of the "One Hundred and Forty-four Thousand" which has been gathering at Benton Harbor, Mich. The leader is "Benjamin," a Kentucky farmer, who has broken the Seventh Seal, Joanna Southcote and others of that ilk having broken the six other seals. The "hundred and forty-four thousand twice over" are to gather at Benton, which is according to prophecy; this is the exact and constant number of elect which the world always contains. After the filtration at Benton, the filtrate goes to Jerusalem, and the usual events, millennium, binding of Satan, and so forth, ensue. The people are long-haired and of the ordinary amiable mild fanatical sort.

The isolation of mind, the magnificent conceit, of such people is wonderful. The paltriness of conception as to the scheme of things divine and universal is pitiable. STUDENT

Frontispiece---William Quan Judge

THIS week's cover-page of the NEW CENTURY PATH contains the face of Wm. Q. Judge, the second in the line of succession of the world's Theosophical Leaders. Mr. Judge succeeded to the Foundress of the Theosophical Society, Helena Petrovna Blavatsky. A successful lawyer, a brilliant writer, and a man of extraordinary insight into human nature, he was well fitted to carry on the great humanitarian and philosophic work of H. P. Blavatsky.

Some Views on XXth Century Problems

"Do We Believe?"

SOME time ago, an English daily paper opened its columns to a correspondence—Do we believe?

Eight thousand letters were received and for many weeks selections from these were printed. The selections have now appeared in book form and anyone

can study his own convictions in the light of the convictions of others.

Do we believe *what*? The *Spectator*, commenting on the whole discussion, answers: "All forms of Christianity postulate a future life, a life infinitely more important, infinitely longer, than this, for which the present life is a preparation."

Suppose the *Spectator* had been able to say: "All forms of Christianity postulate an *inner* life, a life infinitely fuller, richer, diviner, than the outer life amid sensations," there never could have been any such discussion.

"The Kingdom of Heaven is within you"; knock at the door of it, and the door will open. That was the teaching of Christ.

The moment he was dead, preparations were made to take the life out of his message. The rats were let loose among the foundations of his edifice. Man was to find himself in this world only in order to turn his attention to another. He was to turn his attention from his life to his death, from what noble thing he could be now to what artificially ennobled thing he could get himself made hereafter. His mind was psychologized away from the potentialities of the *now*, about which he could *know*, to the possibilities of a *future*, about which he could only have faith; psychologized away from the potentialities of his own soul—which by consequence he ceased to look for and cultivate, and which by further consequence became an abstraction—to an absolute reliance on a strength outside.

Now, said Christ, you can enter the royal place within yourself and shine as a son of light, now, as an embodied soul. So if Christ's *now* could be altered into *hereafter*, it would lose nine-tenths of its living potent actuality; if Christ's Kingdom of Heaven *within you* could be made not only a place *outside* of you but ahead of you, accessible only by death—then all reality and urgency and nearly all the radiant stimulation of Christ's teaching would be gone.

That was the precise program that was successfully followed. And since it is only when the Kingdom of Heaven *within* has been won that Christ's nature can be understood to realization, for it is only light that can comprehend light, it is obvious that in directing men's attention away from that *within*, the disintegrating force was making Christ incomprehensible, taking away from men a Presence and substituting a dogma. And the dogma begat others and they others, and all warred together till today. The enemy has won the game for the time and there is general unbelief—shown by the discussion as to whether we *do* believe.

People have wondered why Theosophy, which claims to be Christianity, does not use the terminology of Christianity. Precisely because that terminology has had a false set of meanings crammed into it. "Kingdom of Heaven" does not mean what Christ meant; "Christ" does not mean what Christ meant; nor "God"; nor "Son of Man"; nor "Children of Light." In the *rescue of Christ*—Katherine Tingley's phrase—which is the object of The Theosophical Movement, it is necessary to use other words and phrases for that *Teacher's ideas*. And the "enemy" is even trying to get at *them*, for there is a false Theosophy about on the platforms, which, pretending to expound Theosophic ideals and ideas, is carefully killing them. The difference here between false and true is not hard to detect. Expositions which require a blackboard, which charge an admission fee, which are not clear and vivid in their application to conduct, which do not warm with hope, which have no relation to human brotherhood, which deal in Sanskrit and sham Orientalism, are false Theosophy. They are the application to Theosophy of the power that has stifled Christianity for 2000 years. But it will not do. Theosophy is Universal Brotherhood, and the wisdom of the consciousness which is charged with the feeling of Universal Brotherhood. It was to impress the Twentieth century with this fact that the old name *Theosophical Society and Universal Brotherhood* was changed into *Universal Brotherhood* only. This Organization proposes to restore Christianity in its fullness, with all its implications, to the Western world. STUDENT

Criminals & Pathological Cases

CRIMINAL justice will soon have to be quite changed and a new system, based on different principles, introduced. A man has recently committed murder without any apparent motive, and is pleading dual consciousness as a defense. "The subconscious portion of his brain was in control" when he committed the crime.

Now that the refinement of our nervous system has rendered our consciousness so complex, the question of moral responsibility has become a tangled one, and it does not seem possible to draw a just line of demarcation between a criminal and a diseased person. All sorts of excuses are open to any one able to employ a skilful advocate and a nerve-specialist. The only way out of the difficulty seems to be to treat all alike; and if we cannot make up our minds to execute everybody who kills, and imprison all who steal, irrespective of pleas of insanity, kleptomania, etc., we would better decide to treat them all as patients.

In short the treatment of misdemeanants of all classes should be curative in its aim. A man who kills another from an unexplained impulse is as great a danger and in as great need of help as one who murders in cold blood. Both are cripples, invalids, and need our help for their own sake and for ours.

But what a complicated scientific jargon is taking the place of the wise old saws and moral truths. A man allows his will to become enervated and gives way to impulse until he can no longer control it. Then, with the aid of a nerve-specialist, he pleads some gaudy and illustrious pathological condition and becomes an interesting case. There was a school boy who, when rebuked for laughing, said, "Please, Sir, my face slipped!"

But the real difficulty in the treatment of defaulters, whether classed as insane or as criminal, is, not an ignorance of what to do, but an inability to do it. *Quis custodiet ipsos custodes?* Who is to guard the guards? And we must look, for answer to this question, to the Raja Yoga nuclei of a better order of mankind now in the making. E.

Torturing the Prophets

A NEW YORK pastor has been finding the defeat of Russia foretold in *Ezekiel*. This is the passage (*xxxviii, xxxix: i*):

Son of man, set thy face against Gog, the land of Magog, the chief prince of Meshech and Tubal, and prophesy against him.

Thus saith the Lord God: behold, I am against thee, O Gog, the chief prince of Meshech and Tubal.

It is a difficult passage. Gog is a land, the home of Magog, in the first verse; a prince in the second. In Genesis Magog alone is mentioned, as a person. According to Josephus and Jerome, the Scythians are meant by Magog, Scythians being a vague word for any tribes to the north. The Hebrew word translated *chief*—"chief prince"—(old version) is Rosh. Correctly rendered, as in the new version, Rosh becomes a proper name; and Rosh, Meshech and Tubal are three Scythian tribes whose prince was ("is") Magog. Commentators of weight, including Gesenius, consider Rosh to mean a tribe north of the Volga or Rha, in fact the Roshians or Russians. Meshech stands for Muscovy—again Russia.

All this being obvious and indisputable, it only remains to see in Magog the Czar, and in the recent great battle Armageddon (easily done by mixing the 16th chapter of Revelations with Ezekiel), and you have the whole Russo-Japanese war and its outcome completely foretold! Unfortunately the same mixture has before now done duty as a prediction of several other noted historic events and will doubtless serve for some more yet. Is it not obvious that by methods like this any event whatever, and its outcome, can be found in the poems of the Hebrew prophets and in Revelations? The Hebrew prophecies seem to consist in reality of poetic comments on their own times, ecstatic visions that cannot be placed in time, fragments of archaic Hebrew Mystery teaching, and sublime exhortatory sermons. To attempt to run them with the newspaper is surely desecration. STUDENT

Brief Glimpses of the Prehistoric World

Archeology
Paleontology
Ethnology

A Relic of Arizona's Mighty Past

ONE of the most remarkable natural curiosities to be found in America, is the Petrified Forest of Arizona.

The latter state can truly be said to be America's natural museum, as it is certainly one of many surprises and wonders.

In this case we find a forest of trees of all sizes, with trunks from one to twelve feet in diameter, not however trees as we ordinarily know them; long ago they ceased to wave their boughs in the breezes, long ago the mild, temperate and humid atmosphere, and the fertile soil of the former Arizona caused these giants to thrive and multiply prolifically. The climate has changed since then, and we have only the petrified forest as a silent witness of what it was in the far distant past. The trees are not of ordinary wood, but a flinty stone which is almost as hard as the diamond, and which on account of the beautiful assembly of colors makes an effect, when polished, far superior to the best grade of onyx.

The Petrified Forest being situated in a valley, covering a space almost as far as one can see, makes a magnificent sight as one first comes upon it. The ground is thickly strewn with these enormous logs of stone, which glisten in the sun and reflect their many beautiful shades in all directions, making in all a colossal relic of Arizona's past and a record that will be preserved for all time to come; and showing that this country now so barren and desolate, was once thickly covered with thriving vegetation, at the time when Arizona was the center of the teeming prehistoric life of the semi-tropical Middle West.

It almost seems that nature performed this curious feat of turning wood into stone, for the benefit of the races of men who were to come; to show them how old a country they live in and how the surface conditions have changed; and to hold out a promise of what the future may again bring forth. For may not the desert yet "blossom forth as the rose" as it did in the past? It is hard to realize on first looking over the scene that trees could ever have grown here, for with the exception of the petrified forest itself the limitless expanse of dry and desolate sand is only broken here and there by a bunch of the ever-present cactus, that mysterious plant which grows so luxuriantly without water or nourishing soil, in a place where all other plant life withers and dies. The history of this remarkable curiosity must have been something like the following: Thousands of years ago this part of Arizona was covered with a forest that probably surpassed in size the big forests of Northern California and Oregon. Then the volcanic upheavals which have left so many traces around began. Into a basin so formed a stream of water saturated with siliceous matter came bubbling out of some hidden crevice, gradually forming a huge lake which in time completely covered the tops of the trees, with the exception of the tallest ones.

The action of this siliceous water gradually consumed the fibre of the still standing trees, replacing it with various mineral substances which

gradually turned to flint-like stone. It is these different mineral elements held in solution by the water that formed those exquisite combinations of colors, which are such a mystery to those uninitiated into the mysteries of Nature's methods.

To state how long they stood in this natural pickling vat is mere guess work, but the time came at last when by a disturbance of the earth, either an earthquake or volcanic action, a fissure was formed in one side of this valley, and the huge body of water flowed out with a rush, to find its way tortuously to its home in the sea. The tall upright pillars of now solid stone could not withstand the force of this vast body of water rushing in one direction. They began to snap off like so many gigantic pipe-stems, breaking into dozens of pieces as they crashed to the ground. This is the reason why all the logs are found pointing in one direction. We also know a few of the tallest trees were not completely covered, by finding that the tops of some are missing, because being out of the action of the water, they were not preserved.

By measuring the height of these trunks, some of which have been pieced together, the depth of this ancient lake can be told exactly.

These pillars, too heavy to wash away, too hard to waste away, now lie buried and half buried in the ever drifting sand, Nature's mighty tribute from a forgotten past.

The Indians have known of this place from their earliest days. It used to be one of their great meeting places, where they congregated to gather material for making their arrow points and spear heads, the hard flint being much prized by them for this purpose.

Tons and tons of chips and splinters strew the ground in all directions, so one can realize what an ideal place it must have been for this purpose. These agate arrow and spear heads have been found among the Indians as far south as Yucatan and as far north as Canada, which shows how the Indians used to travel and communicate with each other in the days when they were masters of the land.

As could be expected, the handiwork of the ever present vandal and despoiler is to be seen on every side. Magnificent logs have been blown to fragments by dynamite on the chance of the despoilers obtaining a few crystals from the heart of the trunk—and tons of the agate have been

shipped away to be polished and placed in museums. In fact the forest was in great danger of disappearing altogether when the Government at last took a hand in the matter and now the despoliation has been stopped, and that none too soon.

Museums or individuals can obtain specimens by applying to the proper authorities, but the wholesale destruction and carrying off has been stopped forever. There is plenty of material for the above purpose, however, as it is estimated that there is ten times more buried under the sands than appears on the surface. But modern wisdom is ignorant of the higher qualities and uses of such spots. We cannot even express in English what the Romans understood by *genius loci*. STUDENT

THE DAIBUTSU, FAMOUS GREAT SITTING STATUE OF BUDDHA GAUTAMA, JAPAN

This wonderful statue is in Nara, the oldest of the successive capitals of Japan, situated in the middle of the main island. This city was the seat of the Mikados in the Eighth century, and was a great center of Buddhism and Shintoism. Now it has shrunk to one-tenth the size, but it is a mine of antiquarian wealth. The Buddhist To-dai-ji or "Great Temple of the East" was begun in the Eighth century and last restored in the Eighteenth. The buildings enclose a quadrangle 620 feet by 520, on the south side of which is the huge Daibutsu. The casting of the statue was accomplished in 749 by a Korean artist after eight failures. The head has twice been melted in conflagrations, and was for over a century exposed to the weather, but it still remains nearly perfect. It is 55 feet high, the face is 13 feet long, the ears 8, the nose 3, and the halo has a diameter of 80 feet.

The Trend of Twentieth Century Science

The Signature of Earthquake

WE do not as yet know much about earthquakes, what their causes are, whether they are in some enormous way periodic, or whether they depend upon changes in other parts of the solar system. We hardly know more than that they are extensions or amplifications of those tremors of our earth which never cease; and between the extremest of which, and the slightest of earthquakes, no line can be drawn. Before much knowledge can come out of our statistics, observations must have been carefully kept over a great length of time. They are kept at several places, perhaps most fully at the Isle of Wight in England.

An upright post stands on a metal plate, and the plate is fixed to masonry bedded in the earth. From the post a long metal rod projects at right angles to it, carrying a pointer at its end. The pointer rests on a carbonized tape wound on a drum. As the drum rotates, the pointer draws a line on it; and if the earth is trembling the line waves.

All earthquakes are propagated throughout the mass of the earth in waves like sound-waves: and all over its surface in waves like water-waves; that is, by longitudinal and by transverse waves. Those that go through the earth are much swifter than the others that go over its surface like ripples. So an observer anywhere can tell, from the distance in time between the two sets of oscillations of the line on his recording drum, how far away was the earthquake. The Indian calamity took ten minutes to shake the pointer in the observatory at the Isle of Wight. But the observer can only say how far away was the disturbance; it may have been at any point of that distance from him.

A periodicity in earthquakes would be a striking discovery. One cannot but suspect its existence. STUDENT

Radiant Medicine

THE president of an Eastern university is unfortunately the victim of cancer, the disease being within the body and not surgically accessible. An interesting experiment with ultra-violet light is being tried upon it in the hands of a well-known and reputable New York physician.

This light has but little penetrative power, and if it is to do its work it must be generated on the spot, *in* the disease.

Solutions of quinine upon which ordinary light, or X-rays, fall, become fluorescent, giving rise to gleams of the higher spectrum colors of exquisite delicacy, and also to invisible rays beyond the spectrum.

Making the blood a solution of quinine, by giving the patient a full dose, and then exposing the body to X-rays—which *do* penetrate—the blood and tissues become fluorescent, that is, yield the required form of light. The rays are directed upon the seat of disease.

The case is being widely published, and there are doubtless thousands of sufferers anxiously awaiting results.

One wonders whether the effects of quinine in other cases, malaria for example, may not be due to the light it emits; whether indeed drugs as a whole, leaving the body as most of them do "unchanged," may not owe their efficacy to their radiations rather than to their visible material? The word "unchanged," in this connection, surely ought to have quotation marks; it does not follow, because present-day chemistry cannot find any change in a dose of iron or other medicine after it has dwelt awhile in the body, that there *is* no change. STUDENT

Mars' Private Life

IN our knowledge of the planets we have at present to be content with very small facts. But even the least step onward in our acquaintance with these great neighbors, any speck of gossip, is interesting.

Spring was late this year on Mars. His spring begins early in November, or should do so. But this year (*his* "this year," *our* last year) it was not till towards the month's end that those changes began to occur which are regarded with great probability as due to the melting of his polar snow-cap. The edge of this cap in his winter are sharp and clear. But with the breath of his spring they melt and a haze from all over the cap rolls outward and obscures the definition of the edge, considerably

enlarging the area of the whole white patch. The cap thins, and gets a dim appearance, whilst the soft haze over and around it gives the effect of an Elizabethan collar.

By our February's end, it was Mars' midsummer. The haze was gone, and the diminished cap was once more able to exhibit its shining white surface.

Evidently the haze is cloud, and it hangs about till summer is fully in. All this may not seem much in the way of knowledge. But it is all worth recording. A seemingly unimportant fact in science, well established, often suddenly proves the door into a whole field of new knowledge. Astronomy may be nearing an epoch as great as that which came so swiftly for chemistry when, ten years ago, the X-rays were discovered. STUDENT

Chemistry and Alchemy

AN eminent American professor has been pointing out to the public that the modern chemist has become an alchemist, having arrived at a belief in the transmutability of elements.

But really he is a long way from *being* an alchemist. An alchemist would be a chemist who *effected* a transmutation, just as a musician is not merely a man who believes that music can be composed.

Our chemists so far merely *watch* the alchemy of nature, watch uranium decaying into a nameless and property-less gas, watch radium decaying into helium, and thorium into we know not what. They cannot hinder; they cannot expedite.

Moreover it is only *decay* they watch, the retrogression of elements into simpler, more stable, ones. The *advance*, the evolution, of elements, from simple into complex or unstable, they have not yet seen. But it must be going on, just as formation of leaves and flowers goes on in the vegetable world concurrently with the decay of those of last year.

So to be alchemists they have to find out where in nature elemental evolution is going on, and then imitate it. The old alchemists thought that the human will had something to do in their work. STUDENT

Turpentine in Influenza

THE value of turpentine against influenza was accidentally discovered in Madretsch, Germany, in the outbreak of that disease in 1890. In one of the four watch-factories in that town, no one was attacked; in the other three, many. Investigation showed that in that one, oil of turpentine was used in the metal-turning for the watch-cases. The oil became warm and was inhaled in some quantity by the workers. The hint was taken; since then turpentine has always been evaporated on a stove, and there has never been a case of influenza. The same manœuvre, with the same success, is now being employed in many private dwellings.

Any other aromatic oil—peppermint, rosemary or what not—would doubtless be as effective; camphor more so. But the turpentine is cheap and not unpleasant. It absorbs oxygen, converting it into ozone, and is thus a germicide of considerable power. C.

The "Metal Cure" in Meningitis

THE "metal cure," to which we have already referred as having been adopted in Paris for pneumonia, is now being successfully used for the New York meningitis epidemic. It will be remembered that Dr. Robin of Paris found that when metal electrodes were disintegrated in water by electricity, the water acquired valuable curative and tonic powers. Dr. Robin thinks that the metals exist in the water in the shape of radiant matter, and that this may be the explanation of the curative powers of certain mineral waters.

It seems that the metallic waters thus made have no direct influence on the germs of the disease, but rather arouse the constitution to do its own fighting. The metals Dr. Robin uses are not stated. For each metal there would certainly be a different role.

The "cure" seems to be a new form of that metallo-therapy which was in considerable vogue in France a few years ago. The physicians who then advocated that, believed that metals radiated a curative force, and that their contact with the body was enough. The "radiating force" was in much derision, but we now know that metals *do* radiate luminous force. PHYSICIAN

Our Bird Friends

THE nest, mentioned in a recent Nature page as being built in the eaves of a Nature-writer's tent-home, now contains four vigorous young birdies nearly ready to fly. The dweller has to be careful not to accidentally jostle them when he fastens back his tent-flap. How ready our bird friends are to trust us if only we will give them a chance. E.

Wonderful Effects of Erosion in the Colorado Desert

NOWHERE are the weird effects of denudation seen better than in parts of the Colorado desert. These regions are great shallow basins which in ages long past have been seas or lakes; but now, though below sea-level, they are drier than the driest land found anywhere else, and have been subjected for ages to the disintegrating forces of heat and wind. The rocks too are volcanic, and the successive influence of all these agencies has produced marvelous effects in natural sculpture. In one part the sea has rounded the rocks into boulders, and then the air has fretted them out along the lines of lamination, leaving a field of what looks like cabbages, so exactly does the foliation of the boulders imitate that of the plants. In another part, a further extension of the same process has separated the layers still more, forming what looks like piles of dinner-plates; or has completely disunited them into disks that lie scattered around. Dumb-bells, cannon-balls and quoits, imitations of flowers and even of birds and animals, are found each in its particular locality. In Yuha there are two small mountains composed entirely of ancient sea-shells that were piled up by the waves. STUDENT

The Spineless Cactus

BURBANK has now invented a spineless cactus, which, we are told, is to be the great forage plant of the future, turning the desert into pasture-land and making it a sojourning place for herds and men. The cactus, though less nutritious than alfalfa, is bulkier, so there will be more food to the acre. It is very cheap, as it is only necessary to scatter pieces about and they will root and grow as ordinary cactus does. It is a variety of the numerous prickly pear tribe.

All kinds of stock, from horses to geese, relish the spineless, and it has the advantages of the ordinary cactus in the way of hardiness, without the notorious drawback. It occurs to one that it might possibly revert to the prickly variety if sown at large in the cactus' native habitat. You cannot stock a forest with domestic cats.

However, California has great faith in its Burbank. STUDENT

IN SILENCE GROWS THE PERFECT FLOWER

by LEIGH HUNT—Selected

WE are the sweet flowers, born of sunny showers
(Think, when'er you see us, what our beauty saith):
Utterance mute and bright, of some unknown delight,

We fill the air with pleasure by our simple breath:

All who see us love us— we befit all places:

Unto sorrow we give smiles, and unto graces, graces.

Mark our ways, how noiseless all, and sweetly voiceless,

Though the March winds pipe, to make our passage clear:

Not a whisper tells where our small seed dwells,

Nor is known the moment green when our tips appear.

We thread the earth in SILENCE, in silence build our bowers—

And leaf by leaf in silence show, till we laugh atop sweet flowers.

extraordinary that his attention was at once attracted. Holding one leg out horizontally, the wasp moved the end of it up and down in a manner astonishingly like a wigwag signal or telegraphic code. The part next the thorax was held rigidly immovable, the motion being from one or another of the many joints toward the end. Dots, dashes, pauses, etc., were done with the steady regularity of a machine, while the opposite leg curled and twisted in the tension of idleness.

Was this in reality some mode of telegraphy known to the insect world? We know that insects do live in and use conditions of matter

and forms of force imperceptible to us, just as we use ones which are unknown to savages.

Or perhaps that wasp may have been the unwilling instrument of some generic intelligence; some nature-god, as a general uses a soldier to transmit cipher despatches whose meaning he does not know. Perhaps the wasps have a private code. What would some superior entity, accustomed to thought-transference, think of our postal system and telegraph wires? Y.

Growth of Plants Made Visible

THE cinematograph is destined to be a most valuable aid to science. It eliminates from our ideas the factor, time, thus enabling us to penetrate one of Nature's veils. The

apparatus is at present scarcely convenient enough for frequent use. So far it has mostly been applied to depicting rapid motions in slower time, but it can equally well be used to accelerate slow processes. For instance it is being used to show the growth of plants. By exposing a plate every quarter of an hour, a record can be obtained which, when reeled off rapidly in the machine, shows us the flower visibly unfolding. Speculation exhausts itself in attempting to anticipate the uses that can be made of this method and the discoveries that must be in prospect. Crystals and rocks might be watched in their growth; changes that take years might be gone through in a few minutes; the changes in the human body could be watched. STUDENT

LAKES OF KILLARNEY, IRELAND

Remarkable Instance of Protective Mimicry

THERE is a caterpillar which covers itself with the buds of the plant upon which it feeds. It is covered with spines, and upon these it fastens by silken threads the husks of the buds out of which it has eaten the insides. Thus clothed in husks, it resembles a part of the plant and is quite invisible even to the sharp eye of the predatory bird.

Do Insects Telegraph?

A NATURE-STUDENT of Lomaland one day noticed a beautiful little wasp alight before him and begin a performance so

The Opportunity of the Hour

THAT the cycle of womanhood now winds upward, would seem as a sign in the heavens that a new and better day is dawning for the world.

It is written in an ancient book—old when our present civilization was yet in its infancy: "When women are honored, the divinities are content; but when they are not honored, all undertakings fail." Legends of that fairest time in the mighty past, known as the Golden Age, picture women occupying positions of the highest honor. They were priestesses in the temples and guardians of the sacred mysteries.

But at those times when history has inscribed her darkest pages we find womanhood least honored, and the mothers of men forced into an inferior position, fettered on every hand by bigotry and tyranny.

Now, after many days, the tide has turned, bearing to women the opportunity for which their souls have waited long—the chance to step out in the strength of their superb woman-nature and take their rightful place as the builders and preservers of that which is noblest and most worth preserving in human life.

The time is ripe and the world is waiting, but, as a body, women are not fully alive to the meaning of the hour. It is true that there has been wonderful progress on many lines within the past few years; and it may be argued that it is quite natural that women should lack confidence in their ability after centuries of oppression and false education. But has the suffering of those years added no strength to their soul-qualities? Self-trust may have been weakened somewhat but their hearts should have grown strong. Truly, the hearts of many have grown strong and the splendid courage native to woman-nature would enable them to sweep away, at a stroke, the accumulated rubbish of centuries, if they would make a UNITED effort to close the door against injustice—if, as women and as souls, they would learn to *work together*.

Women have a great lesson to learn before they can fully grasp the opportunity now open to all womanhood. They must learn to work together; to be loyal to each other and to rely upon their own inherent and Divine strength.

There are many indications that an appreciation of the necessity for unity of effort is growing among women. But do women yet fully realize that this effort must go beyond the things which pertain only to the personal life? Real joy will come to women only when they step beyond the personal into that diviner life which is Universal—by no means divested of the personal element, but including it. STUDENT

The Inference and the Fact

THE following item, as well as the comment made upon it, is suggestive: "According to statistics for the past year the reading rooms of two cities in Germany were visited by 98,214 persons, of which number, 93,375 were men and 4,839 were women," and the clever editor concludes from this "that the women of Germany take but slight interest in educational and literary matters compared with their husbands and brothers." He has evidently forgotten Germany's age-old gospel recently formulated so well by the Kaiser, to wit: that "woman's sphere is bounded by three things only, children, church and cooking—*kinder, kirche, und kuchen*."

It is not improbable that one might exhume from their burial places in the kitchens and nurseries of even Germany a good many thousands of women who do not spend hours in public reading-rooms, *not* because they do not want a broader outlook, but simply because their duties to the household baby, the household stomach and the household conscience, prevent. Nay, more—it is not impossible that these women may be asking themselves furtively why it is that babies and other domestic problems, the solution of which theoretically devolves as much upon the husband as the wife, are in practical life shifted entirely upon the shoulders of the latter. Treasonous indeed were such ideas, yet it is not impossible that they are being considered—even by the women of Germany! Last year's Woman's Congress which was held in Berlin points that way, certainly.

The fact that the "setting hen" keeps conscientiously within her sphere may not indicate a distaste on her part for the gadding and gossip that contribute to broaden the views of her lord and master. It may be that she sits still and says nothing, merely because she knows that the welfare of the coming brood demands it. And perhaps she, too, may be biding her time until, in the course of evolution—well, to save the risks of prophesy, let us draw the veil. It may not be out of place, however, to point out a certain analogy between the higher types of birds, in which during the nesting period, the father-bird shares with the mother-bird equally every parental responsibility, and the finer types of human husbands and fathers who realize that, unless the wife and mother has some freedom to live her life, she cannot become the comrade of their ideal, nor the worthy mother of such sons and daughters as they would wish to have. But, that is another story after all, scarcely within the boundaries of the subject under discussion—reading-rooms! E.

FRAGMENT

by EMERSON

DAY by day for her darlings
To her much she added more;
In her hundred-gated Thebes
Every chamber was a door;
A door to something grander—
Loftier walls and vaster floor.

Antoinette Sterling

"I LOVE to feel I am speaking to hearts—the mere idea of singing for fame or money or anything else dwindles beside the ideal of reaching men and women, and helping them in the battle of life."

The words of Antoinette Sterling sound the keynote of her character. She was, first and last, a singer that touched the hearts of her hearers.

Antoinette Sterling was an American. She was born in the State of New York, tracing her descent through William Bradford, the second governor of Plymouth Colony. Even in childhood she possessed a voice of unusual range and beauty which finally settled into a rich contralto. Among her teachers was Madam Marchesi and, after some years of study abroad, she returned to America and went upon the concert stage. Her home for many years was in London, where she held a favored position that will not soon be filled by another singer.

Madam Sterling was essentially a ballad singer. Several of our best known songs were especially composed for her, among them, "The Better Land," "Darby and Joan," "Love's Old Sweet Song," and "The Lost Chord."

I cannot sing songs with which I have no sympathy—my feeling has always dictated my choice, and I care less and less for songs which relate to death. We have so much sorrow, so much trouble and disaster, that I do not like to sing about it. I like to speak of my friends not as having died, but passed on, and when it comes to our turn to cast off this sheath of flesh I believe we shall continue a higher and more beautiful life, freed from all the limiting effects of our present existence. I have been all my life immensely interested in spiritual problems, and that has determined for me much of what I have done and sung.

Her perfect unconsciousness of self when singing was one of her greatest charms. She had all her songs written in a small blank book, which was used by her constantly, and to which she referred if necessary. The ballad, "The Better Land," was perhaps the most favored of all, and it always left a most remarkable impression upon the audience. Song and singer seemed forgotten in the pictures playing before the mind.

Antoinette Sterling was of a profoundly religious temperament, but her religion was of the heart rather than of the head. She was intensely dramatic and magnetic, and while her voice was one of unusual richness, warmth and beauty, it was the sympathetic intensity that she poured into her ballads that appealed so strongly to the public heart. Hers was a religion of humanity and her gospel was one of optimism and of the joy of life.

JULIA HECHT

THOSE who love Paris and all that is best in its traditions, will be glad to hear that the historic studio of Madam Vigée Lebrun in the old Hotel de Rohan is to be preserved. The mansion has been for some time occupied by a sausage-maker, but, at last, it has been formally decided to maintain it as an annex of the Archives Nationales. Madam Lebrun certainly evidenced that woman had the ability to create works of art.

The Bereaved Swan

EVERY now and then one is thrilled by some unusual occurrence or incident in connection with bird and animal life, which seems to reveal the fact that the finer traits of the human are as strongly implanted in them. A London paper relates the following pathetic story of a mourning Swan which has just returned for its Summer visit to Moor-house Tarn:

Originally the swan took up his abode on the lakelet in company with his mate, but their nest was robbed, and the female bird died, apparently brokenhearted. The bereaved consort covered the body with leaves and reeds and departed.

Every spring since he has regularly returned to the grave, always alone and, with the water hens for company, swims disconsolately about the tarn throughout the summer.

The Eagle is another bird that mates but once, and if left a widower is disconsolate, and never mates again. He remains alone on his lofty crag—or pine or whatever formed his home when his mate was alive—and no female eagle has power to make him forsake it. It is said the happy little golden woodpecker grieves himself away after the death of his mate, tapping vainly on the tree beside the nest in the effort to recall her.

In the light of such constancy human affections seem to lose something of their rarity, do they not? W. H.

MR. BRYCE, in that chapter of his *American Commonwealth* which discusses the "Position of Women," remarks that "the average European man has usually a slight sense of condescension when he talks to a woman on serious subjects. Even if she is his superior in intellect, in character, in social rank, he thinks that, as a man, he is superior to her, and consciously or unconsciously talks down to her. . . . But such a notion does not cross an American's mind. He talks to a woman just as he would to a man, of course with more deference of manner, and with a proper regard to the topics likely to interest her, but giving

her his intellectual best, addressing her as a person whose opinion is understood by both to be worth as much as his own." In America, Mr. Bryce says also, "women have made their way into most of the professions more largely than in Europe, and it is easier for them to find a career, for popular sentiment is entirely in favor of giving them every chance."

MME. CLARA SCHUMANN was for many years Germany's foremost woman composer and it is related that for a long time Schumann himself was known as "the husband of Clara Wieck." Her compositions include a long list of fugues, romances, scherzos and songs.

THE convenient pin, which is put to such a variety of uses in the modern toilet, was an after thought, and a late one at that. Needles were used for thirty-five centuries before pins were invented.

THE FAMOUS CONTRALTO—ANTOINETTE STERLING

AND now, more high than the vision of Souls may climb,
The Soul whose song was as music of stars that chime,
Clothed round with life as of dawn and the mounting sun.

Sings, and we know not here of the song sublime.

—Swinburne

OUR YOUNG FOLK

Jenny Marten's Birthday Present

ONCE upon a time there was a little girl named Jenny Marten. She was a small, thin, large-eyed child, with an unselfish and affectionate disposition. Jenny Marten had many little brothers and sisters. There were Joe and Ben (the twins), Ellen and Caroline, Bob, Jessie and Dan, besides the baby, who was Jenny's especial care, for Jenny was like a little mother to them all.

Mrs. Marten was the sole support of her large family. She had to work very hard, doing washing and scrubbing, to supply so many with even the plainest of food and clothing. They had always been poor, even before the father died, for he had been a drunkard.

Now, my story is to be about Jenny's birthday presents. No attention was paid to the little Martens' birthdays, usually, excepting to measure them in turn against the door to see how much each had grown. On this particular day, however, an artist came to their little brown house, which was in the country, a mile from town. Great, good fortune had befallen the artist. He was going across the sea to the land of picture-galleries. He came to say that he must have his clothes in two days. While he talked to the mother, the children stood about, Jenny in the background with the babe in her arms as usual. Now, perhaps Jenny's large expressive eyes attracted the artist's attention. At any rate, he asked her how old she was. Ben quickly spoke up, "Jenny's ten today and grown an inch."

The artist was in such good spirits himself, that he wanted to make others happy. Sitting down on the steps, he counted out ten silver quarters.

"Here's a birthday present for you, Jenny," said he, "one for each year of your life," and he put them in her hand. "Now, buy something you want, Jenny, something you didn't expect to get." And then he hurried away before the bewildered little girl could thank him.

Instantly, Jenny was besieged with questions by all the children. The word "presents" rang in her ear, and excluded all other sounds.

"May I spend it today? Now?" she asked her mother delightedly.

"Yes, dear child," said her mother, though she could not help thinking of the flour that two dollars and a half would buy. "The good, patient child deserves something," she said to herself.

"Get it part candy," advised Joe, as Jenny put on her worn straw hat. "Get it all candy. I'll help eat it." "And me—and me—and me," screamed all the rest.

Jenny heard them not. She was wrapped deep in happy thoughts and happier calculations, which ran something like this:

"The blue calico will be a dollar. Won't mother look nice? That takes four quarters. Then the knives will be fifteen cents, or may be, two for a quarter—then two dolls with hair, and a rubber lamb, and, oh, dear, I can't keep track. I'll wait till I get there."

In the big, general store, Jenny climbed upon a stool and arrayed her quarters on the counter. Mr. Klein, the merchant, himself came to wait upon her.

"It's all mine," Jenny told him proudly, "for my birthday presents, and I can buy what I like."

"Well, well, that certainly is fine," agreed the merchant. "Now, what shall it be? Some ribbons, or Sunday shoes, or—maybe a new dress?"

"Yes," said Jenny, with much importance, laying aside four quarters. "I want this much worth of good blue and white calico."

"That's ten yards. You don't need as much as that for a dress."

"It takes ten yards for mother," insisted Jenny.

"Oh, I see," said Mr. Klein,

"I thought it was *your* birthday."

"So it is," returned Jenny. He looked puzzled but said nothing.

"Now, I want two boys' knives, and I can't pay more than fifteen cents apiece for them, or maybe ten. These are just fine! Joe and Ben can tell them apart, too."

The old merchant looked over his glasses, curiously, at this strange little girl, but only remarked, "Well, well!"

"I want three dolls with *surely hair*, if I can get them for two quarters. They are for Elly, and Carry, and Jessie, you know. They never had a doll with hair."

"Oh, Goody! and a nickel back from the two quarters. I think your store is very reasonable, Mr. Klein."

The merchant made no comments, but was thinking, all to himself, as he sold Jenny a gas ball, a rubber lamb, a bright book, ten pounds of rosy apples, and a small package of tea.

Jenny passed over her last quarter with a satisfied sigh, and a friendly smile. "What glorious things birthdays are!" she was quietly thinking.

"Well," said Mr. Klein, "where is *your* birthday present?"

"Why," said Jenny, "they are all my presents. It is so nice to have birthday presents."

"You can ride out on the delivery wagon, with the bundles, if you like," Mr. Klein said.

As Jenny departed, the old gentleman walked to the back of the store, and, for some strange reason, took out his handkerchief furtively and wiped his eyes.

"Well, well," said he to himself, "surely it is more blessed to give than to receive." And that night a barrel of flour was sent to the Martens, with no name attached. The Martens never knew where it came from, but Mr. Klein did.

When the artist came for his clothes, he was met by a flock of little Martens, each with a gift to show. At first he looked puzzled, but presently Jenny's idea of birthday presents dawned upon him. With a very kind look, he bent over the little maid. "You enjoyed it?" he asked.

"Oh! yes sir," she replied, her bright eyes sparkling. "It was just the very *loveliest* birthday."

"Yes," repeated the artist, looking at Jenny's

mother, "it was a lovely birthday."

The next day Ben found Joe in a shed, whittling away with his new knife. Joe looked up as he entered, a new light in his eyes.

"What are you doing?" asked Ben.

"Well, Ben," said Joe, slowly, "I've just been thinking. We might help mother and Jenny lots more than we do. I'm making mother some more clothes-pins, 'cause she needs them."

"Why, Joe," laughed Ben, "I've been thinking the same thing. I just carried in a lot of water for mother!"

COUSIN KATE.

Facts Worth Knowing

EMERSON once said: There is a time in every man's education when he arrives at the conviction that envy is ignorance; that imitation is suicide; that no kernel of nourishing corn can come to him but through his own toil bestowed on the plot of ground which is given him to till.

How MANY of our young folk know that the stern reformer, Martin Luther, was a great lover of music? He believed that the people could learn to live better lives and to worship God more truly by means of song. So he wrote many hymns, the first one in 1524. Luther also wrote *chorales*, and his work in music helped to lay the foundation for the German musical life of today. He once said: "I verily think, and am not ashamed to say, that, next to divinity, no art is comparable to music."

"BOYS WANTED"

BOYS of spirit, boys of will,
Boys of muscle, brain and power,
Fit to cope with anything,
These are wanted every hour.

Not the weak and whining drones,
Who all troubles magnify;
Not the watchword of "I can't,"
But the nobler one, "I'll try."

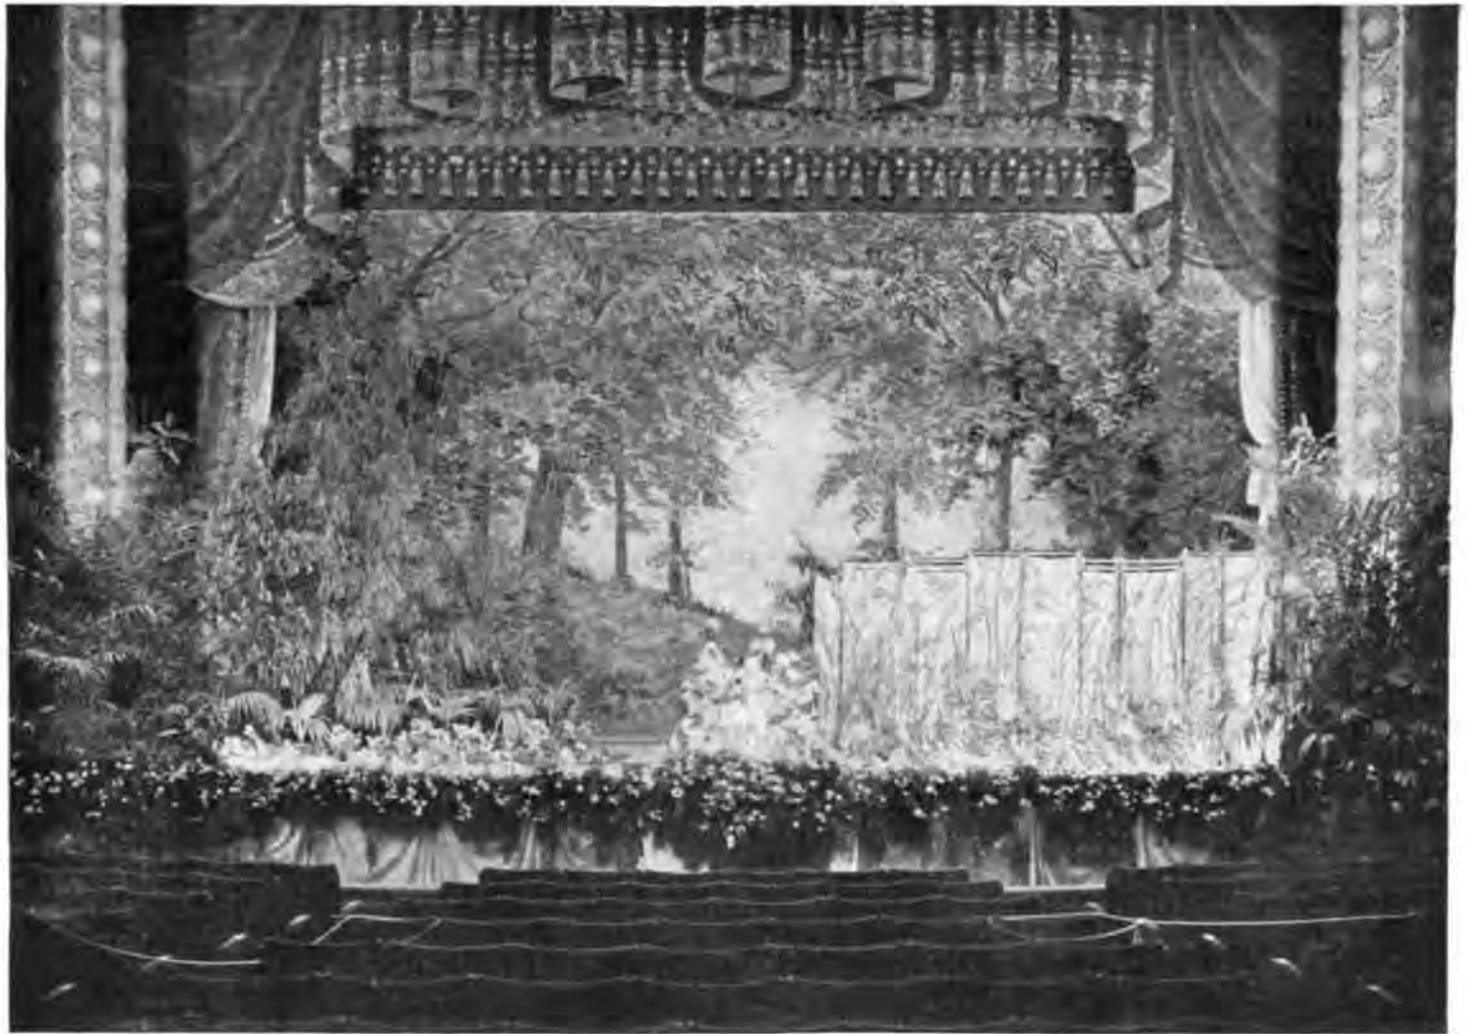

Do what'er you have to do
With a true and earnest zeal;
Bead your sinews to the task,
"Put your shoulders to the wheel."

Though your duty may be hard,
Look not on it as an ill;
If it be an honest task,
Do it with an honest will.

In the workshop, on the farm,
At the desk, where'er you be,
From your future efforts, boys,
Comes a nation's destiny.—Selected

Isis
Theatre
San
Diego
California

THE THEOSOPHICAL FORUM, IN ISIS THEATRE

THE Universal Brotherhood meeting at Isis Theatre last Sunday evening was one of unusual interest. The musical numbers were carefully arranged, and included a piano solo by Miss Julia Hecht, "Prelude," (Rachmaninoff); also a violin solo by Mr. R. Bland, "Allemanda," and "Introduction and Gavotte" (F. Ries). Miss Hecht and Mr. Bland are both favorites with Isis Theatre audiences, and both were warmly applauded by the delighted public. There were also selections from Wagner and Mendelssohn.

Mrs. T. Y. Stevens, of Buffalo, a prominent and well-known member of the Organization in the East, read a paper on "Individual Responsibility." Mrs. Stevens took for her text an article in a London daily, on the need of force of character. She said: "What people of today most need is force. Nations always need it, and it is always needed in individual life. But the present is a time when it is called for specially, both for the duty of the community and in the sphere of private life.

"Feebleness, whether of purpose or of character, means ruin. Nations have fallen into littleness and nothingness through the loss of virility—never through the pressure of circumstances. Had they possessed qualities of manly strength, out of changed circumstances they would have made a new greatness. It was not the prowess of Alexander that conquered Persia, but the powerlessness of Persia which made it easy of conquest.

"Circumstances do not crush a life or character with ruin, except where the resisting manly force has been sapped away.

"But what is this force that is needed? The writer goes on to show what it is not and what it is. Often 'what seems to be enormous displays of force are in reality nothing of the kind; but, on the contrary, the exposures and the outcome of weakness.' He compares 'force' of this kind with the force that plunges a rock down a chasm, a force exerted by external influences on a weakened, loosened integrity.

"When races and nations are on the downward course to ruin, they not infrequently startle the world with epileptic developments of this sort. They are not vigor; they are weakness. They are not the upward climb; they are the downward plunge.

"The following sentence shows up our lack of the sense of individual

responsibility and our readiness to give the merely verbal help that costs us no comfort: 'Those snug persons who shovel upon the pitiable perpetrators (of a national crime) their disgust and condemnation, themselves pass their days in quiet and uninterrupted security and comfort, however one may remind them of the rebuke: "'Tis not for you to measure passion's force or misery's temptation.'"

"It is a very serious matter indeed when a people gets to believe that certain violent, or noisy, or showy manifestations are the signs of national strength; when, in fact, they are the indubitable symptoms of weakness, vain-glorious ambition, Jingoism, the pursuit of, or at least the shouting for, rubbishy, glittering ideals—a disdain of steady, unexciting work and for plain, solid qualities.

"We fancy we are getting strength by living upon the ideas which lead to this kind of talk and behavior. . . . What we need is ideas of things which are truthful, and, therefore, nutritious.

"The mind is being fed with in-nutritious and flatulent ideas—political, social, religious.

"The writer, asking how the true Force can be obtained, says that in place of shows we must have realities, Truth.

"A teacher of Truth. . . . is one who opens vast stores and granaries for the soul and for character. One of the great uses of the genuine hero and of the genuinely heroic is that they radiate inspiration.

"He concludes by asking the people to put away shams and select leaders after the pattern of heroes who radiate Force that is real and can build and purify.

"Is there not need that, when hands are thus being stretched out to us from the world, we should labor earnestly at our work of realizing a life founded on truth and manliness, on compassion and purity?"

Mr. S. G. Bonn also read a paper entitled "The Foundations of Real Religion," which was very ably presented and much enjoyed.—*San Diego News*.

No DEED, not even a sinful thought, will go unpunished; the latter more severely even than the former, as a thought is far more potential in creating evil results than even a deed.—HELENA P. BLAVATSKY

Art Music Literature and the Drama

Our College Graduates—Why Are They Not More Prominent as Writers?

ACCORDING to *The Critic* there are few college graduates among the best known literary women of today. We must conclude that, while a large number of women have been taking advantage of the opportunity for intellectual training afforded by college courses, many were being prepared by some other means for literary work that has proved successful.

There is nothing in modern life corresponding to the school conducted of old for women by Sappho, at Lesbos, where her pupils were instructed in the art of poesy, yet there are not a few women today whose literary impulse finds expression in verse, and many who excel in other forms of literary art.

The successful writer, man or woman, stands midway between all that has been achieved by heart and brain, and the needs of the people of the world. For the world needs some presentation of the heart history of humanity, that shall not only throw a fresh light on the old-new theme of human nature in its relation to the eternal verities, but shall do this in a manner that appeals to the sense of form, which every one possesses in greater or less degree. A person, then, to be successful as a literary worker, must be so closely in touch with the time that she can discern the form in which readers will be soonest able to find what they seek, and she must master the use of it. Those writers who have stood firmly on middle ground, keenly alive to the need of the time, equally sensitive to high standards of truth and beauty, and willing to perform the drudgery that attends literary production, have acquired the education that enables them to give expression to some glimpses of life. It is such as these who are able to assure their readers that the home of the struggling individual is in the great whole of truth and beauty and love. These writers are able to reveal human nature in such a way that people know themselves, and love one another, better. They can touch the hearts of the people. They succeed in doing this, to the extent that it is done in the world today, by virtue of an inner responsiveness to great ideals of truth and beauty, and an inspired industry. For these have to do with deeper currents of creative impulse than are aroused into activity by the mere opportunity to obtain an education along the lines followed in our colleges at present.

The average college life of women is, as yet, based upon no such comprehension of the nature and needs of students as suffices to call forth the impulse for creative work in literature. It is as yet deficient even in the means of instructing students in æsthetics and the history of art, that might quicken their perception of the highest ideals of truth and beauty, and in the intellectual atmosphere of our colleges there is no influence or training to awaken, and wisely direct, the deepest heart energies, nothing to summon these to keep pace with mental acquirements.

Mental training college women assuredly do get, and it is fair to expect that this will serve them well in any career which they may choose. But only in the educational institution that includes a course in what might be termed "The Wisdom of the Heart," with a teacher who knows the secret of unfolding the highest powers and qualities of womanhood, in balanced and harmonious development, can we look for women as a body to be educated so as to insure the blossoming of creative impulse into literary or any other art form. Only in the Raja Yoga Schools and Institutes as yet is this training given; only there can be found this heart culture combined with physical and mental training, this heart touch with the best that has been, and the present need, that kindles in natural course, the impulse for creative work. Only Raja Yoga can give women the higher education in the true sense. STUDENT

IGNORANCE of music on the part of religious teachers has never been a matter of much concern, but ignorance of Latin on the part of Porpora, one of Haydn's teachers, once raised an ecclesiastical tempest in a tea-pot. In setting the Latin creed to music for certain church dignitaries of his time, Porpora arranged the words as follows: "*Credo, non credo, non credo in Deum.*" The church authorities were scandalized. It was only by explaining that he was ignorant of Latin that poor Porpora saved himself from the terrors of an Inquisition.

Lomaland Photo and Eng. Dept.

FROM A GROUP BY THE SWEDISH SCULPTOR MOLEN—1855
(Representing the two brothers of an old Swedish tale, who, in consequence of the love of both for the same beautiful woman, became sworn enemies and, at last, fought to the death)

ACCORDING to correspondence from Syracuse, Sicily, Gustav Salvini, the son of the famous tragedian, Salvini, is preparing to produce the Greek classic, *Ædipus*, in the ancient Greek theatre at that place. The theatre is one of the best preserved of all the monuments of Greece and it is said that it is Salvini's intention to produce the tragedy just as it was played two thousand years ago—surely a sign of the times.

Universal Brotherhood Organization

Central Office Point Loma California

Practical Theosophy and the Influence of Point Loma.

CAN anyone deny the influence of the great Center of the Universal Brotherhood Organization, having regard for its practical, its educational, its humanitarian work in various countries? Its practical work is known everywhere and is attracting the attention of the thinkers and workers in all parts of the world who have humanity's best interests at heart.

Most people would like to do something for the bettering of conditions generally, but the trouble is, they have gotten out of the habit of doing so. Through long years the idea that laymen, so to speak, should concern themselves only with the grosser side of life has gained remarkable credence. In some manner we have been led to believe that a wide gulf separates things terrestrial and things celestial, and that we should leave the latter for the consideration of those who make it their profession to square the circle of spirituality and furnish us a creed to fit, just as one would secure a dress pattern from stock. This has led us to stand in superstitious awe of those things that should concern us most vitally; that is, an understanding of our own natures and our relation to our fellow men.

Just here the practicability of Theosophy asserts itself, for its educational work is well known, and its humanitarian efforts drew the approval and support of the American government on the memorable occasion of the Cuban war, a few years since, and is now a matter of history.

Is it not indubitable proof of the influence of this Center, when we consider that the membership of the organization comprises people in every walk of life—people who have joined for the most unselfish of motives—I ask, is that not sufficient proof of its influence? And considering the stupendous and magnificent work already done and still being prosecuted at Point Loma, can we not truly say that Theosophy practically applied, is indeed a revelation to the peoples of the earth?

Who would have thought, even one decade ago, that there would be today so many activities in connection with the movement, and especially activities conducted by unsalaried officers? It would scarcely have been accounted possible.

Into the realms of Education, Philosophy, Art, Literature, Music, The Drama, and Science, Theosophy has entered with uplifting effect, demonstrating that in all these things, there is something higher and nobler than the idea of money-getting, which has been attached to them by a selfish age. Into the domain of agriculture and the mechanical arts it has also entered; and is it not well that it has, for have we not recently had striking illustrations of the selfish extremes to which man is applying his money-getting propensities? Selfishness has long had a monopoly of these things.

Through the Raja Yoga system of education, new ideas that tend upward to a fuller, richer recognition of human possibilities have already stirred the minds of many a visitor to Point Loma. Already the question is asked: "What marvelous method has Katherine Tingley discovered that her educational system should produce such wonderful results?" It is a question easily answered but difficult of comprehension, by some, for her method is simplicity itself. It is awakening honor, integrity, purity of thought and action in the lives of the students; this is the secret of the quickening of the mental faculties. This is the secret of Raja Yoga.

May we not say that the very opposition to the work of the Theosophical movement by its enemies is a proof that the success of its undertakings is a revelation to the world? For it will be fairly conceded that had such work been of no effect, it would have aroused no opposition. But the very gates of hell cannot prevail against truth and right.

So much already having been accomplished, is it not reasonable to infer that in the near future, Theosophy will prove itself to be the only philosophy capable of uplifting the human race, and of bringing real life and joy—yea, the very consummation of happiness to long-suffering

humanity? Katherine Tingley has said that for none are the opportunities so great as for Theosophists. To the problems of life Theosophy brings the answer and it is our opportunity to proclaim its message and make manifest its light.

STUDENT

The Sun God

"A largest universal like the sun."—Shakespeare

THE modern mind has been so clouded and benumbed by looking upon Nature as a dead machine controlled by a Creator far away, that we can hardly follow the free flight of ancient thought which viewed the Universe as if it pulsed with life in every part. The ancients moved about the world with ever fresh delight and saw no desolate, forsaken spots although they passed through lands without inhabitant. The moving sea, the shady groves, the sunlit rocks and running streams were thickly peopled by divinities and haunted by glad throngs of nature spirits. The sun was not a ball of incandescent lava but the glittering raiment of a god thus veiled from mortal sight, through whose incessant bounty all things living were sustained. We may however get some little understanding of the ancient point of view helped by the very Science that has sometimes seemed to have destroyed that standing ground.

The microscope has shown us living forms which are as round as marbles, and recently it has been shown that electricity can exist in a globular form, so that we run counter to no fact of ascertained knowledge if we try to imagine the sun as being truly alive, and embodied in a vehicle of electric matter. The solar orb may be perhaps a vast intelligence enveloped in a living frame of stationary lightning, a temple fit for such august divinity. There is no need *en passant* to remind the intelligent reader that heat and light may be derived from a source which is both cool and non-luminous. Every incandescent electric lamp generates heat and light by setting up local resistance to a current supplied from a distant dynamo. The sun hangs in space beholden to no external source of light and from the dark robes of primeval night he spins a shining garment of a dazzling brightness. He floods the boundless æther with his glory and the swift currents of his vitalizing force bathe the remotest regions of the solar system.

There is nothing parasitic or dependent about the sun. He is an infinite bestower, an exhaustless generator. No shadow ever falls athwart his face. He has no barren intervals in his existence. Dwelling in the central fountain whence all energy proceeds he gives with neither pause nor stint and fears no scarcity or want. Perpetual positivity is his condition and as the ceaseless rivers of the cosmic force takes rise in his huge heart he thus repels all hostile influence from without. And we—need we forever be consumers merely of the sun's beneficence and paupers in the universe? Why should not man in emulation of the bright divinity become himself a sun to the society in which he lives? Can we not spin a shining garment from surrounding gloom and generate from source unseen a flow of life and brightness for our brothers in the dark? To our confusion be it said that we too often live upon the love of others. We are indolently satisfied to be receivers when we might originate instead. We make appeals for sympathy, attention and applause, and yet if we but willed we might be always giving like the god of day.

Hail Great Sun!

P. LEONARD

For the Benefit of Enquirers

REGULAR weekly meetings of the Aryan Theosophical Society, established in New York City by William Q. Judge, the second Leader of the World's Theosophical Movement, are held every Thursday evening at 8 o'clock in Isis Hall, 1120 Fifth Street, San Diego, California. These meetings are intended to meet that large and growing body of earnest enquirers who desire to know more of the different tenets of the Theosophical philosophy. Students from the Universal Brotherhood Headquarters at Point Loma, California, conduct these interesting gatherings to which every truthseeker is cordially invited.

THE CLIMBERS

by MARY FRANCES WRIGHT

O YE, so far beyond me on the Height,
 I cannot hear your voices as ye stand
 Facing the Vast, invisible to me.
 But I can see your gestures of delight,
 And something gages of that wide glorious sea,
 The glimmering isles of that Enchanted Land,
 The winds which from that ocean freshly blow,
 And so your Vision lifts me toward the Height,
 Although ye have forgot me far below.
 But you, my brother, you, my near of kin,
 Who some few steps above me on the steep
 Look smiling back to cheer me ever on,
 Who lead a hand as I the chasm leap,
 And stay your haste that I the crag may win,
 Thinking it scorn for Strength to climb alone;
 You, with your morning song when sings the lark,
 You, with your sunset footing where I fall,
 You, with unflagging purpose at high noon,
 And quiet-hearted trust when comes the dark—
 To you I owe it that I climb at all.—*Selected*

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question Does humanity keep on progressing forever? Is there no stop, rest, or end?

Answer This question was asked and answered not very long ago in these columns, but as it has come up again, a further word may be said.

Taking the main question as to eternal progression, a negative answer is unthinkable. On every hand we are surrounded by infinities. What are we in comparison with this earth on which we live? What do we know of the life of this earth, which manifests in such an infinity of forms? What is our earth compared to the sun, and what is the whole solar system compared to the systems of numberless universes which fill the depths of infinite space? And yet the mind of puny—or should we not say, omnipotent, divine—man reaches out to measure and comprehend them.

There is an inference in the question that the thought of eternal progression is something appalling, but we only live moment by moment, and each moment has its duty; and, too, however great may be our desire to accomplish some great work, we can only go step by step. But is there no stop, rest or end? All progress is cyclic, activity and rest follow one another ceaselessly, and to answer the question we have only to look at the course of our own lives. Does not the rest of night follow the activities of the day? Is there not a moment of pause between every heart-beat?

But stop, or end? No! not in the sense of a finality. We cannot conceive of it, we do not desire it. One phase of life may end, when we have learned all that that phase can teach us, but we enter upon a new one, just as we end one life and then after a period of rest we take up a new life on earth, and take another step forward on the pathway of life. True progress and true happiness come from the faithful performance of the duty that lies to our hands and at the moment to do, and so gradually we find that our horizon widens until one day we shall have glimpses of infinity that will not appall but inspire and encourage. STUDENT

Question Is it true that man ever was, is and ever will be? If so how can there be something beyond him, towards which he is evolving, or below him from which he has evolved; or is man not an evolving entity?

Answer It is probable that the question has arisen from the fact that the word man is used with different signification at different times. At one time, it is used with reference to the outer man whom we see and hear and talk to, the personality; while at another time, what is sometimes called the real man, the soul, is meant. The personality, we know, changes, grows, evolves; it is the garment which the soul is ever seeking to fit more perfectly to express its own nature and serve its purposes. But the soul is divine in its essence, immortal, and in this aspect changeless, but in its power to express itself, it too may be said to evolve, being subject to growth or limitation through its experience of the outer world, by means of the personality.

Man is in fact dual; he has a higher nature and a lower nature, with the power of identifying himself with either. This is one of the fundamental teachings of Theosophy, and taken with the further teaching,

that at the root and center of man's being is the divine spark, illuminating the whole of his life in proportion as he permits the higher nature to have rule, it is one of the most needed teachings today; for men have forgotten their divinity and the duality of their natures, and have come to regard the personality as the real man, and have enthroned their brain-mind and intellect as their god instead of making it their servant.

In one aspect, then, we may say that man is an evolving entity, and in another that he is changeless, and eternal, forever the same. In the *Book of Golden Precepts* occurs the following stanza:

Have perseverance as one that doth forevermore endure. Thy shadows live and vanish; that which in thee shall live forever, that which in thee *knows*, for it is knowledge, is not of fleeting life: it is the Man that was, that is, and will be for whom the hour shall never strike.

In a note to this, H. P. Blavatsky says, "Personalities or physical bodies, called shadows, are evanescent." And in another note, that "Mind the thinking principle or Ego in man, is referred to 'knowledge' itself because the human *Egos* are called the sons of (universal) Mind."

Plato expresses the nature of man very quaintly, and at the same time quite in harmony with the above. He says that "man is compound of the same and the other"—that which is eternally the same, changeless, and that which is "the other," forever changing, growing, evolving.

But there is another aspect from which the question may be considered. Has man yet attained the full stature of manhood? Has he yet realized his divinity which as man it is his destiny to attain? Has he yet become perfect as the Father in Heaven is perfect? What room then there is for growth, advancement and evolution! And to reach to his destined state must be by evolution, by the evolving, the coming forth, of the divine spark that lies hidden in the heart of each, until it shines through and irradiates the whole of life. STUDENT

Question What position do Theosophists take in regard to the intellect? I have heard it said that there are higher faculties which man has and should use. Will you please explain?

Answer The reasoning faculties have been so much abused that people have forgotten what the *intellect* is, and it is often necessary to condemn the so-called "intellect," because it leads people away from the light. When the reasoning faculties are actuated by doubt, fear, suspicion, mistaken self-interest, and such like chilly and damp motive, of course they can only mislead and delude. But what a mistake to blame the intellect! Nevertheless one must blame it, for the word has lost its true meaning, and one cannot be responsible for all the meanings that people may choose to attach to it.

Let us rather use the word "Understanding." The Understanding is a lamp unto life. It is possessed by the simple and true-hearted, and has no connection with the showy false logic and misuse of words that so often masquerades under the name of intellect.

To get understanding it is necessary to sacrifice much of what we have been accustomed to regard as intellect—not a difficult task for those who have discovered that their own private and particular personal wisdom cannot do much for them, but merely leads them into useless byways or strands them on desert islands.

The understanding (or *true* intellect) arises when heart-rays strike the brain; no other motive than a pure love and trust can possibly arouse that light. The vain, selfish, or doubting must be content to follow false lights.

Doubtless there is a Knowledge so vast and luminous that all the intellect we know of—even the highest—will seem like vain foolishness before it. But may we be preserved from the burden of the responsibility of such knowledge until we are able to bear it! It would crush our timorous spirits.

According to H. P. Blavatsky, the brain in man is as yet almost totally unused, only its lowest functions being called into play, under the stimulus of inferior and selfish emotions. What the brain is really for, and what powers lurk in it, we cannot guess; for only by pure heart-force can they be unlocked. (Needless to say, it is useless to try to pick that lock.)

So there is plenty of wisdom in store—for those who do not lust after it. For those who do their duty, trusting in the Law, and resisting the beguilements of supposed self-interest and private wisdom, flashes of Understanding may come. Then the greedy mind will try to seize the light and hold it tight—and lo! it is gone. But enough has been seen to reward the pilgrim's faith.

He will pray for a true understanding; he will realize that the goddess Wisdom dwells in Olympus and is twin sister of universal love. H. T. E.

In Europe

(By our special correspondent)

April 30th, 1905

“**H**ELPING and sharing is what Brotherhood means.” This saying cannot be too widely applied. One method of application is to works of Art; and it is pleasant to note the concluding words of a recent article in the *Petit Journal* in which the decentralization of the art treasures of France is advocated. Every town in France ought to have a share in them. Such a suggestion, carried out unselfishly, would tend to make the whole people artistic in feeling. Other nations might copy with benefit!

Nowadays, it is impossible to open a French newspaper without reading something about La Mutualité's scheme of material co-operations of the national life. *Le*

*al*ité in the school. By its aid ves with a suitable trousseau. the age of nine, and the outfit s of seventy-three articles. For ie must surely be a great boon 'resident of this department of or all, all for one." troubles next month, when the of "*Don Quixote*," will be cele- rs on May 7th, and all kinds of paniards know so well how to pies nearly two columns in *El* a national subscription to erect rid. All the Latin Republics of

comrades in Sweden I have re- re delivered before the members of the Art Club of Stockholm a few weeks ago by Dr. Starbäck, on "Original Nature." It is an earnest plea for the protection of North-land scenery from the destruction with which it is threatened, both by the modern utilitarian spirit, and by the vandalism of sportsmen and naturalists. The lecturer says: "In vast regions of our country Nature is threatened, and in very few places can virgin soil be trodden. Even in the depths of Norrland the consumption of wood, and the employment of water-power in the service of industry are tending to destruction." And advertisements are put up in prominent places amid some of the most picturesque scenery of the beautiful North! Rare plants are disappearing, owing to the modern craze for "specimens." But worst of all is the ruthless destruction of bird life. "On Helga-

land in one year 12,000 birds of the same species were shot. In a few months 335,000 swallows, and 502,000 singing birds were brought into the market of Uizza." The lecture concludes with the wise remark, "Culture is rooted deeply in Nature, therefore culture ought not to destroy Nature."

Earlier Dr. Starbäck says that the question of protecting Nature is one of especial interest to artists. Surely it concerns all men who would understand themselves? I am reminded of that beautiful passage in the "*Voice of the Silence*:" "Help Nature, and work on with her, and Nature will regard thee as one of her creators, and make obeisance." Much more than natural scenery is here indicated. But respect for the latter must be felt ere the mysteries of Nature can be even approached.

Nine Foot Three

THE Russian giant Machnoff, recently brought to London to be exhibited at a variety hall, is the largest man on record. He is nine foot three, and well proportioned. A paper gives the measurements for his dress suit, and the outside leg measurement is seventy-two inches and the sleeve fifty-five and one-half. His hand is one foot seven and one-half from wrist to finger tip, and his foot twenty-four inches. His diet consists of proportionately enormous quantities of eggs, milk, bread, and meat. He is twenty-three and weighs four hundred and fifty pounds.

Degrees in Superstition

THE Archbishop of Santiago, Chile, according to the papal official gazette, recently sent a perplexing query to the Congregation of the Inquisition. It was this: May a sick Catholic be permitted to swallow saints' pictures, whether in the shape of pills, or dissolved in water, in order to regain his health?

It is not recorded how long the Congregation sat on this question, but at length an answer was given which possesses considerable ingenuity: He may do so, but it would be wrong to attach any superstitious beliefs to the act.

From a medical point of view the answer is open to much criticism. A sick Catholic who scraped the picture, even of a saint, and swallowed the scraping, might get a dose of lead or mercury or other metal which would certainly complicate his case.

The Congregation, whilst sanctioning the sick man following a practise common enough in the Middle Ages and even today, and by tacit implication approving it, tries to guard itself from criticism by the last clause. But the degree or form of belief in the efficacy of a saint's relics or picture, which to the Congregation would seem "superstitious," is beyond the constructive powers of one's imagination. C.

The Energy of a Gospel

PRESIDENT SCHURMAN of Cornell University, some time ago addressing the students assembled at the chapel, on "Christian Faith," must have sent them away in some doubt as to his attitude towards Christianity. For on the negative side he said that educated men no longer regard the "facts" in the Bible as true, and that the Bible was only a mould into which religion was poured 2000 years ago. It contains no history and no science. "The Christ of the Twentieth century differs from the Christ of the Nineteenth and preceding centuries. I don't attempt to explain the miracles attributed to Jesus Christ by the Bible." Later he said: "Although we are recoiling from these dogmatism of the Bible, yet I believe no age since Christ came into the world needs the Gospel of Jesus Christ as does our own

age, and no place needs it more than our own seats of learning."

What is that gospel of Jesus of which we and our universities are declared to stand so much in need?

First: is it not evident that it did not consist entirely in words? Would any other man going about among the peasantry of the villages in a corner of Asia, attended by a few of those same peasantry as his immediate disciples, saying the things that Christ said, the very same things, have

Real Gospel Worked Into Consciousness

been able to make his name, at this lapse of time, the spiritual watchword of more than half the human race? If not, what went forth from him beside the words, which, with them, constituted his gospel? Great numbers who call themselves Christians have perhaps no right to the title. But amidst these, from Christ's day to now, there has been a thin unbroken stream of those who had the real gospel worked into their consciousness. These have constituted the real being of the Christian world. What is their secret?

There is a suggestive passage in one of H. P. Blavatsky's works in which she says that sometime men will know

That there never yet was a great World-reformer whose name has passed into our generation . . . who had not appeared before, in past Cycles. They will recognize them, the cause which produces certain riddles of the ages, in both history and chronology; the reason, for instance, why it is impossible for them to assign any reliable date to Zoroaster, who is found multiplied by twelve and fourteen in the *Dabistan*; why the numbers and individualities of the Rishis and Manus are so mixed up; why Krishna and Buddha speak of themselves as reincarnations, Krishna identifying himself with the Rishi Narayana, and Gautama giving a series of his previous births; and . . . finally, why Osiris is a Great God, and at

A Lost Teaching of Antiquity

the same time a 'Prince on Earth,' who reappears in Thoth Hermes; and why Jesus (in Hebrew, Joshua) of Nazareth is recognized, kabalistically, in Joshua, the son of Nun, as well as in other personages.

It was a view of some of the early Church Fathers, which may easily have been a (now lost) teaching of Jesus himself, that he had previously appeared many times during the previous history of humanity.

But whether we regard the Teachers of humanity as many, or as a few reappearing, or as One only constantly reappearing, we have to ask ourselves what is that common element in this long and unbroken line of gospels taught to all peoples and at all times which was the life-element, which gave them such a vast and enduring power beyond what the mere words spoken by common men would have possessed?

For in every case, the words of this gospel urge men to do what they do not want to do, to give up what they want to keep. And a proportion of the hearers did and do it rejoicingly. They got a reward; what was and is it?

To man, as distinct from animals, colors may not only be colors but beauty; sounds may not only be sounds but music; form may not only be form but grace; duty is not only compelled deeds, but self-compelled

Pleasures Be Renounced for Joy

deeds, having as their internal accompaniment something which is to the deeds what the beauty is to the colors and sounds; and by men only may pleasures be renounced for joy. Colors, sounds, forms, deeds, and pleasures, all belong to simple consciousness; but beauty, duty, renunciation, and joy, will and self-compulsion, belong all to self-consciousness. They belong to and are rooted in, the self-knowing, looking-inward consciousness, as distinct from the merely animal out-looking sense-consciousness. They are specifically human, and are all aroused together.

The question remains: what appeal to this do the Teachers make which is so much more potent than words; or rather, what backed the words? It is true, they all directed men to look inward and thus enhance their self-consciousness; in various ways they all said: The Kingdom of Heaven is within you, find it and act and think from there. But other men might have said the same and got no response.

To return a moment to H. P. Blavatsky. As a part of the passage from which we have quoted, speaking of the World-reformers, she says that there was not one of them who was not a direct emanation of the Logos, of the "Divine Spirit." The Epistle to the Hebrews opens by saying that "God . . . hath at the end of these days spoken unto us in his son, . . . through whom he made the worlds." The Gospel of John has the same teaching: "All things were made by

**Scriptural
Quotations
Harmonious**

him. In him was life. . . . He was in the world, and the world was made by him." In the great Indian scripture Krishna says: "In all creatures I am the life; all things hang on me as precious gems from a string. I am the light in the sun and moon," etc., etc.

It is the same doctrine everywhere. Divine self-consciousness radiating life, whose subjective face is consciousness, into nature. Gradually the radiated life-light in nature passes from simple consciousness to (in humanity) self-consciousness. Upon that new phase, which, deepened, will lead us to knowledge of our divinity, we have begun. The Teachers call us to come further into it, to come through this door into a new and most spacious life, beyond death, since it is very life conscious of itself. From thence, the outer world of dissolutions and formations is surveyed, the world in which lives and dies even the outer personality of the man who surveys these changes, himself now not changing save to become ever more and more conscious of what is, of what he is, and life is.

And because the Teachers had attained this, (if we regard them as far products of evolution), or were from the first this, (if we regard them as direct images of the Divine self-consciousness), they were able to awake inductively something of it in men, by a directly stimulating power which in the rest of us is but in germ. It was the acting of a high consciousness upon lower ones, as awakening as sunlight upon seed. These in their turn transmitted it, though with less force. And so onward.

**Divinity
Awakened
in Mankind**

So, through human history, Teacher after Teacher sends outward and onward this self-expanding wave. When, in the course of centuries, the wave exhausts itself, another Teacher—often, it may be, the same—appears and arouses and transmits another wave, so that humanity should never be left unhelped.

This doctrine is in the Bible, and, more clearly, in several of the world-Scriptures. The Hindu Teacher, Krishna, in the *Bhagavad Gita*, is quoted as putting it in its clearest form in the well-known passage beginning "I incarnate from age to age for the help of virtue and the destruction of vice."

The implications of all this are very many. But there is no space to say more—save to express our view that through the Universal Brotherhood Organization is now pulsing that same force which in other epochs has been the energy of the gospel of all the Teachers. H. C.

A New Day for Korea

IT is reported that the Emperor of Korea is not seeing eye to eye with his people in respect of Japan's friendly occupancy of his country. "The reforms that Japan has already effected," says the Pekin correspondent of the *London Times*, "are unmixed blessings to the people, but are causing dismay to the emperor and his corrupt court. . . . The conduct of the Japanese has been exemplary." They are pouring into the country, already to the number of sixty thousand, and there is now an uninterrupted chain of Japanese settlements from Fusan to the Yalu. Railway extension and other commercial improvements are in full swing. The Korean army has been practically abolished, to the great monetary profit of the people; and the police suspended in favor of Japanese protection. That is to say there is now a real police. Crime is becoming unusual, instead of part of the Capital's ordinary daily programme. "Most of the foreign advisers"—schemers in the interests of their respective countries, most of them—"have left the country and been succeeded by Japanese." But the adviser to the foreign office is an American! Approved by Japan, he at any rate will not be grinding any axe that ought not to be ground. A.

The College Yell a Barbarian Incantation

SUPERSTITIONS die hard. In fact the belief that a superstition is a superstition is itself a superstition. A belief in the power of sound survives in the "college yell," for what other possible reason can we assign for it and its peculiar and carefully-worded form? Here is the yell of the University of Wales at Aberystwyth:

"Hip-pip-hur(long)-Aber! Hip-hip-hur-Aber! Hip-hip-hur-Aberystwyth! With a pip and a pang, and a yip and a yang. Yak! Yak! Yak!"

Similarly songs and musics are still used, in defiance of reasoned science and in obedience to traditional intuition, to inaugurate all kinds of occasions. But it is not fashionable to speak of them as incantations. E.

Sophistry About Niagara

A GOVERNMENT geologist recently gave his views on the question of preserving Niagara Falls. The audience, we are told, enthusiastically applauded the points made for its preservation, but the lecturer went on to show what a good case the other side of the controversy had also. Niagara, he said, can yield four million horsepower, which would do the work of one-fortieth of the coal mined in the United States, and represents one-fifteenth of the power used to operate all the trains. Fuel supply is not permanent, but water power practically is; and future generations might need Niagara to supply power. He even argued that mankind, because richer economically thereby, would be enabled to do other things for esthetics.

But is not the real issue confounded? It is not a question of a whole nation gratefully turning to artistic purposes the forces of nature. It is a question of a few greedy monopolies grabbing the power for their private interests. This is the first point to be settled—whether Niagara is to be leased to private individuals and concerns or kept for the nation. When that is settled, the question of whether to use it as scenery or as water-power can be discussed without cant and hypocrisy. For it is cant to wax suddenly enthusiastic about posterity, and it is cant to pretend to a reverence for nature which one does not manifest in one's daily life. There is not much to choose between one who cants about the artistic welfare of posterity, and a city-haunting vandal who cants about respect for nature.

Let the nation save Niagara from the grasp of the private exploiter, and refuse to be hoodwinked by such a deliberate false issue as that which is involved in raising the question of benefit to humanity. H.

The Old New England Academies

THE order in which the old New England academies enumerated their objects is worth noting. An Act was passed in 1780 incorporating the first of the Massachusetts academies, the "Phillips," at Andover. It begins thus: "Whereas the education of youth has ever been considered by the wise and good as an object of the highest consequence to the safety and happiness of a people; as at that period the mind easily receives and retains impressions, is formed with peculiar advantage to piety and virtue, and directed to the pursuit of the most useful knowledge: . . . hereby is established an Academy . . . for the purpose of promoting true piety and virtue, and for the education of youth."

The "piety and virtue" comes first; then the "useful knowledge." The modern Academies with one exception, reverse the order—when they do not omit from their stated objects the first altogether. The one exception is that at Point Loma, whose name "Raja Yoga" means piety and virtue, and more. This object comes so decidedly first as to be included in the name. STUDENT

How We Spoil Rice

THE reason why the Japanese are so muscular on a diet of rice, which is supposed to be a food deficient in muscle-forming constituents, may be that they eat the rice in a whole and natural state. We mill and polish the grain, processes which remove the husk and bran, and also the rough protein surface of the grain. Thus we eliminate the sustaining part of the cereal, as we do in the case of our grains used for bread. Cookery is often, but not always, an improvement on nature. STUDENT

Yosemite Valley Preserved

Everybody will be glad that the Yosemite Valley and the Mariposa Big Tree Grove have been restored to the National Government by the bill which Governor Pardee signed, and these wonderlands of Californian beauty preserved to the world from the spoliation of private interests. May Niagara also be saved! The arguments in favor of utilizing natural forces are of course a blind—a false issue. The real issue is between national ownership and private monopoly. E.

Frontispiece---Helena Petrovna Blavatsky

THE cover-page of the NEW CENTURY PATH this week shows the well-known face of Helena Petrovna Blavatsky, Foundress of the World's Theosophical Movement.

Her work and teachings have startled thinking men by their depth and scope in a humanitarian and philosophic sense, while their characteristic feature is that they bind all men together in an absolute Brotherhood of Humanity.

Some Views on XXth Century Problems

Theosophy in Dante

WHEN Theosophy is better known, there will be a fuller comprehension, and a new study, of certain of the world's greater writers. They will in fact be seen to have been teaching Theosophy.

An important study of Dante appears in a contemporary, by the Rev. S. Udny. He points out that Dante believed in Reincarnation, in the *emanation* of the human soul from the Divine (emanation as against creation), and in the constant communicating relation of the soul to "angels," God's "universal ideas."

That he believed in the possibility of Reincarnation is a certainty, because he deliberately describes it in the case of the soul of the Emperor Trajan.

The Gnostic theory of "emanation," in its fuller form, is that the human soul came from God, the Supreme Energizing Fire, as a spark, colorless, potentially possessed of *all* divine powers and qualities; but that these powers lay latent. The "Angels" were represented as spiritual beings actively possessed each of some measure of *one* of those divine powers which in their fullness and collectivity were present in God alone. The angels, pitying the soul because of the long wanderings in matter which, if unassisted, it would have to undergo before its powers were awaked, took upon themselves the duty of helping it, each stimulating to life in it that power which he specially possessed. Man was therefore "a little lower than the angels" in that he started as it were blind and naked. Potentially he is higher than they because he has the capacity of transcending them and of uniting in himself some measure of *all* powers. Whoever will read Paul will see the Gnostic touch. He calls the angels "principalities," "powers in heavenly places," and so on. In *Hebrews* they are quite gnostically called "ministering spirits." And *Revelation* is full of references to them.

Man's communion with these, according to Theosophy, is neither by word nor even anything which can be called thought. Their "message" reaches us as a stimulation to aspiration and high action. Our reply, if we make one, must be the aspiration and action. To look for anything else, to try to reply in any other way, is to wander up a blind alley or even over a precipice.

The spiritual life, in which we are mostly infants, develops like the physical. The infant is conscious of uneasiness, a want, vague, undefined. Not till later does it realize *what* the want is, *which* of the wants is present at the moment. And the spiritual world is as vague to us as the physical to the infant. We stretch out hands vaguely to it. We do not yet know of *which* of its surpassingly rich and varied contents we stand in need, or that there are such contents. Even if we try to conceive it at all, we do so in terms of physical life. In truth the "Angels" of the Gnostics are only known to us of the average as our spiritual wants, at present only a blur of higher feeling. Further knowledge of them can come only to those who are victors in the struggle against the failings of our present human nature.

STUDENT

Eating and Devouring

A GOOD DEAL is being said just now about the advantage of eating less and chewing more. It is more economical. The small quantity goes as far as the large quantity used to go, and in addition it clogs the system less. Bolting introduces a quantity

of unchewed food into the system, and this is not assimilated; also it blocks up and poisons the system. By thorough mastication we get as much—nay more—pleasure out of the food as before. Satiety sets in sooner, and we have to leave off before we have overeaten. Result—greatly increased health, comfort, and efficiency.

All this is of course perfectly obvious. Why then is it necessary to say it? Because we do not practice it. Why do we not practice it?

The paradoxical reason why people do not do this is—*because* it would make them well. People do not want to be well. They want to go on craving and worrying and being angry and rushing and indulging all sorts of moods and vices which are perfectly incompatible with a healthy body. For them to eat properly would be like putting a broadcloth patch on a pair of worn-out overalls. The demon in their stomach pre-

fers unchewed food, like a wolf or tiger.

Society, we are told, has the chewing fad. How long will it keep it? Nine days.

Anyone attempting this excellent practice will find that it requires all the Christian virtues in constant exercise three times a day to achieve it successfully. Unflagging watchfulness, perfect steadiness of the mind, perseverance, determination, etc., are needed. A strong revulsion towards the old habit has to be overcome. He will find, in short, that it is not possible to reform the life in one place only. He will have to undertake a general reform as well.

But for one whose whole life is a continual effort at reform—what a help such a practice would be! He could make it part and parcel of his continual progress towards self-governance. It might be just the help he needed.

But again, what discrimination would be needed, not to overdo it! Not an anxious, brow-knitted, glaring, paralytic wrestle, such as we are prone to when we make one of our periodical fierce resolves. But just an easy, gentle but continuous pressure in the desired direction, not expecting instant and complete success, nor relinquishing the attempt after temporary failure.

Let us not, oh! let us not, turn into an animated wax-work show of chewing cranks; but let us hope that we may gradually induce our stomachs to be more economical and less wolfish as time goes on. H. T. E.

Twenty-Three Ounces of Soul

PROFESSOR HAECKEL will soon be an interesting prehistoric remain, and discussion of his philosophical utterances will be properly conducted on the archæological page. As Cato could not close a speech on any topic without his formula *Delenda est Carthago*, no more can Haeckel discuss anything in biology without his sacred formula *There is no soul*. He has just delivered himself of it again in a lecture at Berlin. "What is vulgarly described as the human soul is really contained in the skull's matter. The difference between the soul of man and the soul of apes is a matter of quantity, not quality." In fact, a matter of 23 ounces of soul as against 46!

As humanity rises year by year to a clearer consciousness of soul, this old man with the diminishing little band that he leads remains shouting *There is no soul, only matter*. Whilst they are proclaiming that there is no sun, the sun is already in the east. The spectacle is almost pathetic. A good deal of energy has, in times past, been expended by religious and philosophical people in the refutation of contentions like these. They are wise in expending no more. Time is on their side. The foundations of materialism are utterly undermined by the waves of the new consciousness.

STUDENT

An Imported Debauchery

LOS ANGELES is getting alarmed at the steadily increasing use of hashish in that city, and at the number of cases of insanity now known to be due to it. For the morphine and cocain sots there is often some excuse. They are introduced to the drugs which finally ruin body, mind, and will, by using them for the palliation of pain or other medical reason.

No one ever got the hashish habit in that way, or can plead that as an excuse. It was begun as a mode of debauchery with open eyes. And though in one way of classifying insane statistics, the drug may be called the cause of the ultimately inevitable insanity, one may well question whether anyone who enters upon such a habit, who crazes his intellect as does this drug, with the deliberate intention of thus temporarily crazing it, can be regarded as sane. It is a nice line between criminality and insanity. On the whole we should be inclined to make the use of hashish *ipso facto* evidence of insanity, treating the case by prolonged detention with some compulsory employment demanding considerable healthy and useful bodily labor. As for the opium, morphine, and cocain habits, we would once again urge the medical profession to reconsider its ways and to remember that the hypodermic syringe, once introduced at a patient's bedside may well-nigh wreck his soul as its finale. Connection Between Irish and Ancient Inhabitants of Italy—Meaning of Ancient Funereal Customs—Veneration of Ancestors

A STRIKING vindication of Theosophical teachings is afforded by an article entitled "The Irish Italians," by Amy A. Bernardy in the *Boston Evening Transcript*. The writer takes a less dry-as-dust view of the subject than is usual with archeologists, and shows a reverence for ancient beliefs which may be unscientific but certainly does not obscure the question. The points brought out are as follows:

The similarity and fraternizing between Italians and Irish in American cities has been noticed, but few indeed would have thought of deducing from it a connection between Erin and the Roman Forum. Yet it is just this connection which indisputable facts, collected in both places, establish.

The people who occupied the place where the Forum later stood were that branch of the Aryans known as Celts. Their customs and beliefs were obliterated in Italy by the later races and times; although, as will be seen, they are not out of reach of the pick-ax of archeology. But in Ireland, whither the Celts emigrated, no succeeding nation has followed to obliterate them; and these traditions consequently exist there, in the more secluded regions, in a form very like the original.

The monuments preserved by the Romans in their Forum "retained a traditional allegorical meaning besides their obvious *raison d'être*."

The Romans themselves, materialistic as they have been deemed, knew of this and revered it.

The remains of ancient Ireland, as also some still extant customs, throw a light on the meaning of these pre-Romulean traditions, and supply a missing link.

The Celts attached much importance to the preservation in one spot of ancient sacred relics, since these "*radiated physical and moral energies for the race.*"

The Romans followed them in this belief, and so did the ancient Irish. In fact, all the Aryans, as we gather from Greek and Latin tradition, had this *veneration for ancestors*, and believed that the relics of the

mighty dead were potent as charms for future humanity. Hence they erected massive and splendid tombs, and used these places as the scene of all their important undertakings and public ceremonies.

Everywhere these tombs are found, and are usually mistaken for fortresses, though those on the Appian way (for instance) teach us otherwise. They were doubtless used as fortresses in times of trouble, when it would be essential to fortify every available building.

Respecting these relics, the writer says:

A brief review of the monuments of the Forum from the standpoint of their allegorical meaning might be as follows: At the foot of the Capitoline hill the "sacrum," where the ancient objects of patriotic veneration were kept, supposed

to radiate physical and moral energies for the race. The area of metallurgic Vulcan faced the temple of domestic Vesta. The Palatine tribes, nomadic by tradition, had their round hut in significant contrast to the rectangular sacrum of the public Lares. In the midst of these most sacred testimonials of unfathomable tradition, the lake of Curtius, symbolizing the sacrifice of the individual to the welfare of the race, and so respected that until very late times the offerings to the manes of the hero were made within the primeval cavities or on the primeval altars—a respect of tradition which explains, by the way, how the "lapis niger" survived safe and sound so many changes of generations and events. When all these monuments had been traced and explained severally, there still remained unsolved the problem of their grouping. Why were they all with such persistency crammed into the small space of the valley between the Palatine and the Capitol?

And why was the restricted space between them exclusively and persistently used as the place for discussion and promulgation of laws, punishment of trespassers, glorification of worthy citizens, transaction of business and exchange, celebration of banquets and gladiatorial or athletic exercises with funereal character?

Ireland solves this problem. The Book of Ballymote, among MSS. in the Irish Academy, and the Book of Leinster, contain detailed information about the burying-ground of Carman, the magician, who decreed that her burial-place should be made the scene of a *fair and market*, words which then implied not only commercial but administrative, festal, and all kinds of public functions. Races were run on Carman's field, games played, prizes given to bards, etc. A prehistoric necropolis was found in the very heart of the Roman Forum; and so the connection between tombs, relics, and public ceremonials, in the ideas of both peoples, is established. There is plenty of other evidence to the same effect.

The Irish "raths" or circular moated fortifications, and the "carns," rounded tumuli, covered with earth and encircled by huge blocks of stone, afford us the prototype of the traditional shape after which the elaborate tumuli on the banks of the Tiber were erected later.

It is indeed a hopeful sign that, after all the sickening twaddle that has been talked about the Egyptian tombs and ancestor worship and pagan superstitions generally, we should be approximating to a reasonable guess as

to why the ancients invariably attached so much importance to perpetuating the memory of the heroes of the past. They knew that the light had been handed down to them from their ancestors and that it must be preserved through dark ages till the day of resurrection. There is much evidence given, both from Roman and Irish archeology, in support of all the above points, which it is difficult to condense into a limited space. But the author refers to many classical beliefs and customs which have their parallel in ancient and in modern Ireland, and compares the various kinds of monuments, such as dolmens, menhirs, etc., left scattered in different countries by migrating Aryans. Certainly the influence of H. P. Blavatsky's writings is making itself felt, and it is to her that we must credit the starting of the current and the furnishing of the clues to these problems. E.

TEMPLE AND ROYAL TOMB, MADURA, INDIA

These monuments afford a striking example of the order of architecture built by the Tamil races of southern India. The temple forms a parallelogram 847 feet by 744 and the tomb is 152 feet high. The principal structure is the "Hall of a Thousand Pillars," containing 997 columns.

The Trend of Twentieth Century Science

The Planet Mars is Near the Earth

ON clear evenings for a few months, the ruddy, warlike planet will be seen shining brilliantly in the southern sky. In consequence of the great ellipticity of its orbit its distance from us varies considerably at different seasons. Just now it is comparatively close to the earth, but its very nearest approach will not occur for a couple of years. Mars is travelling through the zodiacal sign Scorpio, and is found just a little to the right of the glittering Constellation of that name, the heart of which is the flashing green and red star Antares, supposed, as the result of recent measurements, to be over eighty thousand times the mass of our sun! On May 8th an observer standing on Mars would have seen the rare and interesting transit of the Earth and Moon across the disk of the Sun, as the planets happened then to be in an absolutely straight line with the Sun, an event which will not occur again for seventy-nine years.

The disputed question of the "canals" on Mars has again been raised by some recent American observations confirming the claim of Schiaparelli, the Milanese astronomer, that many of them are double. The convenient conclusion that the darker patches on the planet are oceans has been rudely shaken of late by the discovery that as the Martian autumn approaches (it is August there now) they become lighter in color and the dark "canals" are then seen crossing the "oceans!" Clearly we are hardly on the threshold of real knowledge of the mysterious conditions of this miniature world, but its striking apparent resemblance to our earth and its comparative closeness to us—a little matter of thirty-four million miles when nearest—will always make it of profound interest.

The poets and ancient legends have credited Mars with the reputation of stirring up violent passions, but he had a nobler side which is well expressed by Longfellow in the well-known lines:

". . . from that blue tent above
A hero's armor gleams,

And earnest thoughts within me rise
When I behold afar,
Suspended in the evening skies,
The shield of that red star.

The star of the unconquered will,
He rises in my breast,
Serene, and resolute, and still,
And calm, and self-possessed."

Northwest Passage Forced at Last—Magnetic Pole Revisited

NEWS comes (May 10) that an expedition to visit the north magnetic pole and force the northwest passage has been virtually successful. The explorer is Captain Amundsen of Norway. The report does not state what point he has reached, but says he has gotten through the dangerous straits south of King William's Land, thus being past the pole and in practically open water.

The itinerary of Amundsen, as given by Prof. Davidson, was from Disco Island on the west coast of Greenland, north to Wolstenholm Sound, across to Cape Horsburgh, through Lancaster Sound to Beechy Bay and Erebus Island, down between North Somerset and Prince of Wales Land to Boothia where the magnetic pole is (or at least was), then south of King William's Land and through the straits to Cape Bathurst, and so to San Francisco. He started quietly with seven men in a sealing sloop. He found Franklin's monument at Erebus Island. The latest report says he has established a magnetic observation station on the ice near the pole.

The northwest passage has never been forced before, and it does not seem likely to be a favorite route for commerce and excursions even now. The pole was discovered by Sir James Ross in 1831, but he did not succeed in getting through. Many attempts have been made, beginning with Cabot's in 1498, which was followed by Sir Hugh Willoughby's in 1553, Frobisher's in 1576, Davis' in 1585, Hudson's in 1607, Cook's, Ross', Perry's, etc.

The world waits with interest to see whether the magnetic pole is still where it was, and for the other unexpected information which the explorer is sure to have when he arrives at San Francisco. STUDENT

The Sun Plays with a Granite Ball

SCIENTIFIC contemporary calls attention to a curious and perhaps at present inexplicable phenomenon. In the cemetery at Marion, Ohio, is a huge stone ball a yard in diameter, weighing 4200 pounds, and standing on a pedestal. It was erected as a monument. Last spring it was noticed that the ball was rotating, and measurements show that the movement is at the rate of about an inch a month. When it was put in place, the spot at which it touched the pedestal was left unpolished. This spot has now traveled a quarter circle and is therefore in full view half way up the side. It is supposed that the slow creep is due to the sun's warmth, slightly expanding the stone along an arc from east to west. This is not impossible. It is known that even a great stone mass like the Washington monument is bent in the course of every day by the sun, though of course it as regularly recovers itself by night.

Our contemporary does not give the direction in which the ball is turning. It can hardly be east to west if due to the sun; for the afternoon rays would always undo what the morning rays had done, unless there is some shading from trees on the west. If there is no shade, and the phenomenon is due to the sun, then since the sun is in Ohio to the south of vertical, the rotation must be south-north. If not, then the sun cannot be the cause and another must be sought. STUDENT

Instrument and Sense

ADVANTAGE is now taken in microscopy of the fact that ultra-violet light, though invisible, will affect a photographic plate. It is used instead of white light to (invisibly) illuminate the microscope stage, and the invisible picture rendered by the microscope registers itself on a sensitive plate. The resulting photograph, which can itself be further magnified, is studied at leisure. The wave length of this light is much shorter than that of white light, and the definition of minute points correspondingly clearer.

At each stage in the advancing perfection of the microscope and telescope, we are apt to think (and some of us to say) that at last we are in sight of the finality of possibility. History should teach us how unwise is that. The sciences play into each others' hands; the lines between them are fading out. Chemistry, physics, and astronomy can hardly now be studied apart. The products of discovery in one science become instruments of discovery in another. Thus the ultra-violet light of the chemist, of the physicist and electrician, becomes an accessory to the microscope of the biologist.

The aim of the microscope, telescope and other instruments is to bring that which is beyond the range of the senses, within it. How if the senses themselves, in the natural course of evolution, should take to extending their own range, or should add another to themselves? STUDENT

Distilled Water as a Vampire

DISTILLED water is a vampire, is the recent pronouncement of an authority on hygiene. Deprived of the salts that belong to it, it seizes them forcibly from the coats and blood-vessels of the stomach. Almost everything we use in modern life, including the tooth brush, comes in for authoritative denunciation. Now it is the turn of distilled water. Its use may be a physiological sin, but we commit such vastly bigger ones!

It is certainly a very active solvent, but would the Doctor extend his indictment to include water distilled by nature, rain-water? Everything he urges against distilled water applies to rain-water; and yet we doubt not that the drinking of the latter, if it had not been collected in a city, would receive his approval.

If he had claimed that the long boiling of water in the process of distillation, deprived it of a *vital magnetic something* which it is eager to reacquire and *does* reacquire at the expense of the vital magnetism of the person drinking it, science could not prove him wrong even if it would not grant him right. And so also if he went further and suggested that water distilled by and in sunlight was very different from the laboratory product, possessed to the utmost the vital magnetic something, and gave to, rather than took from, the man who drank it. STUDENT

Egyptian Mummy-Wheat
 SYDNEY, AUSTRALIA,
 April 14th, 1905.

DEAR EDITOR: In relation to the question touched upon in a recent number of the NEW CENTURY PATH, as to whether Egyptian "mummy-wheat" will germinate, I can state that my mother has often told us of her father having been given some, which grew and matured. Grandfather had two ears of the wheat, which he planted in the garden, and from the seed next year planted more, till he had finally five or six three-bushel bags of it. When he gave up wheat sowing, this wheat was sold to a farmer in the vicinity. This happened forty years ago; and last year, when my mother tried to get some to send to Point Loma, it was discovered that there was none of it left at the old homestead.

Mother has often described the wheat to us, saying it was not like our own wheat, but more like barley, with long whiskers between the grains; and that the grains were very closely packed in the ears, more so than in our usual wheat.

The wheat was grown in the Western District of New South Wales at a well-known cattle station homestead. E. I. W.

Curious Sense-Organs in Deep-Sea Fishes

THE five senses are really five differentiations of the one sense—the perceptive sense. In out-of-the-way kinds of animals, these senses become mixed and shade off into one another, so that we can no longer say, "An eye for an eye, or a tooth for a tooth," as some of these creatures have horns for eyes and whalebones for teeth.

A fish caught in the Caribbean deeps has no eyes, but long antennæ running out from its nose, by which it found its way and its food. Another had eyes on long stalks, like a snail. Another had an eye on a long, lily-like stem, projecting eighteen inches from the nose and able to see around corners. A study of Nature reveals the fact that nothing is fixed, and that the living soul, or "Nephesh," is able to create for itself any kind of organ that may be needed. Attempts to classify and differentiate species of animals or organs of the body can never be more than convenient approximations. Varieties in nature shade off into one another like the colors in a rainbow. Here we see that there can be sense-organs which cannot be accurately classed under any one of the five familiar heads, but are part nose, part eye and part finger. STUDENT.

THE SIMPLE JOYS OF NATURE

by VIRGIL

OHAPPY, if he knew his happy state,
 The swain, who, free from business and debate,
 Receives his easy food from Nature's hand,
 And just returns of cultivated land!
 No palace, with a lofty gate, he wants,
 To admit the tides of early visitants,
 With eager eyes devouring, as they pass,
 The breathing figures of Corinthian brass.
 No statues threaten, from high pedestals;
 No Persian arras hides his homely walls,
 With antic vests, which, through their shady fold,
 Betray the streaks of ill-dissembled gold:
 He boasts no wool, whose native white is dyed

With purple poison of Assyrian pride;
 No costly drags of Araby deſile,
 With foreign scents, the sweetness of his oil:
 But easy quiet, a secure retreat,
 A harmless life that knows not how to cheat.
 With home-bred plenty, the rich owner bless:
 And rural pleasures crown his happiness.
 Unvex'd with quarrels, undisturb'd with noise,
 The country king his peaceful realm enjoys—
 Cool grots, and living lakes, the flowery pride
 Of meads, and streams that through the valley glide
 And shady groves that easy sleep invite,
 And, after toilsome days, a soft repose at night.

AVENUE OF ROYAL PALMS, BRIDGETOWN, BARBADOES, BRITISH WEST INDIES

suggest thoughtful investigation.

Mesozoic Amber

A large deposit of amber, which was discovered recently at Staten Island, contained masses of leaves and twigs, and pieces of petrified wood belonging to the later mesozoic period, so that the amber must have been deposited in the age before mammals appeared on the earth. Such things make one gasp as the imagination vainly tries to conceive the antiquity. E.

Nature in Samples

THEY make a pathetic, and yet successful, attempt at the Stepney Museum in London to illustrate Nature and her ways to the thronging poor of that great London district. There is a small greenhouse stand, beneath which is a reservoir of water. The stand is pierced with holes, and every week quantities of foliage of various trees is placed there with the stems projecting through into the water. One week there were oaks, elm, beech, lilac, chestnut, rhododendron and several others. Above the shelves are pictures of the full-grown trees, so as to assist the imagination. The samples are changed regularly, so that a continuous picture of what is doing in real nature is presented, and people who have hardly ever seen a tree, and have never seen a field or scented a hedge of wild flowers, may get that touch of life which nothing else would supply.

We can hardly conceive the colorless bleakness of a mind that has had to grow to its poor maturity without any touch of nature, indeed, without anything whatever capable of appealing to the higher imagination. C.

Mineral Atoms as Factors in Plant Growth

WE know that all plants require mineral substances, but we think of these only as forming constituents of the plant-substance. Yet there are facts which point to the conclusion that certain minerals play a more important part than that, and have a creative or reproductive power, being, as it were, a kind of mineral seeds.

It has been found that the addition of certain mineral substances to plant food, in quantities so small that subsequent analysis was scarcely able to detect them, has nevertheless been sufficient to very definitely alter the condition and character of the vegetation. Whether we regard these minute mineral particles as seeds, or as atoms which, like those of radium, can emit rays that generate other substances, there is at any rate much to STUDENT

"Soul, nothing has been which shall not bettered be,
Hereafter."—*Browning*

WHETHER we, as women,
realize it or not, from the
first moment of our entrance

✧ The Virtue Inclusive ✧

as real workers into the ranks of the unselfish, all events conspire to teach us the virtue of continuity. Our lives may have been, before that time, embroidered with breaks and gaps. The undone duty of today complacently waited for the morrow. The lack of punctuality on this or that occasion *apparently* brought no serious results; the slighted work invited no one to the guillotine. And so we went on from day to day, our lives resembling the dismembered links of a chain more closely than anything else. Yet debts were piling up, our weaknesses were growing apace, slowly but surely the God-stuff in our characters was being frittered away. At last the time came when, as Students, we faced ourselves and resolved to really build. A meandering series of shocks awaited us. Then we saw the crime of these little, or apparently little, faults of ours. The gaps in our lives as truly threatened our very being, as a tiny rift in a musical instrument threatens absolute silence.

At Lomaland we find that every event has its part to play in teaching us continuity. It lies within our power to accept all events with equanimity, thus learning their lesson. It lies equally within our power to find fault when things don't go just to suit. Then we refuse the lesson and another link is broken or left unforged in this life chain of ours—this life chain which we have vowed shall be so perfect and so strong that all humanity's woe shall not break it asunder. Do we forget our vows?

Those who adopt the latter tactics, whether from ignorance of what Student-life means, from an innate irresponsibility, or from sheer perversity, are not to be congratulated. The time comes when the rapidly accumulating debt must be paid, and such Students simply find that they have contracted something larger than they can handle.

The lives of all the Leaders have been filled with disappointments because of the great gaps that have existed in the lives of their Students. One with brilliant possibilities succumbs to some weakness just for lack of being "On Guard." Another ruins some great plan because of a lapse from absolute punctuality, or from strict adherence to some regulation.

Yet another one climbs and climbs until but a single step is needed—so little a space separates him from the real thing. Alas! Too secure in his conviction of the power to be eternally vigilant, he stumbles at just the critical moment and is flung down again to the very foot of the steep ascent.

This is perhaps oftener seen in the lives of women than of men because the former have, in general, been wholly untrained in continuity. To a greater or less extent men receive that training in business life, to say nothing of the part played by heredity. But again and again the Leaders have had to see some promising student trip and fall, just before the moment of the great victory; not from wilfulness, not from

treachery, but simply because of failure in continuity on some line of effort or vigilance or work. Some have the courage to get up again, bruised but wiser, and begin anew the climb. Others have not. They are the "failures." But with those who do not actually fail, months pass, years even, before the old confidence, the old joy, returns, and in the meantime the work that was waiting, *and had to wait for just their hands to do it*, remains undone.

There are strange and terrible moments when the woman-worker realizes that her every act affects others more than it affects herself. If such a moment of reflection comes in the trail of a mistake or lapse, the door is opened to a remorse that might easily unbalance the strongest mind.

It is ignorance of the dual forces that play upon and through all of life's phases and processes that causes us, as women, to look lightly upon breaks in continuity. It is customary to think, "O, well, the wall is half builded. There can be no harm in stopping for a time. I will take up the work again where I left off." But you can't and won't. When you go back to the neglected duty, the neglected work, *it isn't there*. The half built wall has been torn down, every stone flung from its place. For, as soon as the up-building forces in life cease their active work the destroying forces sweep in. It is an unfailing law. It is as if one should pause to take a vacation in the midst of seed-planting time. He may come back to the spring-plowed fields and spend all August in the most frantic and conscientious kind of seed-planting—but to no avail. There will be no harvest that year,

THREE WOMEN

From *Poems* by MARY McNEIL FENOLLOSA

I KNOW three women. One is brave and strong
To lift calm eyes beside her chosen king.
Upward they toil, nor scornful whispering,
Nor dull indifference, nor suffered wrong
Can balk their striving; but, the way is long.
The next is wild and free; and, as a wing
May cleave the azure of a prairie's ring,
Her mateless soul would cleave the rim of song.
The third is gentle, hushed in quiet needs,
A brooding bird among the water-reeds.
Love is her heaven; and, where it mirrored lies,
Lean the blue blossoms of her children's eyes.
"Clear types," you say, "and strangely set apart."
Look deeper, friend, 'tis but one woman's heart.

spite of all he can do. Nature loves justice and to those who insult the continuity of her processes she measures out heavy penalties.

But if the penalties incurred by breaks in continuity—these gaps in life's work—are great, the rewards of steady, persistent, unvaryingly continuous effort are greater. Doorways are opened into veritable treasure-houses of power. Opportunities present themselves with every day, every hour even—opportunities which unfold the life into undreamed of privilege and joy. The brain clears, the lower tendencies gradually refine and become transmuted into the golden fabric of the Higher, the Soul becomes not a theory but a living and realized Presence. Let us, as Students and as women, make greater effort to preserve continuity in our every line of thought and of deed. Let us study our duties in human life as the weaver studies the myriad colors of the thousand soft threads ere he fastens them into the loom. Then let us fit these duties into their right places on the line of every day's onward march, and let us keep them there. Let us begin each day with a definite Purpose, and then let us abide within it.

STUDENT

Adelaide Ristori

AT the present time, when the eyes of the world are so much upon the women of the stage, there are certain ones that take pre-eminence. One of these is certainly Adelaide Ristori, who comes before one, her face serenely classic, yet capable of presenting a veritable soul-panorama in its mobile picturing of all passions, all states of consciousness, all moods. Born an Italian, Ristori in her temperament was thoroughly Spanish, in many of her characteristics, thoroughly French. She was a child of the Drama itself, the daughter of strolling players, and she made her entry upon the boards when but two months of age.

Like Jenny Lind, Ristori's earliest confidante and wisest teacher was her dear old grandmother, and this sweet comradeship was almost the only bright spot in her early life. At the age of twelve she virtually supported the entire family, consisting of her parents and six brothers and sisters.

There are those who contend that no one ever pictured the depths, the heights, the possibilities of the mother-nature as Ristori pictured it. And it is significant that her real triumphs came after she herself had become wife and mother. Not only did the happiness and deep joys of her marriage and her motherhood develop her in a thousand ways as an actress, but the broader life whose air she breathed made her wiser and more ideal as a mother. This is the testimony of those who knew her. And, in this connection, the story of Ristori's return to the stage, after once completely retiring from it, serves to point out one of her most marked characteristics, an unflinching compassion.

As is well known, her marriage to Guliano del Grillo, son and heir of the wealthy Marchese Capranica, was clandestine, owing to the opposition of his relatives, who forbade marriage with a woman who was his social inferior and an actress to boot. A reconciliation took place when del Grillo's father met Ristori and became aware of the purity and beauty of her life, and it was out of respect to his wishes that Ristori retired from the stage. Some years later, when in the midst of domestic cares and joys, she heard that one of her old managers had been imprisoned for debt. With Ristori to resolve was to act, and she resolved to give three performances for his benefit. Her reappearance was made in Rome, and the Drama claimed her once again. With an Italian company she later went to Paris and as *Francesca da Rimini*, *Myrrha* and *Mary Stuart* she conquered the French capital. Napoleon III testified to his appreciation by means of a diamond bracelet, the first of many honors Ristori was destined to receive from royalty throughout Europe.

The secret of Ristori's power as an actress was her soul-depth as a woman. There was in her nothing selfish, nothing trivial. The money she earned was lavishly poured out to this or that charity. Every sorrow that came into her life served to sweeten and refine and teach. She presents a marked contrast to many of her contemporaries. "Ristori," wrote Jules Yanin, then the great dramatic critic, "she is tragedy itself; she is comedy; she is the drama." "Our language is too poor," said Lamartine, "to express the fulness of her worth."

STUDENT

ADELAIDE RISTORI

A Universal Grandmother

MRS. GILBERT, the late actress, will be the first to be honored by a memorial statue in America. A bronze figure erected to her memory will be placed in one of the New York public parks, and this act will greatly please the public, which remained loyal in its regard for her to the last.

To Mrs. E. St. John Matthews, the gifted sculptor, the one woman on the International Jury of Awards at St. Louis, has been awarded the commission for modelling the statue. Mrs. Matthews has chosen, most appropriately for a model, the figure of Mrs. Gilbert as seen in the role of "Granny," the last part enacted. It represents her seated in her chair, her characteristic attitude throughout most of the play—with her hands folded contentedly in her lap.

It is to be hoped that the sculptor may be able to reproduce the sympathetic, quaintly humorous expression depicted on the countenance which was one of Mrs. Gilbert's greatest charms.

Whoever had the good fortune to see Mrs. Gilbert in the role of "Granny" will not soon forget the rare picture presented as she came forward towards the audience, in answer to the nightly ovation she received at the finale of the play, and recited the following verses with evident pleasure, pride and pathos:

Dear friends in front—the curtain must not fall
Until a grateful woman says good-bye to all,
Just think of all the kindness that I've got of you!
I'd like to be the 'Granny' of the lot of you!
Old age to bear becomes a happy load
When love and friendship line the lengthening road.
And as I've lived long years in this dear land,

I've never lacked the pressure of your hand.
Nor missed your smile the times I tried to jest,
Nor wanted for a tear when tears were best.
So when the curtain's down, the footlights out,
Once and for all for me, I'll turn about
And in my memories live again each day
Your hands and hearts made glad for me my way.

Dear days! so many too, red-lettered ones and gold!
The curtain falls on all of them—I'm eighty-three years old!
Good-bye, old friends! new friends! my children every one of you!
Listen, for its true, I love each mother's son of you!
For wealth, for fame, my goodness, I don't care a filbert,
If only in your hearts you'll keep old Mrs. Gilbert.

Mrs. Gilbert was a living proof that it is possible for a woman to spend the greater part of her life before the footlights, earning her own independence by entertaining the public, and yet retain to the end, all those qualities and virtues that belong to true womanhood.

AN OBSERVER

"TO the actress of the future I address myself, to her whose eyes my eyes have never met, to her whose hands my hands have never clasped; and of her I make one demand. When she enters the great temple of this art, let her take upon herself the solemn vow that whether she enter the inner circle or whether she serve her whole life long in some outer court, when all is over, her services ended, she will leave upon the altar of her art the pure white flower of a stainless life."—Clara Morris.

THE first string quartet in America to be composed entirely of women was the Eichberg String Quartet formed in Boston some years ago. When the four young women composing it visited the continent, partly for study and partly for concert work, all Europe was astonished. They were known as the "American wonders," but their success was phenomenal. Today there are a number of quartets and even orchestras composed entirely of women. It is certainly true that if, as Dvorak once prophesied, chamber music is to rank first in America in the future, a wide doorway is opening before women who are proficient upon stringed instruments.

UNWIELDY as the violincello seems to be, it is coming steadily into favor as an instrument for women. The brilliant young Portuguese 'cellist, one Guillermina Suggia, is at present meeting with phenomenal success in Europe. Though but nineteen, it is said that she plays not only like one entirely in love with her art, but, according to unprejudiced critics, with apparently a complete mastery of her instrument.

OUR YOUNG FOLK

Games at Lomaland

IN viewing the statues of the heroes of ancient Greece, we are impressed by the strength and grace which are there expressed, in poise of head, graceful contour of limb and erectness of carriage. They seem to be manifestations of a divinity and tranquillity never met with today. One naturally looks to the life and training of the Greeks for the reason for such results; and one finds that the Greek boys and girls were athletes from childhood. Nor were they deficient in the accomplishments of mind.

The schools or *gymnasia* of that time gave a goodly portion of daily work to athletics, consisting not only of athletic events proper, but also of games wherein physical ability, both individual and coöperative, was brought into play.

This training, infused into the race almost from birth, made the Greeks a people fair to behold, happy and successful as a nation. The highest honor a young Greek could desire was to be allowed to compete in the contests held at the Olympic and similar Festivals, for so high were the qualifications that few could enter.

A boy must not only have been "in training" for the ten months just passed, but he must also be of unblemished character, a worthy son, and fit to become a citizen of the nation. Compare these with the requirements made today!

Today we hear of marvelous (?) records in the athletic field. But how much is the race benefited physically or morally by them? Yet it is said that modern "records" surpass those made by the Greeks! Comparing the physique of the respective races as a whole, and considering the probable ratio in which the athlete surpassed layman, the writer is inclined to yield the palm to the Greeks.

The trouble today is lack of balanced effort and a selfish desire to make a "record." Bodily perfection, using the word in its true sense, can only come as the result or natural expression of a perfect life. Athletics is one of the *means*; a perfect instrument for the soul to use should be the end of all athletic training.

At Lomaland, holding before us our ideal of a regenerated humanity, we all seek to embody in our lives a consistent relation between outdoor sports and the more serious duties of life. Visitors frequently remark the erect carriage and calm demeanor of Point Loma students; especially the children. The reason is clear. From the tiny tots who go through their little "setting up" drill each morning, to the oldest residents, all practise and receive benefit from some form of athletic exercise.

The mild climate makes it possible to be always in the open air; and the spacious grounds, the wide hills traversed by winding paths, together with the nearby ocean, afford ample opportunity for healthful outdoor amusements. Those already underway are golf; baseball and basket-ball; children's games; swimming and the various features of track athletics. As the work in general advances, other games, appropriate to the ideals of the Olympian Games already established by Katherine Tingley, will find their proper places.

Baseball and basket-ball instill a spirit of alertness into body and mind, developing coöperation between hand and eye. The boy who can play a good "live" game of ball well, (other things being equal) becomes a

better business man, musician, lawyer, than one who cannot. Swimming gives one confidence, develops the breathing capacity and the muscles of arms and back. Outdoor games for the smaller children are much encouraged. They furnish amusement and at the same time give the exercise so desirable in the development of a growing child.

Within the last few months the first of a series of athletic events connected with the Olympian Games were held in the Greek Theatre at Point Loma, one being for the senior and the other for the junior students. Both were distinguished by the true spirit of athletic activity and a frank brotherliness in competition; the whole being animated by a good-natured rivalry that was quite refreshing. In watching the Raja Yoga students at these gatherings one cannot help feeling that they are the fore-runners of a new and wiser race.

Before long the best that was contained in the ancient games will be restored. The hills of Lomaland will be as famed as the slopes of Olympus; for truly, only by proper control of the body and mind can man attain to happiness or to perfection.

A STUDENT OF RAJA YOGA

"Fact"

THE juice of the curious ink plant of New Granada can be used for writing without any preparation. At first it is red, but after a few hours it changes to black.

IN DENMARK education is free and compulsory. There are colleges, technical schools, scientific and classic academies galore. The peasantry of Denmark are a remarkably well-educated and thoughtful class. Higher education is the right of every man, say the Danes, and in their country it is made possible for every man to secure it. Their system of High Schools for young farmers is most unique.

How many ever heard of the

little town of Mogok, lying in the northern State of Burma, on a table land fully seven thousand feet above the level of the sea? It is noted for the marvelous rubies which are found there, not deep in the earth, but in the soil upon the surface. It is not uncommon to see the daughters of wealthy natives wearing thousands of dollars worth of jewels at one time, and the wealth of the natives, they say, is estimated not in dollars but in rubies.

AUSTRALIA lies more than one-third within the southern tropics, therefore never having extremes of cold and but seldom extremes of heat. It was not until five years after England had acknowledged the independence of the United States that there was a single white settler upon that continent, and for the first half century it was little more than a place of refuge for British convicts. It is only fifty years since responsible government has been established, and yet today, in many respects, its civic life is an example to nations the most advanced.

A RAILROAD will shortly be completed in the Egyptian Sudan connecting the Nile with the Red Sea, thus meeting the imperative demand of growing commercial interests in the inland country. Only the most valuable products could stand the expense of slow camel transportation. The railroad will open the way for export of grain and cotton, which were too heavy and too cheap to be transported by animals. By caravan the journey of two hundred and fifty miles requires fifteen days, whereas the distance is covered in one day by rail. Plainly, the completion of this road will mark an epoch in the progress of the Sudan.

A GLIMPSE OF ONE OF THE GAMES OF LOMALAND

FRAGMENT

NOW is the high-tide of the year,
And whatever of life hath ebbed away
Comes flooding back with a ripply cheer,
Into every bare inlet and creek and bay
And the heart is so full that a drop overfills it.

THE CHILDREN'S HOUR

A Lark's Visit to a Lotus Group

"I HAVE a true fairy-tale for you," sang a little bird one day to some bright-faced children, who were sitting on the grass round the lilac bush on which he was perched.

"Oh, how lovely!" said they. "And we are not particular about its being true, either!" "Well, listen," chirruped the little songster.

"There was once a Master Musician. His home was not on this earth. Where he lived there was eternal music. But when he looked at this planet, called 'The Sorrowful Star,' he found that, although nature was singing, men and women and little children were silent. Alas! They knew not how to sing. This made the Master Musician sad, and he resolved to come and stay awhile and teach the people to sing.

"It was to Lomaland he came, and from thence gave forth notes clear and strong and true, and so penetrating that they reached to the very ends of the earth—to those green islands called England and Ireland, to Holland, Germany and Sweden, to Greece and ancient Egypt and India, echoing and re-echoing, north and south and east and west.

"But only a few people whose hearts were in tune caught these notes.

"Now a wonderful thing happened. You must know that this music is mystery-music and whoever hears it, is obliged to rise and follow it; but one said:

"Yes, the music is beautiful, more beautiful than any music I have ever heard, but I am not going to follow it. In fact I cannot. I have my business which keeps me bound hand and foot!" Another said: "Oh that music! It is the music of my soul! I would go. But I cannot. I have a friend dearer to me than life and to leave him would break my heart. It is impossible!"

"But this music is, as I told you, enchanted and wonderful music. And this is the wonderful part. You know magic can do impossible things. So, no matter what the people thought and said, when these strains fell on their ears, sooner or later the unselfish ones would follow and follow until they found their Master Musician."

"Then what happened?" said the children.

"Then the Master Musician woke the music that lay sleeping in the souls of those who had heard and obeyed the summons. And they became transformed. And hark! children—today, the music of the human heart-life, most beautiful of all, is blending with the divine harmonies of nature's own song."

"And," added the little bird, as he rose to fly away, "the Master Musician lives still in Lomaland, and when all the people of the earth have heard and responded to the magic of his music, this world will no longer be called 'The Sorrowful Star,' but 'The Singing Star.'" And this is just as I heard the tale, sung out to the flowers, the children, the sunshine and the blue, blue, sky by a little Lomaland lark. M. V. H.

"Be Open Ever More"

BE OPEN EVERMORE
OH THOU MY DOOR!
TO NONE BE SHUT—TO HONEST OR TO POOR!

DEAR CHILDREN: Have you ever heard the story these words contain? In a far-off country place a man once built his house, wherein he dwelt so happily that he longed to give to others less fortunate than himself something of his own joy. Out of this kindness of spirit he caused to be cut in the stone above his house-door these beautiful words of welcome to all who passed.

Is it not a pleasant thought to picture the way-worn pilgrim, the travel-stained wanderer, the various members of the world's great family of "the honest and the poor" reading in that inscription renewed hope and comfort?

Then here comes the dark side of the story. In time the house that had sheltered so many of the homeless ones, and under whose roof hunger had so often been relieved, passed out of the ownership of the big-hearted man who had built it, into the hands of another who, in his hurried scramble through life, had forgotten certain very vital facts. You know how the place we live in changes as we change and is never anything but the reflection of ourselves to those who see things rightly. So you will understand what happened to the "House of Hope." It was not long before it changed to accommodate its new occupant, and among other alterations, instead of the hospitable invitation to enter, the passerby read with sinking heart this inscription above the door:

BE OPEN EVERMORE
O THOU MY DOOR
TO NONE! BE SHUT TO HONEST OR TO POOR!

Would you have dreamed an innocent exclamation point could have been made to do so much mischief? Shall we not believe, though the story leaves us in this disagreeable place, that the second owner of the house changed his mind, or his heart, or himself wholly, and caused the exclamation point to resume its rightful place in the legend written over the door of the "House of Hope"? STUDENT

AWAY at the very top of a giant tree the eagle often builds its nest. And if the tree grows on a high mountain the eagle is just so much happier, for it loves to be near the clouds, or even above them, high in the sunlight. There, covered with vines perhaps, is the nest where the mother eagle rears her young. The nest is large and crude, being made of sticks and branches, yet inside it is as warm and downy as hair and soft feathers and delicate moss can make it.

The mother eagle is very unselfish and courageous. It may be her example that makes young eagles so strong and fearless. STUDENT

OUR CHILDHOOD'S GOLD

"TIS scattered all about the hills,
In stars and bells adown the dells.
We children gather aprons full
Where little Dandelion dwells.
And yellow Cowslip, at our feet
Stands like a king: rich gold he hath.
And Columbine, with nod so sweet,
Shakes gold upon our path.

Our homes are built upon the hills
Where life is joyful, sweet and pure,
Where sunshine every season fills,
How can a happy child be poor?
With gold about us everywhere,
The whole sweet story can't be told!
Sunbeams and bird-songs, stars and flowers—
Come! Share our childhood's gold!—Selected

Isis
Theatre
*
San
Diego
California

THE THEOSOPHICAL FORUM, IN ISIS THEATRE

THE Universal Brotherhood meeting at Isis Theatre last Sunday evening, included, beside the three papers read, a musical program of rare excellence. The overture from *Tannhäuser* was given by special request. There was an andante for two violins from Papini, and the Raja Yoga string quartette rendered two numbers: *Andante Cantabile*, by Tschaikowsky, and *Serenade*, for strings, by Mozart. This is the first time in many months that the Raja Yoga boys have appeared at the Theatre, but their playing on this occasion was even better than usual.

"The New Day" was the subject of a paper read by Master Montague Machell, one of the Raja Yoga boys. In part he said: "H. P. Blavatsky, through all her work, must have had before her mind's eye a picture that gave her a brighter ray of hope for the future. I think she must have seen a new golden age returning, a new race being born and new and higher ideals being given out. And I am sure that her picture showed her the children, the unspoiled and unselfish little buds and blossoms of this new age, coming forth and leading the elders toward the light. We children of the Raja Yoga school have faith in this new day, for our heart tells us it is true.

"And, as Mrs. Tingley has said so many times, the only true workers for this great cause are those who have become free from their lower selves and are not bound by personal likes and dislikes, and unhealthy habits of mind and body. Those who can forget themselves and in this higher battle for right, strike down the foes of progress in their own natures, the little petty habits and mistakes of everyday life. Where, you will ask, are we to find people, so much as approaching this ideal? At Point Loma, in the Raja Yoga School, under Katherine Tingley's loving care are children and students trying to learn these lessons, endeavoring every day to overcome some little fault, and always ready to learn."

Rev. S. J. Neill read a paper entitled: "Man as the Temple of God." The speaker declared that man was the microcosm, the little world, which is the picture or image of the universe. "This," he said, "is an old teaching. The post-Christian writers who have used the phrase, 'as above, so below,' or who have called 'man the microcosm and the uni-

verse the macrocosm,' have but amplified the pre-Christian teaching. The Jewish Rabbi in olden time taught the same thing." The speaker declared that man is the temple of God, and quoted freely from both the Old and New Testaments in support of the statement.

"The body of man, notwithstanding all its limitations, is a wonderful temple, a wonderful instrument in the hand of the soul. It corresponds to the outer court of the temple; and it should be kept pure and clean, and in every way it should be 'fit for the Master's use.' But man is the temple of God more especially as to his mind and soul. If the outer court of the temple should be clean and pure, much more should the holy place, the Holy of Holies be so; 'For thus saith the high and lofty One that inhabits it to eternity, whose name is Holy. I dwell in the high and holy place, with him also that is of a contrite and humble spirit.' Can the Infinite, the Eternal, the Absolute, be confined in man's soul or mentality? Beyond our limited vision, beyond our narrow consciousness, even beyond the consciousness of the highest adept, does not the Absolute, the Most High, rule in the Boundless All? Yet while that is so it must also be true that man is the temple of God. We look within to find God."

Mr. W. A. Rounds also read a paper entitled: "Beliefs: Living and Lifeless." He said:

"If one were to name the chief present weakness of the human mind, one would perhaps say it is powerlessness in realizing beliefs. . . . But we can learn to add to our beliefs that something from the heart that will make them "living powers," to dwell on them until they can no longer be swept under by the rushing waters of the hour."—*San Diego News*

Theosophical Meetings for Sunday Nights

Public Theosophical meetings are conducted every Sunday night in San Diego at 8:15, at the Isis Theatre, by the students of Lomaland.

Theosophical subjects pertaining to all departments of thought and bearing on all conditions of life are attractively and thoughtfully presented.

An interesting feature is the excellent music rendered by some of the students of the Isis Conservatory of Music of Lomaland. Theosophical literature may always be purchased at these meetings.

Art Music Literature and the Drama

What Shall Be the Musical Notation of the Future?

NOT content with a new language we are now to have a new notation based on the fact—or assumption rather—of what is known to musicians as “equal temperament.” The inventor, by means of a staff of seven lines, dispenses with sharps and flats altogether, leaving, of course, only one way of writing any one note. According to his system, for example, A-flat and G-sharp must be identical. As a matter of musical fact they are not. One student writes:

It would seem that this new method is really a step toward the old system of musical writing with which the eye had to contend with a solid page of lines, there being only an occasional clef to remind the reader of the pitch. Does this method simplify matters? One seriously questions, even though it is not impossible to imagine there coming into use in the future a system of musical notation which differs from the one used at present. It will not be an arbitrary thing, however, but the result of growth along logical lines, conveying deeper musical meanings than is possible to our present system.

There is a strange analogy between this and the theory of those who contend for the phonetic spelling of English words. As to the latter, there is not only the objection that the question “What is the exact and only correct sound of this word or that” can never be answered, but such wholesale deviation from the present system would involve the sweeping away of all that glorious background which is so rich and true to those to whom words reveal themselves in their real meaning. Those who have a really poetic conception of what English means, even those who have some of the finer knowledge that comes from a study of, say, three or four languages, simply cannot understand the man who declares that “physics” has the same inherent value as a literary quantity as “fisiks,” or that the meaning of “psychical” can possibly be expressed by “sikikal.”

As the blossom is to the tree so is each word to the language from which it has sprung, the roots of its parent tree reaching far back into the past. In a strangely ingenuous fashion the author of this new system of notation refuses to recognize two facts:—that, as the present notation is a thing of evolutionary growth so must be that of the future; and, also, that equal temperament is not a fact musically, nor mathematically, but merely a concession on our part to mental and mechanical limitations. What inspiration remains for a composer under this new system? Surely, there would be little enough for one who understands the theory of his art in its finer, higher and more poetic significance.

STUDENT

A CONTEMPORARY discusses the merits, possibilities and management of boy-choirs and counsels the teacher or leader to use tact because “boys have their moods and have to be humored and one often has to put up with a good deal.” If that is the way an appreciable number of musicians are beginning their careers, it is easy to predict that the future will witness no shortage in the supply of headstrong, willful and obstinate concert soloists and pouting prima donnas. But where are the religionists whose work is so closely connected with that of the teachers of their boy-choirs? Surely, for simple humanity’s sake, they should teach their fellow-workers one or two little things about human nature.

In the face of conditions as we see them, one is tempted to question, “But have they this knowledge themselves? If so, why do they not impart it out of sheer compassion?”

STUDENT

IT WAS one of Wagner’s theories that a composer should not be confined to a given succession of keys, but that he should be at liberty to swim in a “sea of tone.” Wagner, however, was never drowned in this sea, which might not always be the case with other composers.

Furl the Sails—The Message of the Days

FURL your sails. It is a good thing to do, sometimes more than once a day.

As the sun climbs the sky, and the hours give birth one to another, consciousness changes, sometimes quite quickly and definitely. Amid the changes we become occasionally conscious of a breath from some deeper fountain of life, quite apart from the activities of the hour.

Welcome these; furl the sails of thought and action a moment or two. Let the breath of this deeper consciousness pass out from the place in the heart where is always peace, and pervade the field of mind and brain and body. It is an opportune message from the soul, though at first you may not be able to interpret it. It will give strength for the work that in a moment you will resume.

Those waves, if you note them, will become fuller and fuller of meaning, and at last illuminate life and your own nature for you. They will be present in the fullest rush of your activities, strengthen your nobler qualities, destroy the worse, mend your weaknesses. Their message will build up an ideal of life to which your character will slowly come to conform. And as the years pass, you will find that they have taken away all the dread of sickness and of death; for the new consciousness that they confer is affected by neither.

H.

A RECENT writer objects to musical study on the ground that music arouses impulses that, in the nature of the case, must remain unsatisfied; hence, a weakening of the moral power. (!) He shows, with some elaborateness of diction, how one listens to a beautiful piece

of music and is stirred by it to aspirations for better things. Then he continues by showing how this sentiment and these aspirations remain fruitless, of course. Hence the moral power is weakened. *Ergo*, abolish music!!

From the common sense point of view one would consider that the blame for all this rests not at the door of music but at the door of the individual will. If the will is feeble or lacking, of course good impulses are fruitless. Who would expect them to be otherwise? But if we are to abolish music because it succeeds in rousing these, then let us clean off the world’s slate all great art, all great architecture, all great living. We need not less sentiment, but more common sense; not less

aspiration, but more unselfishness and will power; not less music but more honesty and altruism; not less of the beautiful but more of the good and the true.

STUDENT

THE Venetians, in honoring the memory of Ruskin by a festival, are, in reality, paying homage to the great past of their beautiful city, for Ruskin in his writings not only did much to encourage the appreciation of the art of Venice, but he made better known the heroes of her early history. And will not this demonstration of gratitude and affection stand as an evidence of loyalty and patriotism on the part of the Venetians, forging one more kindly link between two nations?

H.

STATISTICIANS are never satisfied. Here is one assuring us that Rossini received thirty-five cents per note for the opera of *Semiramide*; that every time Patti sings she receives thirty cents per note, excepting in *Lucia* where, the notes being fewer, the ratio is higher. Not satisfied with this, another informs us that at a certain concert at which Paganini played he received \$2.30 per measure!! Valuable information this—it is a pity the world of music has been without it so long.

FROM the standpoint of artists as well as archeologists, the addition of important Greco-Egyptian treasures to the Alexandrian Museum has its significance. Among these are some heads in terra-cotta of the grotesque type but of undoubted Grecian workmanship.

FRAGMENT

WE may shut our eyes, but we cannot help knowing
That skies are clear and grass is growing;
The breeze comes whispering in our ear,
That dandelions are blossoming near.
That maize has sprouted, that streams are flowing,
That the river is bluer than the sky,
That the robin is plastering his house hard by;
And if the breeze kept the good news back,
For other countries we should not lack;
We could guess it all by yon heifer’s lowing—
And hark! how clear bold chanticleer,
Warmed with the new wine of the year,
Tells it all in his lusty crowing!—*James Russell Lowell*

Universal Brotherhood Organization

Central Office Point Loma California

"Give Us a Faith!"

A RECENT speaker in Lomaland, in enumerating some of the blessings of a life led in accordance with Theosophical ideals, made the pregnant remark that it gave a man Faith. For a cultured man in this modern world to gain a Faith, without losing his senses and joining some babbling sect, is indeed a blessing. It takes something to find a Faith able to satisfy such a man; and his thankfulness will be fully understood by all who have been able to gain this Faith, and that without narrowing their ideas, but on the contrary immensely enlarging them.

The other side of the picture is that the world is calling out for a faith. Yes, the materialistic, self-satisfied Occident sees at last that its civilization is really dangerously unsafe for want of a backbone of idealism.

For instance, Dr. Felix Adler of New York is quoted as saying:

We are going through the most trying period of human history. We are losing our symbols. Politics has lost the symbols of the greatness of the State. . . . We have fallen upon times when men think that the State is a mere convenience. . . . We need a new spirit, not merely new mechanical devices.

And the *Los Angeles Saturday Post* says, in comparing the yellow races with the white, that what makes the yellow races so strong as to be called a "peril" is their *faith*. The Chinese and Japanese have a powerful faith in the permanence of their ancestral spirits and in the family ideal. The writer does not give at all a clear idea of what this ancestor and family worship is, but he is convinced that it is a real faith to the Orientals and makes them strong, industrious, and united. He is afraid the white race will go down before them *unless it gets a faith*.

Our weak point is diminution of religious or soul ideal commanding the individual to productive work and to reproductive family life. Our standard of life is less and less spiritual and more and more material. This is an impasse. The domination of the material standard over the spiritual ideal has always been fatal to mankind.

He adds that material objects of pursuit increase faster than the means of attaining them, so that we are running after the unattainable. This is another way of stating the old truth that desire is a fire which grows by what it feeds upon. He concludes:

What our people need is an ideal. If we can find a spiritual ideal founded on facts conformable to the limitations of the human mind to receive evidence, or on a scientific basis, we will have solved the problem of life.

We believe fully that there is an ideal for the Spirit capable of scientific demonstration.

Was there ever a plainer request for the very ideals and teaching which we have in Lomaland? Oh if these truthseekers could but muster enough faith to honestly and sincerely investigate Lomaland methods, they might find what they wanted. It is no use waiting for intellectual conviction to come first; faith is the assurance of knowledge to come.

There is an ideal for the Spirit capable of scientific demonstration, but that boon is for the brave, the self-sacrificing, the trustful. We must have faith in the indomitable power of our own interior Life and Light, faith in the power of unselfish love, faith in the efficacy of sincerity of motive; and then the light of intellectual conviction will penetrate the mists of our doubt- and desire-clouded mind.

The people at Lomaland have had faith enough to cast aside doubts, fears, and prejudices, and follow the path of duty indicated to them by Theosophy. And light has come.

Theosophy is the only thing that can restore ideals to the world, and it can do it. Have faith enough to investigate it. O ye who persecuted the prophets, do ye ask for a sign? What if the sign were not to your liking? What if the language of Truth were *too* true for you, and her garb *too* humble? "A carpenter's son! A Russian adventuress! A market-place gossip and misleader of young men! A hysterical French peasant!" Shall we wait for Truth to address us in a frock-coat and kid gloves? Shall we wait for a Soul or a Spirit to come rushing down from the sky to fill us with faith? Go to! The Soul, the Spirit, and

Faith, and the Truth is in you all the while, and you deny it. Spread your wings and seek the Light. STUDENT

Renegade "Theosophists" Branded by the Press--- Jesuitical Casuistry About War

THE name of Theosophy is still used by a few persons who, formerly belonging to the Theosophical Society, are no longer recognized by it.

These people, after vainly trying to overthrow the then Leader, Mr. W. Q. Judge, formed a little coterie of their own, since split up into still smaller cliques. A magazine was run which has since dwindled into a quarterly. Its teachings are now so far removed from anything conveyed by the word Theosophy that they are the laughing stock of any one who may by a rare chance get hold of a copy. In fact they cannot any longer even mislead, as the following shows. Thus are those who abuse sacred knowledge fated to become more deluded than the most ignorant fanatic.

Picking up a recent number of the *New York Independent*, we notice a quotation from this "Theosophical quarterly" in which the most pitiful sophistries about war are indulged in. The attempt is to reconcile men's minds to war as not only a necessary evil, but even a good, and the *Independent* spares half a column to point out the obvious fallacies. Says the "Theosophical" quarterly mentioned:

It seems highly probable that war among nations performs very much the same function that a boil does in an individual. There is an accumulation of evil force, of wickedness, of moral poison, which must express itself outwardly or it will fester within and the body will become unwholesome, diseased and die. War, with its inevitable suffering and attendant misery, must carry off, as it were, large masses of bad *karma*, and when it is over even the chief sufferers must have a clearer way open to them for their future higher evolution. So, like everything else in the world, it cannot be wholly evil.

To this the *Independent* replies that war *engenders* passion and hatred— a fact so perfectly obvious that one marvels at the opacity (or is it Jesuitry?) of the minds that can state the contrary. Theosophy does *not* teach that evil is "worked off" by *indulging* it, nor that fire is exhausted by *feeding* it. Theosophy does not advocate quarrels as a means of peace-making. The purpose of all enemies to human welfare is to set men to hating and killing each other, for well they know that strife grows as it spreads, like a conflagration. In war thousands of innocent people suffer, the homes of the peaceful are desolated, and miseries untold produced. And this is to work off an insignificant amount of jealousy, etc.!!! If it gets too warm, set your house afire, and after that it will be nice and cool!

Again, bodily impurities are eliminated by the intestines, skin, lungs, kidneys, etc.; but a boil is a disease. Catarrh and other undesirable things also remove impurities, but through a wrong channel. We must remove drainage from our dwelling, sure; but *not* through the drawing-room windows! The evil thoughts of man can be purified in a natural way, just as the body or the house can; and war is not that way.

The *Independent* adds:

And lastly, we question whether the statement quoted is any more sound from a Theosophical standpoint than it is from the psychological and medical. Is it not the teaching of Theosophy that bad *karma* is never destroyed by the death of the individual, but must be worked out of the system, like malaria, in some future lives?

So an ordinary magazine knows enough about Theosophy to be able to detect that the word "Theosophical" is misused in this instance. Needless to say the word *karma*, originally used by H. P. Blavatsky to explain certain Theosophical teachings, is here used in lord-knows-what sense to suit the very peculiar views of the warlike cult.

Now we see that the public can understand the situation about the Universal Brotherhood and Theosophical Society and its enemies, perfectly well by its own common-sense.

It is easy to see why these people have such bitter hatred for true Theosophy, for Katherine Tingley, and for her work. H. T. E.

THE URGE OF THE RACE

J. A. FERGERTON

TO the West! To the West! So the human tides sweep
From land unto land, like a billow of light.
O'er Asia, o'er Europe, and thence o'er the deep,
As the snow from the peak, came the avalanche bright.
It surged o'er the wave to a clime that was new,
A shore that was virgin, a threshold untrod,
That gleamed on humanity's wondering view
Like the world-spirit's last revelation from God.
Then on, ever on, over mountains it rolled,
O'er rivers and plains, without pause, without rest,
Till it came to the verge by the Gateway of Gold;
And still it flows on to the West, to the West.

To the West! To the West! In the path of the sun,
It speeds to the isles of the Orient sea,
Where the New and the Old shall clasp hands and be one
In the COSMICAL BROTHERHOOD waiting to be:
Till the impulse that stirred at the cradle of Man
Shall have finished its course and encircled the earth,
To return and awaken each slumbering clan
Of the nations that lie 'round the place of its birth;
And the wave on humanity's ocean made bright
By the glitter of Empires that rose on its crest,
Shall have left 'round the planet a girdle of light,
As it surged on its way to the West, to the West.—Selected

"Good Pessimism and Bad Optimism"

THE people prefer bad optimism to good pessimism. This, according to a writer of literary jottings, is why they read dime novels and go to inferior plays. Perhaps he should have interchanged his parts of speech and said "optimistic badness and pessimistic goodness." The good pessimism or pessimistic goodness alluded to in the remarks was that of a certain unclassified "yearnist" with a vague gospel of higher things literary, artistic, and otherwise.

What a hopeful sign! The people prefer optimism. Joy is life. This is why the bad boy of the Sunday-school books is more attractive than the oily-haired good boy, and the lively villain than the sloppy hero.

But what a pity the "devil should have all the best times." Must we be either heathens or prigs? The greatest revelation to a Raja Yoga teacher is to realize that a schoolboy can be good and manly at one and the same time. The tone of the school is such that a boy can be healthy-minded and jolly without having to wear the badge of laxity, and keep his self-respect without having to join the ranks of goody-goodyism.

When will there be such a tone in the world at large; and when can people have books and amusements that are both optimistic and good? Instead of having to choose between the bad that is and the good that can't be, people should be enabled to see the good that is in life. STUDENT

Enthusiasm

ENTHUSIASM, in its literal sense, is God in us arousing and stirring us to action. Without this we should be lifeless. All our power comes from the same original source, though we may fall far short of using it for divine purposes even when we mean well, on account of our ignorance. And it may be and often is knowingly used for evil as well as for good. So the term enthusiasm has come to reach from pole to pole so far as motive goes and covers all energetic action in which the interest of the actor is absorbed, and this may be a selfish or an unselfish interest, but it is great and powerful.

A true and perfect enthusiasm would have God active in it in every respect. The Divine Spirit in man would move him not only with power but with wisdom and compassion, and he would be a true enthusiast of the noblest type. Such ones we see in the World's great Helpers and Teachers; such were H. P. Blavatsky and William Q. Judge, and such a one is our present Leader and Teacher.

We see people following purely selfish and ambitious ends with a devotion and energy called enthusiasm, by which they succeed in attaining what they seek; but sooner or later the much coveted prize turns, as it were, to dust and ashes, and becomes worthless to the possessor. Then the lesson is learned that to work for self is in the end to work for disappointment; and God is in it all teaching through bitter experience the lesson of brotherhood and the folly of working for self alone.

Without some measure of enthusiasm we are as dead sticks drifting with the current. Better enthusiasm mistakenly directed than no enthusiasm, for in time it will be used aright and turned to worthy ends, and then its power will increase.

What cause for unbounded enthusiasm have those who work for humanity's welfare! Though crippled to an extent by past as well as present selfishness, we may by the force of our wills and the help of the Divine Power within arise out of this condition and make ourselves fit instruments for the indwelling God to use in the uplifting of the world.

BANDUSIA WAKEFIELD

FRIENDS IN COUNSEL

DEAR COMRADES: The recent celebration of the anniversary of the laying of the cornerstone of the Isis Conservatory of Music and Drama, has once more called to mind that very early in the history of the Institution here the high importance of music in the life of the community was emphasized. Music in the Raja Yoga system is no surface gilding nor decorative finish but is woven in the warp and woof of the life fabric that we weave from day to day upon the hill. A Raja Yoga boy or girl who did not sing would be as much a curiosity as a dumb linnnet or as a minnow who had never learned to swim. The air is vibrant with the strains of music all day long, for even when not occupied with song the wind-borne voices of the children that are wafted to our ears are soft and full of melody. It seems as though they lived in such complete and full accord with natural law that harmony and rhythm mark their common and familiar speech.

To visitors who ask, "Is singing, then, compulsory for every child?" the first reply would be a smile, for to associate coercion with the children's songs is somewhat of an incongruity, and secondly we should explain that every child is asked to sing and every child complies, "but not upon compulsion," for they pour their souls spontaneously in song like birds in sunshine after rain. Coercion of a very powerful kind, indeed, would be required before the singing of the children could be stopped, a "labor" truly that would tax the powers of much prevailing Hercules himself. A natural, temperate, active life whose motive is to help the world and keep in time and tune with Universal Law, would seem to generate perpetual joy that seeks a natural overflow in musical expression.

The magic power of song is something more than vague poetic fancy. The human voice when perfectly responsive to the lightest touch of our diviner selves, works powerfully in secret ways that baffle our attempts to understand. Its field of action is upon the inner regions of our complex nature and its subtle harmonies will long survive the transient memory of the brain. The echoes are continued and prolonged in the abyssal depths of our subconscious selves.

Visitors arriving in our midst out of the world's confusion hear the children sing and are affected, though they know not why. The sounds that ripple through the air die out and fade away, but who is able to deny that in some more ethereal medium those clear tones are ringing still? The hearer goes his way and plunges in the whirling maelstrom of the city's life; but even there, are seasons when a quiet hush subdues the mind, and in those silent moments then the inner ears again are greeted with the echoes of the children's song. Thus in the deep unfathomed spaces of the inner world the voices are resounding still, and in the memory of the Soul the sounds shall never wholly die away. STUDENT

TWO things are essential to the realization of the progress we seek: the declaration of a principle and its incarnation in action. . . .

And when that faith shall be not only upon your lips but in your hearts; when your acts shall correspond to your words, and virtue shall sanctify your life, as liberty has sanctified your intelligence; when united, brothers and believers, and rallied round one sole banner, you appear before mankind as seekers after Good, and they say of you amongst themselves: *These men are a living religion*—think you your appeal to the peoples will not meet with a ready response?—From *Faith and the Future*, by Mazzini

THE DAUNTLESS SPIRIT

SHAKESPEARE

BE great in act as you have been in thought;
Be stirring as the time; be fire with fire;
Threaten the thrcatener, and outface the brow
Of bragging Horror; so shall inferior eyes,
That borrow their behaviors from the great,
Grow great by your example, and put on
The dauntless spirit of resolution.

TRUST AND REASON

WILLIAM CULLEN BRYANT

Iwould not always reason. The straight path
Wearies us with its never-varying lines
And we grow melancholy. I would make
Reason my guide, but she should sometimes sit
Patiently by the wayside, while I traced
The mazes of the pleasant wilderness
Around me. She should be my counsellor,
But not my tyrant. For the spirit acceds
Impulses from a deeper source than hers,
And there are motives in the mind of man
That she must look upon with awe.

THE OSOPHICAL FORUM

Conducted by J. H. Fussell

Question Referring to a previous question, would you say there are two kinds of intellect, and, if so, what are their distinguishing characteristics?

Answer Modern knowledge cannot be congratulated on its acquaintance with the make-up of the human nature. What with a religion that bars reasoning and a science that cannot get above the material world, our ignorance of our own nature is simply appalling.

Take, for instance, our ideas about the "intellect." We use this word in the very vaguest and loosest sense. There is no vestige of an appreciation of that fact, known to ancient philosophies, that the mind is dual, being a mingling of an earthy with a divine element (for want of better words in such a language). H. P. Blavatsky took the whole of modern psychology and science to task over this point, showing that their conclusions were either vitiated or confused by ignoring or failing to distinguish the higher element in the mind.

There is an intellect which does nothing but formulate and classify and never discovers anything. It would have nothing to do if the other kind of intellect did not find out things for it to analyze and classify. It at the same time exploits and contemns the speculative intellect. By itself it is useless as a practical guide. It becomes merely an automatic learning machine turning out shoals of dry learning; or else it ministers to the passions, using its powers in finding argumentative justification for selfish and pessimistic ideals. One calls to mind a certain learned doctor of science who was a most profound authority on biology, anthropology, and all kindred ologies; an erudite classical scholar; and a man of encyclopedic reading and indelible memory. His writings bristle with accurate quotations in every language and allusions taken from all possible sources. But, though he could quote all that had ever been said about anything, his own conclusions never took any other form than that of an interrogation point, and he hovered in the regions of religious doubt and blind faith. He could make no use of his vast learning; but, fortunately, his simple nature led him to H. P. Blavatsky, who was able to supply the clues and connecting links that turned it into a science serviceable to humanity.

These lower, analyzing, classifying faculties of the intellect are useful and necessary, but not when they try to take the reins; then they only confuse and lead astray. A simple intuition is better; but best is the mind that both has learning and knows how to use it. STUDENT

Question Does the working out of Karma depend upon ourselves, or do we have to await the opportunity for its fulfillment? For instance, will not a strong, energetic character work through more Karma than one who is negative and weak?

Answer Replying to the first part of the question, it would appear that the working out of Karma depended both upon ourselves and the opportunity. Given the opportunity, it depends upon us to use it or not; but is it not an almost universal experience that

opportunity after opportunity slips by, because we are not ready to "take the current when it serves" and so we lose our venture?

But if we are ready at all times, and to be so comes only from the performance of the duty at hand, need we ever trouble about the opportunity coming? Come it will, we may be sure, for the Law never fails, but brings to each his due and in due season.

Each one has a reserve of unexpended Karma, which, because of present environment, and the Karma now being worked out, cannot yet come to fruition.

Present conditions and present environment permit of the working of Karma along certain lines, but are obstacles to its working on other lines. This means that the opportunity for this latter Karma must be awaited, and is it not clear that we ourselves can bring about this opportunity by fulfilling present Karma, that is by doing the duty and fulfilling the obligations of the present life? For if we shirk and try to escape from these we do but pile up for ourselves more Karma and add to the web of destiny in which we have enwrapped ourselves.

As to the second part of the question, we know very well that the life of an energetic, strong man or woman is much fuller and richer than that of one who is negative and weak. But it is not physical strength and energy that is alone referred to, but mental and moral strength. In the former case the amount of Karma worked out might be very small as there would be little opportunity for any but physical Karma to operate.

Speaking of Karma held back because of the lack of suitable conditions, W. Q. Judge wrote:

The force of a certain set of bodily, mental and psychical faculties with their tendencies wholly inhibit the operation on us of causes with which we are connected, because the whole nature of each person is used in the carrying out of this law. Hence the weak and mediocre furnish a weak focus for Karma, and in them the general result of a lifetime is limited, although they may feel it all to be very heavy. But that person who has a wide and deep-reaching character and much force will feel the operation of a greater quantity of Karma than the weaker person.

STUDENT

Question If the soul reincarnates, where does the child at its birth get the soul from, if the supply of souls has been exhausted by an increase of population on the earth? Does the soul or ego at the death of the body go back to nature, and then re-appear the same soul at its next incarnation?

Answer It is the teaching of Theosophy that the soul does reincarnate, and to ask where does the child get its soul from is rather, so to say, putting the cart before the horse, for the soul is immortal, whereas the body, as such, is transitory. So that it would be more correct to put it this way—that the soul waits for its body, and it may be that often it has to wait a long time for a suitable one, for how often do parents provide unfit, diseased, and imperfect bodies for their offspring, in which the soul can hardly make its presence felt!

As to the question respecting the supply of souls connected with this earth's evolution, this is fully discussed in our literature, to which the questioner is referred—there is no occasion for any alarm on that score.

At death the soul does not return to nature in the sense of losing its individuality, for it is the soul that preserves individuality from life to life. The body changes, but the soul remains the same. Just as the soul remains the same during the intervals of sleep, though our brain minds may not remember the hours that have passed; so when we return to earth life through re-birth, although we may not remember the experiences of the intervening period, nothing has been lost, the soul or ego is the same and retains the memory of all. Some day, Theosophy teaches, when we shall have purified our lives, and shall have learned to use all our powers for the good of humanity, we shall be able to reflect this soul memory in our brain minds; but even now we all have the sense of our permanence and immortality, by which we may face the future and death when it shall come, with equanimity and without fear.

STUDENT

"It is not proper," said Zoroaster, "to understand the Intelligible with vehemence, but if you incline your mind, you will apprehend it: not too earnestly, but bringing a pure and inquiring eye. You will not understand it as when understanding some particular thing, but with the flower of the mind. Things divine are not attainable by mortals who understand sensual things, but only the light-armed arrive at the summit."—Quoted by Emerson in "The Method of Nature."

Professor Hilprecht's Dreams

THE papers are recalling some remarkable dreams which Dr. Hilprecht the Assyriologist is said to have had in connection with his investigations. One is as follows:

All of the day before Prof. Hilprecht had been engaged in trying to decipher the inscription on two small fragments of agate. The fragments were supposed to be broken pieces of finger rings, and from the nature of the characters engraved on them Prof. Hilprecht was inclined to date them anywhere from 1140 to 1700 B. C. The first character of the fourth line seemed to read "K U," and Prof. Hil-

In order to execute the command there was nothing for us to do but cut the votive cylinder in three parts, thus making three rings. Each of these rings contained a part of the original inscription.

"The first two rings served as earrings for the statue of the god. The two fragments which have given you so much trouble are parts of those rings. If you will put them together you will have confirmation of my words. But the third ring you have not found yet, and you never will find it."

Then the long, thin priest vanished.

Another dream revelation according to the story occurred in 1883:

Prof. Hilprecht in that year was working on a translation of an inscription where-

in came the words: "Nabû — Kudûrsu — Usur." These words had been translated by Prof. Delitzsch as "Nebo protect my mortar board." Prof. Hilprecht had accepted this translation and went to bed one night fully believing it to be the correct one.

In his sleep he had a vision which revealed to him that the correct translation was not "Nebo protect my mortar board," but "Nebo protect my boundary." This last translation Prof. Hilprecht then and there adopted, and the story of the dream says it has been the accepted one among scholars ever since.

PAUL DUCHAILLU, the African explorer, performed a good Samaritan act one night in assisting a very intoxicated stran-

ger. The man told him where his home was, and after considerable difficulty, du Chaillu got him to his door. The bibulous one was very grateful and wanted to know his helper's name. As the explorer did not care to give him his name in full, he merely replied that it was Paul. "So it'sh—hic—Paul, ish it?" hiccuped the man, and then after some moments of apparent thought, he inquired solicitously, "Shay, ol' man, did y' ever get any—hic—any answer to those lo-ong lettersh y' wrote to th' Ephesians?" — *Anon*

AN EVICTION IN OLD KILLARNEY

tin priest of the old pre-Christian Nippur suddenly stood revealed to him. The priest appeared to be about 40 years of age.

He led Prof. Hilprecht to the treasure chambers of the Nippur temple on its northeast side and there into a small, low-ceilinged room without windows in which

was a large wooden chest, while scraps of agate and lapis lazuli lay scattered on the floor. There the priest addressed the professor as follows:

"The two fragments belong together. They are not finger rings and their history is as follows:

"Kurigalzu once sent to the temple of Bel, among other articles of agate and lapis lazuli, an inscribed votive cylinder of agate. Then the priests suddenly received the command to make for the statue of the god Nibib a pair of earrings of agate. We were in great dismay, since there was no agate as raw material at hand.

Why People Forsake the Country

WHY do people flock from the country to the towns, and why can no system we can devise to counteract it produce any effect? The question may seem insoluble to the general run of thinkers, because they have not the key to such problems; but it is easy from a Theosophical point of view.

The answer is two-fold. First, the people are running after wrong ideals, which they seek to realize in the towns. Secondly, country life would not, as at present understood, afford scope for the right ideals even if people had them.

The ideal of life which people have is to make money and obtain luxuries and pleasures, to have an exciting restless time, to succeed in some business or profession. Our system of education has fostered this restless

spirit, for it feeds the superficial part of the mind and neglects the character, there being nowhere any deep and constant source of knowledge from which to draw for character-building. By our materialism and lack of an abiding faith in any rock of idealism, we are producing an ever-increasing swarm of these restless superficial people, who can find only in the towns the kind of life they are attracted by and adapted to.

On the other hand, there is in a rural life no social interest worth speaking of, and the active mind prefers bad companionship to flat dullness or solitude.

Rural Social Life Not Very Enticing

No wonder the people cannot be bribed back to the land by promises of private holdings and such like. Why should they adopt a life which has no interests for them and holds out no tempting prospects? The plain fact is, that while money and excitement form the blood of life, people will go to the cities for them. We cannot get back to the "unenlightened contentment" of a previous age. We must get on to a new kind of simple life and find a new joy in nature, new uses for the country. The whole spirit which moves the machinery of modern life needs changing.

A world of light is thrown on the subject by comparing the case of Japan with that of England. The secret of Japan's strength, according to many observers, lies in its wonderful skill in husbandry, based on an obvious intense enthusiasm for the work. Their little country is thus made to produce enough to support a mighty nation; whereas in England the vast bulk of agricultural produce is imported.

The cry that land-systems, railway rates, and so forth prevent England from growing its own crops is almost all pure nonsense. The fact is the people are not in the least agricultural; they have no intense interest in the soil. They do not use the land they have, and

Husbandry in Japan and England

would not use more if they had it. The above-mentioned evils would give way before a population that was unitedly devoted to husbandry. If the discontented farmer's son, contemplating a migration to town, were to be given a holding of his own, what would he do with it? He would work it in the same old wasteful way, with the same impatient methods, and try to raise thereby enough money to spend on other pursuits. It would not make a husbandman of him; he would regard it as a means of making money. But a Japanese in similar circumstances would make of that plot a beloved home, a paradise, a life's hobby.

The country must be made a home fit for happy human habitation; peaceful and healthy, and yet full and strenuous enough to give ample material and scope for human aspiration and endeavor; social, with denizens who can be at once rural and cultured; intellectual, artistic, industrial, and yet without factory chimneys and slums.

But with present ideals there is no demand for such an order of life. It needs the grander and richer ideals of Universal Brotherhood and Theosophy to give people the spirit that renders such an order possible and necessary. If people are to be prevented from flocking to towns, they must have something worth flocking to where they are.

STUDENT

Manliness and Politics

IN this present year 1905 of the Christian era, the most advanced form of government, historically known, is that which is representative of the will of the people under some form of political constitution. The ideals and opinions of the people are expressed at the polling booths, from time to time, and representative men are elected to serve the best interests of their state or country for definite periods of time. Such are the governments of the United States, England and France, and of all those nations which stand on the crest wave of Western progress. The further East we go, the further we find ourselves removed from those centres where the people have assumed their individual control of the public welfare.

It would be invidious to compare the types of manhood which have been selected by the people of Western nations as their trusted representatives in this sacred duty of providing for the well-being of the community. There are many public men of the last half century whose names are enshrined in the hearts of the people, as valiant and true defenders of the right. They have striven unselfishly for the public welfare. In studying the characters of these men it is a well defined and striking fact, that in proportion to a man's disinterested honesty of pur-

pose, self-sacrifice and unselfish labor for the public good—in that proportion has he been successful in his work.

The question of the kind of man who is selected as the people's representative cannot fail to be of vital importance to every citizen. No doubt every one will agree that he should be of the highest type of *manliness*. And then the question comes—What is true manliness?

A keen observer of human nature will always detect the outward bluster which takes the place of the quiet and tempered courage of the inner man, the vanity which replaces the true self-respect of honest conviction, the self-seeking which is reckless of efficiency so that private ends may be served, the desire for power which obliterates the truer desire to serve his fellow men.

The representative of the people has power conferred upon him as a sacred trust. But surely it cannot be, that a man who desires that outward power for its own sake is a fit recipient of it.

In these days we are beginning to find out that the most manly man is he who has power over himself. The power to crush out the sprouting seeds of evil in one's own character, and to hold one's self in control, is the mark of the truest manliness. Men who have this inner power are modest in outer mien though they may hold the reins of the greatest power for good. And such only are fitted to serve their fellow men.

When these facts are generally recognized we shall have no more self-seeking politicians. The men who will be entrusted with the public administration will take office at the invitation of their fellow citizens, who will thus recognize their fitness for their position. Their greatness will be thrust upon them. They will stand forth as leaders by *divine right*. Office will not be self-sought or even desired, but once assumed, it will be administered with firmness, strength, honesty and righteousness. C. W.

The Reincarnation of Words

TRENCH long ago pointed out that words are reborn into common life—like men, though Trench did not say that—after a period of rest. He quotes Horace, who, long before, had made the same observation. In Spenser's *Shepherd's Calendar*, the edition of 1579, is a glossary "for the exposition of old words." Among these "old words" are dapper, askance, sere, embellish, bevy, forestall, and pain—all *now* in use, *then* undergoing a rest between a pre-Spenserian and a present incarnation. A similar glossary in the 1667 edition of Chaucer explains these "old and obscure words": anthem, bland, blithe, carol, deluge, franchise, illusion, problem, sphere, revert, tissue, and transcend. Skinner's *Etymologicon* (1671) explains dovetail, interlace, elfish, plumage, and many another just as familiar *now*.

The same is true of phrases. What is an "Americanism"? A pure old English word or phrase which has long ago died in England. But ere it died there, it began to move to another planet (this country), finally taking up its abode here. Now they are all reincarnating in England—or nearly all. Any English reader of Shakespeare will find him full of "Americanisms," and should Shakespeare reincarnate about now and take to the drama again, he will use his old phrases quite naturally and properly.

May not the reincarnation of words be a type of a greater process at an immensely longer period—the reincarnation of languages? May not Sanskrit, and her younger sisters Greek and Latin, sleep in waiting for the need of them? May not even their mysterious root live on somewhere, ready to step forth for the expression of ideas long lost to us? We are daily uncovering proofs of civilizations so old that we know nothing of their people, and the idea of the ascent of man from barbarism is beginning to thin out. The impossible is always coming true or happening, and the discovery of the speech of these civilizations is merely an "impossible."
STUDENT

The Alliance Francaise

THE work of the *Alliance Française* in promoting the study of the French language and literature in the United States is a hopeful sign of the growing spirit of union among nations. The Americans, we are told, seem to appreciate French more than German. This does not of course imply any disparagement to the last mentioned, but it indicates a disposition to transcend the conventional distinctions that have been drawn between Latin and Teuton. England, largely through the influence of her King, is also drawing closer to the French people, and that, at the very time when the French are freeing themselves from a certain retrogressive influence that does not make for international

amity. It is reassuring to see the forces thus shaping themselves for the future, and nations recognizing each other as needed friends rather than as strangers.
STUDENT

The Needs of India

A NATIVE Hindu now in this country to study our institutions, has been making some comments on missionary work and methods, and pleading for a more rational treatment of his people. Some of the missionaries, he says, "are living a life of luxury in that country which they could not enjoy among the democratic people of the United States." Evidently he has something yet to learn about *us*.

Whether it be true or not that there are missionaries in India open to the charge he brings, he thinks that even those who are working honestly are mostly wasting their efforts:

It is true that some of them are trying to teach the lower classes the spirit of God, and also teaching them to read and write. But they are not teaching them how to better their condition in everyday life, and the people of my country will never make any advancement until they are taught to work and follow different lines of industry.

In the meantime the Christianity of the natives is often assumed. "When the missionary offers them a mouthful of bread or a handful of grain, they are grateful. They are ready to profess to be what you call converted, but they are not Christians." This of course is true, and they go down on the home list of "converts."

As a matter of fact India wants a kind of person who has never yet worked there. *Not* a missionary, *not* someone offering them a new creed while they starve. Neither does she need sham Hindus, Europeans with a false note of Hinduism, pretending sympathy with the people, yet trying to lay upon their backs an even heavier load of superstition and long meaningless rites than they now bear. There are such, soiling the name of Theosophy with their mummery.

Nor does India want the trader, aiming only to exploit her resources for their own pockets.

She needs a few who shall come in the pure spirit of brotherhood, asking the people neither to believe nor disbelieve, letting their beliefs alone, teaching them to revive their ancient and dying arts, and helping them to learn how to avail themselves, in their daily life of field and village, of such of the simpler modern implements and inventions as shall make the bread winning easier.
C.

The Two Americas

WHY do the peoples of the two Americas differ so markedly? The historian, Mr. James Bryce, in a recent lecture, attempted to answer this question. The difference is rooted in their very beginnings, in the character of the first colonists, and in their reasons for coming away from their homes. There was not a point in common; they were two different species of men.

Spaniards and Portuguese came to South America for gold and silver. They were not "strong on" religion, but what religion they had was strictly orthodox Catholicism; the Spanish Government was very careful that no "heretics" left its shores for the colonies.

They brought few women and therefore married freely with the natives. And their views of marriage must have been of an extremely emancipated character, such as would satisfy the "ideas" of certain moderns!

They took little interest in agriculture; they developed no self-governing institutions, and felt no sense of responsibility for the present or future of their new home—which indeed most of them regarded as quite temporary. They traded but little, and that little with Spain only.

In every point the origination of North America differed, in the character and in the proceedings of the early comers. They did not come for gold, but in pursuit of an ideal—freedom. Not only were they strongly religious, but they came that they might practise their religion.

Women of similarly stern and heroic mold came with them, and they married no natives.

They betook themselves to agriculture, and then to trade, developing rich commercial relations with their mother country.

They founded political governing institutions at once, designed to be permanent, and felt complete responsibility for the districts they inhabited.

The Governments of South America should remember these facts and endeavor to cultivate among their peoples the qualities that were lacking in their origins. For, indeed, they have a future. STUDENT

Some Views on XXth Century Problems

Shakespeare's Message

AN English critic and playwright, Mr. G. B. Shaw, has been delivering himself of some remarks about Shakespeare which entirely miss the point of Shakespeare's work. For Shakespeare was of that company who in their writings not merely express the spirit of their time, and leave it as it was, but who work upon it and leave it *other* than it was. To this day we think Shakespeare and never know it—till we learn that in every other sentence we quote him, and that this undying stream of word quotations corresponds to an unseen stream of thought quotations that are parts of our working consciousness.

Mr. Shaw says that Shakespeare is "deficient in that highest sphere of thought, in which poetry embraces religion, philosophy, morality, and the bearing of these on communities, which is sociology." His characters "have no religion, no politics, no conscience, no hope, no convictions of any sort," and there are no heroes among them.

There is a Theosophic explanation of the appearance and work of great men which will soon receive more respectful hearing than now. It is intimately bound up with the idea of reincarnation. When that rapidly spreading idea has passed into the domain of general discussion, people will begin to speculate whether the number of the great men and women, workers upon—rather than mere voices of—the time spirit, may not be relatively very small, and whether the great historic figures in the spheres of thought and action down to our own time, may not be the successive reappearance of that few. Whether each of them, preserving his or her special line of work may not reserve his or her prominent reappearance on earth till that special kind of work is needed and will be effective for promoting human progress.

Great Teachers Reappear in History

One here and there of this company, appearing as a teacher, occasionally raises the veil a little. And those who are willing to learn and willing to give themselves over to the cause of human progress, begin upon that cycle of growth which will finally place them in the ranks of this natural aristocracy, an aristocracy that *serves*.

If we suppose—and they have said so—that Shakespeare, like Æschylus, was one of them, it is easy to understand the "limitations" with which he is charged. The consciousness behind which is the real man, the overshadowing soul; the consciousness which is born into the brain, which is the created instrument for the work to be done—must assimilate itself to the general consciousness of the time ere it can work upon it. Only when that process is completed is there a differentiation between this man who will work *upon* the consciousness of his time, and that of other men—geniuses also, some of them—who work *in* it.

But now his pledge to humanity begins to work as an added fire, even though the pledge is rooted deeper than his working consciousness.

Drama Then and Now Great Power

The guiding force of England was then in its court and aristocracy; England was about to play a weighty role in the world's history. And a large part of the intellectual life of the aristocracy was bound up in and expressed by the current drama—which therefore became exceedingly rich and luminous. The aristocrats who ruled England talked and thought drama. Shakespeare was not then after "problems;" if he had been, no one would have paid any attention. He had to take the fighting, ambitious, roystering, carousing life of the time and deal with it in its terms, *taking all the elements upward one step*. He made the fighting and domineering instinct seem less glorious; he showed conscienceless cruelty and ambition as followed by their nemesis; he raised the gross love-making into the purest light of poetry; he showed Kings and Queens as subject to all the common pains and laws. He stretched the imagination of his hearers, drenched them with poetic images and phrases that throb yet, made their minds work beyond the common grossness, yet not so much beyond as that they fell baffled. What would have been the use of Shelley?

Shakespeare's "message" therefore was not a message; it was a general force uplifting current tendencies to higher terms. And he therefore moulded the consciousness of England from that day to now. Who shall

say that whatever has been good in England's work, whatever has shown gleams of magnanimity and protecting heroism; and even that the freedom and purity of her home political life—may not be greatly due to the light radiated by Shakespeare? To say that he had no doctrine is no better than to sneer at Beethoven for not taking up the question of free-will, or Joan of Arc for teaching nothing concerning evolution. The soul guides its personality, in such cases, to sow seed that fits the soil. STUDENT

Omissions in Education

THE secretary of the California State Board of Examiners has been thinking over the causes of youthful crime, crime which fills the State Reform Schools and prisons with young men and boys. He blames the lack of manual training in the school course. "At about the time when a boy's voice begins to break, he begins to tire of purely academic work in the public schools, and drops out. He has acquired no manual training in the schools, is perhaps unable to get work or employment of any nature in consequence, and acquires a habit of indolence." The habit of theft advances from small to great things as conscience becomes blunter and the pleasure of gaining money without work grows more dominant.

Nor are the Reform Schools, to which theft presently leads him, any better. "He is seldom able to acquire there a trade which will prove useful when he next regains his liberty; and the next crime he commits lands him in a State prison."

Here also he is unable to acquire or practice a livelihood, "and he concludes that the entire world has combined against him and on gaining his liberty he becomes a confirmed criminal." Those who have made it their business to come into real touch with criminals will know that many of them have actually got that conviction. And in a sense it is true. Society regards the criminal as *sui generis*, as actuated by a unique impulse peculiar to him. In words only does society admit that in him merely overflows into acts an impulse which in others rises only into thought. It is a question of degree.

The secretary of the Board, in showing us the process of criminal-making, shows us how *not* to make him, how to provide an outlet for that natural fund of young energy which will otherwise carry latent impulse into act. There is another point also missed in our education systems. We complain of overcrowded cities, and yet educate the millions of city children with no knowledge of and no taste for country life. A little move in the right direction has however been made in England and to a smaller degree here. As a part of their education, children are furnished with little plots of ground which they are taught to cultivate, to be proud of, and in which they raise flowers and vegetables. In one or two cases there are cows and poultry under their care. The result will, among many of them, be a taste for country work and a dissatisfaction with the lean life of streets and desks. A very proper dissatisfaction one may remark, for a life lived out of touch with nature, personal practical touch, is necessarily a deformed life. STUDENT

The Jew and Gentile Child

A LEEDS (England) physician has been studying the relative conditions of the children among poor Jews and Gentiles, living under the same conditions and in the same places. As his studies embrace 3000 children they are of considerable value.

At the age of 8 the Jewish child is 2 inches taller and 3 pounds heavier than the poor Gentile child; at 10 he is 2½ inches taller and 6¼ pounds heavier; at 12 he is 7 pounds heavier and 1¼ inches taller. The Jewish children are also much less rickety and have better teeth; whilst fewer suffer from enlarged tonsils and post-nasal growths. Their chest expansion must therefore on the whole be greater.

Dr. Hall attributes these facts to the better feeding of Hebrew children after their birth, and of their mothers previously.

His figures do not distinguish between the sexes. If they did, it might become obvious that the Jewish rite, acting as a preventive safeguard, shielded half the Jewish children from a grave and frequent, though often unsuspected, cause of the broken health and undeveloped physique so common among the children of Gentiles. Progress of Egyptology: Philæ

THE state of the Philæ Temple is, up to the present, extremely satisfactory. M. Maspéro writes as follows:

“Je suis heureux de constater que l'état de Philæ est de plus en plus satisfaisant. Le grès au lieu de se décomposer sous l'influence de l'eau, comme on pouvait le craindre, s'est raffermi et endurci; il a plus de consistance, et par conséquent plus de chances de durée qu'auparavant. Toute crainte n'est pas écartée encore en ce qui concerne l'action du salpêtre et des matières organiques, dont la pierre s'est imprégnée pendant le temps que les édifices furent habités par les fellahs. Toutefois, les indices recueillis à ce propos sont des plus rassurants, et nous avons tout lieu d'espérer que l'expérience des années qui viennent confirmera la bonne impression que nous laisse celle des deux années écoulées.

“[Trans.—I am happy to report that the state of Philæ is more and more satisfactory. The stone, instead of decomposing under the influence of the water, as one might fear, has strengthened and hardened; it has more consistence, and consequently there is more chance of it lasting than previously. All fear is not yet removed in view of the action of the saltpeter and the organic matters with which the stone was impregnated whilst the buildings were inhabited by the fellahs. Nevertheless, the signs are most reassuring, and there is every chance that the experience of coming years will confirm the good impression established in the last two years.]

“Mr. Howard Carter, the Inspector of Antiquities in Upper Egypt, in a recent report to M. Maspéro, also writes very reassuringly with regard to the state of these temples, although he states that it will not be possible to pronounce definitely upon the action caused by the water for several years to come. He says: ‘The state of Philæ as regards stability appears to be better than the general state of the temples in Egypt. The action of the water on the stone work has been slight, and really only distinguishable when the stone is of a bad quality; even then, there is at present but little fear of disintegration. The deposits of salts, as well as vegetable growths, on the wall surfaces that have been submerged, were certainly far less than in the former year. In many cases, the stone appeared to have become harder, perhaps owing to the water replacing, or rather taking the place of, the original quarry sap, as had been already surmised in former Reports. To bind the corners of the masonry with metal guards, from the high water level downwards, would, I think, be a great protection against the native boats taken into the temple by visitors, as certainly more damage has been done in this way than by the water itself.’

“Until the question of raising the Assouan Dam has been finally settled, it would be premature to discuss what further steps, if any, should be taken in connection with the preservation of the Temple of Philæ. It is singularly unfortunate that it is impossible to confer the great benefits which the population of Egypt will certainly derive, if the dam is raised, without still further submerging the temple. At the same time, it is obvious that the archæological and artistic, must yield to the general interests of the country. Nevertheless, although the Egyptian Government has already spent a considerable sum on preserving Philæ—and apparently with excellent results—they would be prepared to incur some further moderate expenditure if there is good reason to believe that results will be obtained in any degree commensurate with the cost. Any representations made by those who are specially interested in this subject will, I need hardly say, receive careful and sympathetic consideration; but I should add that I do not think that the suggestion, which has at times been made, that the whole of the temple should be removed to the mainland or elsewhere, is one that can be entertained. In view of the recent decision to postpone the raising of the dam, it is not for the moment necessary to say anything further on this question.”

—Extract from Lord Cromer's Annual Report

The reading of this report from the representative of the British Government in Egypt is most welcome evidence that there are people in authority whose energies are wholly devoted to the conscientious and intelligent discharge of the various duties intrusted to them. STUDENT

The Cross an Incomplete Symbol

AN inquirer has written to one of the daily papers asking: “Why do the Roman Catholic and Episcopal Churches hold so sacred the cross? Jesus Christ did not love the cross. . . . Do you think Jesus would wish his followers to hold a thing sacred that he himself so despised, as he naturally would? I have thought of this matter for a long time, and it has simply looked to me like a pagan idea.”

Two Jesuit Fathers were told off to supply the answer, and, after loftily chiding the inquirer, they simply said that Jesus did love the cross because, though an emblem of his own death, it was an emblem of man's redemption. It is well known that Christianity, as we have it today, is a curious medley of mystic symbolism, pagan rites, and Christian tradition. Whether or not Jesus was actually crucified is a question for historians and antiquarians to settle. But what is quite certain is that the Cross is one

of the commonest and most important symbols in the ancient and once universal mystery-language. We find it in Egyptian, Hindu, Norse, and ancient American symbology; and the Christians have adopted it, as they have other things, from pagan sources. They have, however, entirely lost the real meaning of the symbol and given it instead the familiar historical significance.

The Cross is the emblem of the material world, its four arms representing the four cardinal points, the four elements, and various other quaternaries in nature. But the Cross should be surmounted by a circle, to symbolize the power of the Soul over the material world. This cross and circle, or *crux ansata*, is the ancient symbol, found in ancient Egypt.

The Christian cross is, therefore, a symbol, standing for the material world alone, with no circle to denote mastery thereof.

The mystical meaning of Christ's crucifixion—an allegory, be it remembered, which the ancient Egyptians had in almost identical form—is that the *Christos*, or divine Soul, is bound to the cross of matter, or life in the material world, where it undergoes a kind of death, but is finally resurrected and becomes lord over death and matter. This is the original Christian doctrine, being a teaching of the archaic Wisdom-Religion. Who it was that suppressed all the real meaning and turned it into its present form, and why they did this, are questions which are worth consideration. When the Cross gets back its crowning circle and becomes once more the ancient *ansated* Cross, Christianity will become a living faith able to vitalize mankind. STUDENT

Fiction Truer than Truth

IT was remarked in a recent archeological note that, on the authority of H. P. Blavatsky, tradition is more reliable than history. History is the work of students long after the events they record; tradition is the testimony of eye-witnesses. History is written down and its errors thereby perpetuated; tradition, living eternally in the indelible memory of the race-soul, never deviates far from the truth. Modern discoveries have plentifully illustrated this; and soon we shall be ransacking all the lumber piles of tradition in search of valuables we have thrown away. When a historian is seen “throwing doubt” on a story, it is worth while investigating what it is he is trying to quell. Legends and traditions are bad form in a sober history; they are too festive and romantic. They are the kind of things that stick in people's minds and arouse their enthusiasm; so homely and natural; altogether out of place in a tissue of cold fact.

A writer on Roman discoveries, who is a woman, says:

When the exploration of the Forum reached that point of surpassing interest by which the most ancient and mysterious racial rites were revealed, or at least suggested, it was soon perceived that the critical distinctive work of certain modern historians had but little reason to be, and that there was more truth in the tradition registered by Livy and the Latin historians than said tradition had ever been credited with. Fragments and myths thus seemed to reconstruct for us more clearly than criticism and iconoclasm had done, the appearance and significance of the sacred valley, at the time when the temples on the Capitol were not yet. —Amy A. Bernardy in *Boston Evening Transcript*

PHILÆ DURING INUNDATION

✻ The Trend of Twentieth Century Science ✻

Insects as Mimic.

AN Italian zoologist has made a remarkable suggestion in explanation of the phenomena of mimicry, and in the use of the idea of mimicry to account for phenomena with which it would ordinarily be regarded as having no connection. He thinks that animals tend to become like things at which they look frequently and with interest.

Professor Beccari first describes the appearance of a Borneo forest by night:

Every dead leaf, every branch or twig in a decaying condition, was luminous, showing a pale glow through the slight mist which rose from the humus of the forest soil. The rain of the preceding day had apparently set alight the whole network of mycelium thread, which, invading the ruins of the giant vegetation, slowly disorganized and consumed them. A huge, rotten tree-trunk, a few feet from where I lay, emitted a brilliant phosphorescent light, emanating from certain white fungi belonging to the genus *Agaricus*. A single one of these enabled me easily to read a newspaper when placed upon it, so strong was the white and very beautiful light it gave off.

Then he considers the brilliant phosphorescence of the fireflies, and it occurs to him that this may be "the result of a kind of reproduction of luminous impressions received through the eyes." In other words, much looking at phosphorescent things makes the flies luminous in the same way.

Having reached this idea he does not hesitate to press it:

In the same way I do not think it impossible that the attractions for luminous and glittering objects may have been the *prima causa* of the production of luminous spots and metallic or iridescent colours in many beetles and butterflies. Thus the golden green of *Buprestis* reproduces, possibly, the shiny surfaces of leaves in strong light, on which they love to rest; and the mother-of-pearl spots on the wings of some butterflies might find an explanation in the fascination which reflected sunlight on a pool of water has for them. Phosphorescence and mimetic luminosity would thus in insects have been derived from a common cause; but in nocturnal insects, in whom the colour of the external portion of the body cannot have originated an ambitious sentiment, the physiological process which has rendered luminous phenomena possible has shown its effects internally: whilst in the others its manifestation is on the external surface of the body.

This remarkable suggestion implies that there is a conscious something *in* the insect which, taking note through its senses, of striking external phenomena, modifies it to resemble them. It is *in* the insect, yet it is not the insect, for no one would credit an insect with such a power of consciously affecting its own colors. The same power, not that of the individual yet within him, must be at work where strong or constant maternal impressions are registered in the child. It is in fact the *Archæus* of the ancients, the conscious and intelligent life force in nature.

The same ingenious naturalist advances the hypothesis that in the early days of organic life the types of species were much more fluid and protean than now. Those sudden and unaccountable originations of new species which Professor de Vries is observing among the primroses of his back garden, were once much more numerous and much wider. The power to do this has been gradually passing out of use. New types thus formed, and also others formed by an individual's variations during its own life, were handed on by heredity. Professor Beccari does not regard the intermediate links in the orthodox way. He does not think that through them one species gradually varied into another. But widely distinct species having suddenly arisen, the steps between came about through hybridization. H. P. Blavatsky long ago taught that in the early days of animal life, hybrid unions were common and fertile, and fertile were their products. This idea Professor Beccari clearly restates:

I am more inclined to admit the sudden appearing of some principal adaptation forms, and I believe that originally hybrids between such prototypes have been the reason of the concatenation of all organisms, and of the apparent descent of one from the other. I hold that hybridism had a large share in the formation of existing species, and it seems to me possible that, in the creative or plasmative period, even widely different types could cross and produce offspring, owing to the very imperfect influence of the force of heredity.

He is ahead of his time, but in these days ideas move quickly. There is new life in the intellectual ether. STUDENT

The Next Step

IN these days of the transition of the molecular sciences, their acquirement must be somewhat difficult to the beginner. For, he has to make room in his mind for contradictory statements in the same treatise and in the same part of it.

A popular monthly contains an article designed to enlighten the public on the nature of electricity and light. It begins with the latter. Newton's corpuscular theory is patronizingly mentioned and we are told that "it is now known that light does not consist of minute particles or corpuscles, but of waves in the ether."

Then comes the turn of electricity. "Science now suspects, with daily increasing certainty, that electricity is corpuscular, consists of very minute particles either carrying—or, as some think, consisting of—a minute electric charge."

So light is undulations; electricity is particles. Then follows this: "Light and electricity are identical; no longer must we conceive of them as two forces, but as waves of vibration, very short in the case of light, very long in the case of electricity."

What shall the young student do? If he is modest he will think the fault is with himself. If the writer had been modest he would pay out the phrase "it is now known that . . ." with less frequency.

The most important step of transition upon which science is now entering is over the border of the objective into the subjective. When French and Italian observers record that on concentration of attention the output of their N- and I-rays is increased, they have almost taken the step. It is recognition of the subjective nature of all forces. Then science will have grasped hands with true ancient psychology and will be on her way to real study of man and the universe. In their recognition of the relation of inner and outer, the attention of her students will be turned as much on the former as the latter. The *roots* of the mummery of medieval magic lay in that recognition. STUDENT

Sleep Is a Positive Process

WHAT is sleep? The rough and ready explanation is that the bodily functions, having used up all their force, sink to rest and so recover. This theory is good enough for simple cases, like that of the man with regular habits and simple make-up, say a day-laborer. It is sufficiently exact to say that he starts the day full of vitality like a cistern, and gradually empties until nightfall.

But with highly organized people the explanation is inadequate. Sleep then often bears no particular relation to work or weariness. We may be too tired to sleep. Sometimes people are afflicted with chronic sleeplessness. An idle day may make us sleep heavily at night. Weak people find that it takes strength to be able to sleep and that they are often unequal to the effort; also that sleeping, especially in the daytime, actually *exhausts* them.

A French scientist has discovered that sleep is not a mere negation of waking activity, not a mere absence of energy. It is, he says, a *positive* condition, a state of the nerves which comes on. We sleep to avoid nervous stress of various kinds.

One moment's sleep is frequently enough, because it enables us to go down into the center of our consciousness and come up again another way. It changes our conditions. Weariness is not necessarily exhaustion; it may mean disharmony or fever. Hence a change of occupation may remove it, and sleep not be necessary.

The French scientist defines sleep as "a reaction produced by various excitants, and an inhibition which manifests itself subjectively by a lack of interest in exterior things." This definition might be useful to some people as an excuse.

According to an explanation given by W. Q. Judge, activity and work *create* vitality—not use it up. The body after a while becomes surcharged with its own electricity, so to say, and at last sinks overwhelmed into sleep, during which the excess of vitality is thrown off and the organism becomes clear for action again. Sleep beyond this moment becomes an injury instead of a benefit. STUDENT

English Scenery

THE Great Ouse winds through several of the eastern counties of England, where the country is level and extremely fertile. The climate is soft, the scenery verdant and pastoral, the villages picturesque and charming. Washington Irving speaks enthusiastically of the rural scenery of England. "I thought I never could be sated with the sweetness and freshness of a country so completely carpeted with verdure; where every air breathed of the balmy pasture and the honey-suckled hedge. I was continually coming upon some little document of poetry, in the blossomed hawthorn, the daisy, the cowslip, the primrose, or some other simple object that had received a supernatural value from the Muse."

And men and women have gone forth, filled with the poetry of that land of autumn beauty, to those far Western shores where a new spring is dawning; that they might find an older truer Home, and link the past with the future, weaving threads of Old England into the fabric of the new Race. H. T. E.

Studying the Minds of Insects

THE study of Natural History opens a world which is still comparatively unknown, although, as with other departments of science, more rapid progress has been made during the past fifty years than for many previous centuries. It is really astonishing how ignorant people were, only a few decades ago, about the simplest details of animal life, and how readily fiction was accepted for fact by our immediate forefathers. One illustration of this was a standard work on Natural History written by Oliver Goldsmith, the poet. Amongst other marvelous statements he committed himself to this: "Cows shed their horns once a year." Every farmer must have known that this was untrue, and yet nobody seems to have troubled himself about it. Perhaps farmers did not read Natural History books in those days.

Certainly the general public had but little sympathy with animals and really knew but little of their habits, feelings, instincts, and marvelous intelligence.

Truly we are finding out that in order to know all about animals it is not sufficient to dissect their bodies and microscopically examine their tissues. We must also examine with the mind, those unseen qualities which no outward eye can discover. There are other sorts of microscopic examination, beside and beyond such as are conducted by an instrument of brass and glass. Science, true knowledge is receiving a wider and truer interpretation.

And so it has been left to us in modern times to discover the powers of the calculating horse, and other similar wonders previously unsuspected. We have found out these things because we have begun to love animals, to enter with sympathy into their daily life, to watch their do-

IN NATURE'S TEMPLE

WORDSWORTH

Therefore am I still
A lover of the meadows and the woods
And mountains, and of all that we behold
From this green earth; of all the mighty world
Of eye and ear, both of what they half create
And half perceive; well pleased to recognise
In Nature and the language of the sense,
The anchor of my purest thoughts, the nurse,
The guide, the guardian of my heart, and soul
Of all my moral being.

THE OUSE, NEAR BEDFORD, ENGLAND

Lomaland Photo and Eng. Dept

ings with pleasure, and to give some tardy recognition to the great intelligence behind all, which is the mainspring of the whole.

Yet even now it is not unusual to find that observers of animal life confess themselves almost afraid to publish the details of their observations lest they should be accused of romancing.

Witness the following story told by Dr. Leland O. Howard, chief of the division of Entomology in the United States Department of Agriculture in Washington:

In one of the greenhouses of the Department of Agriculture at Washington a medium-sized black ant occurred in considerable numbers, attracted by the presence of plant lice and mealy bugs upon the hothouse plants. As is well known ants are especially fond of the nectar secreted by these insects. A number of years ago some Liberian coffee trees were started in the greenhouse. On the under side of the leaves of these coffee trees, there exists at the bases of certain of the leaf ribs, some very minute, nectar-secreting glands. The ants soon found this out and sipped the nectar. Then the idea occurred to some clever ant that these nectar glands would be the best places in the world for mealy bugs to live and grow fat, and they would in consequence secrete a good deal more nectar than they would in other parts of the leaf. But the nectar glands were too small to accommodate even one good-sized mealy bug. So the word was passed round, and the ants gnawed the edges of the gland, and enlarged it, so that it would accommodate a good-sized mealy bug, which was carried to it. Doubtless to the delight of the ants, the result was as we may imagine. The mealy bug thrived exceedingly. The gland was enlarged still farther, and a whole family of mealy bugs were raised in the same hole. Thus a custom grew up, and many such greatly enlarged glands were found after a few months. Here was an ant then apparently taking advantage of an opportunity which was new not only to the experience of the individual but new to the experience of the race, and if we adopt the most reasonable of the definitions of instinct, here seems to have been displayed positive intelligence of a high order. STUDENT

Luther Burbank's Perseverance

LUTHER BURBANK'S success in horticulture is the outcome of indomitable courage in face of obstacles. He has known the pangs of hunger, slept in noisome places when he could call no roof his own, done the most disagreeable tasks to earn a pittance to keep body and soul together, fought off fever when he had not money enough to pay for a daily pint of milk.

After years of self-denial, poverty, and hard work, he has at last achieved his life's ambition, and the State endowment will enable him to continue his work in peace.

Such toilers live a richer fuller life and are happier than many whose lives are cast in what are considered paths of ease. For they live in the higher part of their nature to which the toils and tribulations of the lower are but opportunities. In honoring such a one the State is honored. STUDENT

"All things are ready, if our minds be so."—Shakespeare

The Passing of a Pioneer

BETWEEN the leaves of a cherished but long unused volume of Blackstone lies a little scrap of bond, its edges yellowed by the waiting of twenty years. On it is written in a clear strong handwriting, the following lines:

To M——
 "Be like the bird that, halting in her flight
 Awhile on bough too slight,
 Feels it give way beneath her and yet sings,
 Knowing that she hath wings."
 Affectionately,

MARY A. LIVERMORE

"I want to leave a word with you, M——" said Mrs. Livermore, on the occasion of one of her visits at my father's house, and she wrote these lines on a little slip of paper. The young girl for whom they were written read them and something made it impossible for her to forget them. More than once they have come into her mind at a critical moment, doing their part in turning the tide of her thought into the channels of a healthy optimism. Now, looking back over the record of Mrs. Livermore's life, it is easy to see why she should have chosen these simple lines of Victor Hugo's as the keynote which she hoped to sound in the life of a young enthusiastic girl.

To many of those who did not know her personally the death of Mary A. Livermore, which occurred recently in her home in Melrose, Mass., yet brought with it a sense of personal loss. From the beginning of her career—when she stood side by side with her husband both in his work as Universalist minister and as editor of his own newspaper—she has stood for principle, never for expedient. She had no "hobby," yet underneath all her work was one fundamental aim, to do all possible to secure better conditions for women. Mrs. Livermore always contended that the real solution for all the problems of suffering and injustice was right education, particularly the right education of those who should later become wives and mothers. As a newspaper woman she was one of the first to gain prominence in this country, and had the distinction of being the only woman reporter admitted to the convention which, in 1860, nominated Abraham Lincoln to the Presidency. When the war broke out Mrs. Livermore planned and carried out the great Sanitary Fair which netted nearly \$100,000.00 for the sick and wounded soldiers. During the war she served as a nurse, returning, at its close, to her old work for the higher education of women; this work being carried on both through the columns of her husband's paper and by means of other writings as well as lectures. Her work was educational and philanthropic as well.

THESSE are of us, they are with us,
 All for primal needed work, while the fol-
 lowers there in embryo wait behind,
 We today's procession heading, we the route
 for travel clearing.
 Pioneers. O pioneers.—Walt Whitman

"Why should I retire?" she once said in response to one of my questions. "Why should I stop work when there is so much waiting to be done? For me it would bring neither happiness nor rest. Look at W—— (a retired minister) who stopped active work at sixty and who today, at seventy, is a confirmed pessimist. Look at H—— who thought five years ago he had 'earned a rest.' Well, perhaps he had, for he was seventy then, but he confessed to me the last time I was home that he had not had a happy day since. No, my dear, even without such warnings as these, something in my heart bids me go on. And I am still young and strong—as you see."

That was sixteen years ago and Mary A. Livermore was then passing on toward her seventieth birthday.

Mrs. Livermore came of good old warrior stock. Her father was one of the heroes of the war of 1812. She herself, as upright in stature as in principle, almost ascetic in the simplicity of her daily life, a noble wife and nobler mother, seems to have preserved to this later time the best of the warrior-ideals and pioneer-spirit of the old Plymouth days. STUDENT

A CONTEMPORARY lavishes extended praise upon what he terms "woman's perseverance," basing his conclusions upon the fact that a number of our prominent Greek scholars are women, among them Dr. Sophie Bryant, lecturer on Aristotle; Mrs. Butler, the accomplished wife of the Minister of Trinity; Mrs. Sedgwick and Anna Swanwick as well as others, who are translators.

While such attainments are by no means insignificant, it is not well to close one's eyes to the fact that their rarity has caused them to be somewhat over-rated. No one who has traveled a bit of both roads but knows it is far easier to acquire a good working knowledge of Greek than a good working knowledge of how to run a house, care for a baby, properly feed, clothe and educate half a dozen children and yet keep that exquisite balance between cause and effect which alone will build up—and keep built up—a high, pure and just relationship between husband and wife.

Very few women make an absolute success along this line, to be sure. For one Cornelia we must admit we have a hundred weaklings and perhaps a score of slatterns. Yet, on the other hand, for one Greek scholar among women, have we not hundreds whose Greek study has been mere, aimless dabbling? Yet the fair-minded will not allow the work of the dilettante in Greek to obscure the good, honest research of the few, and still less should the thousand egregious failures in the realm of wifehood and motherhood serve to obscure the honesty, courage, perseverance and womanliness of those who have made of their motherhood a success. STUDENT

The Heart Song

"The sound of music that is born of human breath comes straighter from the Soul than any strain the hand alone can make."—*Arion*

MRS. JESSIE BARTLETT DAVIS, the distinguished contralto singer, who died recently, estimated four years ago that she had sung "O, Promise Me," 8000 times, yet she declared that she loved the song then as much as when she first sang it. "At times I have felt that the audiences must tire of it," she remarked, "and every now and then I have attempted to drop it from my repertoire, but the audience always called for it."

It is not always easy to distinguish, in such cases, whether a popularity such as this is due to the singer or the song. Is it a something emanating from the singer, or merit of the song itself? In all the so-called popular songs which have attained an unusual degree of favor with the majority of all classes, there is a definite something quite apart from the personal attributes of the singer or the words of the song, that touches the heart and leaves its strong impression there.

Why this should be more characteristic of one melody than another is inexplicable, unless we accept the fact brought out by Katherine Tingley years ago, that life itself is based on certain tones and rhythms, that music is a part of life itself. There must be then true combinations of these definite tones and rhythms, which, when heard, would produce a sympathetic harmonious effect upon the auditor. These combinations are unknown to the composer, who has used them unconsciously, caught his melody "out of the air," so to speak. Song after song has attained instantaneous popularity, the words of which were absolutely trivial, yet the melody has taken a wonderful hold on the public. They are sung and played from one end of the land to the other and then as suddenly dropped, set aside for something new. But, if recalled to use, one finds the same familiar pleasure in hearing them again. A notable instance of this is the old popular song "Annie Rooney." The sing-song rhythm and sweet melody will always retain their quaint charm. A well-known master of music once said this song was worthily called classic.

When analyzed, these melodies will be found to contain only a few tones, generally the important intervals of the diatonic scale, no dissonances occurring. It is not the elaborately worked out symphony that rests the mind, rather the reverse. The mental effort used to rightly interpret and appreciate its intricate windings of harmony, either serves to arouse and stimulate the auditors, or overpower them with ennui; while on the contrary, the simple air leaves a quieting influence because it has come nearer to the real center of life, true harmony.

GOVERNOR HIGGINS of New York recently said, with respect to a bill which he promptly vetoed after it had passed both houses of the state legislature:

The bill presents an astonishing proposition, but the most astonishing thing about it is that it passed both houses unnoticed and without opposition or discussion.

It is an insult to every faithful wife and to womanhood itself. The bill recites that A—Q— is the illegitimate infant child of C—B— P— and A—G—S—, and enacts that the child is thereby made the legitimate child of its said parents in all respects, the same as if said child had been born in lawful wedlock.

The father at the time of the birth of the child had and now has a lawful wife living. He and the child's mother, with brazen impudence and utter disregard of the rights of the lawful wife and the rules of morality, unite in a petition to the legislature to legitimize the issue of their lawless love.

If this bill should be approved, a legal status would be given to a semi-polygamous relation and concubinage would become an honorable estate.

But how comes it that this bill "passed both houses unnoticed and without opposition or discussion?" Were the legislators asleep—or what? H. H.

MISS LI BI CHU, a young Chinese woman who has recently received her diploma from the Woman's Medical College of Philadelphia, is said to be the second woman of her race to take up and master the study of medicine in the United States. She intends to return at once to China and enter upon professional work among her own people.

Observations of a Bachelor

A BOOK on child nature written by a bachelor deserves to command some attention. In a recent volume of this kind the problem of discipline is gone into quite at length, and one clever bit shows the author to have possessed a keenness of observation that would be the salvation of many a child if its own mother possessed the same. He refers to a child which disliked elaborate toys because they "play with me and I can't play with them!" He speaks sympathetically of a small girl of his acquaintance who had sixty-three toys given her one Christmas and who had not sufficient interest to finish unpacking them, while she was all interest and alertness at her favorite occupation of turning on the water faucets all over the house, whenever opportunity offered, and watching the result! He relates one little incident which should—or perhaps should not—have some weight in the present discussion of the religious training of children. He says:

Two little friends of mine, aged ten and eleven, say their prayers regularly every night and morning and learn texts and hymns by the yard, playing the most diabolical tricks on one another while so engaged. Their prayers are perfectly serious and God's presence is perfectly real, as is proven by the fact that on one occasion one child got up in the midst of his petition and said, "Excuse me, dear God, for a moment while I get up and kick Nellie," and this he proceeded to do.

The observations of the disinterested few, even though they be of a cynical nature, have a certain value.

THE appointment of Lady Battersea, of England, as a member of the Government Board of Visitors to the woman's prisons of England, reminds one of the time when Elizabeth Fry took her good name, as well as her life, in hand and went on her first visit to those terrible places called "English jails." She was the first English woman to visit the prisons and she found conditions which were appalling. Today, all needed reforms have not yet been brought about, and Lady Battersea's position will not be a sinecure, to judge from her somewhat humorous statement that, so far, she was "able to boast of but two reforms accomplished by herself, the furnishing of women prisoners with tooth brushes and felt slippers, both of which had been withheld previously, whether as needless luxuries or dangerous objects, it would be difficult to say."

THE empress dowager of China was lately presented with a sewing machine, with which she is so pleased that she has ordered three more machines to be purchased, as also a couple of knitting machines.

She is anxious to start a school of industry and art in the palace, the "hands" to be composed of the daughters of the princes, nobles, high ministers and court officials.—*The North China Herald* (Shanghai).

IT IS said that Queen Victoria had the rarest tact with every one, and that in ordinary conversation she always wished to be chatted with as if she were an ordinary woman. "Mr. Gladstone wearies me," she once said. "He always addresses me as if I were a department of State;" while, on the other hand, Lord Beaconsfield won her heart because he petted her dogs and talked housekeeping with her.

"MME. SCHUMANN-HEINK, opera singer, has taken out naturalization papers, and says she will become a good American citizen." America is certainly honored by having such a rare artist and splendid woman as Madame Heink select it for her future home.

WOMAN'S work in the Universal Brotherhood and Theosophical Society has been a real factor in its upbuilding. In the Cabinet of the Organization are three women; and women are at the head of several different departments of the body. The principal teacher of the Raja Yoga School is a very young woman, who also acts as its assistant Superintendent.

A woman is at the head of the Lotus Work for children throughout the world. Helena Petrovna Blavatsky organized the first work for Theosophy in the Occident; and a woman, Katherine Tingley, is today at the head of the Theosophical work throughout the world. During the nine years of Katherine Tingley's office, as Leader of the Organization, she has made two trips around the world in the interest of the movement. The charming part of all this is that there is nothing savoring of woman stepping out of her sphere as a woman in this work.

OUR YOUNG FOLK

The Raja Yoga Question Box

WHAT a terrible thing it is to be in prison! When the world learns brotherhood, prisoners will be treated more wisely than they are now.

1 Who was Dorothea Dix?

ANSWER—Dorothea Dix was an American woman who helped prisoners. She visited a great many prisons in the United States, and the prisoners were glad to have her come. She also helped sick people and during the Civil War was a nurse for the soldiers. She loved children and wrote books for them.

2 Who was John Howard?

ANSWER—John Howard was an Englishman who helped

prisoners. He was once put into prison unjustly, and it made him think about prison-life. Soon he began to visit the prisons in England. He found that they were very bad places so he began to work to make them better, and had many of the laws about prisons changed.

3 Who was Sarah Martin?

ANSWER—Sarah Martin was an Englishwoman. She was poor and had to work hard, but she found time to help prisoners. She visited them, and taught them reading and writing. When prisoners were discharged, Sarah Martin helped them to find work. She was a kind friend to the sick and the poor.

The Maid of France

ON a spring day, nearly five hundred years ago, Joan of Arc, the girl warrior of France, all clad in chain armor, rode up to the quaint old castle of Chinon. This was the royal residence, and at last Joan of Arc was to speak with the Dauphin, and plead with him for men and arms with which to save France.

Chinon Castle, like all the castles of that time, had a postern gate. It could be reached only by a covered passage, and this approach was kept secret, because of the enemies who were all about. But Joan of Arc—how, no one has ever been able to tell—*knew the secret way*, and rode boldly through the gate into the castle.

The news of her coming had spread over the country. The people flocked to see the shepherd maiden, who had already shown herself a brave soldier. They believed that Joan of Arc could save France. The Governor of Vaucouleurs had given her his own sword.

But the Dauphin was surrounded with wicked advisers, who did not wish him to fight for his country. They did everything they could to keep the Dauphin from seeing Joan of Arc. They were afraid he might listen to her burning words of patriotism. These men wished to enjoy themselves in idleness. The country was in despair, but they were selfish and did not care for the suffering of the people.

They thought they would play a trick on Joan of Arc. So when she came into the court it was arranged that one of the courtiers sat upon the throne, and the Dauphin, very simply dressed, stood among the court officials. The Dauphin's advisers thought that Joan of Arc would be bewildered by the splendor of the court, and that they could ridicule her as she stood before the throne, and made obeisance to one who was not the king.

Joan of Arc was not deceived by the trick. She stood with quiet grace, and when her eyes fell on the simply dressed courtier, she *knew he was the Dauphin*. She went swiftly to him, and greeted him as her sovereign. Then she gave him her message.

But even after this Joan of Arc had to wait long for her army. During this time she lived in the castle of Courdray, near Chinon.

Many prisoners had been confined in this old castle. Among them had been the Knights Templar, who were shut up there because the popes and kings were envious of their great wealth and power. Some of them had passed out of the castle only to die at the stake. They

Lomaland Photo and Eng. Dept.

STATUE OF JOAN OF ARC ON THE HILL AT ROUEN, SHOWING HER AS A PRISONER OF THE ENGLISH

HIGH hearts are never long without hearing some new call, some distant clarion of God, even in their dreams; and soon they are observed to break up the camp of ease, and start on some fresh march of faithful service.—*J. Martineau*

had left rough carving on the old stone walls.

Joan of Arc marched away from Chinon and Courdray at the head of her army, the army that broke the power of the enemy and saved France. Think of it, boys and girls, a general-in-chief seventeen years old. A sweet and gentle girl, and yet so strong of heart that she could endure the hardships of war with the stoutest veterans of the army, and lead them on to victory!

Her cruel death is a shameful stain on the honor of those whom she served. The French people love her more every year, and her fame grows. Artists love to paint pictures and carve statues of Joan of Arc. And do you wonder that the people honor her sword and her banner, and count them among the dearest treasures of France?

Facts Worth Knowing

THE University of California has received a French-English dictionary, which is only one and one-eighths inches long by three-fourths of an inch wide. There are 630 pages in the book, each page containing 110 words. This shows what photography can do, for of course this book was originally printed in large type and reduced to its present size by photographic methods.

NOT much more than a decade ago, Luther Burbank was being denounced as an enemy to true scientific progress, because he was making experiments in the production of new forms of fruits, trees and flowers. Today he is acknowledged, not only here but abroad, as a genius of high rank and the founder of a new science. So much for the value of contemporary criticism!

IT is estimated that nearly one-half of the railroads of the world are in the United States. The aggregate length of all the lines in this country is greater than the distance between the earth and the moon, and according to statistics more people are killed and wounded on our railroads each year than the Japanese lost in the capture of Port Arthur. Their receipts and expenditures are greater than those of even the richest nation in time of war.

ACCORDING to report, Vesuvius is awakening. A great lake of lava within its crater is now overflowing the rim and a perfect river of this liquid is flowing into the valley. Part of the west wall of the crater has been torn away by repeated explosions. It will be recalled that the terrible destruction of Pompeii and Herculaneum was preceded by lesser explosions for several years but the people took no heed. Will they listen this time?

THE CHILDREN'S HOUR

One Morning in May

ONE sunny morning—once upon a time—a group of little girls, each with a small basket on her arm, gathered at the gate of a winding lane leading to a pretty wood. It was only five o'clock and perfectly still but for the birds' morning concert. First came Belle and Ethel, then Kate and May and, last of all, Alice, running breathlessly. "Did she hear you come out, Alice?" Ethel called excitedly. "No, I just tiptoed all the way; I am sure no one heard me."

This was Alice's Auntie's wedding day. She lived with Alice's mamma and was a great favorite with the little girls. She was so tall and had such shining golden hair they thought she looked like the princess in a fairy tale. That was why they had planned a delightful surprise for her.

In the north, where these little girls lived, the winters are very, very long. Jack Frost stays many months nipping noses, ears and cheeks. But at last lovely May had come with the first wild flowers, and the little girls thought there could be nothing prettier for a wedding gift.

Off they scampered. When they reached the woods, they picked their steps, careful not to step on the dainty "spring beauties," as they called the hepaticas. Pushing aside dried leaves, which had fallen in the Autumn and made a warm blanket for the tiny plants, poking around in little hidden nooks, they found the shy wee flowers. Soon the little baskets were filled to overflowing.

"Suppose we sit on the fence," said Kate. Such a queer fence it was! Made of rough rails laid together in zig-zag fashion—a "snake fence," the children called it. The corner where the rails crossed and were held in place by an upright rail made a famous seat. Perched there, they chattered and sang like a flock of birds, while their deft fingers were busy arranging the flowers.

First came a soft lining of moss, green and velvety, then the exquisite flowers, pink mauve and white and, here and there, tips of feathery fern.

"There! I don't think they *could* look any prettier," and Alice climbed down carefully. They all followed. When they got to Alice's home, they crept up quietly and laid their baskets on the porch, each whispering a little fairy wish for their Auntie. They all wished her such happiness!

When Auntie saw the five little baskets filled with the dainty flowers still sparkling with dew, she clapped her hands saying, "Pretty pretty. Oh, what a beautiful surprise! Dear little maids!"

And of all her gifts, many very beautiful, Auntie has always prized most the simple little gifts of the first spring flowers. That was ever so many years ago, my dears, and I was one of the little girls. I wonder if all the others remember the day as I do! YOUR RAJA YOGA TEACHER

HOLLAND is said to be the birthplace of the first skates and of the art of skating as well. On the other hand, a Danish historian mentions the sport in that country as early as the Eleventh century. And then, to offset this historical account, the Dutch today show the bone skates which were found in one of the mounds of their country, possibly pre-historic!

A Letter to the Children

DEAR CHILDREN ALL OVER THE WORLD: I know you love stories of child-poets, for all children do. What fascination there is in the tales of the child, Elizabeth Barrett, writing such beautiful poems at eight years of age! Her father encouraged her for she was not very strong and he thought it just a passing fancy. He little dreamed that she would become one of the great poets of the world. Then about Longfellow—what a mere child he was when he began to put his thoughts down in little rhymes! And there was Shelley and Goethe and Tennyson and our own Dora and Elaine Goodale and ever so many others.

Now people think this very unusual, but the really strange thing is that more children do not write poetry. It is only another kind of song, you know, and if the heart is right and the joy-light shines out of the eyes, why some kind of a song must come from the heart just as naturally as from the throat of a little bird.

That gives us the secret, too, of why children love sweet little poems—they are real pictures, you know, painted with words instead of colors or beautiful tones. And they help the heart-light to shine clearer and clearer, just as much as music and color help. That is why the Editor from week to week puts into this page tiny rhythmic bits, beautiful little word-pictures, for all you wee ones the world over. It is just like opening a door for you, is it not?

How many of you are going through this door? How many of you are reading these little poems and really finding the song and answering it, too, with a heart-song of your own? Now, I heard the Editor say the other day that the little poems on this page were not placed here just to be read and then forgotten, but she hoped the tiny tots all over the world—just like those of Lomaland—would learn these little poems and recite them to Papa and Mamma. What a surprise you could prepare for Grandma on her birthday! Why, it would be as beautiful as a new song. And then think, too, how happy big sister who helped you with your lessons would be to have you thank her by reciting a little poem that you learned all by yourself—or big brother, who was so willing to fix your sled last winter and mend your dollies! Is this not a beautiful new way of giving and helping and sharing? I think so—and the Tiny Buds of Lomaland—and the bees and the birds and the flowers—all these think so, too.

AUNT ESTHER

A FRIEND of mine who loves birds and lives where it is very cold in the winter has been keeping a large tray of seeds on his back porch to feed the little songsters during the frosty months. A large flock of song birds have come all winter and with them a solitary robin red-breast. When it came time to fly South with the rest of his kind Robin seemed to prefer to spend his winter with the snowbirds and make daily visits to the seed tray. Is not that strange? I wonder why he stayed. Do you suppose he liked the seeds, or the snowbirds, or felt the kindness in that good man's heart? In Lomaland we have learned how close the birds will come to those they know are kind to them, and I believe the brave Robin loved his kind friend even more than the daily dinner on the seed tray.

JUNE IN LOMALAND—TEACHER AND PUPIL OF THE RAJA YOGA SCHOOL IN A LOMALAND GARDEN

THE clouds had been heavy and dark all day,
I had looked for the sun in vain;
But sweet and clear, in the maple near,
The robins sang in the rain.

Ah, boys and girls who sit and sigh,
And of dreary days complain!
In cloud and sun work bravely on—
The robins sing in the rain.—Selected

Art Music Literature and the Drama

Program Versus Absolute Music, a Commentary

To feel beauty is a better thing than to understand how we come to feel it.—George Santayana

THE remarkable tone-poems of Richard Strauss, which have lately so astonished the musical world, are giving rise to no end of discussion as to whether or not the works of this gifted composer are "program" music, or "absolute" music.

Strauss himself is reported to have said that he wished his "*Sinfonia Domestica*" to be judged as absolute music, but that in composing it, he had a very definite program in his mind. A few of his critics declare that they cannot understand this apparent inconsistency.

"Program" music and "absolute" music have long been "pitted against each other," so to speak, and are erroneously considered to be two distinctly different kinds of music.

So-called "program" music is generally understood to be a form of instrumental music which is designed to represent a set plan or program of incidents; while "absolute" music is considered to be that form of instrumental music which is unrestricted by text, plan of events, or dance steps—music according to its own ideal merely as music, and which each hearer must interpret for himself. A recent writer suggests that not only may a musical composition be at once program and absolute music, but *unless it is both it is not art at all.*

Every composition, whether it be so-called "program" or "absolute" music, has its plan, its message to convey.

It may be one of esthetics, of philosophy, of mysticism, or it may be merely descriptive in the ordinary sense. Music that appeals to a finer, higher part of our natures than the brain-mind, must have a coherent message and expression in accordance with the plane of consciousness of which it is the interpreter, the language. The lesser form of "program" music limits by attempting detailed description, and requires verbal explanation in order to be understood. In general, the more it descends into the ordinary descriptive, the more is it lacking in that essence of truth and beauty which it should have as pure and high art.

Music, when consistent art, expresses its noble message by a "concord of sweet sounds," not in words—and its meaning or "program," is so obvious and real that words cannot add to it.

The greatest musicians have had definite pictures in mind when composing, but they rarely described in terms of brain-mind detail just what those pictures were, for they have sought to evoke in others a *feeling* similar to that which inspired their creations, rather than to make inevitable the contemplation of a particular series of events, etc. They give us *reflections* of their great and intimate thoughts, which are and must ever be recorded as in cipher. The real mysteries lie deeply hidden, and only reveal themselves to the intuitive few. The record of master thoughts have, however, often been preserved even by the uninitiated purely for their beauty of form. They possess such inherent qualities of immortal charm that they appeal in some way to almost every mind, while to the initiated they can be, and often are, taken as definite instructions, even as a simple fairy tale may please the mind of a child with its graceful narrative, and contain at once the deepest truths for the mature student of life who reads between the lines.

To the unlearned a symphony is too often "a sort of chaos"—a conglomeration of pleasing sounds which reveal to them no definite meaning, although they may, in a vague sort of way, feel something of its grandeur. An emotion is evoked which has an effect on the whole nature, and causes it to respond in some degree to the art work of the composer.

Those whose imaginations are undeveloped may often be helped to better understand and enjoy a composition by being given a "story" about it, but the awakened soul sees vivid pictures and real meaning in the music alone, and responds to the composer's message on the plane to which the message was directed. True music should be to the soul what recorded thoughts in words are to the mind, and each listener—an interpreter according to the light within his own heart—is able to glimpse the real meaning of its message.

The highest music, then, is that which is satisfactory to listen to purely *as music*, and while being unrestricted by verbal annotations, yet has its program, or pure soul, *motif*, carrying its own and definite message which each hearer must interpret for himself.

So, true music can be heard both as "absolute" and "program" music since it includes and *is* both. The great composer has not made contradictory statements. It is certain of his critics, merely, who have failed to understand.

STUDENT

FRAGMENT

WALT WHITMAN

AS I ponder'd in silence,
 Retaining upon my poems, considering, lingering long,
 A Phantom arose before me with distrustful aspect,
 Terrible in beauty, age, and power,
 The genius of poets of old lands,
 As to me directing like flame its eyes,
 With finger pointing to many immortal songs,
 And menacing voice, What singest thou? it said,
 Know'st thou not there is but one theme for ever-enduring
 bards?
 And that is the theme of War, the fortune of battles,
 The making of perfect soldiers.
 Be it so, then I answer'd,
 I, too, haughty Shade, also sing war, and a longer and greater
 one than any.
 Waged in my book with varying fortune, with flight, ad-
 vance and retreat, victory deferred and wavering,
 (Yet methinks certain, or as good as certain, at the last.)
 the field, the world,
 For life and death, for the Body and the eternal Soul,
 Lo, I too am come, chanting the chant of battles,
 I above all promote brave soldiers.

IT is related that one Doctor Christopher Tye, who lived in the time of good Queen Bess, undertook the task of setting to music the *Acts of the Apostles*. He finished full fourteen chapters before he gave it up. His reasons for undertaking the task he gives us on the title page as follows:

"The Actes of the Apostles, translated into Englyshe meetre, and dedicated to the kynge's most excellent majesty, by Cristfer Tye, doctor in musyke, and one of the gentylnen of hys grace's moste honourable chapell, wyth notes to eche chapter, to synge, and also to play upon the flute, very necessary for students after their studye, to fyte theyr wyttes, and alsoe for all Chriftians that cannot synge, to reade the good and godlye froyes of the lives of Chrift and His apofstles."

The work is, however, not to be discovered in the average modern repertory!

THE rarity of really great modern compositions, those which promise to survive the centuries, has long been a mat-

ter of comment. In this connection the amount of really great work left by some of the composers of the last century shows startling figures. Haydn wrote something like eight hundred compositions, among them one hundred and eighteen symphonies. Mozart was one of the most prolific, finishing, before his death, in his thirty-fifth year, nearly seven hundred works, large and small. Beethoven composed, perhaps, more than Haydn, yet of all his compositions only nine were symphonies. These are still, however, the "nine great symphonies of the world."

SAID Ignace Paderewski recently:

Perhaps the greatest defect, taking as a whole our modern methods of piano-forte teaching, is the lack of attention to tone. It is too often sacrificed almost entirely to manual dexterity. Another grave defect is the neglect of rhythm, and phrasing generally. Then again, the ordinary pianist is often a man of narrow sympathies. The music student is not sufficiently encouraged to develop the intellectual and poetic side of his nature. On the one hand he should study the philosophical works of the present age and of the past; on the other, he should read the best of the world's poetry.

BEETHOVEN himself conducted at the first performance of his immortal Ninth Symphony. At that time he could not hear a single tone, in the sense in which we use the word. But is there not an inner hearing as well as an inner sight?

ONE of our magazines contains a lengthy article on the subject: "Is the Art of Singing Lost?" Doubtless, it is true that the *real* art has not been re-discovered, that the *real* science of the human voice was lost or obscured countless ages ago, and that all that is best in the methods and music of today has been the re-discovery of long-lost fragments.

Who Dares Speak the Truth?

A CHICAGO professor and clergyman recently took occasion to say in a sermon that there are three classes of falsifiers in the world today, namely "newspaper men, preachers and teachers." He excused the first as being caterers for an actual demand for sensational reports, but was severe on the preachers and teachers, who, he said, often assume a thing to be true when they know it is not. Something ought to be done to check them from the tendency to prevaricate.

But is it fair to thus distinguish between the journalists and the ministers and professors? Do not all three classes err in ministering to a demand for falsehood, when their position of power should oblige them to resist it? Newspaper men give the public what the public mistakenly thinks it wants; so do the ministers and teachers referred to. In other words they pander to people's weaknesses, instead of satisfying the unexpressed *real* wants of the people. Much of it is perhaps done in the interests of bread and butter, for people do not usually appreciate being told the truth, and will repair to the man who knows how to flatter and pamper them. Be it so; but admit that the teacher and preacher and journalist are hired servants paid to adulate the public like a great man's parasite.

There are people in the world speaking with two voices, the one calling for indulgence, the other (a wistful inner voice) asking for the truth. Which voice does the teacher answer? It is like the case of the child which goes to its mother, outwardly claiming indulgence, but with a secret hope (in the heart) for strengthening rebuke; and which gets, alas! the indulgence. It is like the case of the false friend who sympathizes with you, thus making you realize that that was not what you went to him for. You cannot *ask* him to rebuke you, but you would have been grateful just the same. And how many women there are in the world whose feminine sympathy is bestowed, not on the pleading Soul, but on the querulous temper.

How many men of science, historians, antiquarians are there who know that facts and logic lead direct to truth, and yet dare not speak out for fear of wounding other people's (that is, their own) feelings, or upsetting convenient vested interests?

Yet there have always been a few whose love of truth was strong enough to raise them above considerations of money or reputation or comfort. To them we owe much. STUDENT

The Exiles' Return Home

THERE are gathered together in Lomaland people from divers nations and climes. They have left their homes; and yet, paradoxical as it may sound, they may be truly spoken of as exiles *who have returned home*. For one can be an exile in his native land. The home of his birth and childhood may be a home for the outer man, but it was not the Heart's Home.

Those who have pondered deeply on life, and sought beneath the surface of things for the final source of life and satisfaction, have encountered a void, an unfilled want. Musings on the spirit of one's native scenery and its historic associations lead one back into the irrevocable past, in search of the spirit that is gone and the days when the land and its people were new and young. Today the springtide of humanity's life is elsewhere.

And this is why these people have found themselves drawn by a resistless spell to a land where nature seems to be awakening after a long sleep, with the faint stirrings of a coming vigor. Here in the Golden West is where the Fount of Life at present wells up, and here people have found the lost chord of their native harmony and the key that unlocks the riddle of their former aspirations.

Lomaland is a Home in a deeper and truer sense than the home of the personality; it is an *older* home, carrying us back to more ancient and more sacred memories—memories, not of the mind, but deeper. STUDENT

The Two Silences

MERE not speaking has often little relation to the real silence, the peak from which words uttered or unuttered have fallen back abashed—words and even thoughts. For upon that peak rests the spiritual light.

"The fact is," says a little known essayist, "that the true silence of gold is never mere absence of sound of words; the *real* quality of it lies in its *potentiality* of music or speech"—the speech that strives to convey something from the *fullness* of the *silence*.

It is only in this positively held silence that we can become aware of the presence of the soul, and raise belief in it into certainty. "The silence which proceeds from weakness, incapacity, or mean fear, is a blank which jars like a discord; the silence which is of strength and knowledge is a chord of harmony withheld from bursting into audible sound, but nevertheless setting the air vibrating."

All our training is such as to hinder our knowing anything about this full silence. The newspaper, with its innumerable headlines, is the chatter of our minds and lips made visible.

We complain of so much of our work being routine, monotonous. It would *not* be so if we knew how to be silent within, if we had trained the mind to stop insisting on being supplied with new mental sensation—an insistence exactly parallel with that of the body which requires its program of sensations kept full, with candy, chewing-gum, or tobacco. Even the intervals for prayer in church-time, must be filled with the voice of the clergyman. We do not know that silence and prayer are one thing.

Silence is the rising up into the reservoir of the waters of energy, energy of all planes. But we never let them rise. The reservoir is bored full of holes, and the waters flow in speech and speech-thought as fast as they come in.

Surely not the least of the problems of the Twentieth century, for those who would erect belief into knowledge, is, how to gain the power of silence; nor the least of our duties to the children, the coming generation, to train them in the knowledge of that world within them to which *silence* is the *only* passport. STUDENT

Studien Ueber die Bhagavad-Gita, von William Q. Judge*

THE above, "*Notes on the Bhagavad-Gita*," by William Q. Judge, has just been issued in Germany by members of the Universal Brotherhood Organization. It is a translation into German from the English of a series of articles written during the years 1887-8 by Mr. Judge and published serially in THE PATH.

It is a dainty booklet, Cap. 8vo., charmingly gotten up in the best of printers' and bookbinders' art, with clear, easy (roman) type. It is friendly both to sight and *feel*, and the frequent explanatory notes for beginners by the Translator, a member of the Universal Brotherhood in Germany, make it additionally interesting.

*Nürnberg, Germany, J. Th. Heller, ob. Turnstrasse 3; or The Theosophical Publishing Co., Point Loma, California

IN Sweden most excellent work has been accomplished by translating from English into Swedish the latest volume issued from Point Loma, *The Mysteries of the Heart Doctrine*. This work is most carefully done, and is being published in the form of a series of pamphlets tastefully printed and bound, thus placing in the hands of readers a number of attractive, readable pamphlets instead of a complete single volume. Other interesting publications are soon to follow.

IN Holland similar activity is shown by members of the Universal Brotherhood. The translation and publication has been already commenced, and in part completed, of *The Pith and Marrow of Some Sacred Writings*; a number of unusually good pamphlets on different Theosophical subjects are already out, and more will shortly follow. The printing and binding is in all cases most excellent.

DOE THE NEXT THYNGE

WHEN things go wrong and I am sore perplexed
 With the tumultuous duties of each day,
 I 'mind me of a quaint old Saxon text,
 The burden of this homely roundelay.
 'Twas an inspired thought to send it forth
 To cleave the centuries on healing wing,
 Bearing the message of transcendent worth,
 Doe the next thyng.

"The Lord helps those who help themselves," we say,
 Then fold our arms to worry and complain
 Because some cherished project went astray,
 And where we sowed in joy we reap in pain.
 Accept this ancient paraphrase of work,
 Peace and contentment it will surely bring,
 So when inclined to grumble or to shirk
 Doe the next thyng.

—Chicago Record-Herald

A Mistranslated Text

ONE of the most often quoted sayings of Jesus is a mistranslation, which is corrected in the *Revised Version* (Westminster, 1881). It is still used, although admittedly Jesus never said it; one meets it in a recent daily paper, quoted as divine authority for reading the Bible.

This text runs, in the *Old Version*: "Search the Scriptures" (*John v:39*). Now the word which is translated "search" can be equally well translated "ye search;" there is nothing in the form of the word to show whether it is an indicative or an imperative; we must therefore judge by the context. But the old translation makes nonsense with the context; the sentence following does not fit with it, and the sense of the whole passage contradicts it. The new translation however clears up the meaning at once. Jesus is saying that his own authenticity is proved by his works, but yet the people refuse to acknowledge him. Then he says: "Ye search the scriptures, because ye think that in them ye have eternal life; and yet they are witnesses to me."

Thus Jesus did not enjoin his hearers to search the scriptures, but rather chided them for doing it to so little purpose. STUDENT

The Natural and the Artificial

THE works of man's intellect are called "artificial," in contradistinction from other works which are called "natural." Even in man, those functions which proceed without the help of the conscious mind are classed as natural.

The conscious works of man are considered as in some respects improvements upon the works of Nature, and in other respects as being vastly inferior. This implies a recognition of man's creative power and also of his misuse thereof.

In our treatment of Nature we are like the avaricious man who killed the goose that laid golden eggs; like one who draws blood instead of milk from the cow of plenty. A barbarous crime, and one sure to bring the meed of ignorance; the fate of the blunderer is ours. The least we can incur is to miss and not to know what we have missed.

We tear out the bowels of Mother Earth for the rich store of sun-heat she has been laying-up for ages, and use it up in running our machines at a loss that, even physically, is 96 per cent. We send gangs of slaves down to ferret out her priceless gems that they may adorn — beauty's throat! They are talking of running the Pacific Ocean through a sieve to dredge the very soul out of her, in the hope that by plundering on an enormous scale they may make even her modest grain of gold per ton a source of profit.

As to the animal creation, over which God gave Adam dominion, he could not have known that Eve's daughters would wear feathers in their hats; while Satan himself would never have dreamt of a Chicago stock-yard.

What is the notion of science as to using Nature? About as intelligent

as burning cinnamon in a stove or harnessing a poet to a plow. The most stupendous cataract in the world is turning machinery like the humblest donkey. Everything is valued for its most material and least valuable uses.

There may be powers in Nature far finer, far superior, to those we know of; powers whose use does not involve killing or brutal handling; powers that can be availed of without rooting up or disturbing anything. There may be powers in Nature which are so high as to be intelligent, and which may be invoked or appealed to rather than harnessed and enslaved. Would it not be better if we could learn to call to our aid the gentle but potent influences of living conscious Nature, instead of the violent chemical and molecular forces that lurk in her dead bones?

Possibly men in ages long past may have understood how to do this. If so, we might find herein an explanation of some of their beliefs and rites, which we call superstitions because we can see no other reason for them.

Man has the power, by his creative will and mind, to draw out from plastic Nature many marvelous powers that lie latent in her bosom. In doing this, he would be fulfilling his proper function, and working in harmony with Nature. There would not then be such an invidious distinction between the artificial and the natural. STUDENT

ONE, the Arabian alchemist, Abipili, speaks thus: "I admonish thee, whosoever thou art that desirest to dive into the inmost parts of nature; if that thou seekest thou findest not *within thee*, thou wilt never find it *without thee*. If thou knowest not the excellency of thine own house, why dost thou seek after the excellency of other things? . . . O MAN, KNOW THYSELF! IN THEE IS HID THE TREASURES OF TREASURES."—Quoted by H. P. Blavatsky in *Isis Unveiled*.

THE world is shadowed or brightened by our own heart rather than by anything in itself. Our joy makes the cloudiest day glad, and our grief finds night in the sunniest sky.—*Joseph Parker*

FRIENDS IN COUNSEL

DEAR COMRADES: The value of a musical training has hardly been sufficiently considered with regard to its refining influence on character, its power of calling into play those qualities which fit a man to mingle with his fellows and to take his part in social intercourse with tactful courtesy, and that rare discrimination that suggests the right behavior for every situation in life. The man whose finer feelings have been sensitized by music would possess a delicate perception of social harmony and thus avoid the striking of discordant notes in the assemblies he frequents. Have we not all been made to suffer by the tactless brother who, unable to perceive the mood predominating in a group of friends, has introduced in conversation topics wholly out of tune with the prevailing spirit of the gathering.

A man may be an upright citizen, a faithful husband and a loyal friend, and yet from a defective understanding of the laws of social harmonics may be constantly engaged in spreading consternation and dismay in the society in which he moves. A thousand airy trifles and minor observances require to be considered in our intercourse with others which cannot well be codified and taught by rule, but which must needs be recognized in order to ensure facility and smoothness in our social relations. That delicate perception that informs how to adapt our speech and conduct to the ever fluctuating waves of feeling moving in the minds of men may be largely developed by musical study.

The exercise of choral singing is an aid of no small value in our task of casting off the chains that bind us to our petty orbit around the self. As we combine our voices in concerted singing, not only do our voices join but other bonds are formed as well; for perfect consonance demands a measure of detachment from ourselves, a freedom from constricting egotism and, as the raindrop's outline is dissolved on falling in the ocean wave, so do the boundaries of the individual self fade out and disappear as the performer's voice is merged into a sea of sound.

The singing of the children here is not intended as a challenge for appreciation and applause nor does it utter an appeal to the judgment of cold intellect. It sounds a note caught from the deep melodic undertone of life, a chord from the celestial harmonies cast as an echo down to earth. It is a salutation to the hearer's Soul, a clarion call to our immortal part to waken and respond within its sepulchre of flesh. STUDENT

GENIUS

I AM that Spirit of the deathless mind,
Which men do worship when they search for fame.
I am that Genius, given but to few,
Which yet, all never cease to seek and woo.

This is the lesson my discourse would teach,
That though my vision pierceth through all time,
Though to the gates of heaven my pinions reach,
Though I may lift thy name to heights sublime,
Yet all these gifts, though they do seem to bless,
Cannot alone bring thee true happiness.

Each rational soul --- each insect of the air,
Each sparrow midst a summer's forest leaves,
Hath its appointed place. He form'd them there,
Whose purpose lives in everything that breathes.
Thee also to thy task he now would bring,
Prepared by gifts --- humbled by suffering. --- Anon

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question May Karma be worked out on other planes than that upon which it originated?

Answer In part, no doubt, for there is always interaction between the various parts of man's nature. What affects his mind reacts upon his emotional and physical natures, and *vice versa*.

As the following from W. Q. Judge's writings, bears somewhat upon this question, it is here quoted:

Now as Karmic causes are divisible into three classes, they must have various fields in which to work. They operate upon man in his mental and intellectual nature, in his psychical or soul nature, and in his body and circumstances. The spiritual nature of man is never affected or operated upon by Karma.

One species of Karma may act on the three specified planes of our nature at the same time to the same degree, or there may be a mixture of the causes, some on one plane and some on another. Take a deformed person who has a fine mind and a deficiency in his soul nature. Here punitive or unpleasant Karma is operating on his body while in his mental and intellectual nature good Karma is being experienced, but psychically the Karma, or cause, being of an indifferent sort the result is indifferent. In another person other combinations appear. He has a fine body and favorable circumstances, but the character is morose, peevish, irritable, revengeful, morbid, and disagreeable to himself and others. Here good physical Karma is at work with very bad mental, intellectual and psychical Karma. Cases will occur to readers of persons born in high station having every opportunity and power, yet being imbecile or suddenly becoming insane.

It is said that every action originates in the mind, and that there can be no action which is not preceded by thought. It may not appear always to be so at the moment of the action, but if we could look back we should be able to see the seed of thought, sown perhaps years ago, followed it may be by a long train of thoughts, which because of the power of the will, or through fear of the consequences, or from some other cause, such as a sudden event or calamity, changing the whole course of life, has not resulted in action at the time; yet the seed being there must bear its fruit in the future. It is written in the Scripture, "There is nothing hid which shall not be revealed; neither secret, which shall not be made known." And in the *Book of Golden Precepts*, "A harsh word uttered in past lives is not destroyed, but ever comes again."

It will thus be seen that the operations of Karma are very far reaching, and that man has a great responsibility, not only for his acts, but first and foremost for his thoughts. How many are there who permit their minds to be filled with all manner of pictures and thoughts, which they would be ashamed to have made known, and which they dare not perform in act—thoughts of revenge, uncleanness and vice of all kinds. And yet the world has examples enough of hidden lives and thoughts brought out into the full glare of the sun. And it must not be forgotten that this is true of the many hidden thoughts and lives that are good and pure, as well as those that are evil—for they too will some day come to the light of day.

No plane of life can be separated from the other planes; and so it would appear that Karma will in part at least be worked out upon other planes than that upon which it originated. How far this will be so will depend upon the development of the character, its depth, and the sense of responsibilities which one has. For instance, the Karma of one

who is undeveloped mentally and morally, who has very little sense of responsibility and whose thoughts rise little above the physical plane, will be almost entirely physical, the deeper side of life will not be touched because it is unknown to him. Whereas the one in whom the finer and deeper qualities are developed will both suffer more and enjoy more, and the interaction between the different planes of his nature will be much greater.

STUDENT

Question Will you please explain what meaning Theosophists give to the phrase—"Our Father in heaven."

Answer This question is answered in the following extract from *The Key to Theosophy*, by H. P. Blavatsky:

Enquirer. To whom, then, do you pray when you do so?

Theosophist. To "Our Father in heaven"—in its esoteric meaning.

Enquirer. Is that different from the one given to it in theology?

Theosophist. Entirely so. A Theosophist addresses his prayer to his Father which is in secret (read and try to understand *ch. vi, verse 6, Matthew*), not to an extra-cosmic and therefore finite God; and that "Father" is in man himself.

Enquirer. Then you make of man a God?

Theosophist. Please say "God" and not a God. In our sense, the inner man is the only God we can have cognizance of. And how can this be otherwise? Grant us our postulate that God is a universally diffused, infinite principle, and how can man escape from being soaked by, and in, the Deity? We call our "Father in Heaven" that deific essence of which we are cognizant within us, in our heart and spiritual consciousness, and which has nothing to do with the anthropomorphic conception we may form of it in our physical brain or its fancy: "Know ye not ye are the temple of God, and that the spirit of (the absolute) God dwelleth in you?" Yet let no man anthropomorphize that essence in us. Let no Theosophist, if he would hold to divine, not human truth, say that this "God in secret" listens to, or is distinct from, either finite man or the infinite essence—for all are one.

This teaching of the innate divinity of man is one that has long been forgotten, though it was plainly taught by Jesus. Man is dual in his nature, and were it not for the divine in him he could never hope to conquer the evil and to attain to the destiny which he feels is his. If we would find God we must look within; if we desire heaven we must make it within our own hearts.

STUDENT

Question In what manner can Jews enter your ranks of the Brotherhood; that is, in what light do you consider them? Must they accept the Christ?

Answer First, the manner in which Jews may enter the ranks is the same as for any other people of whatever race, or belief, that is by applying for admission, and this being done full information will be sent from the Central Office of the Organization. Surely the name Universal Brotherhood would be a misnomer if Jews or any race of people should be excluded, and as a matter of fact, not only Jews, but representatives of almost every race are to be found in the Organization which was "ordained and established for the benefit of the people of the earth and all creatures." The following from the Constitution of the Universal Brotherhood, should make this matter clear:

Article II, Section 1.—This organization declares that Brotherhood is a fact in Nature.

Article II, Section 2.—The principle purpose of this Organization is to teach brotherhood, demonstrate that it is a fact in nature and make it a living power in the life of humanity.

Also the following:

The Universal Brotherhood welcomes to membership all who truly love their fellow men and desire the eradication of the evils caused by the barriers of race, creed, caste or color, which have so long impeded human progress; to all sincere lovers of truth and to all who aspire to higher and better things than the mere pleasures and interests of worldly life, and are prepared to do all in their power to make Brotherhood a living power in the life of humanity, its various departments offer unlimited opportunities.

As to the last question, as a logical inference from the foregoing, it must be clear that no profession or creed is asked. In fact, as expressly stated, the Organization is strictly unsectarian, and it is further stated in the Constitution:

Article X, Section 2.—Every member has the right to believe or disbelieve in any religious system or philosophy, each being required to show that toleration for the opinions of others which he expects for his own.

How Science Is Following Theosophy

ONE cannot pick up a paper without finding how amazingly Theosophical ideas, once derided or ignored, are forcing themselves on the public mind. Verily Theosophists are moulders of thought.

W. Q. Judge declares that, in history, the visible characters have moved in obedience to a Design not their own, and that the guiding influence of great but unknown Minds can be traced through human affairs.

A sociologist, Francis Galton, says in a recent book:

The result of investigations went to show that social phenomena were no longer to be considered the product of chance combinations, or arbitrary wills, of local and fortuitous circumstances. Their generality witnesses their essential dependence on general causes which whenever present produce their effects; always the same,

with a necessity equal to that of other natural causes. "Ethnological jurisprudence," says Post, "has discovered in the juridical life of every nation widespread parallelisms which cannot be referred to purely accidental conditions, but must be considered as emanations from human nature as such. This discovery confirms one of the most fundamental propositions of modern ethnology, *i. e.*, that it is not we who think, but that the world thinks in us." Further, historical analysis itself, becoming more acute, finally recognized the impersonal character of the forces which govern history.

Putting Ab- straction For Realities

Thus it is admitted that, instead of individual minds coöperating to produce a collective result, these individual minds are actually the *result* of—of what? Of "general causes," "emanations from human nature as such," "collectivities," say the sociologists, falling a prey to the habit of putting abstractions for realities.

But one is not satisfied to be told that an individual mind—lusty, acute, profound, the mind perhaps of a Cæsar—can be controlled by a collectivity or an emanation-from-human-nature-as-such. And neither is Galton satisfied; so he fills the gap with "the mind of the mass."

Underlying all the action of princes, statesmen, legislators, individual geniuses of all kinds, which was formerly thought to be the preponderating influence, is discovered the decisive influence of the mass. It is realized that legislation is only the codification of popular manners and customs.

Hence the thing amounts to this. The community has a collective mind which is superior to any individual mind and which moulds events. This is what Theosophy teaches, but as only a half-truth. Theosophy also teaches that the truly Great can, by sacrificing their personal mind, become the recipients and agents of this collective mind. Thus the "impersonal forces" which Mr. Galton describes in history may not have

"The Truth Shall Make You Free"

been so abstract after all. The "collective mind of the mass"—what is it?

Science "discovers that men are puppets." Puppets of what? "Blind forces," answers the materialist, as he petrifies his brain with another glass. Men are, in degree, the puppets of all kinds of influences, good and bad, coming from stronger minds and wills. *But they need not remain puppets.* They may turn away their attention and their interest from the narrow circle of their trivial thoughts and emotions, and seek within for a larger and more influential life.

I seek not mine own glory.

And ye shall know the truth, and the truth shall make you free.

He that doeth truth cometh to the Light, that his deeds may be made manifest.—*Jesus*

STUDENT

Insanity

DEALING with the general increase of insanity, a recent English publication bases its remarks on the fact that whereas about forty years ago one person in five hundred and thirty-six of the population was insane, the proportion is now one in two hundred and ninety-three. The causes which our contemporary assigns for this are: drink, over-crowding, and competition. And it can think of no other remedy than a Royal Commission of Enquiry.

One would be glad to know what *that* piece of machinery can be expected to effect. If the causes are as stated, all that is possible is being done. The drink question has already been the subject of enquiry. So has over-crowding. And action is always going on in accordance with the suggestions emanating from the Commissions. As to the third cause, no one, we imagine, now-a-days, thinks that competition can be checked by legislation.

It appears that the proportion of insane to non-insane is double what it was forty years ago. Is the individually proportionate drink bill also doubled? Assuredly not. Figures are not at hand, but it is perfectly safe to assume that the individual's consumption of alcohol in England is not greatly altered during the period named.

And if competition and over-crowding must therefore be regarded as the main causes, it should follow that at least the *increase* wholly falls on the non-leisured classes. The proportion of members of the leisured and titled classes, to whom over-crowding and competition does not apply, in the insane asylums, should have enormously *fallen* during the last forty years. As no one claims that this is so, and as these three ordinarily named causes do not wholly cover the ground, one must look elsewhere for explanation.

Is the advance in education the real cause, as some affirm? If so,

as that advance is mostly felt among those to whom the Compulsory Education Act of 1870 applied, it must be shown that upon them falls the stress of the increase. And the increase from that cause would hardly date its commencement earlier than about 1880. Proof failing in this also, our cause is yet to seek.

May the real cause not be the swifter and ever swifter move of human brain-mind consciousness? The various causes suggested on this hand and on that would come in as subsidiaries and as such find their true place. The speed of the evolutionary wave is too swift for many who in quieter times would have held their balance without difficulty. Creeds are rapidly changing and some decaying; new ideas, and new conceptions of the universe, are preached on all hands. No idea is too fantastic to find an exponent, and no exponent too ambitious, too egotistic, too delirious, to find followers. The daily, weekly, and monthly press multiplies itself by thousands. No department or phase of thought or action is without its printed organ. Everyone knows what everyone else is thinking and doing. Electricity has destroyed space and telescoped time. The world is covered with an iron nervous system. The scientist works in the public square for a laboratory, and daily discovers the hitherto almost undreamed of.

Verily, he is blind to all around him who thinks that the Twentieth century will be but a continuation of the Nineteenth.

This may be taken to be the real cause of insanity's increase. Men's nervous systems must adapt themselves to the new pace. And this can only happen when the mind has done so. This mental adaptation does not mean a wild plunge into everything that is moving on earth. It means an acquirement of the power to live as spectator and actor in the rush, up to the limit of what is necessary and good—and yet retain a hold of the still spot which is in the centre of mind, the divine place where is always peace, and whence, if we will, we may always get strength and inspiration. It is never the man who knows that place who becomes insane or commits suicide. It is never he who follows the half delirious egotist of the platform and market-place. It is not he whose faith in immortality is creed-born.

It may be that for many years yet the numbers of insane and suicidal will go on increasing. But the heaven will also increase, standing in the quiet surety of their own inner experience. The waves will leave them unaffected. The future is with them and their children and children's children. And as the years go by and their influence and numbers spread, a new atmosphere will develop amongst men, the atmosphere of compassion and brotherhood. In that, all the conditions of human life that are evil and painful will vanish. In that, the swift pulse of evolution, the thrill of new thought and discovery, the development of new faculties and avenues of knowledge, will neither kill nor derange, but vivify. Men will have regained their relationship with life itself at its sources. STUDENT

How the Public Greed is Exploited

RECORDS are showing how financiers have ruthlessly fleeced the public, but the blame is not all on the financiers. A writer describes graphically how he was mobbed in his hotel by guests, waiters, cooks and all, mad to double their money without earning. What is this if not unmitigated gambling? There is a class of people who could not be induced by any prospectus whatever to buy stocks offering gigantic returns, because these people know unfair profits when they hear of them, and know that it is either a gamble or a swindle and somebody must suffer. If all or even most of the public had been thus sober-minded, they could not have been taken advantage of. As it is they are devoured by the Moloch to whom their lives are a daily incense. E.

King Edward's Diplomacy

CONTEMPORARY quotes some interesting examples of the diplomacy and tact of King Edward. When he recently visited Portugal, the piece of red baize laid from the landing stage to the carriage was a little too short, and a Portuguese flag was put down to fill the gap. When the King came to this place he stopped, saluted the flag and then stepped sideways to avoid treading upon it.

Hearing that the piano at the Hospice of St. Bernard (which had been his gift many years before) was worn out, he promptly sent another of the finest modern make.

Count Bernstorff, councillor to the German Embassy, said after the

King's visit to Germany: "His Majesty has won the confidence and reverence of all nations far beyond the limits of his dominions, because he is regarded as the personification of a tendency leading to peace and the unity of nations."

And a recent writer in *La Revue de Paris*, speaking of King Edward's visit to the French capital, commented: "It required all the tact of Edward VII. to undertake a mission so perilous. It was not a question of conciliating a Court. It was necessary to conquer a whole population, a most nervous and most impressionable nation. The success exceeded all hopes." STUDENT

Japan to Bring Kingdom of Righteousness

A CLERGYMAN in Los Angeles, speaking on the Japanese success both in war and peace, attributes it to their possession of a priceless boon which we have not—a faith. Their principle is indicated by Buddha's words, "Stronger than woe is will;" and by Christ's, "All things are possible to him that believeth." He adds that he does not think the Japanese will enter on a campaign of militarism and arm the East to invade the West, for:

As one of her own people says, I believe it is the desire and purpose of Japan to endeavor to fulfil a "mission still unfilled by any nations; that is, the realization of a kingdom of righteousness, a realm of justice and purity and virtues such as would be looked upon with respect and deference in the world's intercourse, just as a virtuous person is loved and esteemed in the community." I trust that Japan is about to give the world its greatest example of magnanimity.

A Christian clergyman attributing the success of the poor benighted heathen to religious faith! Christian civilization to be converted to brotherhood by "oriental barbarians"! This is a brave and manly speech for a clergyman. Where are we at? STUDENT

Spain's Possibilities

SPAIN might be one of the richest countries in Europe, and is one of the poorest. Having no colonial possessions, she yet considers a navy necessary. At peace with all other Powers, and the continuance of peace depending only on herself, she must nevertheless maintain an army. And the army and navy mean a weight of taxation which the people can barely carry. By consequence they emigrate in immense numbers, making the situation worse. The other day, says a Consular Report, 4000 laborers, young people nearly all, left for South America. Five thousand more are waiting transportation. And the population is but about 18,000,000. Under better conditions the country could support several times that number. With an area at least eighteen times that of Belgium, she has only a population thrice as great. And there are 75,000,000 acres of arable land lying uncultivated.

Spain is perhaps the only great country that would be perfectly safe under total disarmament. The very act would protect her, and the example would be a lasting service to humanity. C.

Industrial Development of China

A GERMAN consular report from China speaks hopefully of the commercial and industrial development of that country. In many provinces, agricultural and trade schools have been established, with primary courses. Every year there are a greater number of Chinese students educated in foreign countries, chiefly England, Germany, the United States, and Japan. It is said that it seems to be a settled policy of the Empire to exclude foreigners from exploiting the riches of the soil; and long may it continue to be so, at least while foreign exploiters are the greedy vandals they are at present! More than twelve hundred miles of railway are in operation, and are returning good financial results; and further development is expected, although railways are not a good investment from the point of view of the Chinese, who are able to get higher dividends in other enterprises. The line from Hankau to Peking, seven hundred and fifteen miles, is mostly completed. E.

Frontispiece---Helena Petrovna Blavatsky

THE cover-page of the NEW CENTURY PATH this week shows the well-known face of Helena Petrovna Blavatsky, Foundress of the World's Theosophical Movement.

Her work and teachings have startled thinking men by their depth and scope in a humanitarian and philosophic sense, while their characteristic feature is that they bind all men together in an absolute Brotherhood of Humanity.

Some Views on XXth Century Problems

The Cause & Result of Agnosticism

A WELL known novelist and ecclesiastic, writing in an important English monthly, enumerates a long list of symptoms of the decay of civilization. He speaks of the poverty and destitution of millions, "frauds in marriage and dwindling birth-rate, unlimited divorce, degeneracy in offspring, the abuse of stimulants and of pleasure, the clouding of intellect," universal cynicism and pessimism, brutal outrages, insanity and suicide, conscienceless finance, speculation, betting, games of hazard, and the prize-ring.

Being an ecclesiastic, he regards all this as due to the spread of agnostic teaching. And being an ecclesiastic, he makes no inquiry into the cause of that easy spread. It might lie too near home.

Religion comes from the deeper, spiritual nature of man. Belief in that deeper self is properly instinctive; man feels its existence in himself.

It is an unwritten rule in the English Constitution that the Upper House shall not throw out or alter a money bill coming from the Lower House. When the Lower House desires to send up to the Lords a measure which it knows will be distasteful to them and may be rejected or emasculated, it includes the bill among the provisions of a money bill, so as to cover both with the same cloak of privilege.

That same policy has been carried out in religion, but the plan did not work of late years. To the teaching about man's divine nature, which, untampered with, was immediately and instinctively accepted, other teachings were tacked on, in the hope that all alike would be passed through the mental gateway in one party. For a long time the plan worked and a mass of dogmas went through on the same ticket as the legitimate traveler.

But at last their right was questioned, and has been finally denied; and the gateway shut in their faces excludes also the one teaching that should go through. The money bill has not been separated from the accessories.

Agnosticism is the product of ecclesiastical teaching. When the Church made it an article of faith in religion that the sun moved round the earth, and when finally astronomy established the opposite, *all* faith received a blow; not only that "faith" which is an acceptance of the impossible and inconceivable, but that true faith which is a consciousness of the inner spiritual Presence. The latter went by the board with the other, and Agnosticism took the place of both. Ecclesiasticism has shocked thought into incredulity.

Why had it insisted on the dogmas? Perhaps on some of them from stupidity. But on the important ones because they brought *power*. In lust for power lies the cause of present Agnosticism, and by consequence the cause of the evils which the writer quoted above truly attributes to Agnosticism.

Science alone, the pure search for, and explanation of, *facts*, would never have reached Agnosticism. Man's spiritual nature, his free-will, and the divine Law of Retribution and Justice pervading the world, are not made doubtful by a single fact known to science. Discoveries in science only make them seem doubtful when the discoverer starts with the doubt. It was in the air before, and ecclesiasticism is answerable for its presence. Theosophy, re-establishing primal Christianity, can now alone dissipate that presence. Ecclesiasticism and Theosophy (which is Universal Brotherhood) are enemies. H. C.

The Falsification of Ideals

ALL ideals, as they pass out through wider and wider circles of their worshippers, tend to undergo admixture with false elements, and degradation. They are like a story told from one to another, which in the final telling has the primary details but as nucleus all overgrown with foreign matters.

Such a case is the ideal upon which Puritanism was built. As the word Puritanism sounds in modern ears, it means a narrowing and hardening of life achieved by cutting out the graces, pleasures and refinements. These are made to take a false rank as sins, alongside of real sins. Nothing replaces these extirpated elements except the proud sense

of exemption from weaknesses to which others are subject. God is pictured as a being who demands of us this surgical operation as the price of his favors.

Naturally, such overgrowths of the *real* ideal have repelled people from that ideal, and humanity has been cheated of a light that would have come to it. It would seem as if there were some malign power working in the world of thought, making use of certain minds so that directly an ideal is born it is restated so *nearly* true as to be worse than a whole falsehood.

The quest for the diviner and richer life is a battle at every moment, but in the main it is the results of the battle and not the battle itself, that the man knows. *His* part is to develop in his heart a love of all higher things and states of mind. Then, imperceptibly, the lower attractions weaken and he finds freedom developing. He comes to live above desires that he formerly lived in or under. He hears and sees nature, and feels life, in a new way. All things have greater contents, variety, and beauty. So those other matters on which he formerly relied for pleasure, now make no appeal to him. The *Puritan* renounces them; *he* outgrows them. Even when, like the Puritan, he forcibly cuts some of them away, it is because he finds them to be hindrances to that new life of which he is becoming conscious. He does not do it, like the Puritan, to satisfy the requirements of an accepted Deity; or like the false ascetic of all times, to gratify the brute desire to dominate. For this desire prompting the ascetic *is* brutal, though transcendentalized by the fact that the thing dominated is a part of his own nature.

It was very easy to state the ideal nucleus of Puritanism and asceticism in such a form as to make it false and repulsive, and yet say nothing actually false. The grosser misrepresentations came later.

In justice to the original Puritans of England, we may however remember that they represented a *reaction*. STUDENT

Some Mysterious Relations

PHYSIOLOGISTS know that all the various organisms of which the human body is built, such as blood-corpules, leucocytes, and the like, are separate beings, each having a life of its own as well as the corporate life of the whole body in which it shares.

The interesting problem is how the individual lives are related to the collective life; for it must be the same problem as the problem of our separate personalities and their relation to the—"Oversoul," shall we say? How to express fully all that is entailed upon us as independent individuals, and at the same time contribute most effectively to the harmony of the whole—that is our problem. To reconcile individual liberty with social order, freedom of opinion with unity of faith, and so on—these are practical problems suggested and illustrated by the above analogy. E.

Reverence for Age

A DAILY paper has a symposium of prominent clergymen on the question as to whether age is to be no longer respected. The discussion was started by the recent controversy on the uselessness of old men. One writer touches the vital point when he says that the worship of youth as superior to maturity is an outcome of materialism. Youth excels in material attributes, such as physical strength and vital vigor; mature age excels, or should excel, in higher and more refined attributes. Hence our disrespect for age may be a disrespect for those qualities; or again it may be due to an actual lack of those qualities in the old. STUDENT

Egypt's Growing Prosperity

LORD CROMER'S annual report on Egypt calls attention to the steadily rising revenue of the Soudan—in six years from \$40,000 to \$3,000,000. This he regards as due to his policy of unvaryingly low taxation. Of this he is a consistent advocate, holding that expenditure on even desirable objects should be postponed rather than that taxation should be increased. But certain needed outlays are now beginning to be possible and will probably be shortly made. C.

Brief Glimpses of the Prehistoric World

Archeology
Paleontology
Ethnology

Assyrian Lore---Dr. Hilprecht Vindicated

THE wonderful Assyrian discoveries of Hilprecht so enlarge our ideas of ancient wisdom and so threaten all narrow prejudices, that one would naturally expect to see unfortunate attempts to neutralize them by those whose ideas seem threatened by such a discovery. The attack too would be likely to come from certain quarters and to enlist on its side those forces of prejudice which always do league themselves against progress and enlightenment.

As to the attack on Dr. Hilprecht, one cannot speak without investigation of the facts, but it certainly does bear a resemblance to the kind of attacks that always are made by prejudice against liberal thought. The whole vast question of archeology, which would surely absorb an ardent truthseeker, is ignored in the insistence upon the one or two petty charges upon which the case rests. These charges again suggest that familiar kind which are *apparently* unanswerable, and yet so easily explained when the suppressed facts connected with them are restored. Finally, the fact that Hilprecht does not reply is made capital of—most unwarrantably, as appears below.

Dr. Hugo Radaw, Assyriologist and author, of Columbia, Munich, Göttingen, etc., has defended Hilprecht. He testifies that Hilprecht did discover a library, for Radaw himself examined 300 tablets taken at random from a collection of 17,000 or 18,000 of which the great majority were dug up in Hilprecht's expedition. He continues:

The fact of the existence of a library was forced upon me by my acquirement of the knowledge of the variety of subjects included in this collection of tablets, viz., there were tablets appertaining to religion, history, astronomy, astrology, mathematics, surveying, drawing, linguistic subjects, school exercises, consisting of copies made by the pupils, bilingual texts, syllabaries, etc. The existence of such a variety of subjects in a collection like this should prove conclusively even to the lay mind that these tablets must have constituted a library.

I think the facts I have referred to are sufficient to convince any one of the existence of a library at Nippur. If there are any doubting Thomases, let me refer them to the collection of tablets to be found in the British Museum known as the library of Ashurbanipal, King of Assyria, about 650 B. C. It will remove any lingering doubt as to the existence of a library and even of a temple library at Nippur. The Ashurbanipal library was excavated at Nineveh in the years 1850—53 by Layard and Rassam, and among the tablets found were certain religious, astronomical and astrological tablets, which were marked copies from the original in the Temple Library of Bel, at Nippur.

On the point that this library was a temple library he is equally affirmative. The nature of the tablets confirms the idea that the priests were the teachers and the temple the school.

But the most striking point is the way in which Dr. Radaw disposes of the charge that two of the tablets shown by Hilprecht were old ones purchased from Arab traders. As the mounds have been open for many years, it is not only likely but absolutely certain that stray finds and purloined antiques have always been on the market. An enthusiastic antiquary would naturally and rightly lay hands on everything he could dig up, buy, or beg, that might throw light on his subject; nor would he expect to be called upon by his fellow-scholars to give a minute account of the exact method of finding each tablet. So long as the tablets came from Nippur, it matters not if a few were bought and sold in the interval. Nor, even if one or two out of 18,000 should prove to be from some other source, is there any harm done.

People who seize isolated facts like these and twist them out of all meaning do not command our credence.

Finally Dr. Hilprecht is required to prove his innocence by proving a negative to a charge, in defiance of the universally recognized principle of law and justice which requires an accuser to first prove his charge. And failure to respond to this unfair challenge is twisted into a proof of guilt. Truly there is nothing new under the sun! The following quotation will form a fitting conclusion to these remarks:

It is surprising how many persons seem unmindful of the fact that in this collection the University of Pennsylvania is the proud possessor of one of the most ancient and extraordinary historical treasures owned anywhere in the world.

It is even more surprising to me, as an outsider, that in Philadelphia, the city of its custody, all hands are not raised in support of the work Professor Hilprecht has done, rather than tongues employed in criticism. To any one familiar with the facts such a situation is attributable to a condition of ignorance founded on a network of malicious and jealous fabrications, rather than the expert judgment of those who are able to speak.

STUDENT

An Indian Village

THE system of communal life in an Indian Village of the Northwest coast has not a few points of interest for those who realize that the conditions of modern civilization are not by any means ideal. Possibly, too, an insight may be obtained through study of such a life into some of the ancient ways that were not as our ways and yet were in their own fashion idealistic. One such is the patriarchal system—killed mainly by the subtle inroads of personal ambition, its chief enemy. Another is the perfect law of hospitality to strangers who need it—a social law lost in the mazes of modern communal life. Then there is the industrial system by which men and women become skilful workers in their arts and crafts. This leads to a related point of character—the despising of personal wealth. Arts and crafts exercised for necessity or beauty or love of the work are apt to produce costly results, but are they not worth paying for?

This idea of a thread of communal interest in all things is one which our civilizations have yet to attain; the sinking of the personal self in the

ALERT BAY, VANCOUVER ISLAND

interests of the country is yet far from realization. Yet there are signs that it is on the way, not the least of which is the existence of powerful antagonistic efforts. For these, if grown unendurable, will result in final government acquisition and management of all public works and franchises. After which the evolution of wise, just, and fearless leaders and rulers may bring back the glories of old, exemplified in public monuments of a grandeur now unknown among living races. For these totems, Indian baskets, carvings, woven fabrics and (among more southern tribes) pottery, are but the relics of a great civilization of untold antiquity. They stand like the monuments of Egypt as records of a national height of progress in every direction; and, as a book is read, may give to us information on much

that appears at first sight foreign to their sphere of interest. As the "higher criticism" is to the magnificent misunderstood literatures of old, so is the circumstantial evidence of the arts, crafts, life and peculiarities of dying civilizations to our better understanding of the greatness that once was theirs—that we may attain and surpass if we wish. P. A. M.

The Trend of Twentieth Century Science

Man's Three Keyboard

AN interesting discovery in physiology has just been published by a London physician, who in lieu of the vivisection of animals, had the courage to make himself his own subject.

He caused the sensory nerves of one of his arms to be cut, so as to destroy all sensation in the skin supplied by the divided nerves. The cut ends were united at once with sutures and healing was rapid. The new fact came out in the way that sensation returned. The *sense* of touch, and the *feeling* of pain (including the feelings of heat and cold), returned separately; showing that the severed nerves, and all other sensory nerves, contain fibres belonging to two distinct nervous systems. And it is the system that is concerned with *feeling*, which superintends the healing of wounds. This nervous system is of course the "sympathetic," and deals with our home life in the body. Any connection which it has with the outer world, it gets through the intermediation of the other system, the "cerebro-spinal." It is through the latter that we know about the world, and the five senses belong to its departments. And by use of the latter we move about in space.

But it is in the other, the "sympathetic," that we live our home life, and know about the condition of the organs, when sleep and food are necessary, when enough has been eaten, and so on. Like the "cerebro-spinal," it has a motor side, but all the movements made under its supervision are internal, contractions and expansions of the blood-vessels, of the stomach and spleen, and so on. The cerebro-spinal system is probably an evolution of this, an addendum to it, certainly later in the order of organic life. Plants have something corresponding to our sympathetic system, and even, conceivably, crystals.

The two systems are relatively independent, and there is a third—that of the heart—also relatively independent. The heart has a set of minute ganglia in its substance which keep it beating, and if the other systems wish to affect the heart they must do so through its own private "brain" or brains. Of these ganglia, science only knows the *motor* activity. What their *subjective* side is concerned with, is their secret. When, in popular speech, we refer to "the heart" in contradistinction to "the head," we may be verging on a truth concerned with very deep matters. Mankind's intuition may have taught it a truth altogether outside the range of science.

STUDENT

Thought and Brain

AT the recent International Congress of Psychology held in Rome, Professor Sciamanna, in a lecture on the brain, said that as a result of much investigation he had concluded that thought and volition were not confined to a special part of the brain but were of general diffusion throughout it.

He assumed that the brain is the only organ of thought. But in a fuller acceptance of the word thought, it is clear that the brain is only a finisher to the larger part of the process. Thought depends on memory, and memory resides in the organ with which the thing remembered was concerned. A hungry stomach recalls whole sets of sensations produced by the items of bygone meals, and these sensations, transmitted to the brain, excite there the pictures of the various foods. Clearly, the active half of that process is done by the organ concerned, remembering old sensation and clamoring for a renewal of it. The brain is only the means by which the organ shoots pictures of what it wants into the *man's* consciousness. The services of the brain are at the disposal of any organ that knows how to use it. It is a screen, on one side of which stands the man; on the other the bodily organ throwing upon this screen the pictures it wants the man to see.

Anyone trying to pursue a train of thought while he is hungry will soon find that the brain is not entirely at his command. The pictures and thoughts which he is evoking from it are continually interrupted by other pictures concerned with hunger. There are very few who can silence the thinking of organs—or prevent it getting into the brain—for such length of time as they wish.

Physiology will some time come to the Theosophic view taught by

H. P. Blavatsky—that the *active* part of thinking is done in some other department of our nature than the brain, either in the consciousness of the organs of the body, or in the spiritual consciousness which has primarily no connection with the material world at all. The brain is the organ through which the real thinking, the non-pictorial, is made pictorial and thus related to the pictorial outer world. Perhaps only in pure geometry and mathematics, as we study them, is there no pre-existent, compelling, non-pictorial thinking. These sciences, as learned, consist in the forced production of related pictures according to laws of connection.

STUDENT

Theosophy in Science

WHOEVER doubts the rapid infusion of Theosophy into science should study an article on *Life* in the current *North American Review*, by Sir Oliver Lodge.

"Life," he says, "may be something not only ultra-terrestrial, but even immaterial, something outside our present categories of matter and energy; as real as they are, but different, and utilizing them for its own purpose." It vitalizes "the complex material aggregates which exist on this planet," utilizes "their energies for a time to display itself," and then seems to disappear or evaporate whence it came. It is perpetually arriving and perpetually disappearing."

Then he applies this conception to man. While the body is alive, it "moves about and strives after many objects, some worthy, some unworthy. . . . It realizes itself, moreover; becoming conscious of its own mental and spiritual existence." It begins to explore the universe, and finds there a spiritual underlying life that is kindred to its own.

All this is excellently put, save that it seems to make man and body identical, to make man separate from *life*, and to picture him as only coming into being at the moment when life and body join, and only having being while the junction lasts. What Professor Lodge calls *life* might for some reasons be better called soul. Nor would there be any objection to speaking of the soul of a cell or even a crystal, as the power by which the atoms and molecules are drawn into a special arrangement to enable this soul to feel special things and do special work. For the same reasons the soul of a man incarnates in a body, and while there, has below it in the bodily organs and cells a multitude of lesser souls whose stay depends on its stay. In this sense *man* means human soul embodied; *soul* is that entity which can draw matter about it for its purposes; and *life* is the sum of activities exhibited by matter while under the power of a soul of this or that rank.

And if the human soul learns from its temporary incarnation, why not the others, even down to the very lowest?

Sir Oliver Lodge speaks of life as "perpetually arriving (into matter) and perpetually disappearing." Read *soul for life*, apply the idea to man, and you have the ancient teaching of reincarnation.

STUDENT

Modern Medicine Known in Antiquity

THE *LANCET* gives quite a list of so-called modern medical discoveries which were in reality known to the ancients, but of which the knowledge and use were lost during the intervening periods. Thus arsenic was used as a febrifuge by Sentilius, and Hippocrates recommended it for cancerous affections; the latest researches have led to its employment in organic compounds for the same purpose. Pythagoras used squill. Opium has been found in Egyptian tombs and was used by Hippocrates and by Paracelsus. In surgery Hippocrates mentioned intubation of the larynx, and Cælius Aurelianus tracheotomy. Other operations are enumerated, and even asepsis is not modern, for contemporaries of Hippocrates dipped their instruments in boiling water. As to anesthetics, in the thirteenth century it was customary, before operating, to administer, by sponges to the nose, the juices of stramonium, belladonna, etc.

Water-cure, gymnastics, and open-air cure were practised by the Greeks; hypnotism by the priest-physicians of Isis; and doubtless there are many other ancient things which we have not invented yet.

After all, mankind seems to have been at least as intelligent in the past as it is now, and authorities are beginning to recognize the fact. E.

Butterflies: Varying the Species at Will
REMARKABLE results are now being obtained by workers in experimental zoology, which open up new fields both of speculation and of practical science. It has been found that certain species of butterflies have alternating generations, and that others have alternative forms; and that these variations can be produced at will by an experimenter. Thus the *vanessa levana* produces a different kind of butterfly in the summer from what it does in the winter; but, by warming the autumn eggs to a high temperature, the summer form may be produced in the winter. The *vanessa urticae* is found in two forms, a northern one at North Cape and a southern one in Sardinia. But, by warming or cooling the egg, either kind can be produced. The macaone yields even more striking results. By raising the temperature, the beautiful Oriental form is obtained; and, by exposing the chrysalis alternately to temperatures of forty degrees above and forty below zero centigrade, an ancient and extinct species is produced.

Who Invented Paper?

HOW often do we hear the remark: "I wonder who was the first man to invent such and such a thing." We have much to learn about the history of all man's inventions. And as time goes on, we shall find that man has invented nothing at all, in the true sense. As a matter of fact, we have been taught all we know, or we have been permitted to find out a knowledge which pre-existed. Probably there are no modern inventions with which past generations of man have not been quite familiar, although the history of these more perfect races of men is now lost and forgotten. Verily "there is nothing new under the sun."

The "invention" of paper has been one of the most useful of modern arts. A glance of the mind will show how far-reaching has been its effect in spreading intellectual knowledge, and so indirectly promoting wisdom, by giving man the opportunity to digest the knowledge thus brought to his attention. For it is obvious that no man ever saw any true and enduring knowledge written upon paper, which he did not put there himself, and that all he recognizes therein, is limited by the temporary bounds of his own divine prescience.

Long ages before modern man knew anything about paper, the common wasp or yellow-jacket knew all about it, and had reduced it to a fine art.

THE FOREST

HERE in the languorous silence, where the sunlight with shade interlaces,
 Let my soul steep;
 And from the well-springs of beauty, which time neither mars nor effaces,
 Let me drink deep!

Far from the riotous throbbing of busy humanity bustling,
 Here is a balm;
 Only a marvelous bird-song, or music of glad leaves low rustling,
 Breaks the sweet calm.

Oh! to be friends with the lichens, the low-creeping vines, and the mosses,
 There close to lie;
 Gazing aloft at each pine plume that airily playfully tosses
 'Neath the blue sky.

Oh! to be near the beauty, and infinite grandeur of all things
 Simple and free;
 Held by the magic that ages have wrought in the great, and the small things,
 For you and me.

—Maxwell's Talisman

STUDENT

The question as to where the wasp got this knowledge is another matter. It must have learnt it somehow, for the old motto, *ex nihilo nihil fit*, still holds good. It is useless to say that the wasp "grew" up with it like Topsy. If we will think a moment we cannot fail to see that the wasp drew its knowledge from that fount of wisdom which lies back of all created things. There is a boundless ocean of this wisdom which faces us every moment of our lives, if we will but see it. We have much to "discover" but we cannot invent anything, so we may as well quit trying. When we are once convinced of this, perhaps we will also quit trying to corner any invention or discovery for the gratification of our own private greed or selfishness. Why not let them go free, for the benefit of all men, as nature intended them? If we could all once do this, discovery would make such advances as would make us hold our breath and stand amazed. For selfishness is the bar which holds us down in ignorance of the truth. It is the narcotic of the mind which blinds us—the mirage which deceives us—the glamour which shines into our eyes with a false light, and hides from our sight the beauty and usefulness which are so immanent.

The common wasp is similar to the bee in many respects. It differs, in that it is carnivorous, as well as vegetarian. Its food consists of spiders, flies and caterpillars, as well as the juice of plants. It builds its nest of paper instead of wax. This paper is made from *wood pulp*, just as man now makes it. The wasp scrapes the woody fibre from rotten stumps and new sawn logs, chews it up and spreads it, as required, to make the cells and the globular cover of its nest. There is a wasp in South America which makes a nest, the outside of which is as hard as the strongest cardboard, and some of the paper in it is of so fine a texture, that it can be written upon with ink and a fine pen.

But if the wasp is provided with ready-made paper, the intelligent insect will see its opportunity, as some orchardists in California lately discovered to their cost. They had covered the bunches of grapes with paper bags to preserve them. Whenever these had become a little damp the wasps appropriated the ready-made paper and carried it away to their nests, chuckling no doubt at their own powers of "invention." What a wonderful faculty that must be—instinct—that the animals all have. One wonders how the gods philosophize about *our* faculties.

SCENE IN THE SCOTTISH HIGHLANDS

Woman in Art

THE statement has been made that women have never accomplished any very important work in painting. True, men have worn the laurels in the past, but this does not signify that there are not great possibilities yet undeveloped in women.

The history of Madame Vigée Le Brun furnishes an interesting example of what has been done by a brilliant woman. Living in an atmosphere of art, her father being an artist, she displayed in early childhood an intense love for painting. This characteristic was tenderly fostered by her father and the circle of artists, who frequented his studio.

Her father's death, when she was but thirteen years of age, occasioned her the deepest sorrow. It is interesting to note how she found consolation in art, when her mother, Madame Vigée, took her to the Luxembourg Palace to see the works of Rubens. Of this time Madame Le Brun writes:

"I immediately became just like a bee, so eagerly did I gather knowledge, and so intoxicated with bliss was I in studying the works of the great painters."

At the age of fifteen, she became so successful in portrait painting, that she earned the living for her mother and brother; yet her nature was so unaffected and sincere, that her absorbing passion for art filled up all those gaps in her life, where vanity and pride over her success might have crept in.

Reared in Paris, sought by men of letters, the protégée of royalty, and the pet of the art world, she still maintained her sweet womanly nature, and her unabated love of work. Personally, she was beautiful, charming in manner, and gifted with a ready wit. These qualities greatly added to her popularity.

She became the favorite painter of Marie Antoinette, who gave her sittings for no less than twenty portraits, one of which is reproduced on the opposite page.

At the age of twenty Elizabeth Vigée was married. The marriage proved an unhappy one, though through no fault of hers, for she was always loyal and true in her home life. In her *Souvenirs*, she assures us that all the pleasures which she had in her success were as nothing to the joy she felt when her little daughter was born.

The husband and daughter, in after years, became the cause of grief

to Madame Le Brun, yet she always bore her sorrows bravely and was ever the sweet-tempered, gay and enthusiastic lover of art. As an example of her equanimity, one biographer writes that, in the early days of the Revolution she calmly continued at work on a portrait, while the roar of cannon was distinctly heard in the distance.

The terrors of the Revolution forced her to seek refuge in Italy, where she was received with honors. At Florence she was invited to contribute her own portrait, which she painted herself, to the collection of artists' portraits in the Uffizi Gallery.

Madame Le Brun continued her residence in Italy, Austria and Russia for a period of twelve years, during which time she was received into the National Societies of Art in each country, and painted many portraits of members of the royal families, and of titled men and women. She was always surrounded by a gay and brilliant circle, which paid homage to her both as woman and artist.

Madame Le Brun owed her remarkable career as much to her charming personality as to her talent. She had also the rare perseverance and love of work which are absolutely essential, even to genius. Her great industry is evidenced by the six hundred and sixty portraits from her brush, besides two hundred landscapes and a few subject pictures.

The facility with which Madame Le Brun worked, and the early success which her labor earned, obviated, to her regret, the actual necessity for that wider study, which might have led her talent into the field of imaginative or historical work. She remained preëminently a portrait painter to the end. Her work belongs essentially to the French school of the Eighteenth century, and, while she followed, in technique, the methods of Greuze and of Regnault, there was always a grace and charm about her paintings peculiarly her own. She had a keen appreciation of character and never treated her subject with weak sentimentality. She sought to bring out the best, while keeping the truth before her as an ideal to be attained.

There are numerous portraits of Madame Le Brun, painted by herself. Among the most celebrated of these is the one, now in the Louvre, of herself and child in an attitude of affectionate embrace.

To the end of her long life, which closed in her eighty-seventh year,

FRAGMENT

From the poems of MARY DUCLAUX

FAIN would I be the bard who sings
To show the proof of hidden things.
Whose dreams o' night take shape and give
The world a better way to live.

A nursling of the gods is he!
I can but sing the thing I see.
Content if through my music pass
Some rustling of the summer's grass.

Nay, far too vast for me's the girth
And frolic grandeur of our Earth.
Whose dancing forces aye combine
In life, or lightning; wit, or wine.

I sing the fearless flight of birds,
The life of farmers and their herds,
Or such old tales of fount and fell
As watching shepherds wake to tell.

And yet my country friends shall praise
The mirror of my roundelay,
For—brook and blossom, dove or daw—
Believe me, what I sing, I saw!

she remained devoted to her chosen work and to art.

There is no field of art which can be said to belong distinctively to women. If we look for the feminine qualities of delicacy and tenderness, we find that they have often been most truly expressed by men; while many woman painters of the Nineteenth century, notably some who have gained fame in portraiture and mural decoration, prove that art is not dependent upon sex but upon mind and soul.

Today the best art schools are open to woman, and she is taking her share of the prizes. A new era has dawned for her at last. The door of opportunity has been opened to her in all lines of labor and education, and she has stepped out from her age-old passivity and seclusion. As she realizes her release, she takes her rightful place as man's comrade and co-worker, not as his rival or imitator. EDITH WHITE

Art-Craft

THE movement of the past few years toward the revival of our handicrafts has developed the old-time hand bookbinding industry and brought it into prominence. Women especially have taken hold of this art-craft with enthusiasm and promise to rescue it from becoming a mere trade—as has been threatened by the tendency of the last century toward the conventional and machine-made—and make of it an art.

The history of the profession in this country covers little more than a decade, but during that time a number of bookbinderies and several schools of instruction have been established. In the early days, when the first woman undertook to learn the craft, she met with the usual difficulties that women-pioneers in every line have experienced, for it had not then occurred to the masculine mind that women could compete with men in this profession. This pioneer-woman found there was only one place in New York where she would even be accepted as a pupil and that in an obscure little bindery where she labored for two years and then was obliged to go to Europe to learn the finer points of the art. Today, hundreds of her sisters have taken up bookbinding as a profession and are quite as expert as men. In fact, women have by nature the delicacy of touch which is so necessary in hand binding. To the uninitiated it might seem an easy matter to cover a book, but, in reality, it requires considerable skill and most careful handling. Then, too, one must also possess some artistic ability and ingenuity in creating new and original designs, for decoration is a most important part of the finished work. STUDENT

Mlle. CHAMINADE had to fight her way past parental prejudice. But she persevered and succeeded and before the age of eight had produced several compositions. Her father at that juncture wisely insisted on a thorough course of general instruction in the usual scholastic branches as well as instruction in music. She studied piano, violin, harmony, counterpoint, fugue and composition. Her career as a composer has been almost overshadowed at times by her reputation as a performer. H.

Women as Designers

AMONG the many fields now open to women who must earn their own livelihood, or who choose to have some definite occupation for their time, that of designer seems especially attractive. As a profession, it is not overcrowded and offers peculiar opportunities. There are a number of Schools of Design in the country training women for this work, but they report that they are unable to supply the constantly increasing demand for really good designers. Most of the large manufacturers of textiles, silks, wall-paper, etc., now employ a staff, principally of women, to make their designs.

Artistic ability is necessary to the successful designer; but there are comparatively few women without some talent, often unsuspected by themselves. Oftentimes women who claim they cannot execute, have "ideas" and would, with training, make excellent designers. It is not a difficult matter for such an one to learn the technique of designing, to copy or adapt, or apply. So the woman with "ideas," who thinks she knows nothing whatever about art, might possibly be the most valuable when she has had thorough technical training.

It has long been asserted—and generally accepted—that the feminine mind is not inventive, that it follows established lines almost slavishly. May it not be possible that the unnatural position into which women have been forced for centuries has something to do with the opinion, if not the fact? Tied down by prejudice to certain narrow ideas as to her "proper place in the world," ignorant of her real nature and almost limitless power, it is not strange that the latent fire of inventive genius has long been smoldering. Creative power on some line is inherent in every woman-soul and freedom from the fetters which limit her is often all that is needed for her imagination to soar, bird-like, into its native air, opening her mind to the world of beauty. Then there will be no longer just cause for complaint as to lack of originality in designs. STUDENT

MARIE ANTOINETTE
Copy of Madame Vigée Le Brun's celebrated painting in the Museum at Versailles

In ancient Greece we read of three women who achieved fame as composers of music—Sappho, Myrtis and Corinna. And yet

another Corinna is said to have written a poem which was compared by her contemporaries to the work of Homer.

ONE of the most distinguished authorities on nature study in America is Mrs. Anne Botsford Comstock, a lecturer both at Cornell and the Leland Stanford Jr. Universities. She is even better known for her work as wood-engraver of insect life and has won honors at the Expositions of Buffalo, Chicago and Paris.

MARY Queen of Scots received her musical education in France. She is known to have composed, among other things, a number of songs.

WITHIN the last few years the United States has granted more than thirty-five hundred patents to women. Certainly a fair record.

THE CHILDREN'S HOUR

The Fairy of the Old Oak Tree

THERE was once a Fairy who lived in the heart of an old oak tree, in a green wood. Her life was bright, and she thought not of herself, but of her duties. They were happy ones—keeping the great oak straight and strong, its bark healthy and its leaves glossy and green. It was a mighty tree and its branches spread far out. The birds nested in them, and such songs would pour from their little throats as would make the Wood Fairy thrill with joy and love. This was because the Wood Fairy was true and unselfish, for what is in the heart, however deeply hidden it may seem to be, really shines in every part and makes it lovely or unlovely.

Now the Wood Fairy knew nothing of the great world beyond. She had seen travelers passing by, and they sometimes stopped to rest under the big tree.

Sometimes men on prancing horses rode from the palace of the king, far away. Their merry laughter echoed through the woods.

But troubled times came upon the land. The old king died, and his two sons, Edwin and Egbert, through the words of evil men, became enemies. Those men told each brother to take

the throne for himself. The brothers listened and so opened the door for these wicked thoughts to enter. That was how the trouble came.

It spread to all the people. Some took sides with Edwin, and some with Egbert, and there was war. Nowhere was there peace save in the great forest.

One day Edwin fled to the forest—away, away into its cool depths. He fancied he could hear the cries of his pursuers. On he went, till he could go no further, and under the great oak he stopped. As he looked up through the leaves to the glimpses of the sky beyond, his thoughts went back to his childhood when he and Egbert played together. His heart grew full of tenderness toward this brother who even then was seeking his life—and he forgave him, and so fell asleep. The Wood Fairy looked into his heart and saw all this. Night came and he slumbered peacefully.

Again the forest stillness was broken, this time by horses' hoofs. For on a great white charger came Egbert, with anger in his heart. He, too, was now in need of rest. So he stopped by the oak and lay down on the other side of the huge trunk. As his brother had done, he looked up through the leaves at the stars which now were shining down.

And what do you suppose the Wood Fairy did as she looked into both their hearts? Being a Fairy, and pure and unselfish herself, she knew what magic was. So she took the thoughts with which one brother had fallen asleep, and put them in the stormy heart of the other. And by and by, his heart grew calm and compassionate as was the Wood Fairy's, and he saw things as they were and he was filled with love for his brother. He, too, fell asleep, and the Fairy watched them both as the night wore on.

Morning came, and the birds began to wake and twitter. As the first rays of the sun shot into the forest, the brothers awoke and looked into one another's eyes. And they found that the evil and strife were gone and they were as children again.

Mounted on the same horse they rode back, and with them rode peace and joy and brotherhood for all the land. A STUDENT OF RAJA YOGA

Gathering Wild Flowers in Lomaland

NOT long ago we spent the day on the hills gathering wild flowers and having a picnic. Such fun as we have on our picnics in Lomaland!

We gathered the flowers to decorate our Raja Yoga Schoolroom. You only have to go a little way to find millions and millions of flowers in Lomaland. The prettiest ones grow down on the hills near the seashore. There are more purple and yellow ones than any other color.

When I stood on the hills and looked at them, all spread over the ground, it made me think of our school flag. The colors are the same.

The flowers are not all purple and yellow; some are pink, and white, and red.

I found some little "cream-cups" which looked as if they had a little bit of butter on each petal.

There are tiny green ferns growing under the bushes. We call them "silver back ferns," because they have silver dust on the under side of the leaves. When they grow older, the dust turns a golden color and then we call them our "golden back ferns."

Lomaland Photo and Eng. Dept

GATHERING WILD FLOWERS NEAR THE SEASHORE, LOMALAND

"HUNDREDS of stars in the pretty sky,
 Hundreds of shells on the shore together,
 Hundreds of birds that go singing by,
 Hundreds of bees in the sunny weather,
 Hundreds of dewdrops to greet the dawn,
 Hundreds of lambs in the purple clover,
 Hundreds of butterflies on the lawn,
 But only one mother the wide world over."—Selected

After we had gathered a great many flowers we had our lunch, all sitting about upon the ground. What good things came from the big basket which the boys had carried on a pole between them! No wonder it was heavy.

After our luncheon we gathered more flowers and wove them into wreaths and garlands.

When it was time to go home, we put on our wreaths and garlands and, with our baskets

full of flowers, marched home, singing.

On these happy days, we never forget how many little children in the world never have one happy day like this and we wish that they might be with us to share our good times in Lomaland. But how I wish you could know about the children who are coming here from week to week and how many, many more are begging and begging to come here to be with us in our Raja Yoga School! Its splendid! A RAJA YOGA GIRL

The Still Small Voice

LITTLE WILLIE had been housed up all day on account of a driving rainstorm, but late in the afternoon the sun burst through the clouds and he was allowed to go out into the garden to play.

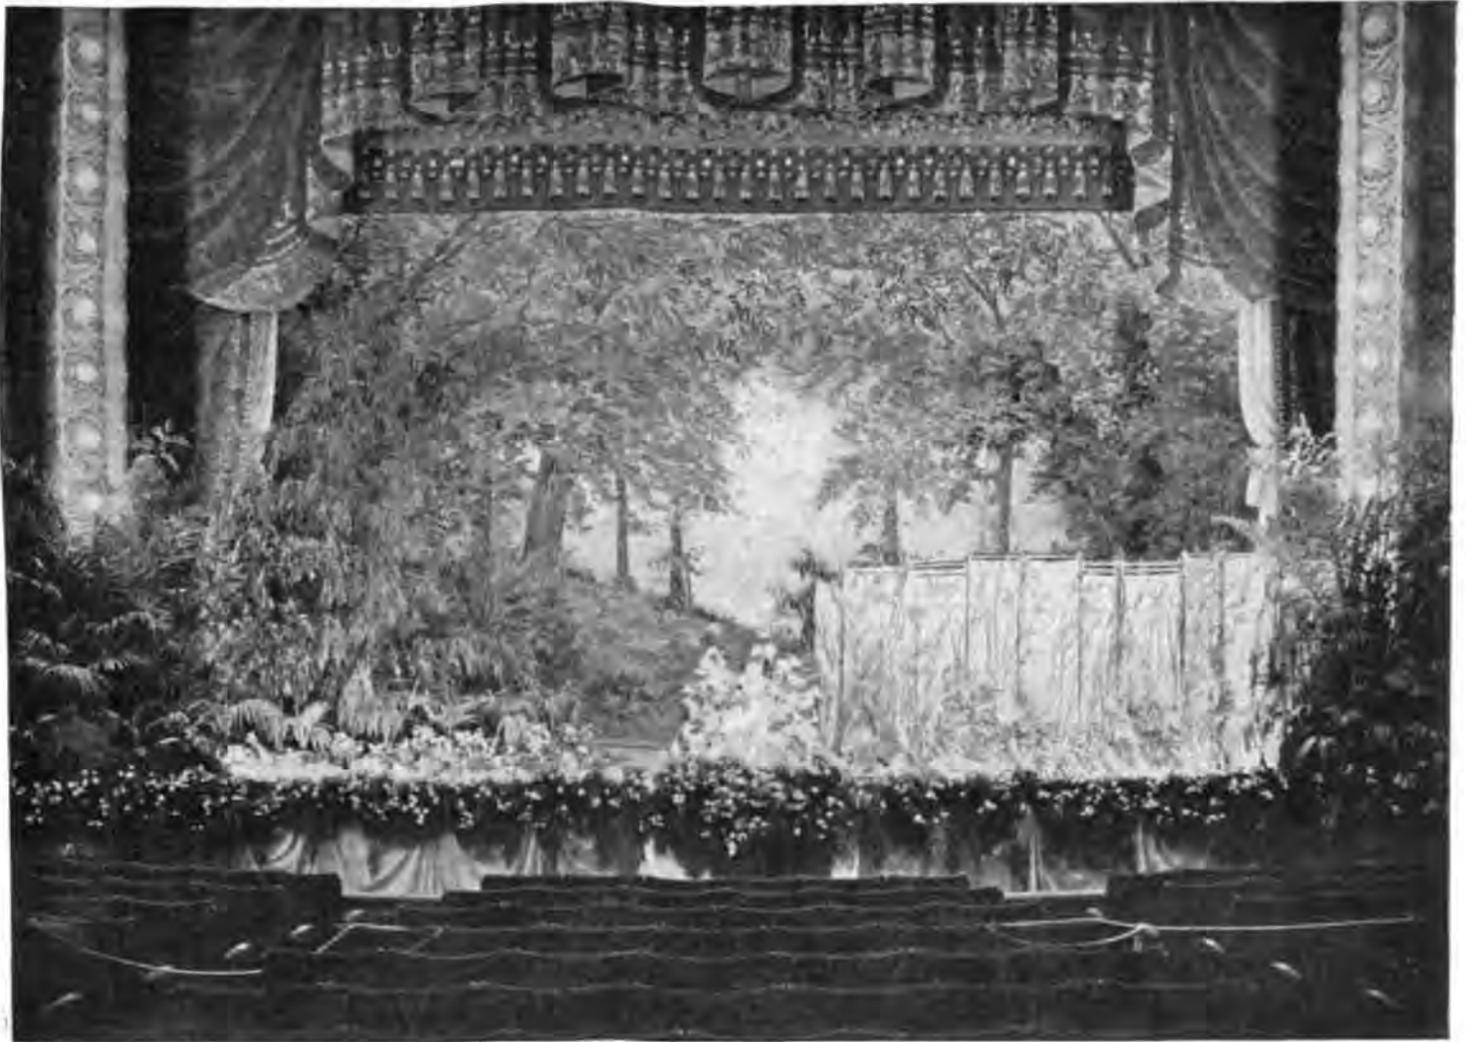

It was not long however before he came in, flushed and excited, exclaiming to his mother that he wanted to tell her a story, and this is what he said:

"Once there was a little boy who went into the garden to walk, and there he saw some beautiful flowers, with raindrops on their petals, which dropped one after another to the ground, where an ugly worm came out to get a drink. It was so ugly the little boy raised his foot to crush it, when a voice of sadness sounded in his ear, and said, 'Will you? will you?'"

At this point, forgetful of all else but the spirit of reproach felt in his tender conscience, he looked up in his mother's eyes, with tears in his own, and said: "And I didn't, Mamma, I didn't."—A. E. B. in Unity Children, what was this sad little voice? Can any one tell? M. E.

THE THEOSOPHICAL FORUM, IN ISIS THEATRE

THE Universal Brotherhood meeting at Isis Theatre last Sunday night included two good papers and the usual delightful musical program. Mrs. E. T. Bundsmann read a paper entitled "The Building of Character." In part she said:

"The building of character should be the ultimate object of our education of the young, for noble character is the well-spring of all good action. If we would have our system of education count in the future lives of our children, all studies, all efforts, must tend in that direction. For as they go forward into the world to fill their places, to answer their callings, they must be equipped with the essentials of character, or we have not fulfilled our duty to them, and they have the right to hold us accountable. To train children to the proper use of all their faculties is one of our highest obligations, and we cannot excuse ourselves if we fail.

"We must begin our work very early indeed, for when we assume the care of little children, we must feel that they have the right to our highest and best endeavor. Parents, study your children, search out their weaknesses and faults, and address their education to the elimination of these and to the development of their latent possibilities. This takes patience, perseverance and sympathy, but the gain to them will be inestimable and enduring, while your own character will receive a rounding out that will give you a deeper hold on the verities of life.

"Theosophists have an added urge to the rounding out of character, for we believe that perfection is attainable in the school of human experience. We accept, literally, that commandment of the Bible which bids: 'Be ye perfect, even as the Father in Heaven is perfect.' In the education of our children, and in the student life, there is a constant marching toward this grand ideal. It vitalizes all work and fills the heart with hope and courage. 'Through labor to the stars,' has been the watchword of all great souls. For example, the high moral excellence of Milton, Bach and Michael Angelo is proclaimed by the precision of their craftsmanship as truly as by the loftiness of their conceptions. 'Trifles make perfection,' said one of them, 'and perfection is no trifle.' The striving after perfection is the highest insignium of virtue, and the most

enduring quality of character."

"Use and Misuse," was the topic of an entertaining and practical paper read by Mrs. W. T. Hanson. "Every gift, every power," said the speaker, "has its corresponding responsibilities; its opportunities for good or evil; its uses and misuses. Try as we may, we cannot escape the consequences of any misuse of any of those powers that could and should be for the benefit of ourselves and all mankind. We are all so closely connected that whatever affects the one affects the whole. If any man has more than another of any one blessing, health, wealth, or happiness — who is responsible for it? Has he not earned it and will he not have to answer for the right use of it? I am discussing it from a Theosophical standpoint. In the first place we do not believe that our life ends at three-score years and ten, and that that is the end. We know we brought our responsibilities in this world with us, and all these conditions of health and wealth, poverty and disease, happiness and unhappiness — are the results of our own actions, and not the gifts or punishments of an Almighty Creator, who represents eternal justice to all creatures.

"We are all brothers, and when we all know that each member of the large family has made his own conditions, and that it rests with him to change them for better or for worse, we will set to work to help and encourage each other in every effort toward a better understanding of life and the laws that are founded on eternal justice. There can be no envy or discontent in any place where dwells the spirit of Universal Brotherhood."—*San Diego News*

Theosophical Meetings for Sunday Nights

Public Theosophical meetings are conducted every Sunday night in San Diego at 8:15, at the Isis Theatre, by the students of Lomaland.

Theosophical subjects pertaining to all departments of thought and bearing on all conditions of life are attractively and thoughtfully presented.

An interesting feature is the excellent music rendered by some of the students of the Isis Conservatory of Music of Lomaland. Theosophical literature may always be purchased at these meetings.

Art Music Literature and the Drama

New Light Upon the Art and Architecture of the Ancients

THE British school at Athens brings again to our notice, in its reports, the wonderful discoveries that will throw new light upon the art of ancient Greece. During the last ten years a new chapter has been written in Grecian history and the world has at last confessed that much that we have called myth and legend is really historical fact. Minos did live and his palace in Crete is something more than tradition. And this is but one of many old legends verified. It is evident from these ruins that the ancients had a knowledge of most scientific engineering and a system of laying pipes throughout their cities and houses for the prevention of disease that is more excellent than that in use in many of our up-to-date American cities.

One point of interest is the fact that many Egyptian monuments and records, as well as articles of Egyptian manufacture, are found among Cretan ruins. Greece and Egypt must have been in intimate communication with each other. In Central America, too, as well as in Alaska have been found coins and carvings unmistakably Egyptian. What is the nature of that link between nation and nation which these things prove to have existed beyond a doubt?

Herculaneum, too, attained exquisite Greek culture as is just now being proven by the evidence derived from excavations there, a culture more purely Grecian than its sister city Pompeii. It is difficult to foretell what surprises archeologists may have in store in the future for those who are seeking to arrive at a better understanding of the art and architecture of ancient days. STUDENT

WHAT will be the nature of that shock which is destined to awaken certain of our impresarios and actors to the bestiality of their present ideals? Not all, to be sure, are governed by the ideal "Will it pay?" or "Does the public want it?" or "Will it draw the crowds?" But very many still are. A paper recently reported the case of a thirteen year old girl who has confessed to the brutal, but most ingeniously planned, murder of an infant. When accused of the crime she made no attempt to conceal her share in it, saying that she carried out the plan of killing the child as it was suggested to her by a play she had seen at the theatre. Where lies the responsibility in this case, at the door of this mere child, or of those who put such a play upon the stage? What is the prospect for the future, if some of those who are giving the public "what it demands," do not awaken to the fact that each is his brother's keeper whether he likes it or not—nay, whether he knows it or not? STUDENT

AND now the newspapers are discussing the question "What is the origin of Yankee Doodle?"

It is said that the Hessians had the honor of bringing this tune to the Colonies; and that it is English there can be no doubt for it may be traced to the reign of Charles I, of England. But other writers credit it to Holland, where it was a harvester's song; still others to Hungary, on the statement of Louis Kossuth who is said to have remembered hearing it there in his youth. Another writer declares that it was recognized in Biscay and in India long before the war of the American Revolution.

Certain it is, however, that at one time "Yankee Doodle," under quite another name, was used as a "rogue's march" to drum soldiers out of the British army. And there is a little tradition that it was played in the streets so often at one time as to disturb the worshipers in the churches of Boston! It is, however, a well-known historical fact that this innocuous tune was played by Lord Percy's division in derision of the Americans as they marched toward Lexington, but that, although the British retreated on that day, the little tune remained, and "Yankee Doodle"

has had its own unique place upon the pages of United States history ever since those strenuous and memorable days. STUDENT

IN 1644 certain religionists succeeded in securing the passage of an ordinance in the House of Lords, England, which not only forbade the use of organs in churches, but ordered their total destruction. There was the logical result: a few organs were purchased by private individuals and a very few were allowed to remain; but most of them were partially or wholly destroyed, often by soldiers. And this was but one of the outrages resulting from the ignorant fanaticism of the day.

Lomaland Photo and Eng. Dept.

THE "GRUEBEL BRUNNEN," NUREMBERG, GERMANY
A TYPICAL CORNER OF AN OLD GERMAN TOWN

The earliest of modern organ builders, counting those who made organ-building a profession, were Germans, and the first organ successfully built in that country was the organ of Nuremberg, built in 1455.

A FRIEND of Mendelssohn's relates how they were walking in the country one day and, getting tired, threw themselves on the grass in the shade and were there pursuing their conversation. Suddenly Mendelssohn seized him by the arm and whispered, "Hush!" A moment later the composer told him that a large fly had just then gone buzzing by and he wished to hear its sound die away in the distance. Mendelssohn was at that time working on his overture to "A Midsummer Night's Dream," and not long afterwards it was completed. He then showed his friend a certain descending bass modulation with the remark, "There, that's the fly that buzzed past us at Schönhausen!"

The Foundations of Real Religion

THE only firm basis for true religion is an intuitive perception of the truth—a direct knowledge of the powers and laws that reign and of the conditions that must be observed in order that men may live well. We have this kind of religion in certain matters concerned with our daily life and mutual intercourse, but we do not call it religion. On more extended matters we have not this direct knowledge, but depend instead upon traditional creeds and various philosophies.

For instance, we do not perceive directly as an obvious truth the Golden Rule, but instead have it in the form of a precept. But suppose mankind were to arrive at a general conviction, founded on experience, of the truth of this principle; suppose it were to become matter of certainty, obvious, indisputable. That would be true religion, and there would be no need for any one to preach the Golden Rule as a maxim.

This would be a "revelation." But, mark, a revelation must be collective. If one man has a revelation, and not others, he cannot impart it, and he may be tempted to set up as a Messiah. It is also much more likely to be a hallucination than a revelation.

There are also such things as collective hallucinations, as we see in revivals and the rise and fall of fanatical sects. But the test of genuineness is the one given by Christ: "By their fruits shall ye know them." Humanity cannot be long misled by false revelations; it has had plenty of experience of such. It will know the true kind when it comes.

THEOSOPHY IN LOMALAND

Students of Theosophy in Lomaland seriously try to make the Golden Rule something more than an injunction. Accepting it as the mainspring of all conduct, the key to all mysteries, the perennial fount of life, the perpetual lamp of the soul, they seek to prove and verify it in every detail of living. Thus a general and collective recognition of it and reliance on it gradually grows up.

The notion of goody-goodness inevitably creeps in when one tries to talk about this. That is because people are wont to regard religion as a kind of tight black clothes that have to be worn, and to use the Golden Rule to rap their children with. The opposite extreme is when people take God down out of the sky and strut about arm in arm with him. There is, however, a dignity which avoids equally the extremes of austerity and flippancy; but its language is silence.

THE SOUL'S PLACE OF STRENGTH

The multitudinous cries that arise from the world—the "simple life," the "new thought" systems, and so on—indicate that the world is turning away from the old authoritative catch-words, and seeking in its own soul for an anchor and for some unflinching light. It is as if men felt vaguely that they have lost something and were trying to find it again; some inner certainty, some place of rest. Perhaps, if this Golden Rule could be contemplated without the usual religious coloring, one might find in it some radical principle that could be applied to every concern in life and every detail of conduct, to every art and science.

One old Scripture says that "the self is the foe of the Self," meaning that what we conceive to be our own interests are not by any means so, but usually quite opposed to our *real* interests. When we resign personal desires, we are only clearing the way for a fuller life. People are everywhere beginning to feel that there must be a fuller life, and that there is an absolute religion founded on indisputable knowledge. H. T. EDGE

Reformers, True and False

"HALF-BAKED reformers" is the theme of a writer, who says they are the worst of all drawbacks to political reform, with cheap-John devices to "transmute leaden instincts into golden conduct," and their panaceas that are to precipitate the millennium tomorrow. They repel the common-sense voter and cause the name of reform to stink in his nostrils; and the professional cynic, laboring to prove the permanence of evil, finds them a regular stock-in-trade.

Well may real lovers of reform despair when they see the pendulum swinging backwards and forwards from stagnant abuse to misguided reform, and the same evils prevailing through all. Yet real progress gains ground slowly all the time, though it comes not where looked for and not in response to schemes. Most of these half-baked reformers, setting aside the obviously insincere and venial, are theorists who construct paper plans in seclusion and then try to spring them on the people irrespective of time and season. In short, they are cranks. It is easy to solve a problem when the materials are mere creatures of your imagination, plastic and obedient, lying still when they are not playing a part in your scheme. But actual people are different.

NEW WINE IN OLD BOTTLES

The matter may be illustrated by comparing the cases of an inexperienced and of an experienced teacher in a school. The former will come with a cut-and-dried plan, hatched under imaginary circumstances, and try to spring it. The latter knows well that he must first study conditions on the spot. He must be an opportunist. He may have all kinds of plans up his sleeve, but he must watch for the right time (if any) to produce them.

Again, let us remember Jesus' parable about the new patch and the new wine.

No man putteth a piece of a new garment upon an old; if otherwise, then both the new maketh a rent, and the piece that was taken out of the new agreeth not with the old.

And no man putteth new wine into old bottles; else the new wine will burst the bottles, and be spilled, and the bottles shall perish.

But new wine must be put into new bottles; and both are preserved.

No man also having drunk old wine straightway desireth new: for he saith, The old is better.

We cannot have a patch of perfection on a dilapidated social fabric, nor entrust people with powers which they are not strong enough to use. The evils of society are enormously complex, and a touch here and a touch there is all we can give.

NO FADDISM IN TRUE REFORM

The Universal Brotherhood at Lomaland, with its central and branch Raja Yoga Schools, is providing the *new bottles* into which the new wine can safely be put. There is no faddism about the reform work of Katherine Tingley, no machine-made plans, no curricula, no diet-lists, no creed. The development of the children under the Raja Yoga system is normal, healthy and natural—according to the needs of the higher nature; and because of this the results already achieved are marvelous. The true reformer is one who has triumphed over the impatience and delusions of the mind, over scepticism and fanaticism, over narrowness and fickleness, and all that distorts the judgment and weakens the hands. He watches his opportunity and gives a telling touch just when and where it is called for.

Notice

Attention is called to the importance of having all remittances to or for any of the different Departments of the International Theosophical Headquarters at Point Loma, California, sent either by postoffice money order or by draft. Otherwise responsibility for any losses must fall upon the sender.

(Signed) CLARK THURSTON,
Chief of Finance.

For the Benefit of Enquirers

REGULAR weekly meetings of the Aryan Theosophical Society, established in New York City by William Q. Judge, the second Leader of the World's Theosophical Movement, are held every Thursday evening at 8 o'clock in Isis Hall, 1120 Fifth Street, San Diego, California. These meetings are intended to meet that large and growing body of earnest enquirers who desire to know more of the different tenets of the Theosophical philosophy. Students from the Universal Brotherhood Headquarters at Point Loma, California, conduct these interesting gatherings to which every truthseeker is cordially invited.

CONCENTRATION

PHILIP VAN ARTEVELDE

ALL my life long
I have beheld with most respect the man
Who knew himself and knew the ways before him,
And from amongst them chose considerately,
With a clear foresight, not a blindfold courage,
And having chosen with a steadfast mind
Pursued his purposes.—*Selected*

MY GUARDIAN ANGEL

ETHELWYN WETHERALD

WHEN from my task I fain would steal,
And into vacuous languor slip,
With inward bleeding then I feel
My guardian angel's whip.

Or when to empty revelry
I give my spirit, though it sears
And shames that inner self, I see
My guardian angel's tears.

Or when I yield to grief, or fear,
Or pride, or say that life is chaff
Blown by an idle wind---I hear
My guardian angel laugh!—*Selected*

The Real Educators of the Age Must be Theosophists in the Profoundest Sense

AS MOST thinking minds are agreed that the present conditions are the logical outgrowth of the past, shall we not rightly conclude that the future will be the outgrowth of the present? We can then make the future just what we will. As the future depends so much on the children, is it not imperative that they shall have, at the earliest possible age, a true knowledge of life and its great purpose? What is of more importance to the children themselves than a real knowledge of the truth of Life? Do we honestly think that turning out reading and writing candidates for starvation, as H. P. Blavatsky said, is real education? Should not children above all be taught self-reliance, love for all men, altruism, mutual sympathy, and more than anything else to think and reason for themselves concerning the purpose of their being here? Should not the inner senses, faculties, and special aptitudes of the children be harmoniously, quietly and naturally brought out? Should not education aim at creating free men and women, free intellectually, free morally, unprejudiced in all respects and above all unselfish, as outlined by Madame Blavatsky in her *Key to Theosophy*?

Why do we not watch our children more and notice the questions they ask, and remarks they make—those *impersonal* questions which show that “the Soul knows what it requires,” and which are a hint to us to give some *rational* help? Do we not know that the battle of life is one between our Warrior-Soul and our personal nature with its lower tendencies? Then is it not important that we give to our questioning children noble and true ideals, such as would lead them to feel they are the Warrior-Soul, and that being *divine* they have to fight for mastery in their hearts for right and truth against the power of selfishness and wrong?

How earnestly they listen when being told that as a Soul, they are divine, immortal and *unconquerable*, if they will but listen to that voice inside—the voice of their conscience! What but the true teaching, the armor of Theosophy, will help a child to win in such a battle? Why are the millions of the earth in such a helpless and deplorable condition today? Is it not through lack of heeding what *all* the World Teachers have taught, and Katherine Tingley is teaching today, that the time for a warrior to put on his armor is *before* battle and not after?

Happily, through the influence of Theosophy we are awakening to our real duties, and we feel that our children must have, while they are

children, the shining armor of Theosophy if they are not to be worsted in the struggle against passion, appetite, and selfishness. But how can this be done unless the Educators themselves be such as have put on this armor, tested its irresistible power, and obtained a clearer insight into the needs and problems the children will have to face? Must they not be alive and alert, in real sympathy with the souls of the children?

Is this possible to the ordinary teacher? Must he not be in close touch and sympathy with his own Soul to be able to realize what is the soul-touch in children? Bringing *information* to the child's mind is not education in its truest sense, but evoking the knowledge and experience it has garnered in its past lives, *is*. And this can be accomplished only on the basis of the teachings of Theosophy: of the law of Cause and Effect, Cyclic law, Reincarnation, the dual nature of man, the Divinity of the Soul, and Brotherhood.

Thus it is essential that a teacher be well-balanced not only mentally, but in his moral and spiritual nature. Children learn readily and gladly the greatest truths when presented in the right way, but how can the teachings of life and destiny, the meaning of duty, the necessity for self-control, kindness, and cheerfulness, be imparted by one who has not himself experienced the truth of these teachings, and who does not express these qualities in his own life?

What are the signs of the times? The children are demanding more and more from us, more and more that we shall show in our lives an absolute sincerity in all that we profess, that we shall practise what we preach. If we would put before them a high standard, they demand that our own standard be high also. And where shall we find the knowledge of the truths of life, the knowledge of our own natures, that will enable us to satisfy these demands of the children? Where but in Theosophy. The education of the future is Raja Yoga, and the educators of the future must be Theosophists in the profoundest sense of the word. S. A. A.

The Philosophy of Action

WHAT is the philosophy of action? We cannot perhaps sum it all up in one phrase, but we can assuredly sum up a very great part of it in one little teaching which W. Q. Judge was never tired of repeating, and which indeed all truly great men have testified to. The secret is to concentrate all one's soul on the duty of the moment. This done, Time will multiply the act, the moment will become a lifetime, and the small duty a life-work.

How often do we allow our imagination to contemplate a task in its entirety, until our courage is staggered at the idea of undertaking it! An absurd delusion, since we fool ourselves by picturing ourselves as doing the whole thing at once, whereas for the present we are only required to *begin*; the time is as plentiful as the work. Sometimes, at the top of a flight of steps, the impatient body balks at the prospect of taking them one at a time and makes a rash attempt to negotiate the whole flight at one bound. At other times we upset a box of pins and stand aghast at the thought of collecting them, or go for a dustpan and brush, when it would take less than a minute to pick them up one by one.

If we have the ultimate object too much in view, we get impatient of the steps—a characteristic failing of this age. We are all too eager to achieve quick results—in education, business, building, what not.

The philosophy of action is concentration on the duty of the moment. Easy to say, hard to carry out; yet each time we reflect on it, we make a little progress towards its attainment. STUDENT

Reflections and Refractions

WAS H. P. Blavatsky dilettante? Not a bit; and one who for a moment supposes that her constant bringing forward of archaic religions and beliefs was not intensely practical, little understands her and her work. Because she is so practical one must constantly transpose her tenses, using the present where she used the past. Thus she says, quoting from the *Book of Dzyan*, “From the effulgency of light—the ray of the ever-darkness—sprang in space the reawakened energies.” If this were put in the present tense it would be also quite correct—from the effulgency of light *are springing* the reawakened energies.

In *The Egyptian Book of the Dead*, the Osirified asks that the image may perform the work in the netherworld. In *The Voice of the Silence* H. P. Blavatsky says that “the image (man's body) has to become as deaf to roarings as to whispers, to cries of bellowing elephants as to the silvery buzzing of the golden fire-fly.” MYSTIC

In the Land of the Rising Sun

(From the Special Correspondent of the NEW CENTURY PATH)

NEAR TOKYO, JAPAN, 10th May, 1905

THERE has just been held in Tokyo a great memorial service at the temple called "Shokonsha," dedicated to the soldiers who have lost their lives in battle. At 3 a. m. on the 3rd of May the sacred fires were lighted; and at about 10, the State dignitaries commenced to assemble at the shrine. Most of the Imperial Princes, Ministers of State and other high officers were present. Prince Fushimi, representing the Emperor, conducted a memorial service. The ceremony ended with ancient sacred music.

The names of about thirty thousand men who have given their lives for their country were solemnly placed on this national altar.

From all parts of Japan relatives of the dead heroes came to attend this service. Farmers from the provinces and young widows accompanied by their aged parents were present in large numbers. They were received with respect and heartiest sympathy. There were many very touching scenes.

"But where is Father? I want Father!" said one dear little fellow to his grandfather who led him to the shrine.

"The honorable home is very large—it is so large," replied the old man gently, and then seeing the poor child's disappointment, he burst into tears. For they are infinitely tender with the little ones. In fact many of the very old people have the simple unspoiled heart of a child.

The harvest in Japan this year may well be called the women's harvest, for so many of the men from every village have been called to the front that their wives and mothers must manage to till the soil. And right well, and bravely are they doing it, for the rice crop is exactly 22.5 better than that of an average year, and the barley crop promises to be equally abundant. In many parts of Japan there are volunteer labour associations who freely give their help to cultivate the fields of those who are very short handed. In fact, throughout the length and breadth of the land there are innumerable cases of real self-sacrifice and true brotherly co-operation of this kind.

It is needless to say, however, that the loss of the bread winner is causing much hardship. And yet it is borne so cheerfully, so admirably.

"Mi Kuni no tame ni" (It is for the sake of the honorable country), they all say—and so there must be no grudging. And there is none. However poor they may be, the children must still go to school, there must somehow be money for books and for the small fee; and so the old women go to the hills and gather edible herbs, and one way and another manage to eke out their scanty fare. And yet they all seem to

be smiling and cheerful and in perfect health in spite of—or is it perhaps on account of?—the extreme simplicity of their vegetarian diet. At all events it is something more than the food that nourishes them.

The time—the joyous time—of the cherry blossoms has just passed, and everywhere the places famous for trees have been visited by all who could manage to go. Here where I live—a most delightful village—there is an old Japanese gentleman over seventy years old. He could not go this year to any of the famous resorts that he has visited so many times before. But some one brought down several branches from a cherry tree in the hills and gave them to the old man. He carefully planted them in a box of earth so as to keep them alive as long as possible. I frequently saw him watering them as I passed by, and it really seemed as if the blossoms kept fresh beyond their allotted time out of gratitude to the good old man.

Many books have been written about Japan and the Japanese, and from many points of view, some of them very conflicting. It may be said, however, that a person sees in Japan just *what he is able to see*. The Japanese, less than any other people in the world, make a display of their treasures, and to the unsympathetic person they may seem to be non-existent. Yet the treasures do exist and in perhaps unsuspected abundance. Japan has learned many things from the Western World, and in years to come these eminently grateful people will make bountiful repayment.

STUDENT

Masons in High Places

NEARLY all our Presidents have been Masons, from George Washington to Theodore Roosevelt. It is said that 87 per cent of the lower house and 80 per cent of the Senate are at this moment members of the Order. If there is an error here, it would be of understatement.

The present King of England, as Prince of Wales, was grand master of British Masons for thirty years, an office now held by the Duke of Connaught. King Edward's successor to the throne, the present Prince of Wales, is also a Mason of high rank.

The King and Crown Prince of Sweden, and all the adult male royal family of Denmark are in the Order.

In Germany there is Prince Frederic Leopold; in France the President, and the President of the Senate; and in Mexico President Diaz.

A majority of the Cabinet officers of the Universal Brotherhood Organization are likewise high members of the Masonic Order. C.

MAN carries under his hat a private theater, wherein a greater drama is acted than is ever performed on the mimic stage, beginning and ending in eternity.—*Carlyle*

The Civilization of Mesopotamia

NEARLY five score years have rolled away since Mr. Rich, the political Resident of the East India Company at Baghdad, first drove the spade of archeology into the mysterious mounds of Hillah, the modern representative of mighty Babylon, following it up by sending home from the mounds of Kuyunjik and Nimrud, on the site of ancient Nineveh, in "a case scarcely three feet square," what was practically the only collection of Assyrian antiquities in Europe. The secrets buried in the plains of Babylonia and in the valleys of the Tigris and Euphrates were then yet to be unearthed; virtually all that was known of the civilizations of Mesopotamia lay in Biblical passages, and in a few allusions in ancient writers, Herodotus, Ctesias, and Diodorus Siculus, with a few questionable references in Eusebius and Moses of Chorene.

Rich's finds stimulated enquiry; but archeology in the early part of the Nineteenth century was lamed in both feet, crippled as much by prejudice as by disbelief. Twenty-five years after Rich, M. Botta, French Consul at Mosul, with funds supplied by the French Government, after he had shocked disbelief into conviction by his wonderful discovery of the royal palace under the Arab village of Khorsabad, returned to Europe with a precious collection of cuneiform inscriptions and tablets. Then, indeed, was science aroused. Colonel Rawlinson and Dr. Hincks, and, later, other scholars, found another Rosetta Stone for the weird and baffling cuneiform, and first began to laboriously spell out and transcribe the writings of a forgotten tongue.

Science Aroused by Discoveries

Botta's discoveries had meanwhile given fresh inspiration to Layard, who, with generous financial assistance furnished by Sir Stratford Canning, at last definitely and forever established the marvelous claims on archeological attention which have borne such strangely great fruit. Since then, Mesopotamia has been more and more dug up, and every fresh find has added interest to a rapidly growing knowledge (?) of ancient life on the Tigris and Euphrates.

Today archeological exploration in these regions is being pursued vigorously. Hilprecht's late finds promise much; but perhaps the most interesting of quite recent discoveries—because so unusual a find—was the unearthing of the statue of "King" Da-Udu by Dr. James Edgar Banks, of the University of Chicago. The age assigned to this statue by its finder is given as some 7,000 years. Now whether this age is arbitrarily assigned to it or not, or according to some scientific canon known to Dr. Banks and other scientists alone, is not stated sufficiently clearly in any report accessible to the general public.

Archeologists Timid About Dates

The timidity shown by most archeologists in refusing to push archaic dates much beyond the (exoteric) chronology of the Jewish Pentateuch, is always a standing wonder to the Theosophist, with his view of civilizations existing in grandeur and power in epochs so far remote that the modern profane scientist sees there naught but the titanic struggles of gigantic reptiles and but the first appearances of the mammalia. Yet, says Theosophy, Man, as a unisexual being, has existed on earth for the last 18,000,000 years, round numbers.

Dr. Banks's new discovery bears on its right arm a group of characters "so ancient and peculiar," according to Dr. Banks, that he had great difficulty in deciphering them. The day will come, certainly, and it may not be so very distant, when the archeological habit of cataloguing all evidences of ancient civilizations as belonging to periods only a few thousand years remote from our own date, will be found to no longer be reasonable or even possible.

Was Berosus a liar when he outlined a history of ten Babylonian "kings"—evidently eponymic—who reigned collectively over a period of time he gives as 120 sari=432,000 mortal years, or 60 neronic cycles? These ten antediluvian "kings," beginning with Alorus and ending with Xisuthrus "in whose time the great Flood happened," bear a very curious resemblance to the ten antediluvian Patriarchs of the Old Testament, and are theoretically accepted as identities by some scholars, in face of the astounding fact that in such a case the average age of each "King," or Patriarch, would have reached the quite unusual figure of 43,200 years! Was Berosus a fool, or a knave, or both?

Curious Resemblance of Patriarchs

Now as the statements of Berosus have in certain instances been found in remarkable accord with the information given in cuneiform tablets, this vouching for his accuracy as a scribe and his fidelity as a historian, and as he was a priest of the god Bel, it seems obvious that not only did he have access to the secret records of the Temple libraries, but that he was one who wrote in good faith. It is an absurdity to suppose for a moment that the ancients, any more than ourselves, believed (as such) in the highly exoteric and figurative expressions of ancient wisdom accepted by the masses. Their knowledge of the arts and sciences, and their mental capacity, are quite sufficiently demonstrated by what has come down to us, to inhibit any contrary presumption.

Theosophy alone, probably, must explain the meaning of the ancient fables and legends; explain them, and show as well that they are based

Theosophy Explains the Mysteries

on fact, on actual experiences which the human races have passed through.

One of four interpretations of the antediluvian chronology of Berosus is, that each of these ten "kings," represents a periodical avatar, an incarnation of a *Zeitgeist*, which held its sway over Humanity until the eternal stars brought the whirling cycles into another stage of upward progress. These figures: 4, 3, 2, with ciphers added according to the knowledge of the calculator, were as much used and as well understood in India as in Babylonia; and besides the ciphers there was always a certain additional sum to be added (or subtracted), which represented the intervals between succeeding races, *i. e.*, the dawn or the twilight of a race-cycle. This same method of computation was employed as well in Egypt as in far distant America; indeed, all over the inhabited globe, for time was when a *Mystery-Language* and a *Mystery-Knowledge* were universal, and this cycle of three figures (with ciphers added or not) is a veritable key to explain the identities—aye, even the (apparent) contradictions—in the remains of ancient human work everywhere.

So, these avatars, these *Zeitgeiste*, at least in this instance, were not men, but mystical eponymic figures for a life-cycle. This manner of

Manner of Counting said in Practice

counting time and computing periods has been a favorite in the Orient from unknown antiquity, and it is still so practiced today, by China and Japan, for instance. The life-cycle presided over by Oannes, the Fish-Man, may be taken as an example, who "instructed them in everything which tended to soften manners and humanize mankind." Perhaps a Platonic Year hence, 25,920 years, some future historian writing about our era and using the old *Mystery-Language*, may refer to our little cycle as that one "reigned over by King Jesus, the Fish-Man, who came up from the Ocean (Mare, Mary) and governed mankind for three neri."! Indeed, it is possible that such an event may well happen, for as a Messianic cycle has just closed (1900), Theosophists may be interested to watch and compare the developments of the next few years. The "Karma of Israel" as H. P. Blavatsky has said, has hung over our European civilization for two millennia; the next score or so of centuries may have another tale to tell posterity, but the way national destinies are trending at present, there bids fair to be soon inaugurated a period of moral horror: not immediately local like the French *Terreur*, but one throwing the entire Occident into a moral convulsion.

Ages of Human Culture Represented

Yet the 432,000 years of civilization found mentioned by Berosus in the Temple records, and passed by him to ourselves, did actually, according to Theosophical Teachers, represent ages of human culture and prosperity at present wholly lost in the night of time, now surviving in a few scattered fragments of tradition to be gathered up by diligent search in the folk-lore and mythologies of the ancient nations and even certain peoples of our own day. Theosophy refuses to accept the current theory of Aryan dispersion in or near the Pamir highland, in the manner sketched by modern science, as also the ethnological classification of mankind followed by modern speculation. For want of a more convenient Western term, that of "Aryan" is used in Theosophical text-books as representing the Caucasian races generally, and under this head and speaking of a *root-race*, the scientific *aryan*, *shemite*, and even *turanian*, are classed as fractions of one unity. Nevertheless, very sharp and distinct lines are drawn as *between* these divisions of the one great general family—in certain ways vastly more sharply defined than those drawn by modern science itself.

The teaching of Theosophy, as understood by its students, states that the "origin" of the so-called Aryan (and Mongolian) races of today and of antiquity, will one day be traced to the immense regions of Central Asia, in and around what are now Thibet and the Gobi Desert: regions once fair and smiling under an amorous sun, now arid and desolate as a nightmare, the abode of death and desolation. Once upon a time, said H. P. Blavatsky, those wastes were covered with flourishing cities that could vie with Babylon in her splendor; cities built up through many centuries by colonies from lost Atlantis, and later, by refugees from the same Continent as it sank in its last throes under the waters of the Atlantic. Gradually did civilization wane there likewise; the *Airyana Vaejo* of our Aryan forefathers became a wilderness and more than once

Once Beautiful Land Became Barren

an inland sea; the sea disappeared ages later to leave the land what it now is. A whole geologic epoch has intervened since its desolation—time enough, surely, for the separation and dispersion of the nations and the building up of many different races!

All that remains now to bear witness to the former glory are the Bamian statues in Afghanistan, the native traditions of the "gods" who once dwelt there, and the reports of occasional travellers who "tell tales" of what *chance* vouchsafed to their amazed eyes.

Hence, then, spread the flow of humanity. Settlers in the Peninsula of Hindustan, in China, and in the Euphrates Valley, and westward still, carried the germs of knowledge with them. They built up civilizations which waxed and waned, and so it continued to historical time.

Thus it is, that in view of the wonderful history outlined in Theosophical teachings, the student of Theosophy is so loath to accept the shrunken dates of many archeological "finds." He feels that they may be, and probably are, older by millennia than the age given to them by cautious science. And it will be so in all probability until the latter shall have been enabled to establish beyond cavil or question its claim to be *exact*, in method as in understanding. G. DE P.

Goodwill and Industrial Strife

THE industrial problem is mainly one of goodwill. The solution of all the contests, of all the disturbances of industrial peace, is to be found in the one word, "goodwill."

So said President Eliot of Harvard the other day. Goodwill lies at the root of all problems of human interrelation. Rules and government cannot replace it. But are we not sick of hearing such a platitude uttered by pulpit, press, and platform, and nothing coming of it? "Be good!" is an excellent maxim, but lacking in force. Goodwill springs naturally from sound health, physical, moral, mental; and these cannot be where the laws of lust and grab prevail. The whole training of citizens, from the cradle up, being of a kind that tends to destroy mutual goodwill by breeding its opposites—emulation, mutual distrust, strife, and so on—it will take something more than a pious aspiration to neutralize the effects.

Raja Yoga training, from the cradle up, is the only thing that can breed mutual goodwill, and make it a dynamic energy springing from an exhaustless reservoir of happy sane life. Teach the child to know goodwill as the very life-breath of the Soul, and he will grow up with an aversion to those selfish passions that breed social and industrial strife.

How can employer and employed have this goodwill, if each is trying for self-advantage at the expense of the other?—if all are strangers one to another, having no common ideal, no common understanding? STUDENT

France and the Revolutionists

FRANCE is aroused to intense indignation at the recent attempt on the life of King Alfonso of Spain. The municipal police of Paris are proposing to deport all the known revolutionists and anarchists of that city, giving them the choice of Switzerland, England, and America. In each case, the police of the country selected will be notified and furnished with the anarchist's record.

But what of Switzerland, England, and America? Are we anxious to accommodate the scourings and rinsings of French life? With every sympathy for France's desire to free herself from such degenerates, we are surely entitled to ask her to consume her own smoke.

Why, when a murder of a public functionary is consummated, are not those who have advocated such murders, held as "accessories before the fact" and treated accordingly—with humanity due to their condition, but with firmness? And why is not such advocacy, even when no murder follows, treated as a crime, the crime of being accessory to a *possible* fact? Murder, or the approval of it, as a method of expressing political opinions, is a mark of degeneracy, and should be treated as such. C.

Forest and Game Reservations

The President has proclaimed the Lassen Peak Reserve, on the northern Sierra Nevada range, in California, as a forest reserve. It contains nearly 900,000 acres. He has also proclaimed the entire Wichita reservation in Oklahoma, 57,000 acres, as a game preserve.

This most energetic and versatile President finds time to whip up every good cause. If this "game preserve" means the preservation from destruction of some of our *fauna americana*, and not a reserve for mere "sport," the action is remarkably commendable. H.

Some Views on XXth Century Problems

The Anti-Theosophical Movement IN various parts of this country a set of lectures is being delivered which have no apparent connection with each other. By way of titles you find "Fakers," "False Christs," "Impostors of History," "Superstition," "The charlatantry of the occult," "Buddhism," "The Religions of India," and many others. Many types of audience are appealed to, religious, freethinking, socialistic, spiritualistic, it matters not what so that an audience is collected to hear some favorite *bête noire* denounced.

It is all part of a movement to crush Theosophy, and whoever does not now see the game may do so by noting that in all of them there is a side wind of denunciation of Theosophy or Mme. Blavatsky or both. Funds are back of the movement, and where necessary are freely forthcoming.

Another part of the movement is concerned with India. The attempt there, it is said, is to identify Theosophy with the vagaries of a deluded person who has for years claimed the title of Theosophist, and who may be seen walking the streets of Benares in the guise of a Brahmin priest, telling beads!

In orthodox and conservative England, perhaps the most usual expression of the movement is, for one audience, to represent Theosophy as a secret attempt to introduce Buddhism under another name, and thus "paganize" England; and for another composed of the increasingly large numbers who are attracted to Oriental studies, to represent Theosophy as pretending to be Buddhism, as trying to be, but as failing because of Theosophists' ignorance of Orientalism. Other lecturers represent Theosophy as sun- or fire-worship. And in England as here, some long-haired lunatic or crank who for self-interest uses the word Theosophist, lectures as such before amused audiences on his psychic powers or the spiritual planes which he reaches. The attempt to tar Theosophy with the "twin soul" brand or that of some other form of sexual nastiness, is also very usual.

When the observer of our time sees clearly he will wonder why Theosophy should excite all this hostility, and from what quarter it sets.

Theosophy is the doctrine of man's spiritual freedom. Those who want his dependency, who want him to think that the power of the keys is in their hands and that to them he must look up in surrender of his spiritual manhood, freedom, and sufficiency, see in Theosophy the swiftly growing menace of their domination. It is the intelligent reader of the last fifteen hundred years of history who will understand. STUDENT

The Inspiration of Right

THE French journalist, Henri Rochefort, writing recently on the successes of the Japanese, said that "it would seem as if a mysterious guiding hand indicated to them the *exact* spot where it was necessary to strike." A noteworthy sentence, and one that may sometime be thought to contain a real truth now nowhere suspected, at any rate among Christian nations. Yet it is in their creed.

It is part of their creed that evolution is an intelligently guided, purposeful process. It is part of their creed that men are brothers, born of one essence. And it is part of their creed that evil sometime comes by its punishment, good by its reward.

Japan owed no debt to the Law. She had no acts of aggression and cruelty to pay for. Her people understands the principle of brotherhood as no modern people understands it. It is as free from internal strife, disunion, and selfishness, as a hive of bees. And she is fighting only in self-defense.

Why then should she not have Rochefort's "mysterious guiding hand" to help? If the Law of evolution is purposeful and intelligent, if it is not a mere accidental process, why should not an unusual light of intelligence come upon the leaders of a nation which, according to that Law, should move to a front place, a nation which has no bad debts to pay, and whose consciousness is, owing to its feeling of brotherhood, almost a unit?

If the idea seems extravagant to any one, it is because, whatever his

words, he does *not* believe in the intelligence, justice, or consciousness guiding the cosmic and human process. He may *talk* about "God," but in God as a present factor in the world, he does not believe.

Let us have it one way or the other. Once we are convinced that evolution is a guided and inspired process, let us have the courage and faith to assume and say that a ray of that supreme guiding intelligence may specially concern itself to help the intelligence of that man or nation whose progress or prominence will make for the general human progress and whose character and record make him a fit and worthy recipient of the illumination. STUDENT

Coal Tar Poisons

THE *Journal of the American Medical Association* publishes an important paper on chronic poisoning by acetanilid—the most popular of all the coal-tar narcotics. This drug is the basis of most of the "head-ache powders" and anti-rheumatic and neuralgic nostrums now on the market; and its use is often prolonged long after the disappearance of the temporary condition for which it was used. In these powders, and in most of the prescriptions containing it, it is combined with a heart tonic so as to obviate the danger of sudden faintness and collapse. This combination (one popular form of which is known as antikamnia) is advertised as being—and by the public is thought to be—harmless, and its use is consequently spreading. With most of those who habitually indulge in it, the habit is really a form of debauchery, not so recognizable as that of morphia, alcohol, or cocain, but scarcely less harmful. The result is a form of blood degeneration similar to that of profound anæmia, and the victim's career is usually cut short by some acute disease to which his condition lays him open. The failure of memory and the reasoning powers is very slow; insanity and the tendency to suicide are comparatively rare; and the individual dose does not betray itself to an observer. M. D.

Hypnotizing By Advertising

"A MYSTIC Eastern adept" has just published a \$2 book which "reveals in plain language the lost secrets of mediæval alchemy." Without doubt it will have a fine sale, and among all those who buy it not one will ask himself why the mystic adept who can make gold should be in need of \$2. This alchemy understands but does not teach the art of transmuting human credulity and folly into gold.

Another recent book shows that its author also understands the same gentle art of fishery in human waters. This book is given away free. The advertisement is perhaps more thoughtfully adapted to awaken curiosity than the other. It is headed: Who Wrote This Most Wonderful Mysterious Book?

We will insert a piece of "occult teaching" here, well known to the writers of such books, but not printed by them. In the shortest terms it is this: To the degree in which the newspaper reader permits his curiosity to be aroused by the heading of an advertisement like these, is he negative to—psychologically "suggestible" by—the statements that follow underneath.

The reader of the column-long advertisement of the second book is therefore fairly unlikely to ask himself where, since the book is gratuitous, the dollar-paying will begin, and why a man who can show the way to "unlimited prosperity and success" needs to make use of such methods. In our days the way is this use of tricks on the gullible, but those who know it do not teach it. What these books teach are methods of self-hypnotism which make the mind forever worthless to the owner, methods of breathing which damage for old age's requirements the respiratory centres, and such a misuse of other organs and functions as invariably results, and can only result, in total wreck.

To those who know how to read them, the advertisement columns of the daily papers complete the picture of a class of minds which is sketched by the news and comment columns. They show what people want sufficiently to be willing to pay for. And so they are not always very very pleasant reading to those who wish the best for men. M. D.

Brief Glimpses of the Prehistoric World

Archeology
Paleontology
Ethnology

Map of the Pyramids

THE accompanying plan, which has been drawn for the NEW CENTURY PATH, gives a good idea of the location and aspect of the pyramids of Gizeh and their neighborhood. The Great Pyramid of Cheops (or Khufu) has a side measurement of one-seventh of a mile and is 450 feet high, one of the most stupendous masses of masonry in the world. It faces the cardinal points. Near it is the second pyramid or Pyramid of Chephren (or Khafra), 4th dynasty; its base is 690 feet square and it is 447 feet high, being thus steeper than the first pyramid. Its original smooth casing is still preserved for one fourth the distance from the summit. The third pyramid, of Menkaura, is only 354 feet at the base and 203 high, but is much more beautifully and richly constructed than the others. It was originally coated with granite.

Kings were buried in these pyramids; and the archeologists infer that the pyramids were built for tombs! Was Westminster Abbey built for a tomb? Would not the people lay the remains of their great and deeply-revered sovereign in the holiest place they had?

There are three small pyramids east of the first, and three more south of the third. All around are numerous tombs, some of stone, and some excavated in the rock, others in the ground. Those west of the Great Pyramid are the most important, and date to the 4th and 5th dynasties.

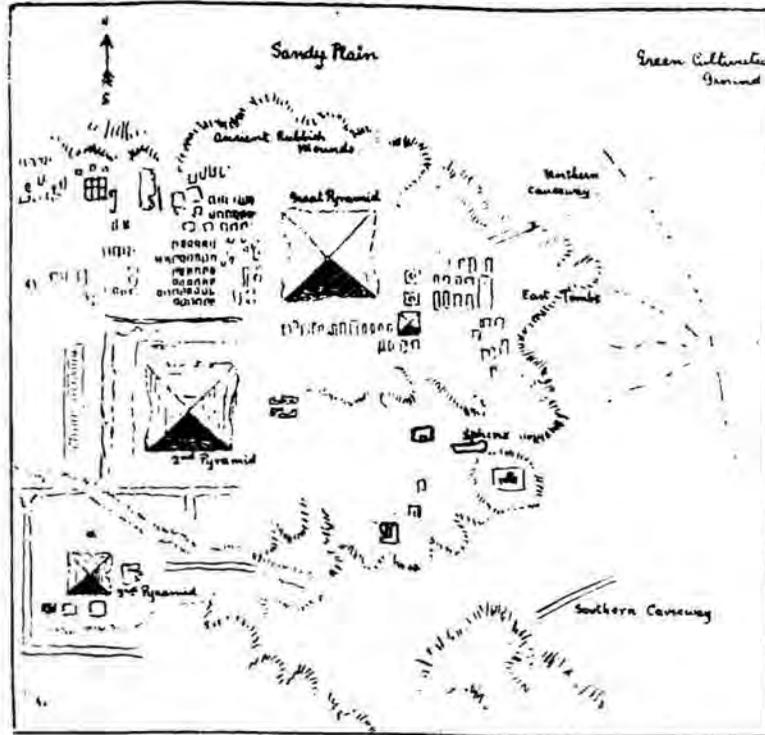

The Great Sphinx is seen to the east of the Second Pyramid—a symbol which typifies wisdom and lion-heartedness in union. 189 feet long, it is hewn out of a natural rock, and dressed with stone. Most of it lies buried in the shifting sand. E.

A Relic of Lemuria

An explorer has recently discovered that Easter Island is surrounded by an extensive submarine plateau, which, though 60 fathoms deep, is very high in comparison with the rest of the ocean floor in those regions. This plateau is, according to all dredgings, entirely devoid of all organic life, whether animal or vegetable, the bottom being of eruptive basalt.

Malayan Tribe in South America

UNDER the title of "An Ethnological Paradox," a traveler describes, in *Harper's Magazine*, a visit to the Leccos of Bolivia. This tribe has very pronounced Malay characteristics, thus differing from all the surrounding peoples and giving color to the theory that Asiatics immigrated to America and settled at some remote epoch in the past. A glance at a globe (not a map) will show that the east coast of Asia is in a nearly straight line with the west coast of America; and, given warm conditions in the Arctic, it might have been possible to coast gradually along in canoes. This theory however would not suffice to explain other ethnological problems of a kindred nature; there are affinities between prehistoric America and prehistoric Asia which demand a more comprehensive explanation. No doubt this people is a survival of one of the various Atlantean races, which got scattered, and they have preserved their distinct racial type by means of long isolation.

Lomaland Photo and Eng. Dept.

MAP OF PYRAMIDS OF GHIZEH AND HILL OF TOMBS

Lomaland Photo and Eng. Dept.

MERIDIAN SECTION THROUGH GREAT PYRAMID, LOOKING WEST

The Leccos were met in an Indian village at the eastern foot-hills of the Andes. They are not big-boned like the Indians, but slender and well-built, with quick lithe movements; perfectly Malayan in feature, like the Hindu or Filipino in complexion. Their costume is also Asiatic. They live in rude huts on river banks, and are very gay and careless, having no records of the past nor known myths.

STUDENT

Our Compound Calendar

FEW people realize what a curious mixture of old memories is our Calendar. We cannot name a date without recalling the past in every direction. Take for instance Wednesday, May 24, 1905, A. D.

Wednesday is *Wodin's Day*, sacred to *Wodin*, *Odin*, or *Votan*, a Scandinavian hero-god who appears in various guises in that mythology—as creator, as the ever present counselor of men, and as himself a warrior.

May is *Maia*, a Roman goddess, mother of *Mercury*; and the Hindoo virgin mother of the divine *Krishna*. A. D. has of course a purely Christian signification.

The numerals are Arabic, and the Arabs got them from India.

A day commences for us at the moment of midnight. This may be a survival from Egypt, for with the Romans the day began at sunrise. The seven-day week came from India or Egypt, as also the 30-day month. Is it not worthy of note that these archaic numbers refuse to die, and survive all attempts at "improvement?" They are not arbitrary. STUDENT

The Sabbath

"THE Sabbath," says a religious paper, "is undergoing a serious assault; troops of influences destructive of its sanctity are widespread, swift and defiant. The Lord's Day prostituted to bacchanalian revelry; Sunday papers, games . . ." and so forth.

This idea of the Sabbath needs to be separated in our minds from its ecclesiastical and religious associations. Sabbath, a very ancient word which has been traced back through the Chaldeans to the Accadians, is an Oriental name for a period of rest, of various duration, being the seventh after six periods of activity. A profound knowledge of universal laws taught the ancients that six periods of various activity are properly followed by a seventh wherein all outward activity ceases. This was a sacred day, devoted to the spirit. There were sabbatical years, as well as sabbatical days. The Hebrews had such periods of sacred rest, and they had them in the time of Jesus. Our Sunday is a pagan or oriental custom adopted by the Christian Church. Jesus does not sanction it. The only occasion on which he says anything about it is where he maintains that it is proper to do deeds of mercy and simple duties on that day, since the Sabbath was made for man, and not man for the Sabbath.

In our present life, the only reaction we know is from feverish work to pleasure; and naturally we keep the seventh day for the latter. If we had six days of orderly work combined with recreation, we could react naturally to a day of sacred calm and contemplation, and the Sabbath would satisfy the natural demand for whose satisfaction it is intended. But, at present, a day of contemplation would mean, for most people, a blank. STUDENT

Natural Lace

THE natives of Samoa and Hawaii wear clothing of "lace-bark," or "tapa" cloth, which is made from the bark of the *Brunsonetia papyrifera*. It is of a brown color, of great strength, and of a fragrant odor like freshly cured tobacco leaf. This however is not the real lace bark.

The real lace-bark, which is snowy white, occurs in Australia, in the *Sterkulia acerifolia* or "flame tree," in Hawaii in the *Plagianthus betulinus*, and in the *Lageta linteria* of the Caribbean Islands. It is a kind of fibrous pith within the outer bark, and can be removed in a sheet of about a square yard and bleached. It is airily light and has a faint fragrance. In the West Indies mantillas, collars, cuffs, curtains, etc., are made of it. It is very strong, and when rolled up makes tough string or rope.

This beautiful natural fabric has no commercial value, and would indeed look out of place on a member of our civilization. Things require to look manufactured to suit our tastes. They must be stiff, angular and creased.

Lost Knowledge of the Spirit of Places

ONE part of the ancient knowledge which we have lost and must recover is that concerned with the *genius loci* or influence of particular spots and localities in nature. To the so-called practical person all places are alike, save for their differences in adaptability to so-called practical purposes. To the more romantic individual, places have an esthetic or poetic quality which influences them but is not connected with any definite ideas or reasons. The former would dump his factory anywhere if water-power, etc., suited; that is, he would, if unseen powers did not constrain him (as they undoubtedly do) to unconsciously avoid certain places. The latter selects a site for his house according to his feelings of natural beauty.

But a study of ancient writers continually shows them as peopling scenes and sites with gods or nature-spirits and attributing various and powerful influences to places, some being holy, others baneful. With later writers, in a more degenerate age, the knowledge may have become little better than poetic superstition; and Horace may have sung of nymphs with little if any real understanding or belief. But, as we get further

CHARMS OF THE PRESENT

C. MACKAY

WE will not dwell amid the graves,
Nor in dim twilights sit alone,
To gaze at moldered architraves,
Or pilasters and columns overthrown;
We will not only see the light
Through painted windows cobwebbed o'er,
Nor know the beauty of the night
Save by the moonbeam on the floor:
But in the presence of the sun,
Or moon, or stars, our hearts shall glow;
We'll look at nature face to face,
And we shall LOVE because we KNOW.
— Selected

back, we come to what was clearly a very definite science, part of the Lost Mysteries, when we find that the ancient inhabitants of India, as of America, and of Greece, had sacred mountains, rivers, vales, etc.

What we look to in a hill site is fresh air; we know nothing of those purer influences of an inner atmosphere which caused the ancients to build temples on hills or retire thither to meditate. Nor do we understand the moral reason for such scenes of weird beauty as a petrified forest, a basaltic formation, or a grand canyon. Forests, streams, valleys, lakes, all have their appropriate influence, which we do not understand, so shallow is our science. And, if we

did understand, we should exploit the benefits for pleasure, profit, and personal interest.

Yes, there are in Nature potencies more wonderful than those that charm the outer sense. And they are ready to contribute to the service of man, when he can be trusted not to misbehave himself, and to refrain from doing what Adam did in Eden.

STUDENT

FORD ON THE CAUTO RIVER, CUBA

Lomaland Photo and Eng. Dept.

The largest river in Cuba; rises in the Sierra del Cobre, and falls into the Bay of Buena Esperanza on the southern coast, after a course of fifty leagues, for twenty of which it is navigable by boats, though at low water obstructed by bars. It is subject to sudden rises, on account of the heavy rains in the mountains, as much as sixty feet in three hours having been known. Cauto means "cautious."

STUDENT

Potatoes That Are Not Potatoes

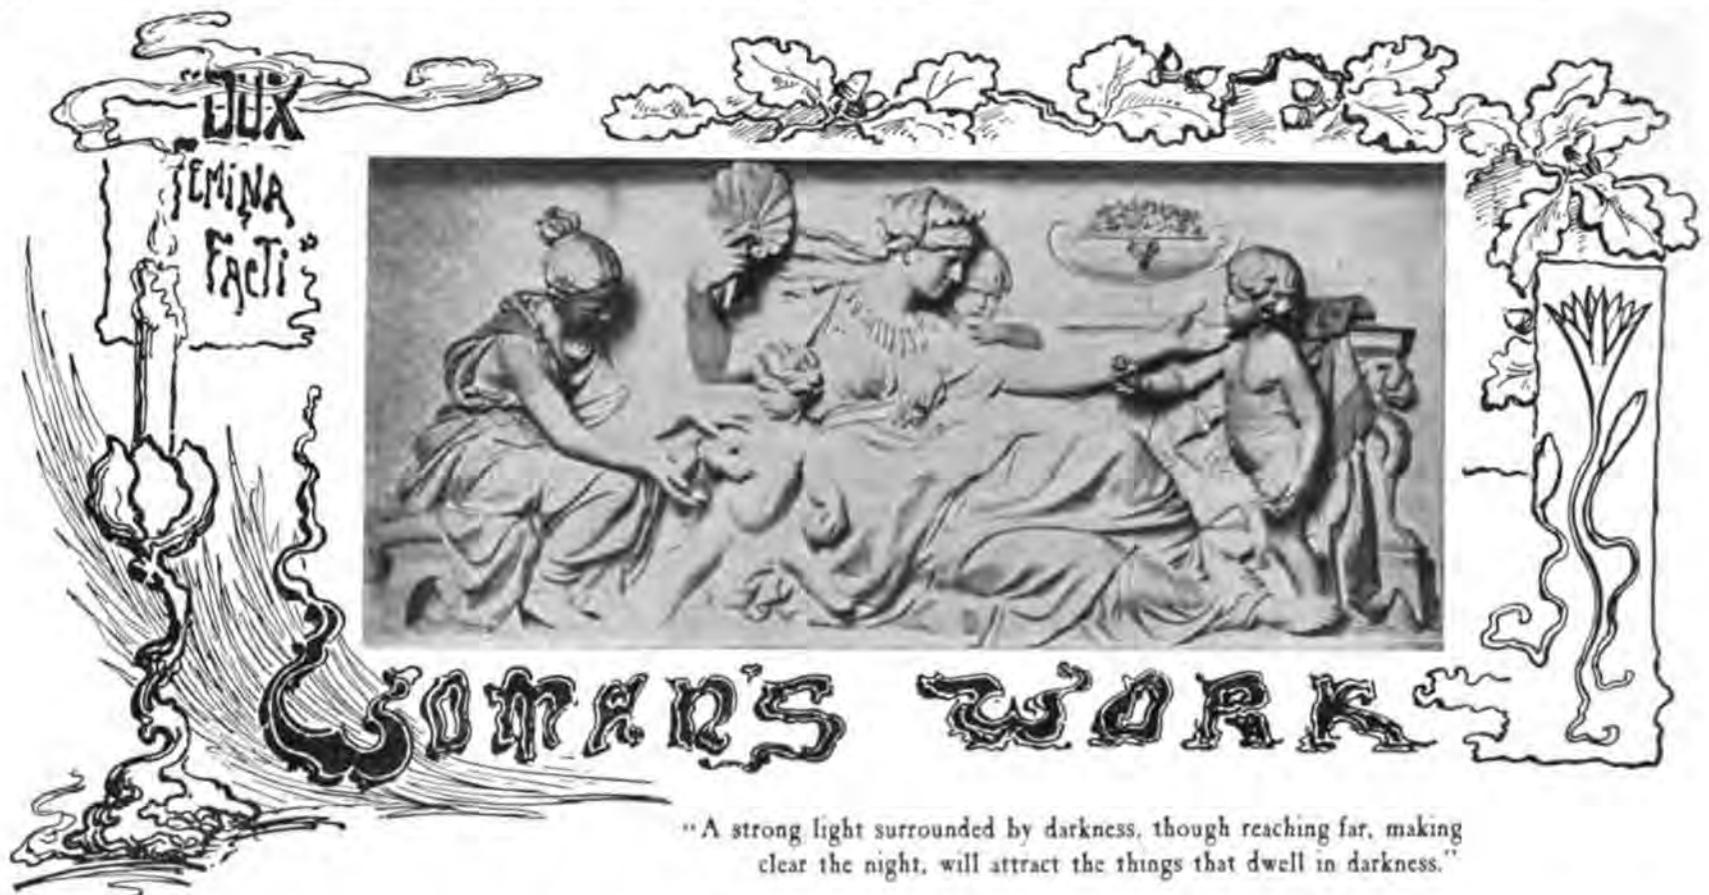

ACCORDING to a report, a man at Great Falls, Montana, has invented a method of growing potatoes without any tops. He puts the potato eyes in a box with a compound resembling soil, and heats the whole with a steam coil. Then the eyes grow and edible potatoes are produced by a growth which is exclusively subterrene and *tuberosa*, and which requires neither light nor air.

One would fancy however that a want of the coöperation of sun and air would cause some defect in the product; and that, since light and air are the finer elements, the qualities thus lacking in the potato would be precisely those which elude chemical analysis. Such a potato would feed the more gross and palpable parts of the human make-up, but it is doubtful whether it would be a truly vitalizing food.

STUDENT

Hedgehogs and Apples

The lairs of hedgehogs are found plentifully stored with apples, even at a great distance from any orchard. The wind-fallen apples in orchards also are sometimes found pierced as by spines. Evidently the hedgehog impales the fruit and thus transports it to its nest; but the secrecy with which this is accomplished is the marvel. H.

"To die for truth is not to die for one's country, but to die for the world. Truth, like the Venus dei Medici, will pass down in thirty fragments to posterity; but posterity will collect and recompense them into a goddess. Then also the temple, O eternal Truth! that now stands half below the earth, made hollow by the sepulchers of its witnesses, will raise itself in the total majesty of its proportions, and will stand in monumental granite; and every pillar on which it rests will be fixed in the grave of a martyr." . . . —*Richier*

HYPATIA was a superb woman in the very highest sense of the word. She herself began, when a mere child, to unfold the higher attributes of her character. It is easy to think that as a child she possessed a very deep and broad conception of the beauty of a sweet and noble life. History has recorded many remarkable stories of her heroic life, but it is the unwritten part which appeals to the writer; those days of sweet childhood, when Hypatia, with her heart reaching to the Infinite, studied with her father as his pupil and his companion! Theon, her father, was a scholar and a thinker; and he must have been a rare helper to Hypatia in the beginning of the upbuilding of her character.

About Hypatia's mother, little, if anything, is said. Yet, do not the splendid balance shown in Hypatia's sanctified life, and her modest and womanly ways, suggest the influence of a superior mother? More: does it need any stretch of imagination for us to believe that Theon and Hypatia's mother were united in thought and effort on altruistic lines, and that the influence of their harmonious life shed its rays upon the early life of Hypatia?

This fair daughter of Egypt sprang into light in Alexandria, at an epoch when she was most needed. In her life we can see the mighty hand of the Divine Law opening a way for truth to manifest through the heart of a young woman. In all the studies that Hypatia chose, one wonders at her rare discrimination. First, she began the study of geometry, which was a basic factor in her early education, and her writings on mathematical subjects were of great merit, though they perished with much other literature of hers at the time of her persecution. In this ignoble work of the enemies of Truth, we realize a terrible loss to the higher interests of Humanity.

Illuminated by the Divine Life, daily she went forth to the public lecture halls of Alexandria, and there gave forth to her hearers simple and elevating truths concerning man and his destiny.

Hypatia---Theosophist and Martyr

As a child, she came among the elders of her people, and pointed out to them the way to the eternal

life: to the glorious knowledge of the victory over death; and to the tender, beneficent mercy of the great Law.

Thousands flocked to hear her, to learn from her lips that they, like her, might find and follow the Christos-Light, which lighteth every man that cometh into the world.

Hypatia possessed rare and fascinating eloquence which held her audiences spellbound. By this gift she easily transformed the lives of many of her listeners, leading them into paths of virtue. She was truly a great Heart-tone in herself, a mystic. No wonder that her followers loved her; the charm of her whole life was, that she strenuously conformed in act to her professions.

Later, Hypatia studied law, and became a powerful and most successful pleader in the courts. This woman, young as she was, righted many wrongs for the people of her land; and if these could speak today, verily, they would call her Blessed among women.

With great enthusiasm she followed the study of philosophy, and with her womanly intuition, strengthened by a trust in her own Divinity, she became her own preceptor for a while. Noble

Hypatia! one can see her with manuscript in hand seated in the shady groves of ancient date palms near the temples, studying some of the problems of life as written by men; and at another time wandering along the silent paths in contemplation, gazing with her soul's eyes into the mysteries of human life, drinking from the fountain of being. And in these hours she found that exaltation which shall come to every soul who, in the right spirit, seeks Truth.

Hypatia's higher education was received in the Silence, away from the haunts of men, in the peaceful meditation of an unselfish love. Her wondrous life of wisdom and noble service points clearly to the fact that while she had the inspiration born of high endeavor, she also had a Teacher, one not recorded on the pages of History. He taught her, unobserved, those teachings that had been handed down by word of mouth, at low breath, from ages past.

There is no straining or effort in the prophecy that Egypt's temples still hold proof of the inner life of the great Hypatia, as well as that of

ON HYPATIA

WHEN I behold thee---when I hear thy lore
Thy maiden presence humbly I adore.
I see in thee the Virgin of the sky
The constellation shining there on high.
The heavens are still thy business and thy home
To which thy lessons lead, from which they come;
Noble Hypatia! of high speech the flower,
The lustrous star of wise instruction's power.

—*By an Unknown Disciple*

A little flower taken from a Greek garland; freshened by new drawn waters and with tender hand offered to Her whose blood was poured upon the Alexandrian sand.

other great Teachers of wayward man.

Hypatia's devotion to knowledge and truth at this time, the Fourth Century A. D., startled the enemies of progress in Alexandria to an organized effort to destroy her work, tending as it did so largely to free the human mind from the treacherous pitfalls of the age, made by men to delude the unwary and the unthinking. Many were the obstacles placed in her path from the very beginning of her public work, by professed followers of the Nazarene.

Her efforts to teach and demonstrate the essential unity of all religious and philosophic truth fanned the antagonism of her opponents into fury; and they renewed their attacks against her in many subtle ways. Yet Hypatia pushed determinedly on, giving no real offense to any of the real lovers of truth.

The wonderful work that she did in making the exact sciences the basis of her instructions, and applying their demonstration to the principles of speculative knowledge, marks her as a chosen teacher for her age. Among her disciples were many persons of high distinction and profound scholarship. One of these was a young Spartan, Synesios by name, of Cyrene. To him history is greatly indebted for many of the interesting records of Hypatia's life; but great as these are, the unwritten part must appear, to all true students, as greater.

Saint (!) Cyril, Christian Patriarch of Alexandria, stepped into public prominence when Hypatia was at the height of success as a teacher. Cyril the Patriarch was her most formidable enemy. He dreaded her power, and the lessening of his own influence among the people of Alexandria. History says that he was not a man to stop at "measures that he might rely upon to accomplish his end; and he was ready with pretexts and instrument for the removal of all who might stand in his way."

Cyril, being an enemy to truth, could not bear its purifying influence in his presence. Whenever persecution was to be carried on against any of his enemies, he headed the mob.

And now we come to the great tragedy, when Hypatia, the teacher and benefactress of men, was torn limb from limb in the great temple dedicated to Christian worship, by monsters in human flesh, who killed in the name of their God.

"It was in the morning of the 15th of March, 415 A. D., that Hypatia set out as usual in her chariot to drive to the lecture hall. She had not gone far, when the mob barred the way. On every side were men howling with all the ferocity of famished wolves. She was forced from her chariot, and dragged along the ground to the "nearest church." This was the ancient Cæsar's temple, which had been dedicated anew to the worship of the 'Christian Trinity.' Here she had been denounced by Cyril the 'Saint,' and her doom determined by his servitors. Her dress was now torn in shreds by their ruffianly violence. She stood by the high altar, BENEATH THE STATUE OF CHRIST. She shook herself free from her tormentors and springing back, rose for one moment to her full height, naked, snow-white, against the dusky mass around—shame and indignation in her wide, clear eyes; but not a stain of fear. With one hand she clasped her golden locks around her; the other long white arm was stretched upward towards the great still Christ, appealing. Her lips were open to speak; but the words that should have come from them reached God's ear alone; for in an instant, Peter, the Christian Reader, struck her down. The dark mass closed over her again. . . . Wail on wail, long, wild, ear-piercing, rang along the vaulted roofs, and thrilled like the trumpet of avenging angels through

Philemon's ears."

Not satisfied with this, these raging demons gathered up the remnants of the body of Hypatia, and ran through the streets with them to the place of burning; and then these creatures threw the ashes into the sea.

Ye Gods! what a blot is this ending on the pages of human life. History early records events as horrible as this in the lives of reformers and teachers; Truth today is being persecuted in many forms, victims of the oppressors can be counted by millions, and evil-doers stalk abroad crucifying Truth and defenders of Truth, with the self-same old spirit of Cyril and Peter.

Hypatia, the Great Soul, lifted the veil of the new life amidst the horror of man's inhumanity to man. But with her eyes turned to the stars, reaching out for the Infinite; and with the pure life of the Christos-Light in her heart, she went out into the realms of a higher exaltation. She left behind her the memory of a sacred life, dedicated to Humanity; and from the seeds of Truth which she sowed through unselfish effort, a larger influence of truth prevails throughout the world today.

Her life was an inspiration,
her memory a benediction.
K. T.

DEATH OF HYPATIA—ONE OF THE WORLD'S GREAT TEACHERS

PARENTS who, in seeking homes for their families in the great apartment buildings of cities, have been confronted with the words, "No children will be tolerated," will naturally be interested in the predicament of an architect and flat-owner of Des Moines.

All children have been carefully excluded from the apartments leased by him. Families into which babies came, were requested to move. Now the birth of a baby girl of his own makes it necessary for him to vacate his own apartments, in accordance with the rule which he has enforced!

A N old boat, fast moored to the dock, has been transformed into a "hotel"

for working girls in New York. Hot and cold water for baths and lavatories; electric lights, steam heat; large comfortable staterooms; wide passageways; a large reading and music room, with current periodicals and a piano; a great dining-room to seat one hundred people, (also provided with a piano); all this, with but one thing left to be added—the true spirit of comradeship. With that, what a glorious opportunity to make a new home life for one hundred girls!

PRINCESS ARISUGAWA, sister of the Crown Princess of Japan, who is to visit England soon with her husband, Prince Arisugawa, will during her stay in that country launch and christen the new Japanese battleship Katori. It is rumored that the Japanese Princes will bring a special message from the Empress of Japan to Queen Alexandra. If true, it will be the first occasion on which a Japanese Empress has ever addressed an autograph communication to the consort of a British monarch.

"QUEEN ALEXANDRA's campaign in England against live pigeon shooting is having its effect. The noted Hurlington Club has decided to drop the sport from its list." This is indeed a striking "sign of the times." The cruel sport of Hurlington live pigeon shooting has been one of the most renowned institutions of England. All honor to noble Queen Alexandra who has worked for years for the abolition of this scandal.

A CERTAIN widow in Vienna now receives part of her income from an unusual source. Two men considered it a practical joke to inform her husband that she was unfaithful to him. The report caused him to take his own life. The slanderers were promptly ordered by the Court to contribute monthly to the widow's support. They will learn by instalments that retribution comes to him who bears false witness.

OUR YOUNG FOLK

The Raja Yoga Question Box

TRUE patriotism in the heart helps each man to find the work by which he can serve his country nobly.

1 Who was Charles Thomson?

ANSWER—Charles Thomson was an American patriot. Thomson used to write down what the white men said to the Indians in their treaties, so that the Indians should not be cheated. The Delaware Indians adopted him into their tribe. They called him by a name that means "one who speaks the truth." When the Colonists met in a Congress to plan for their freedom, they needed some one to write down carefully all that they said. They sent for Charles Thomson, and he kept the minutes of Congress for nearly fifteen years.

2 Who was General Greene?

ANSWER—Nathanael Greene was a brave officer in the War of Independence. He studied military tactics when he was quite young. Washington soon saw that Greene would make a great general. General Greene did some famous fighting. He knew how to act promptly, and once saved his whole army by a quick move.

3 Who was Jonathan Trumbull?

ANSWER—Jonathan Trumbull was the Governor of Connecticut during the War of Independence. Washington's army was often in sore need of supplies. Governor Trumbull was always ready with a plan to get what the soldiers needed. Washington learned to rely on Governor Trumbull's help. The soldiers used to say, "We must consult Brother Jonathan." This was how the name "Brother Jonathan" came to be used.

The Fourth of July

WHEN the bell in the old State House in Philadelphia rang out on the first Independence Day, the hearts of the people were glad. The couriers mounted their horses and rode swiftly over the country to tell the great news. Congress had voted unanimously for a Declaration of Independence.

A great work had been done before this Congress voted, to a man, for independence. It was a work for brotherhood. When the colonists assembled at their first Congress in September 1774, there was not a strong feeling of unity among them. They did not know one another, for it was not so easy to travel then as it is now, and their homes were scattered over a wide area. They had different interests, and each State, naturally, was anxious to increase its own trade. They belonged to many different religious sects, and their customs and manners were by no means the same. Some States were Puritan, Pennsylvania was full of Quakers, and Virginia had been settled by the cavaliers. There had been disputes among them about the boundary lines of the different States.

Between 1774 and 1776, however, the representatives from the Colonies had met in Congress, and they had learned to think less about their differences, and more about what they might do if they could agree to take a step onward all together. The great hero-teachers of that time had begun their work among the people, and their teachings had fired men's hearts with the love of freedom and independence. They had planted a seed of brotherhood also, and when the members of the Congress were willing to look beyond and above their local differences to the great destiny they had in common, the heroes, like Paine and Washington and Jefferson and many others, were able to guide them forward safely and wisely.

When the Congress voted unanimously for the Declaration of Independence, a new strength entered the peoples' hearts. It was the strength that comes from unity. Now, indeed, they could fight to win, for the ideal which their hero-teachers had set before them. Now they were inspired by the thought of the great nation that was to be. The words of the heroes of the Revolution prove that they had the vision of America as a home of freedom from which should go forth light and wisdom to the whole world.

At certain of the ancient Greek festivals, it was the custom to read aloud before all the people assembled in the great open air theatre, the names of those who had rendered noble service to Greece. It was like calling the roll of honor.

What a roll of honored names might be read at our Fourth of July festivals! And, by the way, boys and girls, don't you think that we should

TO YIELD one right which is inalienable is to betray all other rights, making us slaves and cowards.—*Thomas Paine*

OBERVE good faith and justice towards all nations; cultivate peace and harmony with all. . . . It will be worthy of a free, enlightened, and at no distant period, a great nation, to give to mankind the magnanimous and novel example of a people always guided by an exalted justice and benevolence.

George Washington

all the means.—*Written by John Adams to his wife, July, 1776*

NOTHING glorious is accomplished, nothing great is attained, nothing valuable is secured without magnanimity of mind and devotion of heart to the service. Brutus-like, therefore, dedicate yourselves at this day to the service of your country; and henceforth live a life of liberty and glory.—*Josiah Quincy, Boston, 1774*

THE sun never shone on a cause of greater worth. 'Tis not the affair of a city, a country, a province, or a kingdom, but of a continent—of at least one-eighth part of the habitable globe. 'Tis not the concern of a day, a year, or an age; posterity are virtually involved in it even to the end of time. Freedom hath been hunted around the globe. Asia and Africa hath long expelled her; Europe regards her like a stranger, and England hath given her warning to depart. Oh receive the fugitive, and prepare an asylum for mankind.—*Thomas Paine*

TAxATION without representation is tyranny.—*James Otis*

make our festivals worthy of the work that these heroes did? Raja Yoga boys and girls are learning that one of the best ways to make stepping stones of the past and the present, is to do honor to the great in a true way. The Raja Yoga festivals are like a golden thread running through the whole year, linking the boys and girls of today with all that great heroes and Teachers have done for the world. When people have learned the Raja Yoga way of celebrating the Fourth of July, the fire of the higher patriotism will burn more brightly every year, and the great teachers and orators, and the noble statesmen and brave soldiers of the United States will receive the heart-homage that should be theirs. A RAJA YOGA PATRIOT

Sayings of the Heroes of Seventy-Six

WHERE liberty is not, there is my country.—*Thomas Paine*

WE are not contesting for pence, but for principles.—*Samuel Adams*

THE battle, sir, is not to the strong alone; it is to the vigilant, the active, the brave.—*Patrick Henry*

WE have all one common cause; let it therefore be our only contest, who shall most contribute to the security of the liberties of America.—*John Hancock, Boston, March 5th, 1774*

I AM well aware of the toil and blood and treasure that it will cost us to maintain this Declaration, and support and defend these States. Yet, through all the gloom, I can see the rays of ravishing light and glory. I can see that the end is more than worth

THE CHILDREN'S HOUR

Music and Little Children

DEAR CHILDREN: I am sitting by my window in Lomaland. Just across the way is one of the lecture-rooms of the Raja Yoga Academy and I hear the children marching. Near-by is the little music temple and over the still air come sweet strains that seem to take me a long, long way from here. I almost feel as if I were in the shadow world and I can almost see timid little creatures marching up in the silence, dwarfs maybe, until every little shrill-voiced tot comes nearer and nearer and at last—they pass me, a tiny troop. And Lomaland disappears and I see the mountains of Norway and the cloud-hung sky above and the old pines in the distance until—hark! suddenly a song of exquisite loveliness breaks in. The wee elfin procession has passed and the fairies have come. For it must be the fairies' song that I hear! Ah, what a music picture! And all because some one is playing, as it should be played, Grieg's "March of the Dwarfs."

How can music bring to the mind such pictures? Who can say? We only know that it does. And that is why the music of the Raja Yoga children is so carefully selected, and so carefully taught; why their teachers are so careful to distinguish between the *right* kind of music and the *wrong* kind; and why the little ones of Lomaland live in the very atmosphere of the purest music day after day.

Then I fell a-thinking of Grieg, the composer of this fairy tale in song, and I want to tell you a little story of how he first came to write music. As a child he loved the birds and butterflies and blue sky and the flowers more than anything else in the world, and he said to his mother one day, "Mamma, when I grow up I am going to be a painter! Oh, I *wish* I could paint these things now." But the mother had no paints and in her little home no means of getting any, so she said, "My child, we *will* paint them—but in beautiful tones," and she began to teach him music, not only how to play, but how to compose. She, herself, tells the story of how one day the little boy picked up, instead of his school-books, a roll of music he had been composing and marched off to school with it. When he reached the school and discovered his mistake he said to the teacher: "Oh, I brought my music instead! I am so sorry, but I am sure you will like this better than my copy-book," and he showed it to her trustingly.

Was not this mother wise? And is it strange that her little boy should have become one of our great composers? O the magic of musical sound! There is only one thing in the world more wonderful—and that is the magic of the light that glows in little children's hearts.

AUNT ESTHER

WHEN birds build their nests and rear their little ones, the mother-bird does not take care of the baby birds all alone. The father-bird helps, too. Nearly all father-birds feed the mother while she is on the nest and often will sit near by and sing to her. Then, the father-bird is never far away while the little ones are still in the nest, for he seems to know that he must be on guard and ready to protect the mother and babies in case of danger. Is not that a lesson for some humans? How much better the world would be if people only followed the example of their little winged comrades! M. M.

Warrior Boys and Girls

FROM the hearts of warrior boys and girls there is bursting upon the world a great, wondrous song. It may sound strange to many people to speak of warriors having a song in their hearts, because when we hear about "warriors," it almost always has something to do with soldiers in battle, fighting and killing one another.

But the warriors that we refer to here don't believe in battles of that kind. They don't believe in selfish fighting and killing. They believe in building up, not in destroying.

Wars, like those we have now on earth, will cease to be when we warrior boys and girls shall have won our fight. We are fighters for the right and true; for freedom and justice and for peace.

Warrior boys and girls don't use hate and guns and swords for their weapons. They fight with love and knowledge, courage and determination.

We have learned that wars for killing people come from the lower nature in man. We know that in this lower nature live the evil things that bring sorrow into life, such as hate, anger, jealousy, ambition, greed, the selfish desire for possessions, and many more evil things.

And we who are warrior boys and girls also know that there is a higher nature in man, which does not like the evil, but is always wanting to do right and to be true. And on the side of this higher nature, we are fighting to conquer the lower; to change its ugliness, into beauty; its ill tempers and anger, into gentleness; its hate into love.

And as we win these victories, one by one, we find the freedom and peace which shall bless all.

This is our great heart-song, singing its victory out to the world. A RAJA YOGA WARRIOR

From Dramatic Representation by one of the young Students of the Raja Yoga School, Point Loma, Cal.

FRAGMENT

LONGFELLOW

LIVES of great men all remind us
We can make our lives sublime,
And, departing, leave behind us
Footprints on the sands of time;—

Footprints, that perhaps another,
Sailing o'er life's solemn main,
A forlorn and shipwrecked brother,
Seeing, shall take heart again.

Let us, then, be up and doing,
With a heart for any fate;
Still achieving, still pursuing,
Learn to labor and to wait.

DEAR CHILDREN: A friend tells me this beautiful story of the devotion of one of our "brothers of the air." A while ago one of his neighbors, a farmer, set several traps near his poultry-yard for the purpose of catching weasels which were troubling his young chickens. A few days later he found one of the traps missing and on searching for it came across two horned owls beneath an old apple tree near by. One owl, to the leg of which hung the missing trap, was dead. The other, in great distress, was fluttering about, evidently trying to protect its dead mate. For nearly two days the birds had suffered together. Are we not just beginning to find out how much birds and animals know about brotherhood? And isn't it time that humans learned to be more loving and more just to the little creatures that look to them for protection and help and love? H. H.

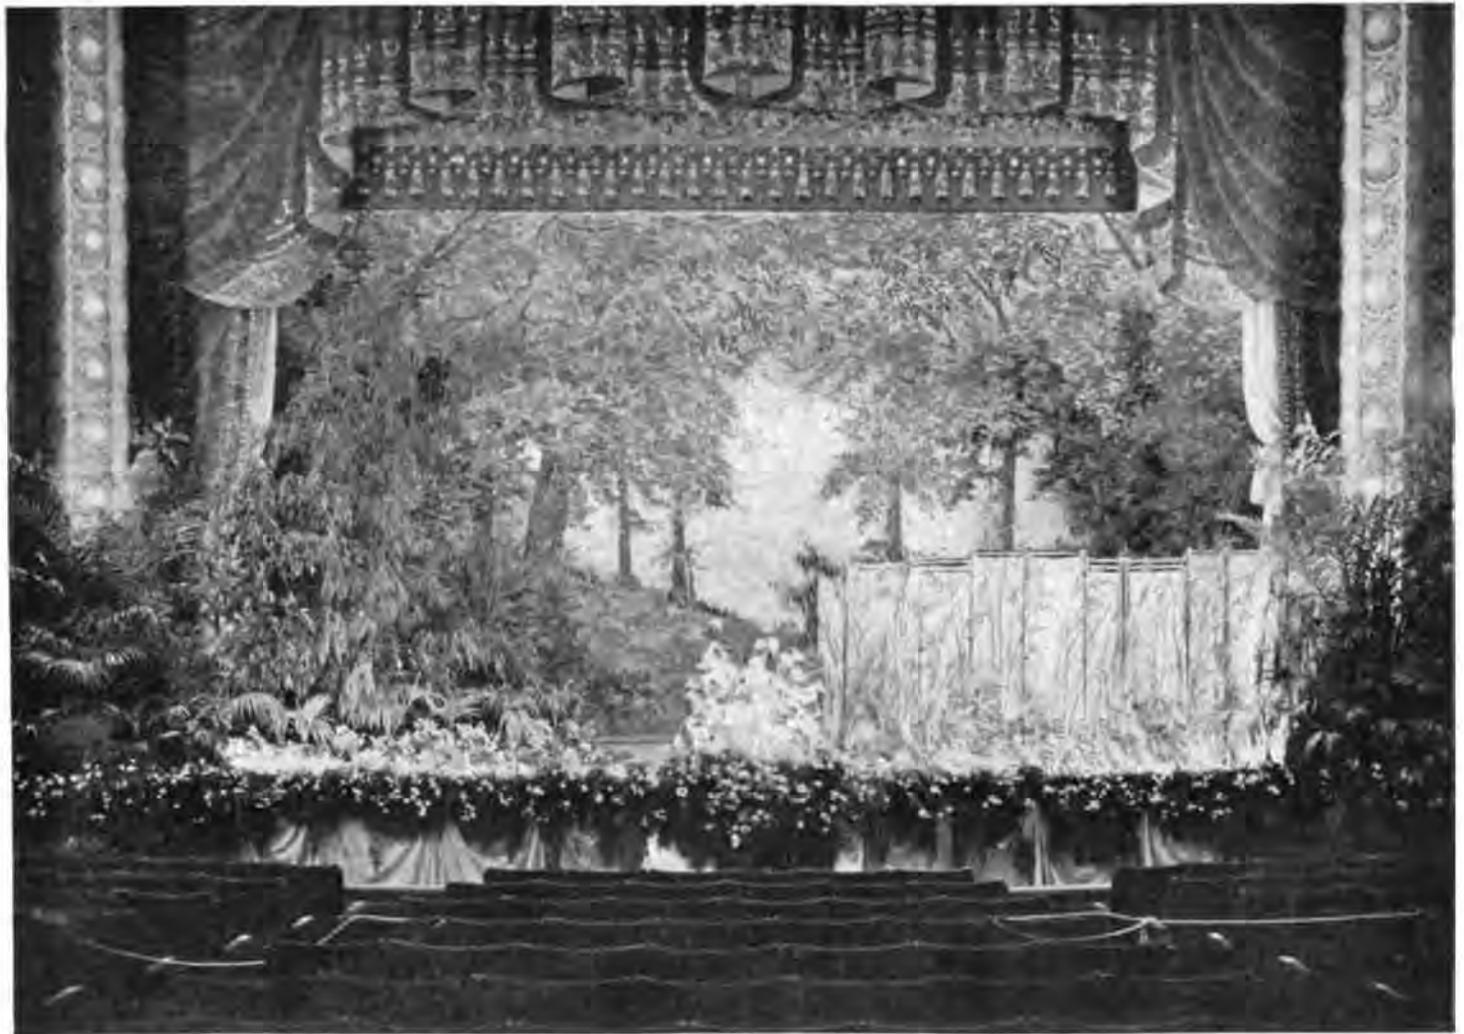

THE following story was told me a few days ago by the lady who owned the dog and cat in question, and who was an eye-witness of the incident, says a writer in *Our Dumb Animals*:

A dish of food was brought in for the dog, and the cat, who seemed very hungry, tried to get hold of it first. On being cuffed and sent across the room the cat began to mew mournfully, and this attracted the attention of the dog.

He looked at his dish of food and then at the cat, and before eating a morsel himself he took one of the best pieces of meat from the pan, carried it across the room and laid it before the cat. Then he proceeded to eat his meal.

THE THEOSOPHICAL FORUM, IN ISIS THEATRE

AT the Universal Brotherhood meeting at Isis Theatre last Sunday evening, the principal topic was "Thomas Paine." Under that caption Mrs. M. C. Hiney read a paper, briefly outlining Paine's life. She pointed out his work in America in the cause of independence, his labors in England in the cause of human liberty; his efforts in France in behalf of an international republic; how that if his wise counsels had prevailed the reign of terror in France would have been averted. "Paine," said the speaker, "had a deeper understanding than any statesman of his time, of fundamental principles. He was a keen reader of human nature and a born diplomat. Then, too, he was honest. His life, standing as it did in the very vanguard of progress, his every motive true as steel, his every act breathing compassion, his one thought being for humanity, naturally challenged the hatred and persecution of the enemies to human happiness and the world's peace.

"And now," continued the speaker, "I bring before you a picture, the significance of which only the few—the very few—can to-day understand—the picture of Paine in that little room in Paris, rising like a tower once more above the wrecks of all his hopes for France, forming with five families the Theophilanthropical Society—the first in centuries to be formed for the purpose of establishing a nucleus of a universal brotherhood. Picture to yourself the simple meetings, the readings from the ancient sacred writings, Chinese, Hindoo and Greek—the flower-strewn altar in the center of the room. Witness Paine's own declaration that 'religion has two principal enemies, fanaticism and infidelity,' and the simple statement of the Theophilanthropists themselves as to belief in God and the immortality of the soul.

"Paine was one of the few who come, from age to age, to bear witness of the light. His doctrine was the heart doctrine, and compassion was the keynote of his life. Does not a knowledge of his life make it easier for us to avoid the mistake of persecuting the great helpers of humanity, whose lives, in their purity and compassion, are such a reproach to our own? For the spirit of persecution has not died out—as those who have followed the Theosophical movement in this century are fully aware—and in the ranks of those who make their living by religion,

are still many who crucify in a thousand ways the Helpers of Humanity, when they should be the first to help, the first to serve, the first to understand."

Mr. S. G. Bonn read a paper entitled: "The Over-ruling Law." In part he said: "The word 'law' is applied to regulations made by men for their common good; and it is also the term which we use to indicate the orderly working of nature. Regarding man-made laws, the measure of their perfection is to be judged by their being in harmony with the higher law, which we call the Law of Nature, or Divine Law.

"It must surely be the highest wisdom for every man, and every nation, to live in harmony with this Over-ruling Law. We hear much now-a-days of national allies. But the perfect safety which must result from acting in harmony with Infinite Power and Absolute Justice is thought of but little. Yet this supreme law is written in our hearts, as the Scripture says: 'I will put my law in their inmost hearts;' for man is the temple of the Most High. It was the wish of Socrates: 'Give me beauty in the inward parts, and may the inner and outer be at one.' It is the object of our existence here to raise the outer nature into perfect union and harmony with the God within. The whole course of life, and of many lives, is to help us to realize this as the highest wisdom, and the most perfect happiness. When we can say truly, and fully, 'Thy will be done,' then heaven and earth are one; and we have merged the imperfectness of the weak personal will in the Eternal Will, which ever lives and reigns throughout the boundless universe."

The program also included several choice musical numbers which were rendered in a manner doing full credit to the performers.—*San Diego News*

Theosophical Meetings for Sunday Nights

Public Theosophical meetings are conducted every Sunday night in San Diego at 8:15, at the Isis Theatre, by the students of Lomaland.

Theosophical subjects pertaining to all departments of thought and bearing on all conditions of life are attractively and thoughtfully presented.

An interesting feature is the excellent music rendered by some of the students of the Isis Conservatory of Music of Lomaland. Theosophical literature may always be purchased at these meetings.

Art Music Literature and the Drama

Architecture—What Type Best Meets the Needs of the Time?

A CONTEMPORARY pleads for the restoration of the Gothic style of architecture; to quote his own words, "not a modernized Gothic nor adaptation of it, but the pure Gothic." He is not concerned as to whether or not "pure Gothic" will meet the needs of today, nor gives he any hint as to the bare possibility that what was alive five hundred years ago may be (we say *may be*) very dead indeed at the present time. Why this critic's naïve refusal to distinguish between "then" and "now"? Our age, of course, is not restless enough! Methinks the tonic that the present day needs is not an architecture that expresses restlessness, but one that expresses serenity, such as the Grecian or that of the ancient Egyptian.

Another point lost sight of by this critic is that the architecture of any age is a thing not separate from the life of the people, but an integral part of it, reflecting the spirit of the age from which it springs. In the stately pylons of Egypt's old temples; in the columns of mighty Luxor; in the sacred places of Philæ; in the pyramids themselves—what do we read? Restlessness, impermanence, vacillation? None of these; Egypt's architecture reveals in all its fullness the secret of the heart-life of the age in which it came to be; and that heart-life, with all its drawbacks, was *serene*.

What about the age which bequeathed to us the Parthenon, the Erectheon, the old canyon-built, open-air Theatre, the severe Doric, the tender Ionic and the glorious acanthus-wreathed Corinthian? Was it an age silly, vain and frivolous; a time that bore no philosophy; whose people saw only the surface of things? By no means; Grecian architecture, in its beauty, simplicity and loveliness, was but a reflection of the unity and loveliness of Greek life itself and it tells a story of deep interest and assurance in things of the soul; a story, above all, of serenity. It is as impossible to dissociate Greek architecture from Greek living and Greek philosophy as it is to dissociate thought and speech, inspiration and deed, cause and effect.

No less is it unphilosophical to study Gothic architecture apart from the age that gave it birth. What was that age? Alas, few pictures are darker than the picture of medieval Europe—superstition rampant, human life held cheap, lands devastated by wars, plagues and famines; feudal barons warring against each other and communities of serfs whose lives weighed nothing against their master's whim. Europe then, saving the light that shone here and there, in Padua, in Venice and in one or two other places, had no philosophy, no light. Her whole life lay in the mud of things, as the lotus seed lies in the mud of a winter-chilled pond.

One of the first signs of a striving upward was Gothic architecture itself, its tall lines telling the story of restlessness, aspiration, of a seeking to leap away from earth altogether; a lack of that three-fold absolute health and balance. It was glorious for that time, glorious in its promise; as marvelous, in that sense, as the first tiny shoot of the lotus coming from the mud and water is a marvelous and rare promise of the blossom that is to be. But this tiny restless upward-striving shoot is not what we pluck and place in a vase to adorn our

rooms. We wait until the flower blooms, when the story it tells us is no longer one of restlessness but of serenity, repose and calm.

Is not the analogy plain? It is too late to make of any style of architecture a fetish. The time has gone by for that. We might have done it twenty-five or even ten years ago, but too many are already seeing the need of wiser thinking. As all must be considered in connection with the time, the spirit of the age, what excuse can those offer who discuss art, architecture or any other one department, and *forget life?* STUDENT

O BUILDING GODS! Every god, every goddess, who passes is in me who have been examined before Ra, before the Priases of Light.

—From the Egyptian "Book of the Dead"

A BIT OF LOMALAND ARCHITECTURE

What Were the Laws Governing the Art of the Ancient Greeks?

M. RODIN, one of the greatest of living sculptors, and the one who has been undoubtedly the most condemned, the most worshiped and the most discussed among all his compeers, said recently:

I invent nothing, I rediscover. And the thing seems new because people generally have lost sight of the aim and the means of art; they take that for an innovation which is nothing but a return to the laws of the great sculpture of long ago. Obviously, I think I like certain symbols, I see things in a sympathetic way, but it is nature that gives me all that. I do not imitate the Greek. I try to put myself in the spiritual state of the men who have left us the antique statues. The Ecole copies their works: the thing that signifies is to recover their method.

Rodin became first widely known to the American public through his work exhibited at the World's Exposition held in Chicago some twelve years ago. He stands today, in certain important respects, still alone. Some of his work, because of its ideals, is to be deplored; some, even of the best, has not escaped a certain dip into the sensuous. But, his work considered as a whole, Rodin is worthy of honor as one of the leaders in the march of a few courageous moderns toward a higher sculpture than the world has ever known. This he will continue to be, it would seem, in proportion as he holds to the convictions quoted. STUDENT

LITTLE MISCHA ELMAN, according to European critics, is not a prodigy in the ordinary sense of the term, but a full-fledged musician. He began playing when but five years of age. "You used to practice a great deal?" was asked him recently. "Oh, no, I never have practiced much; I soon learned to read music at sight and then I could tell just what it was meant to be. I would play it a little and then I would stop playing and think the music over until I felt just how it ought to go. Then I could play it all right."

The probabilities are that the little violinist, if correctly quoted, places too little, rather than too much, stress upon "practise;" for even the hand of a genius cannot become fit interpreter

of a high musical message without manual training which is full, insistent, even severe. Yet, none the less, in these simple words the child revealed certain grasp of one secret that all virtuosi know and most teachers but, for some strange reason, few students. The child in question comes of a musical family, his father and grandfather being violinists, and it is said that his two sisters, both of whom are younger than himself, give promise of being prodigies in their turn. Students'

Path

FAME is no plant that grows on mortal soil,
Nor in the glistening foil
Set off to the world, nor in broad rumour lies,
But lives and spreads aloft by those pure eyes,
And perfect witness of all-judging Jove;
As he pronounces lastly on each deed,
Of so much fame in heaven expect thy meed.

—MILTON

TAKE HEED, O ye who breathe, and, breathing, live,
Say all thou must;
Of thy heart's fulness generously give,
Lest thy sad dust
Wail for the golden words it left unsaid,
And, lying mute, will rest not, though 'tis dead.—Selected

—FANNY GREGORY SANGER

Silence as a Fighting Force --- A New Lesson Learned

IT is related of Christ that he was *silent* in the face of accusation and calumny.

From this fact has developed a complete theory of his character, the theory which makes him *meek*, the lamb theory, a theory buttressed by his injunctions to turn the other cheek, and to give the coat to him who has torn away the cloak.

But another interpretation is at any rate *possible*. The higher—the highest—nature of man, is outraged by an injustice. The closer the unity between a man and his higher nature, the more clearly will he appreciate the injustice, whether done to himself or others. If we maintain that that is not the case, we are maintaining that the higher nature is blinder to principles than the lower.

And again: the closer the unity, the stronger will be the man's will to rectify the injustice. The universe is just as much put out of gear by an injustice to him as to anyone else.

He must not therefore be blind to the injustice or abrogate the will to rectify it.

But if he cultivates the *meek* strain of character, the so-called lamb-like, he will try to blind himself to the injustice merely because it is done to himself, and he will totally paralyze the godlike will to rectify it. He is himself guilty of a double injustice towards the universe. And this injustice, which he justifies on the ground that the injury was towards himself, must like any other affront to the higher nature and the Law, begin to poison the character, and lead to similarly cowardly negligence when *others* are the victims of injustice. Christ said that he brought a sword, not meekness, into the world.

But what method shall the will to rectify employ? It may be reckoned almost axiomatic that any method instinctively employed by the lower nature is wrong or extremely likely to be so. Instinctively, the lower nature "talks back" and hits back and engages in voluble self-defense. This policy stimulates the attacking party to fresh exertions; the original wrong is added to; more defence and counteraggression is called forth; the whole situation is inflamed to the utmost, and no good whatever is achieved.

The opposite policy is a *silence*, a commission of the situation to the higher nature, a quiet positive *watching* of the calumny. During that silence the *higher nature is acting* in several ways, throwing a disconcerting something into the camp of the enemy, a slow but sure force; and, still more slowly, but as surely, calling forth the higher consciousness of the enemy himself. Pursuing this policy, the evil is minimized, the beginning of its rectification is made, and the man who pursues it becomes his brother's (if also enemy's) keeper. Faith in the higher nature as an active power, enables it to become one.

All that seems consistent with Christ's teaching. And if it is what he meant, if perchance it is what he taught—and the teaching may have been lost or somehow suppressed—then *meekness* is a false and unchris-

tian ideal, devised perhaps by an intelligence that did not want men to understand this positive weapon of stern silence, and made instead an emasculated substitute for it.

But if, pursuing this policy, we ourselves make no use of or demand for the common forces of defense, we have no right to pursue it where others are concerned. They, when attacked and calumniated, do look around in appeal, and it becomes our duty to speak and act. The Silence is a weapon within the life-sphere of the one who employs it or invokes it. He can leave his interests in its hands whilst he places all his forces of speech and act at the disposal of the Law of right and justice. But there, his duties are defense only, not aggression. Lastly let us note that the Silence would never be invoked by the man whose thought was: that I may be justified! It is the *injustice* that must be thought of, not that little self that happens to be its victim. In other words, this self-defense is only a particular case of that general living in touch with the Silence at which we should all aim.

H. C.

FRIENDS IN COUNSEL

DEAR COMRADES: In order to secure harmonious working in communities in the world, fixed rules must be devised and times and seasons set if such are to be preserved from quick descent to chaos and misrule. The regulations for our daily life are broadly based on natural law, and simply formulate those principles which would spontaneously occur to every man did he but lend a more attentive ear to intuition's voice. 'Tis true that discipline involves the notion of restraint; but such restraint is only felt by our rebellious personality, and who is there deserving of the name of man who does not always exercise control over his lower tendencies?

A regular routine is of enormous value to conserve that mental force which those who live a solitary life must constantly expend in making small decisions all day long. Our minds are thus left free for other kinds of work. It might be thought that life by rule would be devoid of moving incident and somewhat lacking opportunities to train the mind to meet emergencies. Quite on the contrary with those who have transferred their interests to the inner world. With such the day is crowded with adventures. Temptations we imagined had been buried with our youthful days leap into sudden life and make a vigorous assault. We are exposed at every turn to showers of subtle thought suggestions, poisoned arrows from the hosts of those who war against the light, and unless the venomous shafts are recognized and drawn without delay they may diffuse their virus through our minds and paralyze our spiritual life.

There is no foe more difficult to seize and overthrow than is the gloomy shadow of despondency which sometimes tries to vampirize our very life and chill the ardor of the soul upon its upward way. Its coming on is almost imperceptible. At first a diminution of the heart light, followed by a stealthy spread of overwhelming gloom, until at last a pitchy darkness folds us like a pall and utterly excludes the shining of the eternal day. Against the slow approach of this insidious foe nothing avails but constant vigilance to note its first advances and disperse the gathering gloom by that self-generated sunshine of the dauntless heart. It would appear as though the lower aspect of our human nature was personified in some dark spectral form, blinding the mind to all the glories of the higher life and striking chilly terror to the heart by the suggestion of the emptiness and void of an existence where sensation plays no part.

The guides can do but little to assist the pilgrim at this point. The grim phantasmal shadow is his own creation and must be dispelled by his unaided powers, or rather by the might of that innate divinity residing in the heart whose golden light will shine into the darkest corners of our being if we allow it free, unhindered course.

STUDENT

IT is said in the Book of Poetry, "Although *the fish sink* and lie at the bottom, it is still quite clearly seen." Therefore the superior man examines his heart, that there may be nothing wrong there, and that he may have no cause for dissatisfaction with himself. That wherein the superior man cannot be equalled is simply this,—his *work* which other men cannot see. It is said in the Book of Poetry, "Looked at in your apartment, be there free from shame, where you are exposed to the light of Heaven." Therefore the superior man, even when he is not moving, has a feeling of reverence, and while he speaks not, he has *the feeling* of truthfulness.—*Chinese Classics*

The Lewis and Clark Exposition

JUST over a century ago, two army officers, Meriwether Lewis and William Clark, were sent out with a small party by President Jefferson to explore the vast and then little known territory constituted by the west basin of the Mississippi, between that river and the Rio Grand.

tion through with entire success, for 2600 miles, crossed the Rock-a River, and finally, after three

the great *Lewis and Clark Exposition* name.

manufacturers and foreign governments every square foot of the original additional space as well. One of plan contains 90,000 square feet and the impressive but not unwieldy, *Liberal Arts and Varied Industries and Transportation* needed the addition it is 100 feet wide and 500 feet long by 100 feet. The pressure of

space made it necessary to restrict their occupation. Only exhibits of unusual attractiveness were finally accepted, special attention being paid to working exhibits which show the process of manufacture rather than the manufactured products.

The States of the Union have been fully awake to the duties they owe the Exposition and themselves in the exhibition of their specialties. The Washington legislature appropriated \$75,000 for erecting the Washington building and collecting and installing a comprehensive display of the resources of that State. Our own Californian building is four times as large as the pavilion the State erected at St. Louis.

The Fraternal Societies are not behindhand. They have erected a *Temple of Fraternity*. Over \$20,000 was pledged towards the project, and the raising of a beautiful and appropriate structure is the result.

Besides the exhibits, the Exposition is being used as an opportunity for a number of interesting functions. Germans all over the Pacific Northwest are planning to attend the greatest Saengerfest ever held by the North-Pacific Saengerbund. Distinguished guests will include the German Consul-General and the German Ambassador. The North-Pacific Saengerbund includes Societies in Portland, Tacoma, Seattle, Everett and other cities, and all of them will co-operate in the celebration. "German Day," July 22, will mark the concentration of their

efforts, and special trains from many directions will arrive with large numbers of delegates, each group with its own choir and band:

One of the most important of all the many doings at the Exposition is a great conference of the representatives of cities to be addressed by leaders in the movement for municipal reform. It was proposed that a league of Northwest cities should be formed for their mutual benefit in co-operation for the purposes of good civic government. "*How to fight corruption in cities*," is a vitally important subject set down for discussion. "*Social betterment work in cities*," is another; and this discussion will include the methods available for the suppression of vice and the regulation of the liquor traffic. "*Municipal improvements*," covering such practical matters as drainage, watering, and lighting, is also down on the list.

The floral arrangements of the grounds of the Exposition are on a very elaborate scale. The climate of Oregon leaves nothing to be desired for such purposes. Roses bloom in riotous profusion the year round, and Portland even bears the name of *The Rose City*. Roses will, however, have a competitor. A Portland florist has been giving special attention to the pansy, and his results suggest some of Luther Burbank's works. Last year he had a multitude of pansy blossoms *four inches* in diameter, and this year even better results are promised. Five thousand pansy plants will be bedded in the Exposition grounds, to compete in beauty and luxuriance with the masses of Oregon roses.

Finally it is worth noting that the Exposition buildings are protected from danger of fire by an automatic system of fire alarms. The arrangement not only includes the automatic ringing of the warnings but the automatic harnessing of the horses to the engines and wagons. H. C.

Whales as Food

SOME Newfoundland speculators are arranging to supply whale meat to take the place of beef. They have already supplied the West Indian market and are arranging to supply the London market. It yields a profit at six cents a pound and is described as being finer flavored than beef and more like venison. This will perhaps also help to remind us that the whale is not a fish. E.

House Set on Fire by Goldfish

WATER can, as we know, start a fire under certain conditions, but one would never have suspected so very mild and unenthusiastic a thing as a jar of goldfish of being incendiarily inclined. Yet a news item assigns, as the cause of a recent fire in a tenement house, the leaving of such an article on the piazza, where it acted as a burning glass. The spherical glass paper-weights have been known to behave in the same way, as can readily be proved by experiment. H.

Our Lack of Self-Discipline & Its Results

IN Chicago the strike spirit has spread to the schools, and there exist among the scholars "frats" and "sororities," which are organizations formed out of school and calculated to be subversive of discipline. Says a paragraph: "They are clamoring for enlarging school festivities and uprooting any lively sense of school discipline."

These organizations are entirely distinct from the within-school social unions, which are beneficial, and are "due to the spirit of organization which is splitting up sociability and good-will into labelled factions."

Evidently the world is becoming educated to the fact that things can be done in the name of "fraternity" which are far removed from fraternity, and that an alliance with greed for its motive may be more like a brotherhood among thieves. But the fate of factions is proverbial; they

contain the elements of self-destruction. The paragraph adds the following wholesome remark:

May it not also be asked if the self-abdicating meekness of parents and the refuge from mishaps it did not know how to cure, which the home has sought in the school, is not also accountable for the youthful eagerness to have its own way? The child has been so much studied that at last aware of his powers he has enrolled himself in secret societies and would boss the schools.

Too Feeble to Assert Our Manhood

Feebleness on the part of parents seems to be responsible. And, as there is no reason for supposing that a person becomes feeble when and because he becomes a parent, we may presume that feebleness is general. And what is this feebleness? It is simply the refusal to assert our own manliness and our own authority over ourselves. The prevailing type of character is sloppy, slovenly, and down-at-heels. This description may seem overdrawn to those who estimate smartness by its manifestation in business; but nevertheless human character, contrasted with the ideals set forth in Raja Yoga training, is certainly loose and uncontrolled.

And the penalty for persistent feebleness is tyranny. People kick at governments when perhaps those governments are better than they deserve. If each one governed himself in the spirit of self-forgetfulness there could be no despotism.

DISCIPLINE is what society needs—and the place to begin is on yourself. You cannot discipline other people till you have disciplined yourself. A self-disciplined man can control and harmonize others without speaking a word or lifting a finger. An un-self-disciplined man has to resort to rules or violence or penalties, and even then fails to control.

Self-Respect Will Give Us Character

When we suffer from our lack of self-command, we rush to organizations and suchlike machinery to get that which we could get by our own efforts if we were not so feeble. People form clubs for study and pass resolutions to do things in a body, like a band of cowards holding together for mutual protection.

We cannot pose as a victim, a hero, and a logician at one and the same time. There are too many "victims" in the world, parental and otherwise, and a little more self-respect would diminish the number.

H. T. EDGE

The Futility and Horror of Legalized Murder

FROM the pen of a well-known English writer on questions of social reform we have some trenchant criticisms of the modern systems of punishment for criminals which seem to represent the ideals of the times. Brave words they are, and also true, attacking as they do, the fetish of compassionless heartlessness which blinds even our most progressive peoples in their treatment of law breakers. Some day perhaps we shall awaken to the fact, that in any scheme of reform the idea of revenge can have no part. He says:

The prison, as it has hitherto existed, is simply a hardening institution, which inures folk to crime and the criminal life, and deliberately renders them unfit to become decent and useful members of society. It is an epitome of folly and wickedness. In the prison the State is seen, like an evil stepmother, beating its own children—whom it has reared in poverty and ignorance, and among conditions which must inevitably lead to crime—beating them for its own sins and neglect, and confirming them in their hatred of itself and each other.

And on the scaffold and in capital punishment it completes its program, and carries the same to the bitter end—murdering its own misbegotten sons and daughters, because forsooth they have murdered some one else. Here, finally, it abandons all method or hope of reform, and for the sake of revenge, or on a vague plea of deterrence, commits deliberately the very crime which its victim has committed in a moment of anger or of madness. For nine-tenths of the murders for which men are hanged are of this kind.

The man had killed the thing he loved,
And so he had to die.

They are murders committed in a moment of jealousy, of sudden access of revenge, of despair, of self-defense (as in cases of burglary or poaching); they are committed in the fever of the blood, without premeditation, and are followed by agonies of remorse and grief. Probably, dreadful as such crimes are, there are none (if we except a few deliberate and calculating cases) in which the actors are more open to reforming influences than in these; yet here the State steps in, blind and barbaric, summarily cuts off all hope of amendment, and adds another homicide, cold-blooded and revolting to the last degree, to those which its children must witness. So evil and contaminating has the effect of criminal executions

been recognized to be, that while in some countries they have been abolished altogether, in all modern lands nowadays they have ceased to be public, and the representatives of the people admitted have become more and more limited in number, while we now hear that the officials of Sing-Sing Prison petitioned the New York Legislature some years ago "to remove all executions to the little prison of Dan-nemora in the Adirondack wilderness, on account of the pernicious effect which such events had upon the prisoners generally." STUDENT

Over-Work in Schools

A GERMAN nerve specialist is pleading for shorter hours in school work—for German school-children presumably, who study more assiduously than American or English ones. He proposes a five-hour morning session, with an interval of a quarter hour at the end of each hour, and no afternoon session. Afternoon sessions, he says, exhaust the vitality of the children, and the afternoon should be devoted to outdoor recreation. Medical investigations are cited to show that sickness is much more prevalent among children who have attended morning and afternoon sessions than among those who have attended morning sessions only.

Most sensible advice certainly; and undoubtedly more could be gotten out of the shorter hours than the longer ones, owing to saving in health and efficiency. But why are such long hours considered necessary?

The fact is that under the terrible conditions of our civilization there is an increasing strain felt everywhere. Stamina is weaker, nervous control less; more labor is done and less achieved; more energy lost over useless things; more friction between the various parts of the body politic. We work at an ever increasing disadvantage. What is to show for all this grinding of the children?

The remarkable results attained by the Raja Yoga system at Point Loma and elsewhere are due to the fact that the children are taught from earliest years to gain complete control over their own nervous system, temper, faculties, and attention; so that they have a well-disciplined organism under control of the will, and can learn more in a short time than other children, hampered by ailments and disabilities, can in a longer time. STUDENT

Men of Character Needed for Juries

A SUPERIOR court judge has been addressing members of the Young Men's Christian Association on the subject of juries, and finds that the fault is not with the institution of trial by jury, but with the character of the individuals composing the jury. These may be ignorant, stupid, prejudiced, or affiliated with law-breaking organizations. The judge said that any efforts at improvement, to be successful, must begin with improving the individuals of which the jury is composed.

Thus all questions come down at last to the question of individual character. Institutions have been made on the assumption of a certain standard of integrity and intelligence in the individuals involved in them; and, where these qualities fail, no institution can stand. Originally the institutions derived their strength from a union of the individual strengths; now the individuals rather expect to derive strength from the fact of their union. But there is a vast difference between a lot of sticks propped up against each other and a group of columns supporting a superstructure.

For reliable juries, we need men in whom principle will be stronger than self-interest and prejudice; and we need Theosophy to restore the lost foundations of principle in character. STUDENT

The Vatican's Nest Egg

FROM within the Church of Rome the Pope is being urged to accept at last the appanage offered thirty-five years ago by the Italian Government. This now amounts to 19,000,000 francs, and is under international guarantee. Though it has never been accepted, it has never been refused. The non-acceptation has enabled the Vatican to maintain the pleas for Peter's pence and other forms of donation. And the non-refusal has enabled them to preserve the pleasing consciousness of a large and increasing sum of money which could at any time be claimed. Every possible advantage comes from such an arrangement.

Some of them think that the time to claim has now come. There are hard times everywhere, and Peter's pence are falling off; whilst the defection of France means a serious money loss. This view is voiced by Monsignor Patrice. "Should it please the Holy Father," he says, "to demand this appanage . . . we will submit to his decision and say that he is acting rightly in trying to save at least this small part of his riches from the shipwreck which robbed him of everything else. . . ." C.

Norway's Vivid Past

THE attention Norway is drawing to herself reminds one how considerable a share she has taken in the making of early European history. During the Ninth century her people wandered as uninvited and unwelcome guests all over Europe. One Harold the Fair-Haired, apparently a masterful warrior, subdued all the little Kinglets of the country and made them his vassals. But even as far back as that they were dissentients and so, since they could not conquer they proceeded to emigrate. Some went charging southwards to Italy, and gave much trouble there. Others went to Normandy in France; others to Northumberland in England; some became kings of Ireland and some settled in Iceland. "Settled" is a relative term, for they spent much of their time in the famous Viking raids. But in the long winter time, when they had not much raiding on hand they told stories and sang songs of the past, weaving much and highly colored embroidery around legends and myths already very vivid. And the things they sang, accounts of the creation and all that was before the creation and all that was after it and all that all their heroes had done and suffered—are the sagas on which some of Wagner's operas, and the *Nibelungen Lied*, and many another drama and poem, are founded.

Norway was united with Sweden in 1397, but a century or so after she found she did not like it. She was united again in 1814 and has again found she does not like it. One feels inclined to regret her secession from Sweden, for *union is strength* in more ways than one and against more enemies than one. C.

A New York Horror

NEW YORK has unearthed one of those horrible systems of traffic in youth which will always go on till the punishments allotted are much heavier, and until wealth is no longer permitted to shield a single participant. The rule is to make a scapegoat of one or two, and suppress names wholesale. No less than three hundred citizens appear to have been concerned in this last affair; but as usual, money will flow in any quantity and men who should spend the rest of their lives behind bars will still be able to pose as reputable citizens.

In this case girls were boldly abducted, and in one instance nothing was known of the victim's fate for six years. It was the escape of one after four months of this hideous slavery, that led to the discovery of the nest.

If New York allows this to pass without dissecting out into open view every fibre of the plot, she deserves that it and others shall continue and flourish to her universal shame and speedy downfall! STUDENT

France's Ecclesiastical Treasures

A N official inventory is about to be made of the vast art treasures accumulated for centuries in the churches and cathedrals of France. Including altars, statues, stained glass windows and similar fixtures, the worth of the whole is thought to be not less than \$1,200,000,000. Of this sum the reliquaries, pictures, tapestries and similar movables are estimated at a value of \$400,000,000. A small church in Aveyron put some of its treasures on view at the Exposition of 1900, and they were valuable enough to draw from a syndicate an offer of \$6,200,000. The tapestry in one room of the palace of the Bishop of Beauvais is worth \$60,000.

Bearing in mind the history of France, and its connections with Rome and, later, with the Holy Roman Empire, there can be no doubt that the libraries connected with many of the ancient churches and cathedrals contain literary and historic treasures of untold value. STUDENT

Sakhalin Island

A CURIOUS state of affairs seems to prevail on the island of Sakhalin, if we may trust accounts given of it in a German magazine. It is a penal settlement for the worst class of criminals from Russia; not political convicts, who are either executed or exiled to Siberia, but criminals who in other countries would be sentenced to the horror of capital punishment or imprisonment for life. They are at first imprisoned, chained, and set to labor; but afterwards, on good behavior, released and allowed to go into farming on the island. It is curious that these released prisoners are allowed to go armed, so that they rob each other and are a danger to any person visiting the island. These prisoners are described as being of the class of brutal desperate ruffian, and the condition of Sakhalin must resemble that of hell. Probably now it will revert to its original owners when law and order may be restored. E.

Some Views on XXth Century Problems

Mysticism, Music, and Religion

A WRITER in *The International Journal of Ethics* makes an interesting comparative study of music, mysticism, and religion. His view is somewhat as follows: The mind that is listening to music is thrown into a set of states of feeling; the mystical mind is always in, or constantly throws itself into, similar states, but they are not left to themselves. A sort of unformulated and unwordable comprehension of them is made. And in true religion, similar states are reached, but they are made the basis of definite statements and creeds. Religiously minded people take these statements and use them to reproduce the mystical states of feeling which are at their root.

In these days of scepticism, the formulas of religion are not credited. Mysticism is hardly to be met with, and so through neither of these paths do the majority reach states of mystical feeling. But there is an irrepressible longing for those states; and though they are no longer credited with any noëtic or gnostic value, though it is no longer believed that any wordable or unwordable comprehension of the universe is in them, they are got at through music. Therefore people go to religious services for the music that is offered. Their religious and mystical needs are thus satisfied without any requirement of the intellect that it shall assent to anything. So far the writer we refer to.

He would appear to be very nearly right. Is there anything to add?

Music can hardly help its hearers to spirituality unless they believe that it can. It gives wings to the soul, to the Ego, the wings of high feeling. But the wings are taken as an end in themselves. They are not used. The soul does not fly with them to the height at which spiritual self-recognition is attained. "The universe is the garb of God's feelings," says a mystic of our day; "by feeling with those feelings do we reach God." But for that, the will must act on, select from, intensify, the feelings inspired by music; and the Ego-soul must recognize itself in doing so; not let itself be negatively carried along upon the stream of feeling.

Those who are wise will use music to get up to where the soul can recognize itself and commune with its Source. And they will refuse to permit their minds to gnaw the words of great Teachers to death. They will force the mind to silence whilst a greater faculty than it, bears them on and up to knowledge.

STUDENT

Self-War- ranted Guides

A MAN who volunteered to teach chemistry, or boot-making, or singing, would be required to show credentials. He must have a chemist's diploma, or display a boot, or be prepared to sing a few respectable notes.

But you may advertise that you will teach "soul culture," or "the secrets of spiritual power," without the slightest fear that any one will delay his purchase of your five dollar book to enquire whether you show a single mark of soul culture, or of spiritual power. You will be taken fully at whatever valuation you wish. In perfect safety you may lecture in drawing-rooms or give private lessons.

The teachers of athletics must envy this. They, if they appear in public, must look the part. If they advertise, they must print a photograph. If they give private lessons they must do what they propose to teach the pupil.

What then shall the public do? Shall they buy no books on soul culture or the acquisition of spiritual power?

Why not apply the ordinary tests, *mutatis mutandis*? Why not require the evidences of the life? This man proclaims himself a teacher, and in that act foregoes something of the right to privacy of private life which others claim. The tree must show all its fruit, not merely a lot carefully selected (and perhaps painted) for public view. The firstfruits of soul culture and spiritual power are a clean life, absolute honesty, unselfishness, and freedom from greed. People risk more than they know in reading the books or listening to the well-paid lectures, of the "Swamis" and anonymous and pseudonymous quacks from East and West who gather for the easy spoil in ever greater numbers. The words may read and sound well enough, but like all books and writings that are not mere lists and dictionaries, they are ensouled by the inner character of the author, and it is that which is the real operative; it is that which calls up its like in the recipient. Fine writing on soul culture is today turned

out by the yard, filched from the Upanishads, from Emerson, from H. P. Blavatsky, from Patanjali, from a score of places, either as it stands, or diluted with water, or malodorous with "twin-soul"-ism or other form of sexuality. Why not go to the originals? It is all there, clean, full of the heart-force of teachers whose lives could stand inspection and whose "soul culture" and "spiritual powers" breathe in every line.

But the majority like the vociferous quackery, and the supply almost exceeds the demand.

Ideal Marriage

THE Leader of the New York Society for Ethical Culture, dealing with the divorce question, defines an absolutely theosophic conception of marriage, a conception so unusual outside of Theosophy as to be worth quoting. "The highest aim of marriage," he

says, "is to perpetuate, promote, and enhance the spiritual life of the world, to keep the flame of mentality burning in the universe, and to confer perpetual benefits one upon the other, especially the highest benefits of moral growth."

How many enter on marriage with any such conception, with any knowledge of the power of the relation? How many have any conception, or enter it in any other way than instinctually? And those who have something higher than the commercial or instinctual impulses, are yet thinking only or chiefly of themselves.

That it is no ordinary relationship, the energies that play about it—so often transforming themselves to mutual hate, to be slowly lived down, or not—might show. So far, society knows only of the lower forms of these energies. That real, divine, marriage, sometimes produces around the two a spiritual atmosphere which is a very medicine and healing of all who come within it—this it is true, society dimly knows. But it does not know or suspect that the creation of this atmosphere is the work of those same energies made to show their highest, instead of permitted to revel in their lowest, forms.

But even the higher forms need safeguarding from selfishness. Even when the instinctual is surmounted, a couple are often so closely circled around each other that no one can break through, no other is admitted, no compassion emerges for the world's healing. What compassion can do and be, what heights it can reach, what scope, when energised by the mysterious power that lies in marriage, no one suspects. Purity is much, is an essential; but it is not all. Perhaps by a merely pure marriage, the world is merely not worsened. But by one whose basis is as well unselfish and compassionate, it is endlessly bettered. Let this ideal, and not that of sentimental romance, be set before children, and the divorce question will have solved itself.

STUDENT

Health & Morals

A MEDICAL paper quotes some interesting experiments—if they can be so named—made by the medical officer of a New York school on a thousand boys and girls. His aim was to determine whether the correction of physical deficiencies by appropriate gymnastic and other means, would also correct mental and moral deficiencies.

His report is that without exception, physical betterment was accompanied by moral and mental betterment; that—in his own words—"as the body straightens and approaches the normal, the mind quickens and becomes more retentive, and the moral characteristics are invigorated."

The inner working of the body should go on almost without sensation. The mind stands between body and soul, and if its attention is continually occupied by morbid sensations from below, even when it does not consciously recognize them, or is utterly accustomed to them, so much the less must it be responsive to those infinitely finer waves from above which are the stimuli to morality, which are conscience, and which in their full strength can awaken to the supreme activity we call genius.

And the physical culture also calls for the exercise of will, not only in performing definite gymnastic movements at fixed hours, but in a self-denial of the instincts of laziness, gluttony, and so on. And this exercise of the will is itself a part of morality. The findings of the New York experimenter are just what is being practiced and proved daily at the Raja Yoga School, Point Loma, California.

The Daibutsu at Kamakura

THE Daibutsu of Kamakura is the most wonderful piece of metal-work in Japan if not in the world. It is situated in the grounds of a monastery of the Jodo sect. It is formed of sheets of bronze, cast separately, brazed together and finished off with the chisel. The height is fifty feet; the face is eight feet long, and eighteen wide from ear to ear; there is a boss of silver between the eyes, fifteen inches in diameter and weighing thirty pounds. The eyes are of gold. There has been a temple here since the Eighth century, but the

THE DAIBUTSU, AT KAMAKURA, JAPAN

"The Daibutsu, or Great Buddha, stands alone among Japanese works of art. No other gives such an impression of majesty, or so truly symbolizes the central idea of Buddhism—the intellectual calm which comes of perfected knowledge and the subjugation of all passion."—*In Murray's Hand-Book of Japan*

image is much later. The project of erecting it was first conceived by a priest who in 1195 A. D. was taking part in the dedication of the restored Daibutsu at Nara, and wished to have a similar image at Kamakura. He however died, but money was collected with assiduous devotion and the image made, in wood, during the years from 1224 to 1238. A few years later the image was cast in bronze and the temple restored. This temple has been destroyed twice by storms and finally by a tidal wave in 1495, so that only remnants remain; but collections are on foot for providing a new shrine for the Daibutsu.

Captain John Saris, who visited Japan in 1613, has left a quaint record which, though not always accurate, indisputably refers to the Daibutsu. He says:

We saw . . . amongst others one Image of especial note, called Dabis, made of Copper, being hollow within, but of a very substantial thickness. It was in height, as we guessed, from the ground about one and twentie or two and twentie foot, in the likeness of a man kneeling vpon the ground, . . . his arms of wonderfull largeness, and the whole body proportionable. He is fashioned wearing of a Gowne. This Image is much reuerenced by Trauellers as they pass there.

Many writers have admired the majesty and repose of this statue. Bayard Taylor says: "There is an irresistible charm in the posture of Daibutsu, in the harmony of his bodily proportions, in the noble simplicity of his drapery, and in the calmness and serenity of the countenance."

Hundreds of Ancient Graves Found in Germany

Europe is by no means ransacked yet. Reports from Russia state that near Breslau four hundred graves and one hundred and fifty cave dwellings have been unearthed. They are assigned, some to the "earlier bronze age" and some to the later. There was also a village of a dozen huts containing a collection of spinning and weaving instruments. What archeological riches America must hold in its virgin soil! STUDENT

Anglo-Saxon Respect for Antiquity

IF the men who wantonly burned up vast masses of historical and ethnological treasures found by . . . Spain in Central and South America, could have known of and put their hands upon the books and palm-leaf records of India before the protecting shield of England was raised against them, they would have destroyed them all as they did for the Americans, and as their predecessors attempted to do for the Alexandrian library. Fortunately events worked otherwise.—

W. Q. Judge

However many faults the Anglo-Saxon race may have, it certainly does possess a veneration for antiquity, for knowledge, and for relics,

which has done much on the side of good. Many are the things it has preserved in museums and libraries out of sheer veneration for antiques, keeping them faithfully, in ignorance of their real meaning, against the day when those come who are able to interpret them. And the same race is foremost among the diggers and explorers in every corner of the earth.

It was this race that, with the Dutch, beat back the Catholic power of Spain and Portugal from the Old World and the New; otherwise those Indian records might have shared the fate of the others, and still more devastation would have been wrought in America.

When the English came to India, that land was largely under the dominion of the race that burned the Alexandrian library and so many other things. Notice the words in the quotation above—"attempted to do."

The Painted Tombs of Marissa

THE Committee of the Palestine Exploration Fund has issued a book, with illustrations, on *The Painted Tombs of Marissa*. Marissa is the ancient Mareshah, between Gath and Ziph, and is mentioned in *II Chronicles: xi 8*, as a city fortified by Rehoboam. About 300 B. C. it became the capital of Idumea, and after Alexander's death belonged alternately to the Seleucids and the Ptolemies, finally becoming the seat of a Sidonian colony. To this last period belong the tombs.

There are four burying places at Marissa, and the oldest has a wonderful frieze of painted designs representing animals, which have survived in their colors for 2000 years. Some of the designs are artistic and life-like, others clumsy attempts to draw from description only. The names of the animals are given, such as Camelopardus (the Giraffe), Rhinoceros, Orux, Crocodilos. There is a Cerberus, with three heads, and a man-headed lion, and the mysterious animal known as Grups or the Griffin, here represented as a winged lion with four legs. It is stated that, as soon as the tombs were opened, Moslem fanaticism defaced one of the best paintings, as being contrary to religion. STUDENT

THE SETTLER

THE paths which woad mid gorgeous trees,
The streams whose bright lips kissed their flowers,
The winds that swelled their harmonies
Through those sun-hiding bowers,
The temple vast—the green arcade,
The nestling vale, the grassy glade,
Dark cave and swampy lair;
These scenes and sounds majestic, made
His world, his pleasures, there.

His roof adorned a pleasant spot,
'Mid the black logs green glowed the grain,
And herbs and plants the wood knew not
Throve in the sun and rain.
The smoke-wreath curling o'er the dell,
The low, the bleat, the tinkling bell,
All made a landscape strange,
Which was the living chronicle
Of deeds which wrought the change.

The violet sprang at Spring's first tinge,
The rose of Summer spread its glow,
The maize hung on its Autumn fringe,
Rude Winter brought his snow;
And still the settler labored there,
His shout and whistle woke the air,
As cheerily he plied
His garden spade, or drove his share
Along the hillock's side.—From *The Settler*, by A. B. Street

The Victoria Falls

WE are proud of our Niagara Falls; and justly so, as far as the scenic grandeur of the spectacle is concerned. But in point of size they are surpassed by the Victoria Falls on the Zambesi River in South Africa, which are more than twice the depth. These falls were discovered by Livingstone in 1855. They are the most stupendous and awful in the known world; while the scene at Niagara is one of beauty, that at the Victoria Falls is one of grim and appalling vastness.

The Zambesi runs for a hundred miles over a rough, wild plateau of dull basalt, sparsely covered with vegetation and lonesome and still beyond description. The river is about half a mile wide. As the Falls are approached a vast column of smoke is seen, and a deafening roar heard, but there is nothing to suggest what actually happens. The river suddenly disappears from the scene, comes to an end, is no more. It has been swallowed up by a crack three or four hundred feet deep, down which it pours in a thunderous mass amid dense volumes of mist. According to Livingstone, this crack is a huge rent in the basaltic rock. The effect is that the river is completely removed from its rocky course and escapes from the bottom of the rent by a narrow side-channel which leads it into a zigzag gorge conducting it past the basalt.

The Trap-door Spider

THE trap-door spider is a common member of the very numerous insect tribe in Lomaland. He is very much larger than any ordinary spider, and lives in a deep tubular well which he sinks in the ground to a depth of several inches. This tube is about three-quarters of an inch in diameter and is lined with a fine silky coating of web. It is covered with a round lid made of web and earth mingled together and fastened on one side with a spring hinge of elastic web which keeps it shut. The outside of this trap-door is made to look exactly like the ground, and it fits so perfectly that no joint can be seen. Those that we find are difficult to discover in the hard sandy earth, and there may be many that are overlooked altogether. If the door is opened, the beast will come up and try to shut it again. This particular Arachnid is a fine example

ROYAL SUMMER PALACE OF KING OF GREECE, CORFU

Corfu is agreed to be, with the possible exception of Crete, the most beautiful of all the Greek isles. The surface, being composed of various limestone formations, is greatly diversified, and provides magnificent prospects. The olive and the mulberry, and the cypress and the pine, moderate by their verdure the brightness of the sunny climate. The capital city, Corfu, is picturesque but the streets are narrow and tortuous. The palace is of white Maltese stone, plain and unpretentious in exterior, with many stately apartments within.

of the selfish recluse who hides his person in solitary safety. STUDENT

Papaya Juice

THE culture of the papaw tree is one of the industries of Mexico, and a consular report gives some particulars of it. The papaw tree attains maturity in one year and produces from 40 to 50 papaws of a dark green color, ripening to yellow, in shape like a squash. The papaya juice is collected from shallow incisions in the fruit. It is then evaporated so as to yield a white granulated product which is the papaw of commerce. As it is very corrosive, porcelain and glass vessels must be used and rubber gloves worn. The substance is a powerful digestive, considered superior to the pepsin products. The raw papaw is refined in the United States and used in medicine. The ripe fruit is a good digestive, and meat wrapped in the leaves soon becomes tender without losing flavor. E.

Spring in New England

IT is a wonderful spring. The weather bureau reports call it late and cold, but Nature never seemed so conscious as during the long days of low brooding sky and soft clear moist air, and over and through everything the calm that is peace. No dust or wind or glare or swift warm breath of activity: but all the leaves and buds unfold in fresh and tender beauty as to some hidden music. Everything is moving to a gentle rhythm of harmony, and the very earth seemingly knows the power and sweetness it enfolds.

Sometimes the season comes with warm rains and strong sun, and then the leaves and flowers burst forth in quick eager, riotous profusion. But now it is all sweet leisurely dignity. Everything seems to feel that each note of color is a part of the great chorus of Nature, and is serene and confident that this time men must pause and listen to the music. Every blade of grass stands erect and alert as things do that know, while the tulip heads are balanced with a full measure of the joy and beauty of living. The trees stand with outstretched arms and leaves turned palms downward blessing the earth below. The tree trunks, soft and dark with fresh sap and moist air, now range themselves for Nature's fête day into branched candlesticks illumined with a starlight glow that enhances and shines through fresh shades of living green. NEW ENGLAND

Courage

THE courage required to abide the deed done, is greater, often, than the courage required for its doing. The test comes in the temptation to recede from the position we have taken—a true position or verily it would not have been so hard to take and so hard to keep.

The world needs courage. The good are passive. The bad are active and persistent. Direst of confusion is the result. Why? Mainly, it must be confessed, because the few who long to help humanity have not the courage to actually do so.

The keynote of any life which is helpful, strong and true is courage, courage to do, courage to dare, courage to plunge, courage to brave failure, again and again.

The test of our sincerity as women world-workers lies more in the quality of our courage than most of us are aware. We all come closer to being cowards than most of us would be willing to admit. Of course we are courageous at times, we all know how to be heroic spasmodically; then we drop and become negative. As far as being of any actual and positive assistance to humanity is concerned, we might almost as well not have been brave at all. The student—man or woman—who is courageous by fits and starts is about as useful in the ranks of the Theosophical movement as an epileptic would be in a regiment. The kind of courage needed these days is the quiet, silent, steady, persistent continuous kind. None of us—certainly very few of us—possess it. But if we do not and are not making a strenuous effort to acquire it, we may be certain that our usefulness would be greater without the ranks of this movement than within.

Let us begin, once more, to build in courage. But what shall we build it on? *Trust*. If we have a trust that is unshakable, a devotion to humanity's welfare that nothing can break down, we will not have to bother about being courageous. We will be heroic as a matter of course. We could not be cowardly if we were to try. And at the present time, when so much of awful moment crowds each day, each hour, even; now, when the old is passing away in death-throes which are also the birth-pangs of the new; now, as never before, is there need of the higher courage.

Let us, then, think less about developing courage than about hewing square and strong the foundation stone upon which it must be built, trust, trust in the Great Law, and a wiser, diviner faith in ourselves. The Gods have counseled us. Shall we then lack courage? E. W.

Climbing the Heights

AN English lady who recently had a narrow escape while ascending the Jungfrau writes as follows:

"Has any one looked on the Jungfrau from Interlaken and not wished to make a nearer acquaintance with her gracious undulations of soft white snow?"

"Though she looks so calm and gentle, she is fiercely guarded by her wild lovers (the spirits of the air), who do their best to make an end of any mortal who dares to soil the pure mantle of their beautiful Jungfrau.

"If their furious rage of wind or snow cannot kill the daring one with cold, or bury him alive, they will unexpectedly cause the pinnacles of ice to crack from above and then with booming crash come hurtling down across his path; or having laid deep chasms of green and awful depth and covered them with tender white, wait with an endless patience the slur and drop of their presumptuous rival.

"Not being acquainted with the jealous keepers of her purity, I started up the Jungfrau with eager expectation of all the wondrous loveliness that would be unfolded to me on her snowy plains."

Heavy snow storms soon came on and it would have been dangerous to rest until they reached the little hut placed as a rest house for climbers. They had seen it above them "perched on a piece of rocky mountain, surrounded by eternal glaciers."

The climb became such a struggle that of one period she writes—"I became so petrified with cold and shaking with fatigue, that my one desire was to throw myself backwards and put an end to the exhausting strain, but being roped together this was impossible."

At another time she had slipped into a crevasse while an avalanche of snow came rolling down the mountain over her head. In her account she says: "With a booming roar the avalanche rolled over us, falling thickly over me, between the deep green glistening walls of what might have been my death chamber. Having vainly kicked my swinging feet, cleared the snow from my mouth and face, I quieted myself and looked up through the narrow opening into the blue sky. Then I listened intently for any sign of life from above."

Once safely down in the hotel she looked back on the scene of her struggles. "The weather was perfect and how I wished," she said, "that I was on the white slopes of the Jungfrau, while her wild and jealous keepers were sleeping peacefully in the warmth of the spring sunshine." Even so before the soul's gaze stretch the heights of purity

WILT thou do the deed and repent it?
Thou hadst better never been born.
Wilt thou do the deed and exalt it?
Then thy fame shall be outworn.
Thou shalt do the deed and abide it,
And sit on thy throne on high
And look on today and tomorrow as those
that never die.—William Morris

and clear vision; and their jealous guardians thrust back every aspirant who would bring a trace of impurity within their precincts.

To start on this ascent without presumption we need a guide who knows the way; we must submit to the needful preparation; and our purpose must be strong and true enough to keep us going steadily. Then, if we are roped to our fellow comrades with the ties of love, we may pull each other up in our moments of despair.

When we seem to be overwhelmed with opposing forces, quieting ourselves, we may look up and see the blue of eternal Hope.

Once through the storms the heights allure us again. But in this climb we need not return, only wait with our guide until the right time comes for us to push on further and higher. STUDENT

The prize poem for the Lewis and Clark Exposition at Portland, Oregon, was won by a woman, who wisely entered the poem under the name of John Malcolm Graham:

"THE TRAIL"

Mrs. A. A. LINDSLEY

THE call comes, strong and insistent,
Out of the West---oh, hark!
"Follow through hail and sun the trail
Blazed by Lewis and Clark!"

On with the blanket and saddle,
Ride like the devil possessed,
Swift on the way by night and day,
Hit the trail to the West!

Sting of the wind in our faces,
Craunching of hoofs on sand---
Whate'er betide, pause not, but ride
Straight to the promised land.

Whiteness of sails on the ocean,
Gleaming of gold in the hills,
Glory of grain on the harvest wain,
Curling of smoke from the mills.

Of with the saddle and blanket,

Here's all hail to the Westward trail
Blazed by Lewis and Clark!

little children come from the lower world, (represented by the outside of the basket), and that their destination is the inner world, (represented by the center of the basket). To make this journey the child spirits must pass through the earth, the dark portion, represented by the border with points jutting both into the under world and the upper world. So it comes about that the earth is never quite closed lest the little spirits should be barred from entering. It is said that Indian women have been offered large sums by buyers in the effort to induce them to close the border to the marriage basket, but that not one yet has been induced to do so.

THE recent death of Miss Sarah Chauncey Woolsey, better known as Susan Coolidge, at Newport, R. I., at the age of seventy, removes another favorite author of stories for young people, whose books, like those of Louisa M. Alcott's, will be read by boys and girls of the second and third generations. The "Katy-Did" books were among her most popular and best-known works.

AN Australian woman, who has recently been sent to America to write letters on American life for one of her home papers, says: "The Australian women are more interested in American women than in anything else. Australian women are now, of course, all enfranchised; yet they are very much behind the women of America. Our women have not the influence in public affairs that the women of the United States have, nor do they show the same interest. They do not carry on the great enterprises in education, reform and philanthropy that American women do. It has seemed to me that suffrage would remedy this, but it has not done so.

"Our husbands do not respect our opinions in general, as much as the American husband respects the opinions of his wife. And, altogether, seeing how much more advanced American women are, I feel that the question of suffrage has very much less to do with the question of woman's advancement than I had supposed."

Indian Heroines

ON the Uncompahgre Indian Reservation in eastern Utah still lives Chipeta, wife of the famous Chief Ouray, long celebrated for her daring midnight ride to rescue the women who were captured by the Utes at the time of the terrible massacre in Colorado some twenty-five years ago. She has ever been a strong friend of the white people and loyal to all that was best in civilized life. Her heroism came as a climax to one of the worst Indian massacres in the history of the West.

When Chipeta learned of the proposed massacre, she made the night ride that has been described by Eugene Field in his poem "Chipeta," delivered her husband's ultimatum to the renegade chiefs and forced their consent, then rescued the women and cared for them in her own home.

And she is but one of many Indian heroines who were friends of the white race. The women of the Northwest, in erecting a statue to Sacajawea, the girl-wife who acted as a guide for the Lewis and Clark expedition, have sounded a new key-note and possibly started research on new lines, for Sacajawea is the first woman of her race to be so honored in this century. Is it improbable that in the annals of Indian history, so long obscured, may be found records of many heroic Indian women who stood as guardians

of all that was best in the life and traditions of two races and as links between the red man and the white? Stranger discoveries are being made daily, for the truth is revealing itself with persistent clearness at the present time. E.

INDIANS OF SAN DIEGO COUNTY

Navajo Basket

A CLOSE observer will notice that in the Navajo marriage basket the pattern never meets. It is due to the old superstition that the spirits of

THE widow of Leonidas Hubbard, the explorer who perished while on an expedition into the interior of Labrador in 1903, recently left Halifax for the Labrador coast. It is her intention to continue explorations from the point at which her husband lost his life. Her party includes a number of Americans, besides Indians who will serve as guides. Mrs. Hubbard accompanied her husband in the past on many trips to wild and isolated sections of Canada, and with regard to the last trip that they made it is stated that she was as well versed in his plans as the explorer himself.

OUR YOUNG FOLK

The Raja Yoga Question Box

NEW ENGLAND has given us many writers of song and story, and many teachers who have tried to make the world a happier place.

1 Who was Bronson Alcott?

ANSWER—Amos Bronson Alcott was a philosopher of New England. His home was in Concord, Massachusetts, where so many great men have lived. He was a teacher, and had a famous school for very little children. Bronson Alcott tried to show people how to live simply and wisely, and he used to speak to them about noble ideas, as the philosophers did in olden times.

2 Who was Louisa Alcott?

ANSWER—Louisa May Alcott was Bronson Alcott's daughter. Louisa and her sisters had a very happy childhood. They were busy, unselfish girls. Their life

together helped Louisa Alcott to learn how to write the stories which children love to read. Her books are read by young folks all over the world. During the Civil War, Louisa Alcott worked as a nurse among the soldiers.

3 Who was Longfellow?

ANSWER—Henry Wadsworth Longfellow was an American poet. He was a professor at Harvard College. Longfellow began to write verses when he was thirteen. He learned seven languages, and translated many poems into English. In this way he helped people to know the poetry of other countries. Longfellow's life was long and happy. His poems sing a song of cheer and courage. He loved children, and wrote many poems which they can learn. How many young folks love the music of his "Hiawatha?"

The Magic of Trying

"IF I only had had a chance, I might have done something," we often hear people say, when they are no longer young folks.

They forget that when people try, the doors of opportunity stand wide open. I am going to tell you about two young girls, whose lives would have been full of unhappiness and disappointment, if they had not had heroic perseverance.

One of these was a young American girl, who lost both her arms when she was nine years old. "How unfortunate!" you say. "Her whole life must have been spoiled. Why she could never learn music nor drawing, and not even to write nor to sew. And some one would always have to wait on her."

But this girl did not give up trying because she had no hands. She is over twenty years old now, and her life is busy and happy and useful. Her writing is legible and she can sketch very cleverly. Needlework is quite easy for her, and she earns her own living by selling her drawings and the articles which she has sewed. She does it all with her feet, which she has trained to do what others do with their hands. How she must have worked, to train her feet so cleverly!

Aimée Rapin, the second of my heroines, lives in Switzerland. She was born without arms. One day, when she was a baby, her mother held her up to see the roses in their garden. Little Aimée stretched out her tiny foot and caught a rose by the stem with her toes. The flower seemed to teach the child what she must do.

In a few years Aimée began to dream of painting beautiful pictures. She set to work bravely and patiently to train her feet to serve her as hands, so that she *could* paint. She kept on steadily year after year, and when she was fifteen, she was ready to enter the School of Fine Arts at Geneva. Aimée Rapin was very successful as a student, and after finishing her course in art in Geneva, she went to Paris, and studied with the great artists there.

Today this clever footed girl is a celebrated artist herself. She lives in Geneva, and delights in painting the portraits of children. And so well does she do this that one feels like speaking to the little ones who smile from the canvases. In them Aimée Rapin sees her dreams realized.

A CLASS IN WOOD-CARVING IN THE RAJA YOGA SCHOOL

Don't you think these two young girls had perseverance and trust, real Raja Yoga qualities?

Their lives show that they found out the magic of *trying*.

A RAJA YOGA STUDENT

Facts Worth Knowing

PROFESSOR NICHOLS, the astronomer, has recently made an instrument so sensitive to heat, that it will register the warmth that emanates from a man's face two thousand feet away. As an experiment with this instrument, the Professor selected two stars, Vega and Arcturus, which are an inconceivable distance from the earth. He found that Arcturus sends as much heat to the earth as a man could get from a candle six miles away. Vega sends only half as much heat as this.

Question: if physical science can make such remarkable records, what may we not expect when men have learned the Science of the Soul, that is, Raja Yoga?

THE ARROW AND THE SONG

I SHOT an arrow into the air,
It fell to earth, I knew not where;
For, so swiftly it flew, the sight
Could not follow it in its flight.

I breathed a song into the air,
It fell to earth, I knew not where;
For who has sight so keen and strong,
That it can follow the flight of song?

Long, long afterward in an oak
I found the arrow, still unbroke;
And the song, from beginning to end,
I found again in the heart of a friend.

—Longfellow

loss during the years the farmers have been bombarding the clouds has been only about one-sixth that of former years. The Government does not yet fully agree that it is this means which is lessening the damage, but is obliged to recognize the fact that the sections buying the least powder suffer the most from the destructive hail-storms.

A GIGANTIC floating workshop is being built for the United States Government. It is a dry dock one and a half acres in area, with walls standing nearly sixty feet above the water. Automobiles and locomotives can be run on the top of these walls. This dry dock is soon to be launched in Chesapeake Bay, and tested by our largest battleships. It is fitted out with a machine shop, and every modern appliance necessary for the work of repair.

THE CHILDREN'S HOUR

A Letter About Swedish Children

DEAR CHILDREN: Sweden, the home of this little Lotus Bud, is a very beautiful country. There are big trees growing around the lakes, and rivers with great waterfalls rushing down the high mountains; and nearly all have a song or a fairy story of their own.

What the children love more than anything is the wild flowers. They learn their names; they know what time of the year it is when the different kinds are blooming.

By this time the children are hunting around in valleys, groves and shady places by the brooks. Some one calls out: "There they are! I smell them!" What do you think they have found? Ah—big fragrant clusters of Lilies of the Valley! They also pick bluebells, forget-me-nots and wild narcissus in the meadows.

On Midsummer Eve, 23d of June, the children are busy picking great bunches of leaves and wild flowers with which to decorate their homes, inside and out. Swedish children are always careful not to forget the simple and hidden flowers, the wee ones.

And it is the wild flowers' turn on Midsummer Eve to be invited and honored in place of the garden flowers.

Out on the plain they are woven into wreaths and garlands for the children to wear when they dance around the Maypole, which is adorned with them also.

Swedish children have many songs and sagas about heroes of olden time. They love to hear about their brave ancestors, and they want to become true Warriors also. This is why they love our Lotus Groups so much, for, you know, we have many in Sweden. In these they are taught how to become real true Warriors—Knights of Peace. There have been Knights of War for such long time; people have suffered and many little children have lost their fathers and homes; and now these little Warriors of Peace have much to do, to make the wrongs right. The Lotus Buds in Sweden are learning how just as the Lotus Buds and Blossoms are in Lomaland. When they are grown to be noble women and brave men, they will take their "viking" ships and sail out to help by teaching people Brotherhood.

Sweden has a king of peace, the good King Oscar. He has written many beautiful poems; and he loves and protects all that will make the children of his country noble and happy. AUNT GUDRUN

The Story of Ali Hafed

DEAR CHILDREN: Persian fathers and mothers tell to their little ones an old, old legend which runs something like this:

Once upon a time, Ali Hafed sat with his wife looking out upon the broad lands of his farm. That was in the Orient long, long ago. Suddenly he saw some children coming through the trees bringing with them a stranger; and this stranger, weary and travel stained, showed Ali Hafed a diamond that he had just found. It shone like a glorious great dew-drop in the early morning. He told Ali Hafed that this diamond was worth whole mines of copper and silver; that a handful of these would make him a prince and that a mine would buy a kingdom. "And," he said, "you can find many such as this—if you search."

That night Ali Hafed went to his rest dreaming of diamonds. When

the morning came he sold his farm for gold and went forth on a long, long search. Many years passed by and at last, old and gray, ragged and poor, he returned. He found that the peasant who had bought his farm had labored all these years faithfully and hard and had become a man of wealth. Ali Hafed sat down, sad and discouraged, beside a little stream at the foot of the garden. Suddenly, as he sat, aimlessly digging in the white sand, he saw a shining something and running his hand down through the sand beneath the water, he found it sown with beautiful gems.

"Oh, that I had remained in my own garden and tilled the soil at my very door!" And poor Ali Hafed, old and poor and discouraged, bent his head low over his hands and wept. All his search away from home had been in vain.

Is there not a lesson in this little story for all of us? How many children—and grown-ups too—think they must go far away in order to do wonderful things and make great conquests, when the real chances are so close at hand! UNCLE FRED

Lomaland Photo and Eng. Dept.

A SWEDISH LOTUS BUD

IF I WERE YOU.

IF I a little girl could be,
Well---just like you,
With lips as rosy, cheeks as fair,
Such eyes of blue, and shining hair,
What do you think I'd do?
I'd wear so bright and sweet a smile,
I'd be so loving all the while,
I'd be so helpful with my hand,
So quick and gentle to command,
You soon would see
That every one would turn to say,
" 'Tis good to meet that child to-day."
Yes, yes, my dear, that's what I'd do,
If I were you.

Or, if I chanced to be a boy,
Like some I know,
With crisp curls sparkling in the sun,
And eyes all beaming bright with fun---
Ah, if I could be so,
I'd strive and strive with all my might
To be so true, so brave, polite,
That in me each one might behold
A hero, as in days of old.
'T would be a joy
To hear one, looking at me, say,
"My cheer and comfort all the day."
Yes, if I were a boy, I know
I WOULD be so.—Selected

DEAR CHILDREN: A friend writes me about a dog who, having hurt her foot badly, knew enough to go to the doctor. It happened that this dog had seen the doctor dress her master's wounded hand. On the day she cut her foot she was alone and, evidently losing no time, she hobbled, badly crippled, tired and weak, to the doctor's office, lying down quietly in front of the door. Presently the door opened and Madge walked in. Going up to the doctor, she laid her bleeding paw upon his knee. Quickly and tenderly the wound was dressed, for this doctor knew a great deal about brotherhood and he was just as tender and prompt in the case of poor, wounded Madge as he would have been with a child. And then Madge went happily home, wagging her tail and apparently quite proud of the new white bandage. Her foot is now quite well, but she has never forgotten the doctor's goodness and she never fails to give him a friendly wag of her tail when she sees him. Madge knows about gratitude. A LOTUS GROUP TEACHER

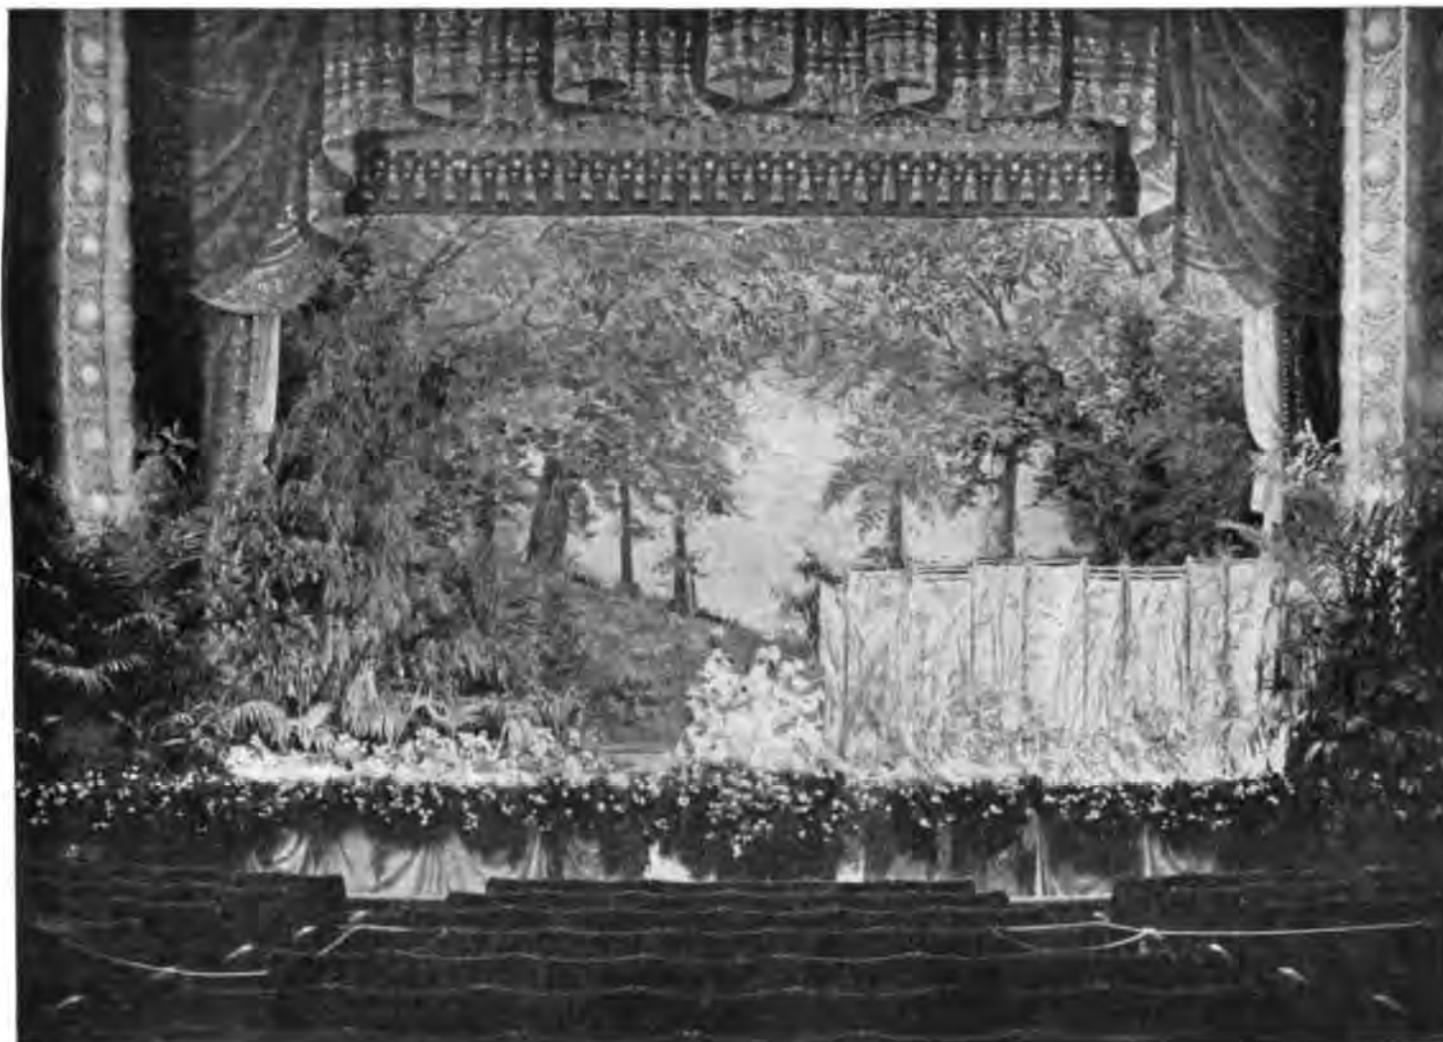

RUBENSTEIN, long after he had won fame as a composer and great pianist, used to tell of his childhood days and of how careful his teacher was about little things; how careful he was about just the correct position of the hands, of holding the fingers and all those tiny, tiny details which the average child would think did not count. "That was what made me a pianist," Rubenstein would say.

But I think his mother's help had something to do with it too. She played the piano and gave him music lessons while he was still a little boy. She had many sons and daughters and all the children learned music, but little Anton was the most musical of all and his mother could inflict no greater punishment than to deny him the privilege of his practice hour.

When he tried, while still a child, to put his thoughts into musical form, his mother aided and encouraged him. Few mothers would have been wise enough and unselfish enough to help their children in this way. How fortunate the little Anton was! His mother must have known about Raja Yoga and heart-light, I am sure. A RAJA YOGA TEACHER

THE THEOSOPHICAL FORUM, IN ISIS THEATRE

THE meeting of the Universal Brotherhood and Theosophical Society, held at Isis Theatre last Sunday evening, was one of more than ordinary interest, being patriotic in its nature. The following musical program was rendered by members of the Isis Conservatory of music: "Agnus Dei," (Bizet); "Adagio," violin solo by Mr. Bland, (Ries); "Einladung zum Tanz," (Weber); "Peer Gynt Suite," (1st Movement,) (Grieg). There was also a charming recitation by a little Raja Yoga girl, the subject being, "An Ode to Liberty."

"A Raja Yoga Boy's Interpretation of the Fourth of July," was the title of a very good paper read by one of the boys, from which the following is a quotation: "The Declaration of Independence! Truly there is a great deal in that statement. It was a bold one, and meant not only the Independence of a nation, but surely, to the framers of it at least, a freeing of their better self from the clutches of their selfish wants and desires, that they might make this country a home for all, in the face of all odds—yea, even against the strongest political power of the time—and they did it.

"And if we would know how they did it, this is the answer: Because they had faith that the very righteousness of their cause would carry them through at any cost. And, while they simply declared themselves free from England, and then went to work to fight for it, they actually made themselves independent of selfishness first. This is readily seen in the life of America's ideal American, George Washington."

"What Theosophists Think of the Fourth of July," was the subject of a paper read by Dr. Herbert Coryn. "The signatories of the great Declaration," said the speaker, "pledged to its support their lives, their fortunes and their sacred honor. In that moment they discharged from their minds the old-world conceptions of a man, and took another. From their midst they discharged the old-world spirit, and another stood among them in that room and touched their thoughts with living fire so that in the glory of that inspiration they saw the promise of the spacious future.

"There is a spirit that has never yet been born on earth, has never yet been permitted to crown with its undimmed presence the splendor of

any civilization. It has stood near with watchful, perhaps hopeful, eyes, as each great nation moved to the climax of its powers; and has time after time withdrawn as the nations successively proved false to its inspiration and to their own possibility. Its light was about the men who signed the Declaration; they felt it in their hearts. From that room it went as a thrill throughout the young nation, and the men and women of those thirteen states, though they knew not fully what had happened, what had come upon them, felt a joy as of rebirth under a new sky and on a new earth. They were face to face with themselves and with Freedom. A great land was in their charge; no traditions tied them; they could do as they would, responsible only to the spirit that had freed them and given all possibilities into their hands. For a moment every heart was linked with the rest; a new consciousness was upon them; they were ready to sacrifice and to serve and to die. Behold! they were an actual nation, one heart, one mind. If they could have stayed so, the earth would have been redeemed by now, and human life were not what it is.

"The signatories of the Declaration pledged their lives, their fortunes and their sacred honor. They held back nothing. Their one care was to safeguard the nation born in that hour. For the instant they were more than men. The light of all redeemers was upon them. Each must have deemed it the greatest hour of his life. It is any man's greatest hour when he is not thinking of himself, but of serving. How many hours of that sort have we? Have we one to look back to? Yet the crown is reserved for that nation which shall consist of such men, men whose lives are one long hour of inspiration, that is, of service."—*San Diego News*

Theosophical Meetings for Sunday Nights

Public Theosophical meetings are conducted every Sunday night in San Diego at 8:15, at the Isis Theatre, by the students of Lomaland.

Theosophical subjects pertaining to all departments of thought and bearing on all conditions of life are attractively and thoughtfully presented.

An interesting feature is the excellent music rendered by some of the students of the Isis Conservatory of Music of Lomaland. Theosophical literature may always be purchased at these meetings.

Art Music Literature and the Drama

The Lesson of the Orient—Modern Ideals Destined to Change

THE following account of a visit to the ancient Hall of Tablets in Shensi, a place virtually unknown to the Occident, is of special interest at this time, not only because present events have forced the Orient upon our attention in a new way, but because the present is so peculiarly a time of change, of transition. The account gives some hint of the way in which certain of our notions are destined to change, as well. Sian, the city referred to, is the capital of Shensi, a part of China that very few travelers know anything about and still fewer visit; a land so ancient that things Pekinese are spoken of by the people of that gray province as altogether modern and even a bit uninteresting, on that account. It is evident enough that one of our ideas which is destined to evolve along with other things these days, is the old notion that the Chinese are "Pagans" with "no sense of beauty;" that they are a race of artisans but not artists.

To ourselves of the Occident who so glibly talk of "art for art's sake," and of "beauty as its own excuse for being"; to the modern world which finds it so easy to forgive the sensuous if it only wears a garment of the so-called beautiful, and to whom art and ethics are not one, but two, the lesson that China is destined to teach us is surely needed. But it will not be learned by us until, as the author of the following, Frances H. Nichols, quite simply states in other writings, "we come to look upon China as something besides a mission field, a yellow peril, and a market for opium!"

Anyone possessed of an adequate knowledge of the Chinese language and literature could find few things more delightful than to spend weeks in studying the old gray slabs in the Sian Hall of Tablets.

Even with my ignorance of the language in which the inscriptions told their stories, I readily understood the hush that the tablets inspired. Apart from their antiquity there seemed to me a cold beauty in some of the outlines on the stones that made commonplace comment sound jarring.

A large oblong tablet was covered for the most part by a series of ponderous proverbs like "Truth is not confined to speech, but the use of speech is to reveal truth," and

"The void has no form, but form reveals the void."

But mortised into the centre of the slab was a panel that had nothing to do with the proverbs. On the panel was pictured a spray of chrysanthemums and bamboo branches. In spite of the difficulty of portraying flower petals on coarse stone, the delicacy of the outline was so perfect that no one who saw it could help an involuntary expression of the sentiment written in verse around the chrysanthemums:

How exact their resemblance,
Their whiteness rivals the snow,
And you almost smell their fragrance,

and the signature of the engraver, Chang Tai Ho of Kurgin. The tablet must at one time have been quite famous because several pilgrims, nearly all of them mandarins, have recorded, near the top of the stone, their names and the fact that they had visited it. A date on the tablet shows that it was placed in its present place A. D. 679, in the twenty-ninth year of Kau Tsung.

This emperor was the husband of Wu How. When Chang's chisel carved the chrysanthemums, she was the dominant power in Sian and in China. It may be only an idle fancy, but more than once, as I have looked at the lamp-black impression of the picture of the white flowers that bloomed twelve centuries ago, I have believed that it was Wu How herself who had the panel mortised into the centre of the slab. It was not like a man—not even a Chinese man—to break the monotony of dreary old proverbs with an irrelevant bouquet. It looks to me like the work of a woman.

The Chinese idea of flourishes and curves differs greatly from ours. Scholars and thoughtful men have a curious habit in a moment of introspection of making idealized characters with a marking brush. The mood of a Chinese at such a time is far different from that of an American school-boy attempting to write

his name in flourishes. The man with the ink tablet and the marking-brush is trying to interpret his soul. He selects at random any well-known character of the alphabet and then allows his brush to swing in curves over the paper, trying, as far as possible, to keep his own personality out of his writing. I have seen a Chinaman sit silently for hours in a moment of illumination, while his brush wanders dreamily over the piece of brown paper before him. Only very rarely, sometimes not more than once or twice in his lifetime, does he succeed in making a character in which he sees his soul reflected.

STUDENT

The "Wonder Child"—What Is the Rationale of Marvelous Precocity?

FLORIZEL VON REUTER, Franz von Vecsey, Mischa Elman—these are the musical prodigies of today, and to the list must now be added the name of another, a nine-year-old girl, little Vivian Chartres, whose wonderful violin playing London critics declare "is likely to remain the uneclipsed sensation of the music season this year."

In a recent conversation held with the mother of little Vivian, the latter stated: "It seems exceedingly strange that Vivian should be so talented and, in one sense, it is a judgment upon me. It was about seven years ago that I heard young Hubermann and I remember how hurt I felt at the sight of the little lad doing what seemed to me inhuman for his age. I was then writing for the newspapers and my critique of that concert I closed with the words: 'Go little lad and burn your fiddle, beautiful as it is, and run and play in the beautiful sunshine.' My own Vivian was only two years old then. I little thought that I would so soon have to take back not only my words but my views.

"As a prodigy Vivian has forced herself upon us against our will and I have had to modify my views on many lines. I had thought, for example, that these mites who play so remarkably must have been forced through endless hours of intolerable drudgery, but I know now it is not the case. The secret lies in the fact that they possess a marvelous ease of acquirement which is simply beyond the comprehension of grown-ups, let alone beyond their imitation. I cannot explain it and it is not confined to music in Vivian's case. She learns other things just as readily, already speaking English, French, German, Italian and Spanish well."

Those who look upon the world as a joke and evolution as a series of accidents may take some comfort in the thought of one child being specially gifted by divine favor, while another is deprived, for some inexplicable reason, through no fault of his own. But those who believe the universe to be governed by eternal and divine plan can see both rhyme and reason in the marvelous aptitude of some children for acquiring knowledge, as well as the slowness—and even stupidity—of others. Karma and reincarnation—these keys will solve the problem of genius and precocity, and these alone.

STUDENT

LISZT used to call some of Wagner's compositions "seven-storied melodies," declaring that it was small wonder they were not appreciated, for most musicians had only a one-storied musical education—a remark that has its application in more than one sense.

ONE of the most remarkable evidences observable in the sculptured hieroglyphics and picture writings of primitive peoples, is that showing the general use of the left hand. A number of the most ancient rock-carvings yet discovered indicate that the artists and sculptors of their day were ambidextrous. Adding to this the fact that it is not at all uncommon, at the present time, to meet with artists who have equal use of both hands, one inevitably concludes that this use must hold some direct or indirect advantage. Certain advantages are obvious enough, others are as yet but hypotheses to our men of science. M.

THE SYMPHONY—FRAGMENT

SIDNEY LANIER

LIFE! LIFE! thou sea-fugue, writ from east to west,
Love, Love alone can pore
On thy dissolving score
Of harsh half-phrasings,
Blotted etc writ,
And double crasings
Of chords most fit.

Yea, Love, sole music-master blest,
May read thy weltering palimpsest,
To follow Time's dying melodies through,
And never to lose the old in the new,
And ever to solve the discords true—
Love alone can do.

And ever Love hears the poor-folks' crying,
And ever Love hears the women's sighing,
And ever sweet knighthood's death-defying,
And ever wise childhood's deep implying,
But never a trader's glozing and lying.

And yet shall Love himself be heard,
Though long deferred, though long deferred:
O'er the modern waste a dove hath whirred:
Music is Love in search of a word.

Universal Brotherhood Organization

Central Office Point Loma California

The Unseen Comrade

BY well-nigh universal consent, those who are seeking the welfare and happiness of their fellow men, agree that the times are out of joint, and that a critical period of history has arrived which must produce a change in many existing conditions. Preachers and teachers, philosophers and politicians, proclaim that ills of all sorts are facing us which require a remedy. No doubt this is the first step towards a better state of affairs. When a man is sick it is sometimes quite a while before he will acknowledge it. Even then he is not generally willing to put things in train to produce a more healthy condition of mind and body.

Probably by far the most important of the new ideals which must be brought about is a right conception of the duty which every man owes to every other. The bond which exists between each member of the human race has been obscured by a dark cloud of wrong and self-seeking, which has deluded us for ages. So thick is this darkness that it has come to be considered as the normal condition of affairs. We are hypnotized by it, so that with difficulty we are aroused to pierce the gloom with which it enfolds us. And in wandering about in this darkness, we find a thousand transient lights which only serve to make it more visible. Yet beyond the cloud there is still the light which Jesus the Nazarene and all the great teachers have proclaimed—the light which is the key to every social problem, showing as it does, the tie which binds us to each other. This is the only true religion.

When we come in contact with our fellow men, how many of us have any clear idea of what we are doing in this daily association? Do we recognize the men whom we think we see, for what they really are, or do we suffer from some old delusion in which we have moved all our lives? Is this man whom I meet really the outward form which meets my eye, or is he something else, invisible, more lasting, a transient inhabitant of the external house before me?

A TENET OF THE WISDOM-RELIGION

The teaching of the Wisdom-Religion is that man is a soul, a divine consciousness with a power to recognize, and a free-will to choose both good and evil. In the cycles of his life-appearances we see his outward tenement only. When he departs we look upon what is left, and we say, "He is gone."

Of this real man whom we do not see, we can really form but little opinion from externals. Of his thoughts, ideals, and aspirations we may indeed know something, but there is obviously very much more that we do not, and cannot know. We cannot know it from what he says, nor from what he writes. We cannot know of the daily struggle of thought which passes through him. We cannot know of the despair which comes of disappointment, nor of the hidden hope. We cannot sit by his pillow and read his longing for a truer and nobler life. We cannot know of the hidden resolve to learn the lessons which life is teaching him. In the place of these, there are indeed outer signs which we may and usually do read wrongly. For they are but the shells of the real, and if we are inclined to judge unwisely we may mistake that which the man has rejected, for that which he has chosen. It is wrong and untrue, to take a man for the mass of mistakes which he may outwardly appear to be. Surely we should not blame him for what he is getting rid of, possibly with efforts of the divinest heroism.

We cannot fail to see that many of the troubles of the world would cease if men realized all this more fully, and had more fellow feeling for their unseen comrades. How much suffering could be avoided, how much real help could be given, how much happiness would spring into being, if we had this compassion for the troubles of others, this confidence in the divine spark which lightens every human soul, and if we fulfilled the command: "Do unto others as ye would that men should do to you."

"HOW BEAUTIFUL IS MY BROTHER!"

In one of her delightful stories, Olive Schreiner relates her dream of

a man who had suffered so deep a wrong, that he could not forgive the offender, try how he would. At last it was given to him to see the soul undraped by the outward form of the wrong-doer. Then, at last, all his anger fell away, and he exclaimed, "How beautiful my brother is."

The Universal Brotherhood Organization—as a body—is founded upon the knowledge of the true comradeship which underlies all the appearances of outward seeming. The joy which is the heritage of all men is starving for the lack of this knowledge. If we look around, perchance we may see with the inner vision the image of our unseen Comrades. Then moved by the sympathy and love which we shall feel, we shall join our hands with theirs and seek the Light. STUDENT

The Influence of H. P. Blavatsky's Work on the Present Century

IN thinking over ideas to best express the influence of Madame H. P. Blavatsky's work on the present century, can we find a truer and better idea than the one of *purity*? Her influence was essentially the touch of the purified hand, and that is why her influence is so loved by young children and pure-hearted unprejudiced people: and as a necessary consequence, in an impure world, she became the great objective point of attack by impurity and those who are really most responsible for the evil in modern life.

THE NOBILITY OF SELF-SACRIFICE

Was not H. P. Blavatsky's purity of the positive royal type? She was not only pure minded and pure in life in every sense of the word, but she had served, and earned the custody of pure truths of vital importance to the world, especially given to modern civilization to help it out of its difficulties. Without this help these difficulties would have strangled it; and our civilization would have died like the great civilizations of old by falling into barbarism. These civilizations fell because the lower savage, selfish influences had gained control, and destroyed all civilized life, as it did in the mighty past of Egypt, Greece and Rome, and many another great civilization of still more ancient times. Imagine the martyrdom of such a soul as H. P. Blavatsky's, working in the malicious, poisonous influences of modern life! For is there not a vast difference between positive and negative purity? The one entering into the life yet holding its ground, in defiance of the most cruel and dastardly attacks, determined to bring the Light even at the cost of life; and the other (if indeed it can be rightly called purity) that separates itself from worldly life, and builds the wall of seclusion. Surely only the great Mother heart out of sheer love for us would even have attempted such a work.

Think of the poisonous influences stirred up by the outspoken truths she proclaimed on religion, science, philosophy, and social life!

SEEDS OF THE FUTURE HARVEST

The very existence of hypocrisy and shams depended upon the destruction of the work and the worker, who lived and spoke the Truth for the common good. This life of constant martyrdom ended at last; but not until she had finished her work, and put in printed records the priceless Truths of pure Theosophy, seeds planted for the future harvest. Is it not this Theosophy, this Divine Wisdom, once translated into living deeds, that will redeem the world and establish our civilization on reformed lines ultimately to make it a permanent blessing to mankind? Who can prove this is not so? If the downward trend to animalism and hopeless pessimism had not been checked, what other result could have occurred but a fall into barbarism? Where can we find an honest, intelligent, hopeful possibility of progress outside of the ideas of Theosophy? Then, as the present century unfolds its life of Brotherhood and Peace, shall we not know that we owe the continuance of our civilized existence to the refining influence of the work of that splendidly royal and masterly Soul, who dared to come and plant the standard of purity and truth in an unstable civilization? IT was the Fairy of the place
Moving within a little light,
Who touched with dim and shadowy grace
The conflict at its fever height.

It seemed to whisper "quietness."
Then quietly itself was gone;
Yet echoes of its mute carress
Still rippled as the years flowed on.

It was the Warrior within
Who called, "Awake! prepare for fight,
"Yet lose not memory in the din;
"Make of thy gentleness thy might.
"Make of thy silence words to shake
"The long-enthroned kings of earth;
"Make of thy will the force to break
"Their towers of wantonness and mirth."

It was the wise all-seeing Soul
Who counselled neither war nor peace.
"Only BE THOU THYSELF that goal
"In which the wars of time shall cease."

Beliefs, Living and Lifeless

IT is said that during the Middle Ages, so firm was men's belief in heaven, that they were able to borrow money from each other upon the agreement to pay it back in that vividly imagined hereafter.

Have we today any spiritual beliefs that are as "live" as that? How much strain will our beliefs stand? Not much; it would seem that we have not inner vitality enough to make them live.

Pick up the last volume of essays on *Plain Living and High Thinking*. The style is exquisite, clothing high and exquisite thought. You think the author must live with his head in the stars; he at least has solved the problem of the perfect and regulated and contemplative life in this perturbed vale of ours. Well, how will he bear close acquaintance? Is he indifferent as to what is on his table, or whether it is half an hour late, or whether the children are noisy? Does his life correspond with his theories?

And then that other volume of *New Thought—Communion With the Silences*—does its author's life correspond, throughout the hours of his waking day, with the meditations whose products fill the pages?

One hopes so, but perhaps it would be just as well to be content with the essays and not try too hard to find the author in undress uniform. For if one were to name the chief present weakness of the human mind, one would perhaps say it is powerlessness in realising beliefs, it is absence of imagination. Our beliefs have no blood in them. The life blood of the spiritual heart does not reach our brains. So we spin theories about life and the soul and God, and hold multitudinous "views;" but none of the theories or the "views" get into action. We have not spiritual energy enough to fertilise our beliefs. It is not more beliefs that the world needs; it is the fertilisation of some of those it already has.

A great character, a leader of men, is one whose beliefs live. For that reason they sway and influence others. They are realised.

But every belief tends to become a living power, if only thought is allowed to rest on it long enough. And that reveals the modern weakness; we cannot control our thought a moment. We believe that this thing is good for us, that that is bad; that this is right, that wrong; that evil brings pain, and virtue joy; that this life is but a moment of eternity; that we are divine souls.

Yet in honest holding of these beliefs, we act as if we had never met with one of them! We have not vitality enough to give them life. We never hold them in thought till, like Galatea, they glow into real life.

But practice makes perfect. There is no need to sit down under the inability. We can learn to add to our beliefs that something from the

heart that will make them "living powers," to dwell on them day by day till they can no longer be swept under by the rushing waters of the hour or obscured by the quick pulse of desire.

STUDENT

The Power of Stillness

RESTLESSNESS, incessant activity, craving for the stimulus of action, inability to keep still, horror of silence and solitude, lack of strength to resist the impulse to do things, impatience, hurry, eagerness for quick results, love of change, inconstancy—these are some of the terms which describe the disease of modern life.

We regard our restless activity as a positive quality, and its absence as an empty void. The truth is that in repose and stillness lies power, while bustle is a mere fretting away and leaking of it. But our secret reservoirs are empty, so that the flame of our energy leaps up like the flame of a lamp when the oil is exhausted. As a man will flee from a desert, so we flee from our silence, which is empty, to where bustle gives a semblance of life.

But this bustle is not energy; it is simply a form of drifting, because it is directed by impulses which are yielded to and not resisted. We are caught in a current. It is not meant however that we should give up, and go and live an idle life in the country; that is also drifting.

The way not to drift is to be able to stand still and resist the countless impulses to action that throng us. To do this demands a nature firmly grounded on a central faith. Who is strong enough to first stand still and then calmly choose a course of action? In times gone by men had the still calm spirit, full of power, a joy in itself. In comparison we seem verily like a lot of chattering monkeys. To restore that forgotten dignity is an aim of Universal Brotherhood work.

STUDENT

FRIENDS IN COUNSEL

DEAR COMRADES: The object of the Raja Yoga training seems to be to form a royal union of the Soul, the mind and the body, each aspect of the triple man receiving due development and forming a united whole of which the Soul is center and animating life. Those who suppose that intellect may reach the highest development without the culture of the moral nature have surely sadly misobserved the facts of life. A man in whom the passions rule may, it is true, acquire a certain subtlety and foxlike cunning; but a profound sagacity and breadth of mental vision can be possessed by him alone whose interests overflow the narrow channel of the personality, on whom the passions cease to exercise their tyrannous control.

That freedom from the domination of the lower self is requisite for free untrammelled thought, is very plainly seen. As everybody is aware, those whose positions are maintained by teaching certain views of man and nature can scarcely trust their intellects to give a fair reception to new facts and arguments which tend to loosen the tenacity with which they hold those doctrines that provide them with a living. No conscious insincerity is here implied; but is it not a fact that love of comfort is so strong in most of us that it can cast a glamour on the mind and so becloud discrimination? Unless we are so strong that we can disregard sensation, we simply cannot give a fair impartial judgment on those questions where our physical well-being is at stake.

It may safely be predicted that pupils going out from here will passionately love the truth for its own sake, and for the power which knowledge gives to serve their fellow men. No soothing falsehood nor expedient compromise will satisfy their hunger of the heart for what is true.

This strong desire to gaze upon the clear unclouded face of the Reality is rare indeed among mankind today. Careless observers may protest that everyone desires the truth, but surely that which most of us desire is just that aspect of the truth which serves to prop and bolster up our preconceptions; while those new truths which threaten to deprive us of our cherished views meet with a very cool reception, or even find the door shut in their faces. Most people are encumbered with a stock of notions and beliefs which by familiarity, and something like parental fondness, come to be regarded as a portion of their very being, and anyone suggesting that they should discard some antiquated, outworn view, is treated with as much resentment as if he tried to amputate a limb.

The readiness to fling away all preconceptions and adopt new truths requires a certain selflessness of character, a quality almost approaching moral sublimity, and only those in whom this quality prevails have minds at liberty to exercise their proper functions.

STUDENT

LIFE

HENRY VAN DYKE

LET me but live my life from year to year,
 With forward face and unreluctant soul,
 Not hurrying to, nor turning from, the goal;
 Not mourning for the things that disappear
 In the dim past, nor holding back in fear
 From what the future veils; but with a whole
 And happy heart, that pays its toll
 To youth and age, and travels on with cheer.

So let the way wind up the hill or down,
 O'er rough or smooth, the journey will be joy,
 Still seeking what I sought when but a boy;
 New friendship, high adventure, and a crown,
 My heart will keep the courage of the quest,
 And hope the road's last turn will be the best.—Selected

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question What is the Theosophic explanation of the Atonement as compared with the orthodox interpretation?

Answer In giving some account of the orthodox view of the Atonement, and then stating the Theosophic interpretation, it may be well to explain the general Theosophic ground on this and other religious or scientific matters.

Theosophy, or divine wisdom, is that ancient teaching concerning man, and nature generally, which was given, and handed down for long ages, by great masters of wisdom. In the course of time these teachings became mixed with gross human conceptions, so much so that in some cases the original teaching was practically lost.

In many cases the original teaching was wrapped in the form of a story or parable, or symbol; and in time men read a materialistic meaning into the story or symbol. Hence, most forms of religion have materialised, and lost the original meaning. The "Fall of Man," "the Serpent," and many other things are illustrations.

The orthodox theory of the Atonement is based, first of all, on the story of Adam and Eve in the garden of Eden, "eating" the forbidden fruit. Modern orthodoxy has philosophised about this and said: Adam being the federal head or representative of mankind his act was for all, hence his fall included all, and produced that original sin which has descended to all. Again, the orthodox theory holds that God is a great Judge, and man's violation of God's law left all men in the position of prisoners condemned to death, and unable to save themselves. Some have even held that the sin being against an infinite Judge, man could be saved only by one who was God as well as man, or by a substitute who was infinite. This Christ was held to be, and by his offering himself up for all humanity he paid the death-penalty due to Adam and all his descendants. This was the "Atonement," in that it completely satisfied the justice of God as Judge, and brought all who accepted Christ as their Substitute into the relation of perfect sonship and unity with God. In other words Christ was the *Second Adam*, the federal head or representative of all who accept him, and who are thereby born from the dead into a new life.

It must not be supposed that this teaching concerning the Atonement sprang into existence all at once. It did not. There is a vast gap between the religion of the *Book of Samuel*, one of the oldest in the Bible, and the Priestly ritual that we find after the captivity. Then again, there is a vast gap between the teaching of the First century and that of the Middle Ages, or the time of Calvin.

The radical difference between the Ancient Wisdom Religion and the orthodox teaching which travestied it, is this: Orthodoxy made God after its image—made God an angry Judge, and placed him away far from man. The ancient teaching was, and is, that man is himself the Temple of God; and that man's lower nature has to be purified—by water, by fire, by sacrifice—and raised from its death-like condition into unity with the Christ within. This is the real At-one-ment—the new birth, the great reconciliation.

In the *New Testament* there are many hints which show that the Theosophic teaching had not been entirely lost. We read of the "new birth": of "Christ being born in you": of "Christ in you the hope of

glory": of being "born not of corruptible seed but of incorruptible." And even in the prophets of the *Old Testament* there are clear statements that the Priestly teaching, on which modern orthodoxy is largely based, was not from God. We read in *Isaiah*: "I delight not in the blood of bullocks or of lambs—who hath required this at your hands to tread my courts? Bring no more vain oblations; incense is an abomination to me." And again, "Is not this the fast that I have chosen? to loose the bands of wickedness, to undo the heavy burdens, and to let the oppressed go free, and that ye break every yoke," etc.

In fact it is very evident that the orthodox notion of the Atonement rests on a false and materialistic conception of ancient symbolic teaching; on a priestly code invented by the priests; and on modern interpretations of those teachings. The Atonement is a real thing, it is the Victory of the Christ, the God within, over the carnal man, or lower nature. This is not accomplished without shedding of blood, and great trial, but it is not physical blood. As is said in *Light on the Path*, "Before the Soul can stand in the presence of the Masters its feet must be washed in the blood of the heart." This blood is not the physical substance, "but the vital creative principle in man's nature which drives him into human life in order to experience pleasure and pain, joy and sorrow."

(REV.) S. J. NEILL

Question Does Theosophy teach that one can suffer through the sins of another?

Answer Theosophy does teach that "Brotherhood is a fact in nature," and what would Brotherhood be did we not suffer for others and through the sins of others, and also have joy because of the joy of others. What is the meaning of compassion? But I do not think that it is necessary to ask does Theosophy teach this, for we have only to look at our own experience and at the experience of the people around us to know it for one of the facts of life. If anyone has not yet had in his own life the experience of suffering for the sins of another, or perhaps of seeing others suffer for his sins, he has certainly much to learn. And because this is one of the facts of Brotherhood, Theosophy does teach it and lay great stress on it, though as said it seems hardly necessary to ask the question, since it is not a theory, but a fact, and certainly Theosophy recognizes all the facts of life.

This further point, however, Theosophy teaches, which is not generally recognized nor acted upon in the world, namely, that every effort after self-conquest, every act of brotherhood, every aspiration towards a nobler life, not only raises the individual but the whole of humanity, and makes the path easier for humanity; whereas every act of self-indulgence, every neglect of duty, every evil committed, in deed or thought, in like manner not only adds to the load of the individual, but weighs down to that extent the whole of humanity, and makes the pathway harder.

Were it not a fact that we do suffer and have joy through another's acts, Brotherhood would be meaningless; compassion, sympathy, friendship, would be mere hollow names; and the solidarity of the human race would be a mockery.

STUDENT

Question In the issue of June 11, a question was asked in regard to the manner in which one may enter the ranks of the Universal Brotherhood, and it has often been said that the Organization has no creed—what then do the members have to accept, and what is it that unites them together?

Answer In the first place it is inconceivable that an honest-minded person should seek to enter the Universal Brotherhood unless he were in thorough sympathy with its purpose and objects. And so safe-guarded is the Organization that it would be a difficult, if not impossible matter for a dishonest man to gain admittance. As stated, there is no creed, but being an organization and, what is also true in a larger sense, an organism, those who would enter its ranks must conform to the principles that govern its life as such. These are expressed in its Constitution, which includes the objects of the Organization (stated in the issue of June 11, referred to), and an applicant for membership must declare his acceptance of the Constitution.

But that which unites the members together is not the mere outward acceptance of a document, but the underlying purpose actuating the whole body, and this purpose, as expressed, is "To teach Brotherhood and to make it a living power in the life of Humanity."

STUDENT

In Europe

(By our special correspondent)

June 6th, 1905

THE advent of Japan was not such a surprising event to students of Theosophy as it was to the civilized world generally, because the former realize that a "new order of ages has begun." Sleeping peoples are awakening to new life, not only in Japan, but in other regions of the earth. Cuba, Spain, Russia, Egypt—are arousing from slumber to become forces in a higher, more comprehensive civilization than the world has witnessed for many a long day.

And yet another people shows signs of awakening. Abyssinia seems likely to emerge from centuries of anarchy and take a place among the

progress"; and that, "between their respective countries, the bonds of affection should be tightened, as is natural for people of the same blood, and who have so many and such great interests in common."

The Oregon Desert

IN central Oregon there is a vast tract which looks extremely simple and unimportant on the map, consisting of a few names ten to twenty miles long with spaces between them. But these clean surfaces of paper on maps often represent regions big enough to lose a nation in. The Oregon desert is as yet almost wholly unknown. It is a vast area of volcanic formations, mostly recent, bounded by mountains, of which those of the Cascade Range on the West are the chief. The elevation varies from about 4000 feet in the valleys to over 10,000, which is the height of Mount Jefferson.

Basaltic lava flows spread over the valleys, from eighty up to several hundred feet thick; and over this has in many parts been scattered a shower of pumiceous dust and fragments to a depth of seventy feet. This covering occupies an extent of several thousand square miles and is very porous. It absorbs what little water is precipitated in this arid region. All over the plain are countless volcanic cones, some ancient, many new and scarcely eroded since their formation. The whole area is characterized by the broadness of its elevations and the level flooring of its valleys, due to the building-up power of vulcanism in the absence of much water influence.

Formerly there was much more rainfall, as is shown by the large river cañons containing only small streams, and some of them quite dry. One of these is seventy-five miles long, and in places is a narrow steep-sided gorge four hundred feet deep, cut in basalt; yet it has never been known to contain enough water to make a continuous stream.

The Deschutes River is anomalous in one way. Though the head of water fluctuates according to the seasonal snows and so on, the level of the stream is almost constant—so much so that bridges are built close to the water. It has been found that the cellular lava through which it flows absorbs the surplus and acts as a regulator. Exploration shows that the water thus absorbed runs under the lava surface and reappears, often at a distance of thirty or forty miles.

The national government has its eye on such places with a view to rendering them habitable and developing them industrially. One always seems to drop suddenly into the dreary common-place, when one fetches up, at the end of a description of colossal scenery, against the commercial question; and the pious aspiration is suggested—May Nature continue to seclude some of these spots until the time when a more ornate and dignified brand of civilization can people them? their manufacture was to convince his people (there were representative men present on both occasions) that there was no mystery in the products of European civilization, but that they themselves could make such things. Menelik has since introduced electricity, motor-cars and Roentgen rays, and is generally alive to all that goes on in the world of inventions. His people are devoted to him, and he to them. His patriotism has a generous quality. He has forbidden the commemoration of a victory gained over the forces of Italy, so as not to wound the feelings of his former enemy!

But the Negus of Abyssinia has competitors in good breeding. The Cuban Legation in Spain has addressed a letter to the Spanish press repudiating in the strongest terms a banquet recently held in Barcelona to celebrate the establishment of the Cuban Republic. Its consular representatives in that town were entirely ignorant of the said celebration, as were Cuban residents therein. The document concludes with the wish that, "All—Spaniards and Cubans—should work only for their common

Incentives to Action

IN an early stage of development we are moved to action by natural instincts. As we grow, the feeling of "mine" and "thine" creeps in, and men are moved by the desire of "self," as the world is largely today. The highest and last stage is when our hearts beat in harmony with the heart of the Universe—when we are moved to action by the pure will to do good; by love; by altruism. This goal is the one pointed out by all religions, but the "Path" by which it may be reached is narrow and difficult; and we make it longer and more difficult than need be.

In an early stage of human progress hunger is one of the great incentives to action, and if it were not for hunger many people would not work, or would do but very little. It is, therefore, a beneficent arrangement that activity, which is so necessary for growth, should be forced

upon us until we are impelled to action by higher motives. Since the soul has come into life on earth for the sake of experience, many conditions must be gone through. Impulses to action for the sake of gaining experience must exist, and these must be in accord with our various stages of development. Difficulties are not drawbacks necessarily: they should be stepping stones, or should be used as a fulcrum.

An Easy Life Tends to Inactivity

In those parts of the earth where Nature has made human life easy, the tendency has been to cease from activity in a greater or less degree. In the torrid zone where little clothing or fuel is needed, and where one can sit in the shade of a banana or bread-fruit tree, and supply the needs of nature without much effort, there human beings tend downwards rather than upward in many instances. Whereas, in the temperate zones, where Nature has to be wrestled with, even where the climate is severe, and the conditions of life difficult, there the rulers of the world are born. The bulk of the land-surface of the world is in the northern hemisphere, and from the North the now existing and progressive races of mankind have sprung.

In the life of the individual the same law holds good. The Scripture says, as the embodiment of ages of experience, "It is good for a man that he bear the yoke in his youth." While too much hardship may repress or kill, as too much cold does in the extreme north, yet a certain amount of trial seems necessary to develop and make strong all the better and nobler qualities of the nature. It is surely in the spirit of this truth that the Apostle says, "Count it all joy my brethren, when ye fall into manifold temptations," or testings. Patience, faith and other lofty qualities can be developed only through trials. Exercise is one of the laws of growth.

Passions and Desires Hard Taskmaster

When men are no longer impelled to action by the need to satisfy hunger, or by other natural instincts, they come under the sway of passions and desires which make them labor harder than ever. The desire for wealth, or for the things it will procure; the desire for fame; the love of power and rule, these are mighty impulses to action with most men: and by action experience is gained. Many require much experience, even bitter experience to make them wise. Without impulse to activity there would be no growth, no wisdom gained through experience.

Humanity today is said to be in the Iron Age, the age in which men are in a larger degree moved to action by some form of selfish desire. In itself this may not be a good thing, for it leads to much pain and suffering, but, in passing through this age of selfishness the human race gains much experience, and gains it quickly. It is, however, eventually found that all incentives to action which have their root in selfishness must bear a bitter fruit. When that lesson has been learnt there comes to many a period of pause. Having found the hollowness of so many incentives to action the question naturally arises, "What is the good of anything?" "Is life worth living?" Many today are in this condition or doubt, of pessimism.

'Find Your Work and Do It'

One stage beyond this is to act from a sense of duty. "To find your work, and to do it," as Carlyle says, that is a great step onward. Many strong, stern, noble lives have been moved to right action by this high sense of duty. There is, however, a still more excellent way; it is when the love of good; the love to uplift and bless all, impels us to take up the cross, wherever it is needed, and truly and gladly to follow the Great Helpers of humanity. This joy of giving; this joy of sacrifice is in itself a reward beyond all comparison; and it sows a Divine Seed which will produce a harvest of joy for all. This Divine incentive to action is the very spring and fount of the Universe; it is the upholding power behind, or within all creation. Hence as we are moved and sustained by noble, altruistic motives, we enter into conscious union with the Life of the Universe; and for us the promise becomes a fact, known and realized, "As thy days, so shall thy strength be."

Generally speaking, the motives which at present move men, are very mixed. There are lives moved by selfish desires, which, now and then, are kindled by the fire of high motives. Again, with many who are moved in a great measure by noble and altruistic purposes, a subtle spirit of self will creep in, and hinder the good results that naturally flow from altruistic aspirations and endeavors. For this reason we need to be continually on our guard without cessation against ourselves: "Guard thou the Lower lest it soil the Higher." (REV.) S. J. NEILL

King Alfonso's Opportunity

WHATEVER crazy idea may have been in the brain of the lunatic criminal who recently attempted the life of the King of Spain, it is certain that his success would have been a serious blow to the cause of liberty. For those who know anything of King Alfonso know that his great aim is the fuller education and awakening of his subjects, their awakening to a complete consciousness and use of their existing constitutional powers.

These powers are really very large and the government of Spain is only oligarchical because the people have permitted it. *In theory* it is even more popular than that of England, but the nation has been carefully kept in ignorance of its formal rights. That ignorance King Alfonso evidently intends to enlighten, and one wonders whether his would-be assassin were not perhaps a tool.

As in England, the legislative authority is divided between the sovereign and two chambers. The "lower" of these two, corresponding to the English House of Commons, is purely elective, and the suffrage right is in the hands of every adult male who has paid a land tax of \$5 for a year or an industrial tax of \$10 for two years. So it is fairly broad.

The other chamber is half elective and half appointed or hereditary. The English House of Lords, it will be remembered, is wholly appointed or hereditary. Of the non-elective half, some are nominated by the King for life, and the rest are members by reason of birth or high state office. The elected half is contributed by the state corporations and by the more highly taxed subjects. King Alfonso has a great opportunity and one feels he will use it in the best interests of his people. STUDENT

To Preserve Our Forests

PRESIDENT ROOSEVELT has called attention to the extensive and in part wasteful destruction of timber in California. The records of the Geological Survey show that while the State's rainfall has been fairly constant during the last twenty years, the waters of the streams are shrinking. The area of fire-bared country and of the deforested and young timber sections is increasing, largely at the expense of the superb forests of redwoods, some of them thousands of years old. The rain is therefore no longer held after its fall, to reach the streams slowly; but allowed to flood downward as it comes.

Great forest sections will now be reserved from the attacks of lumber companies and individuals, and the Bureau of Forestry will attend to the replanting of denuded areas. It has been hitherto believed that the seed of the redwood tree is mostly infertile. At any rate it has rarely been induced to sprout. A ranger of the General Grant National Park has however found that when a thin coating of ashes is spread over the planted seed it sprouts readily and flourishes well. With this fact to go upon, there is no reason why the wasted slopes of this beautiful State should not in a few years begin to show something of their old appearance. STUDENT

An Enlightened Government

PRESIDENT DIAZ and the Mexican Federal Government take a wide view of their duties towards their people, a view that would have horrified Herbert Spencer and his school. They keep a close look out for the exhibition of talent and genius anywhere, and young men of promise are if necessary educated at the State's expense, or even sent abroad for special courses of study. Classes in English are provided for working men and are enthusiastically attended. Spanish is to remain the language of the country, but the necessity for a wide popularization of English is fully recognized. There is no compulsion, but the classes are crowded and if the teacher gives an extra evening hour, every one comes. "What it really means," says the *Mexican Herald*, trying to praise its people in the strongest terms it can command, "is that in a busy crowd of young Mexicans, all working hard for a living, there is a desire for instruction which equals that of a similar number of young Japanese." An unexpected introduction of a compliment to another people.

If this sort of thing goes on, and the intercourse between ourselves and Mexico grows constantly closer and more friendly, English may become a twin tongue to Spanish as "the language of the country." STUDENT

Curious Effects of Tornadoes

THERE is abundant evidence to show that tornadoes can cause straws to become imbedded in trees, wooden splinters in steel, and play other such pranks. This seems impossible, because we imagine the straw being driven into the tree from behind, in which case its soft structure would of course cause it to bend and collapse against the tree instead of penetrating. But the straw is not pushed from behind; it is traveling through the air with great speed, and the front particles are moving as rapidly as those behind. Hence there is no push from behind to

make the straw collapse. We shall get a better idea if we imagine the very apex of the straw as a tiny hard sharp particle piercing the porous wood, and the rest of the straw as being trailed along behind. Such things as wood, straw and feathers are soft in *structure*, but the *particles* are not soft. Consequently, in any case where (as in the present case) the structure does not count, these bodies behave as if they were very hard. Armor-piercing shells have points of soft lead, but these can pierce the hardest steel plates because the lead is not being pushed from behind but is traveling on its own account.

Tornadoes, or "cyclones" as they are called, are said to tear feathers off a bird. Many of the effects, such as the twisting *outwards* of the walls of a house, are caused by the vacuum created in the wake of a condensed air wave. There are all kinds of queer things happen when very high velocities are involved, but the laws of mechanics explain most of them, though few minds are clever enough to *predict* them. STUDENT

It Was That War Office!

RUSSIAN papers have been showing a disposition to push back the blame for defeats from Kuropatkin on to the War Office. It seems that the gentlemen at home knew a great deal more than the general on the field. *His* plan was to refuse battle, retire at once to the Harbin-Kirin line, and there await the Japanese forces. But he was compelled by orders from home to fight the series of losing battles which culminated at Mukden. Then "we should have had the 700,000 men and 2,000 guns dispatched to the commander-in-chief since the beginning of the war. Our adversary would not be exalted in spirit as he is today; our soldiers would not have lost all hope, nor would they regard the Japanese as invincible."

It may be all true. But do the Russian officials extract no other lesson from an unbroken series of full disasters than that their War Office made mistakes? Is the universe run by skillful War Offices? Has the Divine Justice and Law slowly brought out man from the abyss merely to leave his further destiny a question of the biggest and best handled battalions? It cannot write its message to us all plainer than in the progress of this war, and those of us who will not open our eyes must stay blind a little longer yet. C.

Theological Students at a Premium

REALLY there is something to be said for the view that there is plenty of work for those who are willing to do it. At all events this seems to be the case in the ministerial profession—judging from what ministers themselves are reported to be saying about it. But what can be the drawbacks to this kind of work, that are so strong as to overcome such coveted pecuniary advantages?

One writer states that there is, in the theological colleges, an organized system of competition or "bidding for students." A professor in a prominent theological seminary admits this, and justifies it on the ground of its necessity as a means of self-preservation. A case is mentioned where a brilliant young graduate from a Canadian college pitted several seminaries in the United States against one another for inducements to him, and closed with an offer equivalent to \$700 a year. A seminary president complains that a rival institution bought off five of his promising candidates.

It has been supposed by cynics that people can be found who are ready to do anything for money, but apparently they draw the line somewhere. This is not an attack on religion, but it is a criticism of machinery which surely has very little connection with religion. STUDENT

Pelf and the Holy Profession of Teaching

ONE of our papers makes the following remarks as to the teaching profession:

As a matter of fact, the average college graduate enters the profession filled with enthusiasm and energy, but after a short experience with those in power such enthusiasm and energy are soon displaced by a determined desire to quit at the first opportunity.

If the body of New York school teachers were treated more like intelligent human beings, and less like automatic machines, the so-called "holiness" of the profession might become a reality, even at the fabulous salary of \$50 or \$60 a month.

Those in the high places of authority, it seems, get enormous salaries. Thus it appears that the teaching profession, like so many industries and institutions, has become commercialized into a machine by which a few at the top are made rich, the rank and file being considered as merely contributory parts of the mechanism. It is like the gigantic factories where "division of labor" and iron regulations for the employees have turned healthy work into a soulless grind. Does not this illustrate the point so constantly urged in the *NEW CENTURY PATH* that selfishness is fast killing out the humanizing element from our corporate life? E.

Some Views on XXth Century Problems

Ancient and Modern Ways

MIGHT we not try to take a leaf from some of the ancients in their way of presenting religion? Do we not from the first, hamper and tie down the spiritual wings of the children, so that in after life they remain useless? Why not, instead, stimulate and encourage them? An ancient book of precepts from Egypt says: "But if thou shut up thy soul in the body and slight it saying: I understand nothing, I can do nothing, I cannot climb up into Heaven, I know not who I am, I cannot tell what I shall be—what hast thou to do with God? Be a lover of the body, and evil. For it is the greatest evil not to know God. Thou sayest, God is invisible; but be advised, for who is more manifest than He? For therefore hath He made all things, that thou by all things mayest see him."

The pulpits complain of the general lack of interest in things spiritual. Why do they not look in at least as much as out for the cause? May not they themselves be at fault, trying to convey spiritual truths, the profoundest and richest of all, yet so doing it as to leave their hearers', and especially the children's, imagination utterly unstirred?

The ancients held it to be the highest reverence of God to try to understand Him, held it to be His aim to be understood of man. We teach the children that such an attempt would be presumptuous and futile. Can man by searching find out God? Yes, said the ancients, and such search is his duty. "If thou believe in thyself that nothing is impossible, but accountest thyself immortal, become higher than all height, lower than all depth; comprehend (imagine) in thyself the qualities of all the creatures, of the fire, the water, the dry, the moist; (that is, acquire universal sympathy;) conceive thyself as unborn, young, old, dead, the things after death, and all these together—or else thou canst not understand God." And elsewhere the same book says that man's higher mind "is not cut off, or divided from the essentiality of God, but united as the light of the Sun (is to the Sun)."

They taught, then, that as the highest part of the mind was from the essentiality of God, by it could God be comprehended; by it, making itself at sympathetic tune with the inner being and feeling of all animate and inanimate things, could God in them be known. "He therefore, being One, doth all things in many things."

Realize what a child would become, growing up with imagination thus alive to the Divine everywhere, feeling out for the Divine in all things, feeling in for the Divine in himself, for that ray directest of all rays from God which is himself proper and by which he of all created things may ascend to the Creator, thus living outwardly and inwardly in touch with God. His life would be continuous joy, fuller than we can conceive of, loving, compassionate, sympathetic. His mind would be swift in growth and action, rapid in acquirement, viewing the world as some living thing of which it was a part. STUDENT

Philosophic Tailless Foxes

WHY are those who have persuaded themselves out of belief in immortality and the soul, so very anxious to have others share their unbelief? Is it not a case of the fox who has lost his tail? "My friends, tails are not only useless and even injurious, but evidence of a low level of vulpine evolution!"

The dim mental process seems to be this: They have not lost or killed the belief, but only crushed it down almost out of their own sight. That being achieved, the very soul they are denying causes a vague fear that their personal immortality is imperilled by this vehement denial of it. Then comes the natural desire for as much company as possible in the gloomy eternity of conscious non-immortality. So the belief in immortality lies concealed in the denial of it!

The band of the negators is led by Professor Haeckel, who at short intervals issues a Bull. In the latest, a few days ago, he says: "The soul is supposed to have divine origin. Those who believe this do not explain why the Almighty decided to create souls just at the time when man appeared in the animal life of the world." No one ever held any such view; no one ever taught that the appearance of man was the signal for the "Almighty" to bestir himself and add on a soul to the man. It was the adding of a soul to the highest human animal, the full incar-

nation of a soul in it, that made it man. The soul waited till Nature had evolved a being high enough to serve as its vehicle and keyboard.

The Professor argues that God cannot exist because man's ideas of God have constantly changed. Why not argue that the solar system cannot exist because man's ideas about it have changed? Is there no sky because it was once a dome hung with lights or perforated with holes?

Then, speaking of the idea of immortality, he asserts (in order to get in a little blow at the Christians) that Plato and Aristotle introduced it! Does he know nothing of Indian philosophy, of Egyptian, of Persian? We are perfectly willing to admit that he knows very little, but surely not so little as that.

Let us put a question to any man who sincerely thinks that he thinks himself to be but a temporary product of material combinations that will be utterly and finally dissolved in a few years: What lies at the root of the force that impels him to take immense trouble to prove this to as many other equally temporary products as will listen? STUDENT

Medieval Theology Alive Yet

THEOLOGY will have to wake up to the XXth Century, or it will find the world turning for its religion to the science of such men as Sir Oliver Lodge. Here and there it is still dreaming in medievalism, whilst science, with daily increasing clearness and certainty, is moving on to spiritual conceptions of the universe.

A schoolmaster who left his school in riotous disorder, unruly and untaught, till within a few days of the examination, would be regarded as a knave or a lunatic.

In a recent Pentecostal address, a noted theologian delivered himself of some (presumably orthodox) teaching concerning the Holy Ghost, "the third person of the blessed trinity, consequently God." With bracketed comments of our own, here it is:

"The condition of the world (school) before the advent of Christianity was appalling (in riotous disorder)." Then follows particularization of the disorder. "All this has been changed since the coming of the Holy Ghost (schoolmaster)."

Does the analogy fail anywhere? The world was created some indefinite time ago. For millenniums men sinned, warred, robbed, bled, wept. The Power that created it and then took no notice, left the suffering turmoil to rage as it would. Millions upon millions died in darkness.

A trifle of time ago the "Holy Ghost" came, and proceeded to make order in a fragment of the world, the west corner of Asia. Millions went on dying, never hearing what the Holy Ghost was doing. Millions are dying yet, still knowing nothing. Yet this strangely and cruelly neglected world was the creation of this very Power!

One can only pray that the children at least may be spared the injury to their higher nature that such teaching must inflict. STUDENT

Enlightened Selfishness

THE Merchants' Association of New York has adopted a resolution declaring that "as the most important foreign outlet for American manufactures, particularly cotton goods, is China, it is the sense of this Association that the present exclusion laws are harsh, unreasonable, and detrimental to the best interests of the people of the United States," etc., etc.

Whatever the Association may mean behind its phraseology, it means by its phraseology that it has been aroused to a sense of the harshness and injustice of the exclusion laws—not by their harshness and injustice, but by the injury they are doing to the Association's pockets. Are the materialistic sociologists then right in describing the sense of justice and mercy as only an enlightened selfishness, selfishness enlightened by becoming aware that justice and mercy pay?

The same point obtrudes itself in the words of a delegation of the American Asiatic Association which recently called on President Roosevelt and urged him to adjust our relations with China on a basis more equitable to the Chinese. Our present treatment of the Chinese coming to this country was declared to be a bar to the growth of our Asiatic trade. Can we be just and courteous to a "heathen" people for no other reason than that it pays us well to do so? STUDENT

The Foundation of Mexico

AMONG the Aztec picture writings of the foundation of Tenochtitlan, or Mexico, as the city is now named, that of the Codex Mendocino is the best known. This record dates from a period shortly after the conquest. In the centre of the picture describing the foundation is the familiar emblem of the eagle perched on a cactus growing on a rock. Surrounding the island which this picture represents is a stream of clear water, which also, in the shape of a diagonal cross, divides it into four parts.

Around the eagle are grouped the ten founders of Mexico with various plants of hieroglyphic signification. Among the founders is Mexitz, the chief warrior, whose name, together with that of the god Mexi, is perpetuated in the modern Mexico.

Driven from their original habitation by the more powerful tribes, the Mexicans found refuge in this island, availing themselves of the natural defense afforded by the lake. The story runs that an Axolohuan named Cuauhcoatl went with two other pioneers in search of a place to found their new home. Here at Acatitla they found the tenochtli or cactus on which the eagle was perched; at its foot was the nest of the bird Cuahuatli built of the feathers of many beautiful birds. From this place returned Cuauhcoatl and related that the party had reconnoitred the road and the fen; but in the latter one of them named Axadoa was drowned at the place where the cactus grew by the nest. Cuahucoatl added that Axadoa appeared to him the next day and told him that this should be their new home; also that his beloved son Huitzopochtli should be their protector.

After this, according to the story, they all went to Tenochtli and there built an altar and a fortress for the tribe. — *Translated and adapted from "El Mundo Ilustrado" (Mexico), dated September 1904. Hieroglyphic pictures copied from reproductions in same paper.*

The 7000-Years Old Statue in Babylonia

IN the NEW CENTURY PATH, vol. viii, no. 6, under the heading, "Statue of an Ancient King," it was mentioned that on the site of Bismya in Babylonia, a statue was discovered which was conjectured to be that of the ancient Sumirian King Da-Udu or David. In vol. viii, no. 18, under the heading, "Chaldean City 7000 Years Old," it was said that, while working on the site of Bismya, explorers found the city of Adab, dating at least 5000 B. C., and containing many valuable antiques. The discoverer of the statue, Dr. Edgar James Banks, gives some details (in an Eastern paper) about these researches, of which the following is a summary.

In the center of ancient Babylonia, midway between the Tigris and Euphrates, lies a series of long low hills about forty feet high, about a mile and a half long and three-fourths of a mile wide. The country is an absolute desert, forming a neutral boundary between neighboring Arab tribes. The surface is strewn with minute fragments of terra-cotta pottery and small flint saws, and here and there are broken bricks. The absence of water and the presence of the tribes has hitherto discouraged explorers; nor were the in-

with it we have actual specimens of the art of at least 7000 years ago. STUDENT

Antiquity of America

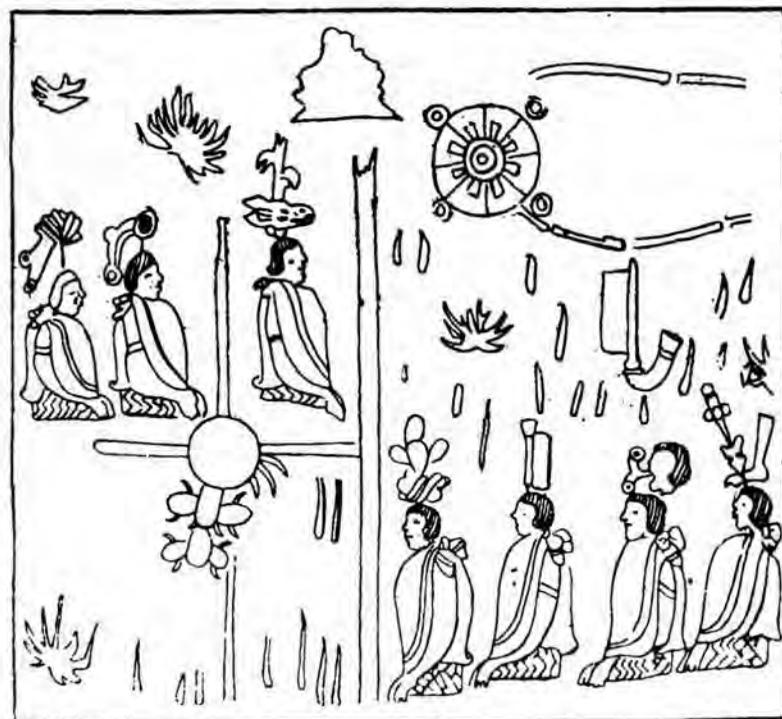

THERE is no subject more fraught with intense interest to Americans than the study of Ancient America as shown in American archeology. That America is older than Egypt is an idea that is making its way more and more among those who pursue such studies.

It is like the idea of Atlantis which, at first laughed at and even derided (although advanced by Plato), has made more and more headway since Donnelly's *Atlantis* appeared, until now it is tacitly accepted by almost everybody.

Baldwin's *Prehistoric America* is also a very strong advocate of this thought. Désiré Charnay, the amusingly egotistical explorer of the Toltec cities of Central America, cites one case where the deposit of fine soil between layers or strata of remains would seem to indicate an antiquity that he declares "ridiculous." In a recent script of the series of *The Pit and Marrow of Some Sacred Writings*, attention is called to the fact quoted by Madame Blavatsky, that at the time Columbus reached America there was a town in Central America called "Atlan." H.

Giant Human Skeletons Found in Maryland

SKELETONS of men nearly eight feet tall have been discovered on the banks of the Choptank River in Maryland. They include the bones of men, women, and children, which are being articulated; and among them was at least one complete skeleton of a man. The place where they were found consisted of steep shelving cliffs of sand and gravel, underlaid by marl; the bones occurred in sand, a few feet above the marl, and were covered by 20 or 30 feet of deposits. An antiquity of at least 1000 years has been assigned, and one would imagine that the cautious archeologist will be on a dilemma as to whether to push the date further back or the giants further forward.

✻ The Trend of Twentieth Century Science ✻

Where is Pain?

SOME years ago, a distinguished surgeon had to submit to a considerable dental operation. Chloroform was administered to complete unconsciousness, and the patient awoke with no memory of having suffered anything. But the following night he dreamed every detail of the operation, going through in dream all the pain that in the narcotic state he had avoided. Consulting the operator, and telling him the details of the dream, he was told that all were correct, that he had actually dreamed every step.

There is a surgical state known as shock, which often follows operations of capital magnitude notwithstanding that an anæsthetic is completely administered. No details of the operation are known; no very marked pain may be suffered after awakening. Yet the state is somewhat like that which an intensely sensitive woman might experience to whom the details of the operation were vividly related. It is usually quite transient and readily met with food, stimulants, and encouragement.

Considering the nature of this condition, along with the surgeon's dream, one is led to suspect the possibility of a fact in our make-up. May not anæsthetics of the chloroform species leave a certain purely sensuous consciousness belonging to and inseparable from the bodily life, quite or almost unaffected, merely divorcing the thinking self, the Ego, from its usual blend with this purely sentient, animal element? And may not the latter, provided it is not *killed* by the chloroform, remain, in its uncomprehending way, conscious? Then when the man, the soul, returns, he is sometimes made aware, by a species of feeling-transference, of the disaster (as the elemental consciousness considers it) that has happened in his absence. If the disaster be great (the operation a "capital" one) though he can get none of the *details* from a creature that does not properly understand them, he gets the general impression, and the state called "shock" supervenes. But it is temporary, because his mind has no pictures, no details, to work upon and reproduce again and again in memory. But in such rare cases as that of the surgeon, the blend—in dream or half sleep—became close enough for the thinking self to get from the physiological consciousness even the details.

May it not be, then, that the sufferer of physical pain, and the enjoyer of physical pleasure, is a sort of entity, conjoined with us in the body, perhaps the inhabitant of the sympathetic nervous system, communicating with the intellectual-spiritual man through the brain? At any rate we know that narcotics are much later in acting upon the brain than upon the sympathetic system, and that when alcohol or chloroform *do* begin to act on the latter, danger to life is imminent.

But the subject goes much further than can be treated here. When physiologists take to the study of Theosophy and admit that H. P. Blavatsky was a teacher of more than will ever be found out in the laboratory, their science will get a new light upon it. Vivisection is not only not the path to any deeper knowledge, but by reason of an unsuspected effect on the vivisector's mind, it renders him *incapable of finding that knowledge in any direction.*

STUDENT

The Coming Eclipse

NATURE occasionally startles us with sensational effects; volcanic eruptions, hurricanes, gorgeous sunsets are profoundly impressive, but what can be more striking than a total eclipse of the sun at noonday? The sudden onrush of strangely colored shadows, flying across the country, the intense and weird darkness when the day-star vanishes into the unknown, the chill and sighing wind, the flashing out of the stars and planets—sometimes the unexpected apparition of an unknown comet—the strange behavior of animals and the roosting of birds, and then the rapid brightening and relief of the blessed sunshine—all this forms the most dramatic episode in nature's moving panorama. Yet this thrilling scene is but the effect of the interposition of the moon's body in front of the sun as she travels in her regular course. If her path lay exactly or nearly in the Ecliptic (that is the imaginary plane in which the earth travels round the sun, as if floating in water) she would eclipse the sun at every period of new moon and the phenomenon

would become familiar, but its rarity is caused by the fact that the lunar path is inclined a little from that of the earth, dipping, as it were, into the imaginary water surface on which we travel, during half its journey round the earth, and rising above it during the other half. Though the moon passes from one side of the earth to the other thirteen times a year, it is only when the sun is in a straight line with the earth and moon at the moment the latter is entering into the plane of the ecliptic that it can throw the moon's shadow upon the earth. This happens rarely, and also it is only occasionally that the moon is near enough to us to cover the whole of the sun's disk. It is usually a little too far, leaving a ring of the sun's brilliant surface visible round the dark body of the moon and producing an "annular eclipse," or it passes above or below the exact center line. The most favorable eclipses for observation occur when the moon is nearest the earth, for then she appears a little larger than the sun, and therefore hides him from our view for the longest possible time. The forthcoming eclipse will last for 3 minutes 45 seconds in Spain. The line of totality passes through Labrador, Spain, Algeria, Tunis, Tripoli and Egypt, and many expeditions are being sent to observe it.

Until lately it was impossible to study the corona at any time except during the few rare moments of totality. It is curious to reflect that but for the illumination of the particles in our atmosphere in daytime the sky would always be as black as midnight; and so, when at total eclipse the moon completely intercepts the sun's rays from reaching the surrounding atmosphere, the corona, a comparatively feeble source of light which is in ordinary daylight entirely lost in the glare, stands out vividly relieved against the dark background of the abysses of space. At such a time its complicated streamers can be seen even with the naked eye.

For many years the red flame-like "prominences" which flash into view round the edge of the sun at the moment of totality have been studied daily by means of the light-sifting power of the spectroscope, and it is almost certain that we shall no longer have to wait for the infrequent total eclipses to study the details of the corona itself, for news is to hand that M. A. Hausky, director of the Mt. Blanc observatory, by attaching a very ingenious light-filter of various-colored films to the 12-inch telescope, has at last succeeded in isolating and photographing the red rays of the corona. If this be so, and in the clear mountain air of Mount Hamilton, California, the great Lick telescope should quickly prove it, a new field of study will be opened which has hitherto baffled explorers. In the whole vast field of astronomy the problems offered us by the sun and his companion orbs, the "fixed stars," are the most profound and important. We cannot hope to penetrate the mysterious veil which hides his true face, but the study of his outer robes and his rhythmic pulsations as they influence our earth-life afford scope for the most acute intellect and the strongest intuition. The sun in more senses than one is the heart of the solar system. R.

A Cured Cancer

THERE seems no doubt that Dr. Harper, President of the Chicago University, is cured of the intestinal cancer that so nearly had his life. He thinks himself cured, and his doctors think so too. Moreover he now looks, say the reports, the picture of health.

As most people will remember, the treatment was the light of fluorescence, that is, light beyond the ultra violet. Quinine was given internally, and then the rays from radium and a cathode tube passed through the blood—which thereupon became fluorescent.

Why the cancer cells cannot carry on their activities in this light, no one knows. It seems possible that the lower end of the spectrum, the red end, would stimulate them. Other experiments lead one to suspect further, that one function at least of the various inorganic elements existing in the body, with their various spectra, may be to respond to and as it were detain this and that ray out of mixed light; that they are in fact the keyboard whose keys separate out and use the tones blended in light. Each would behave as a tuning fork which separates and accentuates its own tone from a chord sounded near it. STUDENT

"Truth only needs to be for once spoken out,
And there's such music in her, such strange rhythm,
As makes men's memories her joyous slaves."—Lowell

IN ancient days the mother who had naught else to give to humanity, had the privilege of tak-

ing to the Temple and consecrating to Humanity's service, her little babe. At least she could give her child, relinquishing all her mother-rights, stepping by that one act out of the life that is personal into the life that is universal; entrusting her babe from that hour to the care of those whose lives were pledged to purity and to service and who, because of this, had the power to lead that child into a usefulness that the mother herself could never hope to do.

Many mothers, particularly among the humbler classes, anciently followed this revered custom, for there were hearts then, as now, yearning to give their uttermost in service to the world's life. But dark days came to humanity. The higher knowledge, yes, even the memory, of this custom, passed away. If we today are grateful to the Teachers who are bringing back the Wisdom-Religion, one reason must be because they are bringing back to the mothers of the world the picture of that ancient ideal. Many other records and ideals have been brought back to us by these Teachers. To many they have appealed more than this simple picture. But there are those—the few—to whom the record of this custom opens as it were, a new doorway.

Yet in many a mother-heart today there is a half smothered rebellion. It is inevitable at first that it should be so, for high ideals serve but to reveal the grim weariness of life's conditions, as the light reveals much of which darkness tells no tale, as wisdom opens many a book that to ignorance remained sealed. Many a mother, to whom this picture of the old ideal comes like a light and an inspiration, finds herself filled with a great longing to give—to give—to give of time, of energy, of her very self in humanity's service. Perhaps it is that mother-suffering has opened the doors of her heart; yet, however that may be, by what seems like the irony of fate, hand in hand with the broader view always comes a host of narrow duties, the personal *little* things of life, the thousand wearisome details that mothers give their lives to because no one else will do so. It may seem, at times, as if everything had been given up. Then it is that the nobler woman quietly transmutes into a higher patience the selfish, perhaps personal, desire to help humanity in the broader way—for baby hands are held out for help and family duties exist to be fulfilled and understood.

It is easy to say that women lack courage to do the broader work, but

✻ The Higher Renunciation ✻

in many cases outward quiescence is but a sign of the greater courage. Let the picture of that ancient custom be

revealed to such as these and there pours into the heart a light which is even an inspiration. It may not be within their power to unfetter themselves. They may have given up all hope of ever being released from conditions that bind. But there is the promise that their children need not be bound; and yet what can they do? How can they give the uttermost, as gave the mothers of old?

Yet after the storm comes the calm. Out of confusion is born the pause—that time of inner quiet when thoughts go their way and the soul steps forth to counsel the life in the silences. Then comes the higher insight and the mother sees that the longing to give her child, since she cannot give herself, may have its selfish side. Then, in the light of that higher insight, she finds it possible to analyze her own motive and to see whether her desire is absolutely selfless and pure, or whether it is colored by some *personal* dislike of petty duties, some *personal* preference for "broader" work than tidying-up rooms and washing soiled little hands.

There is a Higher Renunciation for ever and ever, after all is said and done. There is ever the step beyond, no matter how high we may stand at any moment. There must ever be some truth higher than that which we call truth today. And it is some glimpse of this higher truth that the woman who takes counsel with her

soul at that juncture comes to understand. She sees then that there *may* be a certain hypocrisy in believing herself to be unjustly denied this or that thing; a certain hypocrisy in keeping before her mind, and mentally feeding upon it, this picture of the things that bind and fetter. Verily, the real things are denied to no one and they may be grasped in the quiet of one's own soul, and held, *independent of all outer conditions*.

There is the Law surrounding and encompassing the child's life no less than the mother's. It is higher than even the highest of those that minister to it. If the mother cannot surrender the child to these, there is a higher surrender that she can make, and the first step toward making it is a willingness to accept *in the right spirit* what the Law bestows. Then for the first time will that mother step into the pathway of the life she has longed to live. Then and only then will she find it within her power to give her child to humanity, for humanity's sake, *in the right way*, her renunciation tinged with no selfishness but only with joy.

LIFE

EMILY DICKINSON

ONE share of night to bear,
One blank in scoring,
One blank in bliss to fill,
One share of morning.

Here a star and there a star,
Some lose their way.

Here a mist and there a mist,
Afterward --- day.

The ancient custom itself is but a picture of the highest that mothers could reach to, then. It is not an ideal to be slavishly followed today, but is to be viewed, rather, as symbolic of that giving up of the selfish and personal mother-claims which, all through the ages, have crucified the souls of little children. But mothers are learning slowly. At last, through the suffering of centuries, they are beginning to see that to say "This child is *mine and mine alone*" is an insult to that great Law which bestows motherhood as a gift; a gift which, used after its true nature bringeth peace and joy, but which, not so used, carrieth in its train destruction and danger, sorrow and death. It is no crude, outer giving up that is needed; nor is such required. The real renunciation is that inner and absolute surrender which declares: "Not my will but thine be done; that my child may go forth into the world, a Child of Light, rendering noble service unto all that lives." STUDENT

THE strong protective impulse inherent in the mother love which is forgetful of self is delightfully shown in an anecdote of Sir Arthur Conan Doyle and his aged mother.

When the motor mania seized upon the famous son she felt that her duty called her to his side and she bravely climbed upon the front seat beside him in the early days of his guiding the machine for himself, because she said she knew "he would never do any reckless driving when he had his old mother with him."

"In autumn all the girls' schools in Tokio offered to make the underclothing of the soldiers during the hours of their sewing lessons. The offer was accepted by the War Department, and even the youngest little girl was made happy thinking she was doing something for the soldiers." —*From a letter written by the Marchioness Oyama*

THE Mayor of Chicago has recently appointed three women as members of the city's Board of Education; Mrs. Emmons Blaine, Miss Jane Addams, head of Hull House, and Dr. Cornelia DeBey, philanthropist and educator as well as physician.

It appears that even the mothers of great geniuses have their troubles. Mrs. Rossetti, mother of a whole family of distinguished children, once said, "I always had a passion for intellect; now I wish there were a little less intellect in the family, to allow for a little more common sense."

UNDER the patronage of the wife of the President of France a society known as "La Dentelle de France" has been organized, the object of which is to extend the use and production of French hand-made lace. Its objects are announced to be not commercial, but purely philanthropic.

Empress Eugenie

One of the most pathetic diaries written within our time must surely be that in which the ex-Empress Eugenie has preserved the stirring and eventful history of her life. This, we may be permitted to hope, will one day be placed in sympathetic hands, in order that the inner view of the last years of Imperial France may be given to the world.—*Cassell's Saturday Journal*

ONE of the loneliest figures in this modern panorama of quickly varying shifting scenes, is that of the Empress Eugenie. Once the leader of fashion, the center of a gay Parisian court life, she now passes, unnoticed, through the city where she in former years reigned as queen. She has been observed by those who know her walking much in the Tuilleries Garden, during her recent sojourn in Paris. When questioned she said, "I seek the place where my boy used to play." All her great contemporaries have passed away—and the Empress seems to live entirely in the past, especially brooding over the events connected with her son. Mothers will appreciate the motives which prompted Empress Eugenie, contrary to her custom, to call in person on the young King of Spain during his stay in London, a visit which caused much comment in London at the time, and which gratified King Alfonso greatly.

NOTHING shows better the gentler and tenderer side of Russian life than the fairy tales of that land, many of which are plainly allied to the Grimm fairy tales of Germany. There are, for instance, in the Russian story, "Winter—the Frost King" and the "King of the Mushrooms." "The Golden Bird" of Grimm may easily be identified with "Ivan Czarewich" and the most casual reader cannot fail to recognize the similarity between Grimm's "Three Feathers" and "The Frog King." For years these tales have lacked an interpreter, and the children have had to depend upon their nurses and the village "old women." But within the last decade a woman has come to the rescue and now the children can have these fairy stories, simply and beautifully written, illustrated and published, at so low a price that even the poorest peasant is not debarred from purchasing them. It is a woman who has written these down—Mme. Poljanowa, and she obtained her material from the children, their nurses, and the "old people" themselves. STUDENT

ACCORDING to statistics, Germany employs a greater number of women postal clerks than any other country, having no fewer than 250,000. In that country, however, the postal and telegraph systems are combined, which is not the case in the United States. Otherwise the United States would easily rank first. Great Britain employs but little more than one-half that number, France 81,000, while Russia, Japan and British India, some 60,000 women in this capacity.

OUR YOUNG FOLK

The Raja Yoga Question Box

THE most genuine tribute which we can offer to the patriots who have nobly worked for freedom, is loyal and unselfish service to a great cause.

1 Who was Gen. Gomez?

ANSWER—Maximo Gomez joined the Cuban patriot army in 1868. Before that he had been in the service of Spain. Gomez was a brave and energetic soldier, and rose to be Commander-in-Chief. He knew how to lead the Cubans to the best advantage. Time after time, with few men and poor weapons, he defeated the great Spanish armies. His success encouraged the Cubans all over the island to fight on for freedom. Heart and soul he devoted himself to Cuba Libre. Go-

mez was the staunch comrade of Antonio Maceo, Calixto Garcia and José Martí.

2 Who was Gen. Bolivar?

ANSWER—Simon Bolivar is called the Liberator of South America. He gave his life to the cause of independence, and routed the Spanish armies in several countries. Bolivar was made President of Colombia. Bolivia received its name in honor of this brave patriot who also assisted the Peruvians in gaining their independence.

Bolivar's ideal was to give the people of South America better government and make their lives nobler in every way. He was so enthusiastic and so unselfish, that he became a great leader in the cause of freedom.

Raja Yoga Free Day School, Santiago de Cuba.

BELOW we append a translation of an article published in *La Independencia* about the exercises held at the end of the school year.

A program was given, which consisted of Recitations, Drills, Exercises, Spelling in English and Spanish, Oral Geography, History, Oral Arithmetic, English Reading and Translating into Spanish, (the audience choosing selections and the children reading and translating paragraph by paragraph into Spanish.) This was a difficult test.

The exhibition consisted of Maps, Drawings, Physiology Papers, etc., etc., Embroidery, Lace and Baskets, Spelling, Writing and Drawing-Books, complete volumes of the boys' two Club Newspapers, *The Raja Yoga Century* and *The Progress of Brotherhood*. And last but not least, the Boys' Club Museum, which latter is already, after four months work, large enough to cover seven school tables, and which consists of war relics, money, stamps, mineral specimens, shells, historical articles, curiosities, etc.

This was the first time that a school exhibition had ever been given in Santiago, and it attracted considerable attention, a stream of people pouring through the halls all evening. The school was decorated with foliage and the international flags, all serving to make quite a pretty effect.

FESTIVAL AT THE RAJA YOGA SCHOOL

Having been courteously invited to attend the festival of the Raja Yoga School, which took place there last night, we were agreeably surprised by the execution of the various numbers of the well-planned program, and we passed a delightful hour. Like all the festivals given by this establishment, it was very brilliant, the good-sized audience warmly applauding everything presented by the children.

We give a short resumé of the program. Classes were given in Arithmetic, Reading and Composition, Music, Geography, English, Spanish, and Military and Physical Exercises, in which children from three to sixteen years of age took part.

Miss Bolting, Mrs. Anderson, Miss Sierra, Mr. Reineman and Mr. Turner, who compose the corps of teachers, ought to be well pleased with the work accomplished in the school term just closed. We, echoing public opinion, tender them our sincerest congratulations.

What attracted most attention was the school work on exhibition. We admired a collection of drawn and colored maps, done by various children, with very unusual skill, showing the lines of longitude and latitude in their proper places. Among them we observed one that was very original. It was a map of the United States, intended to show at a glance the products of each State, whether vegetable, animal or mineral; and to demonstrate this, grains of corn, wheat, small pieces of woods, cotton, wool, minerals—gold, silver, copper—etc., were fastened on the map

CUBAN RAJA YOGA CHILDREN IN PATRIOTIC DRAMA AT SANTIAGO DE CUBA

TRIBUTE TO MAXIMO GOMEZ

AT the Raja Yoga Academy, Point Loma, on June eighteenth, nineteenth and twentieth, the Cuban flag was placed at half-mast in the presence of the school-children, who saluted it reverently in silence. This was a tribute of respect to the great Cuban hero and patriot who died June seventeenth. At a general assembly of the school, the life and work of General Gomez were reviewed by the children, and a deep feeling of gratitude, and of love for Cuba's devoted patriots, was stirred in the hearts of the young Raja Yoga Warriors of Lomaland.

physical exercises, which play a most essential part in the development of the intelligence, are not in the least neglected.

May those in charge of the Raja Yoga School continue in the good path already entered upon, and may they be sure that here in this hospitable land, their arduous labors will find, among Cubans of noble soul, the stimulus which grand and good works have a right to receive.

STUDENT

Facts Worth Knowing

IN Iceland there is no jail nor any place of confinement for criminals, neither is there a court where the more serious crimes could be tried. The percentage of crimes is so small that it does not warrant the expense of keeping up a court. When a trial is necessary the offender is taken to Denmark to be tried. Of what other country can this be said?

THE Moki Indians are often bitten by rattlesnakes in their annual snake dances. They never die from the poison, however, as they have an antidote for it, which is kept a profound secret. The Mexicans also have a remedy for the bite of the rattlesnake. They find it in a little sac in the rattlesnake's own body, and store it carefully in bottles made of empty cartridge-shells. Mexicans are never without this medicine on their long rides over the mountains, or on the desert. Many secrets of the healing power of plants are treasured by the Indians, and form a part of the sacred knowledge which is still handed down from generation to generation.

THE CHILDREN'S HOUR

A Story of Cats

DEAR CHILDREN: A letter has just been received from one of our little readers asking for another glimpse of Lucifer and Fifi. "Dear Mrs. Editor: Will you print again Lucifer's picture, and Fifi's? I have a little kitty, too." These are the opening sentences and the little missive is signed "Your loving Lotus Bud, H— L—."

So here is the picture, children. Do you remember Lucifer and the letter he sent you? Well, he is still wandering about Lomaland, devoted to Fifi as always, and the pet of all the students. I often wonder if all cats are as intelligent as Lucifer. I have no doubt that he seems more intelligent merely because we know him better. We really are not one-half as well acquainted with the little animals about our houses—most of us are not—as we should be; with cats in particular. How many ever stop to think what may be going on inside that little furry head, and how much thinking that little cat may do, and what is it keeps it so close to some of the good things that we call in Lomaland, Raja Yoga? It is not often that scientists pay much attention to cats, but not long ago one of the professors in a great University made some investigations. He didn't make them as so many do by first taking the life of the little animal; no, he just—but here is what he says and then you may guess for yourselves how he found it out:

Its anatomical structure considered, the cat is more decidedly specialized and more finely differentiated than man, and is in some respects a finer creature. It is as nearly perfect as an animal can be in an anatomical structure. The muscles are more delicate, they are prettier, and in some cases they are more complex. The eye is protected in a way ours is not, there being a third lid. The shape of the cat is beautiful. It uses all its force to advantage, and never wastes any. When it makes a leap it will alight in just the right place. It can turn in the air in a very slight space, and it always alights on its feet.

The cat has extreme keenness of apprehension. It recognizes its friends and its foes. A single harsh word or blow will alienate the dearest pet of a cat for at least a month.

If cleanliness is next to godliness, the cat is the most religious of animals. Cleanliness is not only a habit, but a fad with it.

The affection of cats for human beings and for each other is remarkable. The homing faculty is extraordinary. In Germany thirty-seven cats were carried in sacks twenty-four miles in various directions, and all of them were home within twenty-four hours.

Now, is this not wonderful? Do we really appreciate cats? A RAJA YOGA TEACHER

One of Our Stumbling-Blocks

WHAT a big stumbling-block prejudice is! Wherever we go, all over the world, we meet it. But what is prejudice? It's when we make up our mind to think a person or thing is good or bad before we are sure—isn't it?

We find prejudice among races and nations, too. One race thinks it is separate from the rest because it is of a different color. And perhaps one nation dislikes another because it has a different government or religion.

Then, prejudice in religion—oh, what a stumbling-block! And one of the worst things about this stumbling-block is, that it makes people blind. When one thinks other people are wrong because they don't believe as he does, isn't he blind? He don't see that his religion is really

prejudice. And when one has prejudice how can he be just? If he only looks at one side of a question he can't know much about the other.

And then this stumbling-block keeps one standing still in one place. Sometimes it does this by telling us to think and act just as our ancestors did. And sometimes it keeps us standing still through fear. We are afraid people will tease us and laugh at us if we do not do as they do.

But where did this great stumbling-block come from?

Don't you think we made it ourselves? Just built it out of our own selfishness and jealousy and fear? For when we are prejudiced, if we look deep enough, we often find it is because we are selfish, or jealous, or afraid.

How shall we move this stumbling-block out of the way of people everywhere?

Let us begin by getting rid of those things in ourselves that helped build it! And when we do this won't we really be pushing against the stumbling-block itself, the prejudice? Perhaps when other people see us pushing they will want to come and help too. And when many push at once don't you think we can roll this stumbling-block right out of the path?

Then we can all march on together! How glorious that is! A RAJA YOGA STUDENT

LUCIFER AND FIFI—TWO CATS OF LOMALAND

THE SONG OF THE THRUSH.

THIS is the song the Brown Thrush sings.

Out of his thicket of roses;
Hark how it warbles and sings.

Mark how it closes:

Luck, luck,
What luck?
Good enough for me!
I'm alive, you see.
Sun shining,
No repining;
Never borrow
Idle sorrow;
Drop it!
Cover it up!
Hold your cup!
Joy will fill it,
Don't spill it,
Steady, be ready,
Good luck!—Selected

rubbed its nose against the dog. The dog's owner tried to call him away, but he refused to go. Finally, one of the onlookers suggested that it might be the stolen horse, and on examination this proved to be the case. The animal's tail had been docked, his mane had been shorn off, his hoofs and several white spots had been dyed, but it was the same horse nevertheless and the dog had recognized it when the owner would have passed it by. Today the horse is back in his home stable and a happier dog than Rex you never knew.

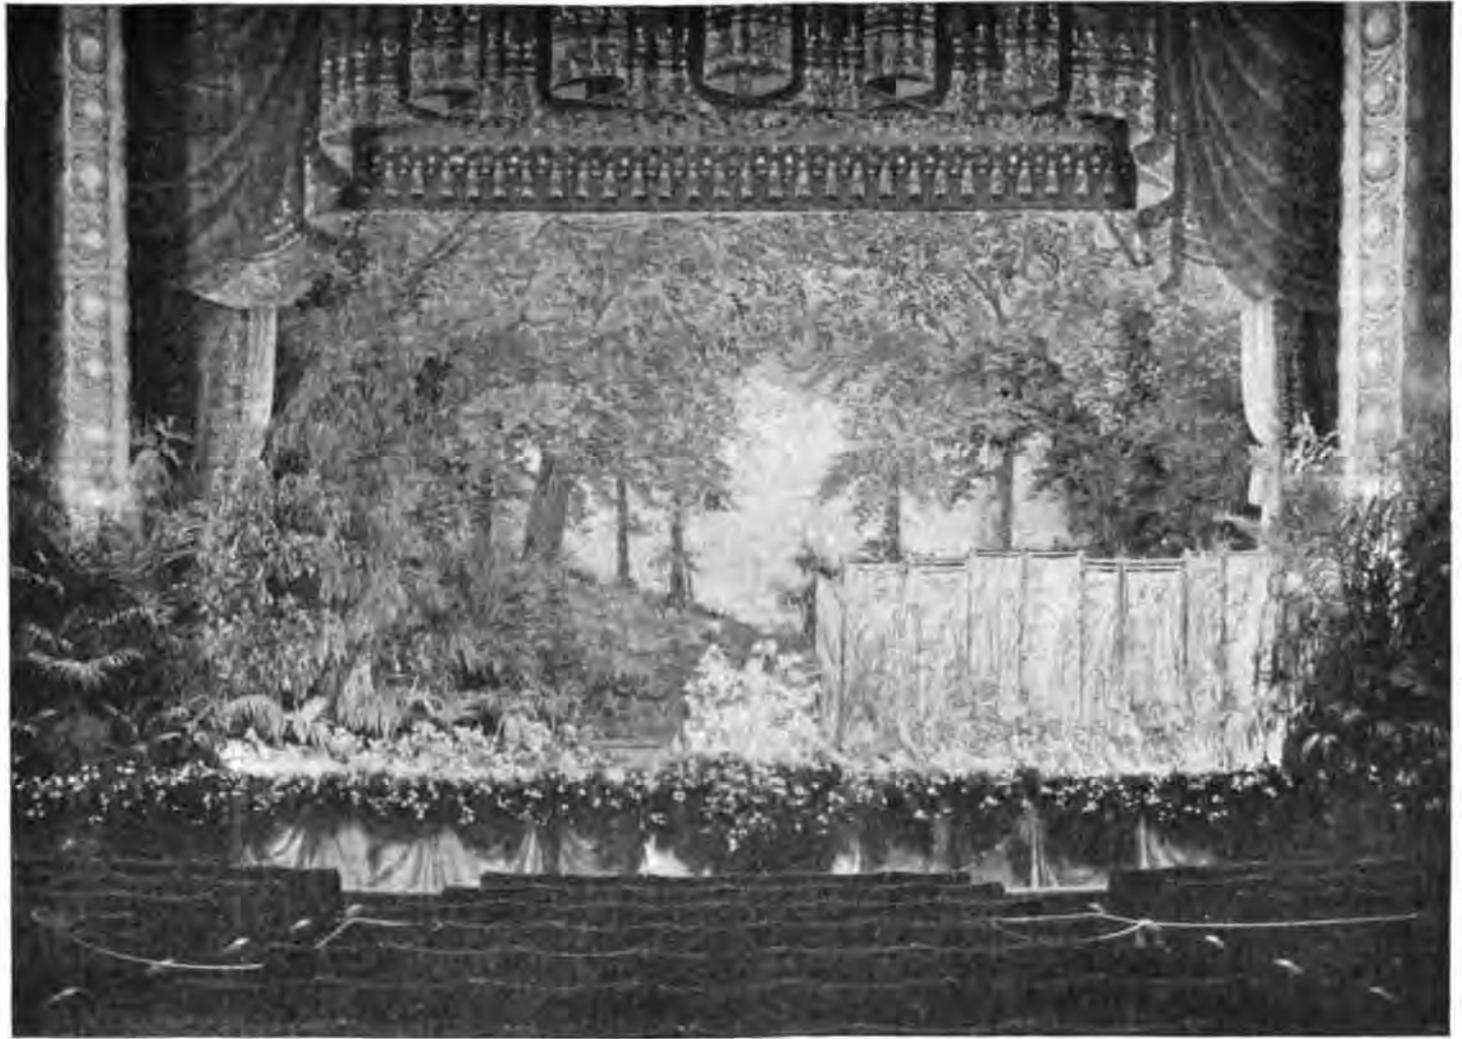

A LOTUS GROUP TEACHER OF WISCONSIN

THERE is a story among the Arabs which tells how the ostrich came to live in the desert. Once upon a time—so they say—all the birds and animals met together to decide which one should be first, and which second, and so on. All went smoothly until the ostrich said, "But, I do not belong to the birds, because I cannot fly. I am an animal." Then the animals drew back and said, "But we have

nothing to do with a creature who wears feathers." And the poor ostrich didn't know what to do. It hid its head and thought and thought and finally said, "Well, since I am neither an animal nor a bird, I must be an angel." At this—so the story goes—all the animals and birds became indignant, rushed upon the ostrich and drove it into the desert where it has lived ever since. But this is just a story, you know, and perhaps it isn't true! However that may be, all the ostriches do not live in the desert, today. In Southern California there are several "ostrich farms" which are well worth going a long way to see. UNCLE FRED

THE THEOSOPHICAL FORUM, IN ISIS THEATRE

AT the Universal Brotherhood meeting at Isis Theatre last Sunday evening, the principal topic was "Theosophy and Capital Punishment," an interesting paper on that subject from the writings of William Q. Judge, being read by Mr. S. G. Bonn.

"The killing of a human being by the authority of the state," said the writer, "is morally wrong and also an injury to all the people; no criminal should be executed no matter what the offence. If the administration of the law is so faulty as to permit the release of the hardened criminal before the term of his sentence has expired, that has nothing to do with the question of killing him.

"Under Christianity this killing is contrary to the law supposed to have emanated from the supreme Lawgiver. The commandment is: 'Thou shalt not kill!' No exception is made for states or governments; it does not even except the animal kingdom.

"All the modes of execution are violent, whether by the knife, the sword, the bullet, by poison, rope, or electricity. And for the Theosophist the term *violent* as applied to death must mean more than it does to those who do not hold Theosophical views. For the latter, a violent death is distinguished from an easy, natural one solely by the violence used against the victim. But for us such a death is the violent separation of the man from his body, and is a serious matter, of interest to the whole state. It creates in fact a paradox, for such persons are not dead; they remain with us as unseen criminals, able to do harm to the living and to cause damage to the whole of society.

"What happens? All the onlooker sees is that the sudden cutting off is accomplished; but what of the reality? A natural death is like the falling of a leaf near the winter time. The time is fully ripe, all the powers of the leaf having separated; those acting no longer, its stem has but a slight hold on the branch and the slightest wind takes it away. So with us; we begin to separate our different innate powers and parts one from the other because their full term has ended, and when the final tremor comes, the various inner component parts of the man fall away from each other and let the soul go free. But the poor criminal has not come to the natural end of his life. His inner body is not ready to

separate from his physical body, nor is the vital, nervous energy ready to leave. The entire inner man is closely knit together, and he is the reality.

"When, then, the mere physical body is so treated that a sudden, premature separation from the real man is effected, he is merely dazed for a time, after which he wakes up in the atmosphere of the earth, fully a sentient, living being save for the body. He sees the people, he sees and feels again the pursuit of him by the law. His passions are alive. He has become a raging fire, a mass of hate; the victim of his fellows and of his own crime.

"Still living as he does in the very realm in which our mind and senses operate, he is forever coming in contact with the mind and senses of the living. More people than we suspect are nervous and sensitive. If these sensitives are touched by this invisible criminal they have injected into them at once the pictures of his crime and punishment, the vibrations from his hate, malice and revenge. Like creates like, and thus these vibrations create their like. Many a person has been impelled by some unknown force to commit crime; and that force came from such an inhabitant of our sphere.

"The Theosophist sees that capital punishment is unjust to the living, a danger to the state, and that it allows no chance whatever for any reformation of the criminal."

Miss Edith White read a very interesting paper entitled: "More Life, More Light." The view presented was that according to our attitude we gain or waste life. Any act of duty done in the spirit of giving yields some life to the doer. "It is not only more blessed, but more joyful, more life-giving to give, than to receive."—*San Diego News*

Theosophical Meetings for Sunday Nights

Public Theosophical meetings are conducted every Sunday night in San Diego at 8:15, at the Isis Theatre, by the students of Lomaland.

Theosophical subjects pertaining to all departments of thought and bearing on all conditions of life are attractively and thoughtfully presented.

An interesting feature is the excellent music rendered by some of the students of the Isis Conservatory of Music of Lomaland. Theosophical literature may always be purchased at these meetings.

Art Music Literature and the Drama

The True Renaissance—What the Future Has in Store

THE history of human evolution is marked by periodic revivals, times of renaissance, or rebirth, when the spirit of man seeks a more perfect expression of its true nature. But in reading works devoted to this subject one can not fail to note the materialistic conception of rebirth that has grown up, and naturally, in a people who have lost touch with the true philosophy. The writers seem to take it for granted that the rebirth, renaissance or renaissance, is the reappearance of an old form made new again, whereas it is and must be the rebirth of that which is never old—the Spirit itself. The fact that such periods are marked by a revival of old forms and methods is due to ignorance and lack of faith; ignorance of the true nature of man and lack of faith in the divine truth of man's perfectibility. This is the basis of that conservatism which causes men to fall back on old methods, instead of trusting to their innate power to find new and more fitting means of expressing the reawakened spiritual force that, at such times, surges through the whole world. Then, too, there is the race memory to contend with, which constitutes what is called "tradition" and in which old forms and methods are shared. This conservatism it is that has constantly thwarted the efforts of the Spirit of the Race to find a free and full expression, by forcing upon it the old mannerisms that stifled its last and former efforts.

In the first outbreak of spiritual energy that shows itself in these periodic revivals of civilization, the lack of a fitting means of expression is felt and a hasty study of the preceding age of greatness affords examples of style, manner or method that were once made vital by the presence of the same spiritual force. These are then once again called into use and lend themselves readily to the expression of some part of the new energy and become identified with it in the public mind. Then come the followers of the revivalists, who think that the force lies in the form, and who slavishly imitate this without seeking to interpret the spirit, that alone can give it life; and they inevitably produce a style that is empty and insincere, an affectation, destined to become later a mere conventionality.

So we find that each revival in art is first marked by a return to nature and a revival of ancient methods and, in the next stage, by affectation and mannerism, which lead to the death-stage of mere convention. But, as the philosophy of life and reincarnation become better understood, we may expect to see revivals of the spiritual life of humanity accompanied by new methods that will not so rapidly become effete but will serve as stepping stones to yet higher development. R. M.

FROM a work on Egypt, written by Maspero, we quote the following: The banjo is strictly evolved from a prehistoric type and the word "banjo" is itself of Egyptian origin. The old harp also is very similar to the modern instrument. At Alexandria the earliest forms of musical notation were discovered. An ancient manuscript by Alypius shows signs for musical notes in harmonic pairs.

Old "Persian Lustre" Tiles

COLLECTORS here and there are occupying themselves with a new departure, that of collecting rare old "Persian lustre" tiles. The most beautiful specimens of these, of which there are no great number extant, date from the Tenth, Eleventh and Twelfth centuries and we first hear of them in the accounts of travellers to Spain, Persia and Egypt. Though the style of decoration known as "Persian lustre" originated in the country which has given it its name, the same spread from the Indus on the one hand to the Guadalquivir on the other. Not until the Fifteenth century did the art reach Italy, to be later introduced into Spain and from there into Mexico. The lustre is evidently a metallic paint of which silver and copper are parts. Being applied over the glaze it is easy to account for the rarity of well preserved examples.

The designs are, of course, distinctively Persian, although in many of them Byzantine influence is plainly traceable. There are the rose, iris and tulip, the bird and the inevitable gazelle. The charm of these tiles, however, consists not in the design, which is often stilted and occasionally disagreeable, but in their wonderful sheen of ruby, copper, nacre and emerald, which glows in certain lights as with all the colors of the rainbow. STUDENT

LANDSCAPE BY COROT (LOUVRE, PARIS)

PSALM OF THE WEST --- FRAGMENT

SIDNEY LANIER

MASTER, Master, poets sing,
The Time calls Thee;
You sea birds hard on everything
Man longs to be.
Oh, shall the sea-bird's aimless wing
Aloof move free?

"Gods of Light" announce by a flock of birds the coming of great heroes to be re-born on earth. To give but one example, the legend of King Conchubar:

One day, it is said, the King and his chieftains were feasting at Emain Macha when a flock of birds appeared above their heads. So beautiful were these birds that the King gave the command to yoke the chariots and follow them. Among those who went out with the warriors was Dechtere, a beautiful woman who afterwards became the mother of Cuchulain.

All day the warriors and this warrior-woman followed—until night came on. "Most beautiful birds they were," says the old manuscript, "and they kept singing in their flight. There were nine flocks and twenty birds in each flock and they were linked together, two by two, with chains of silver; and the two birds that flew at the head of each flock were united by a silver yoke."

Erin has ever been associated with bird legends. Where Dublin now stands was once a sunny plain called "Moy-Elta," meaning "The Plain of the Birds;" and in ancient times a lake in the plain of Ai was named "En-loch" or the "Lake of the Birds." ANNIE P. DICK

A REMARKABLE example of early plastic art has just been received in America from Italy. It is in the form of a small bronze statuette of "Victory" and was discovered in the ruins of a villa in Pompeii, evidently a home of wealth. The lightness and daintiness of the pose, the exquisitely modeled outspread wings, and the work in general bear the mark of exceptional skill. Authorities declare the piece to be Grecian.

Universal Brotherhood Organization

Central Office Point Loma California

PEACEFUL Lomaland this spring is showing rapid growth in every department of the work,

and it would almost seem as if nature was determined not to be left behind, and had put forth her utmost energies in harmony. The season's rainfall has been plentiful and everywhere the plants have flourished luxuriantly. Looking westward from the high bluff on which the Aryan Temple stands, down to the wide expanse of gentle slopes where the famous golf links are laid out, the eye ranges over a most picturesque and diversified sea of green, gold and purple vegetation and flowers, ruddy mother earth peeping out here and there in rich contrast. The hundreds of stately palms in the avenues have now attained such proportions as to give quite an Egyptian look to the scene, and the singing birds, which have been attracted this year in greater numbers than ever before make the air resound with melody. Within the last few months long rows of graceful pepper-trees have been planted along the roads leading to the corner-stone of the School of Antiquity, and the Lotus plants lately put into the pretty little artificial lakes are flourishing mightily. They give an additional Eastern touch to the scene.

Mr. and Mrs. A. G. Spalding (the latter so well known for her tireless work among the children in New York and elsewhere), who now reside ten months out of the twelve here, have laid out a portion of the flower garden round their lovely home in unique manner for the culture of a great variety of quaint cactuses which thrive so well in this equable climate; while

of flowers there is never a scarcity.

WORK OF THE HORTICULTURAL DEPARTMENT

Point Loma was once thickly covered with trees and a splendid beginning of re-afforestation has been made by our Horticultural Department. Thousands of young trees, pines chiefly, are being brought from the mountains and replanted in picturesque groups upon the slopes of the hills and the sides of the cañons, and much of the level ground north of the International Headquarters of the Universal Brotherhood, hitherto uncultivated, has been reclaimed from the wild sage-brush and grasses. Here, also, many trees have been planted, to form shady groves, such as in old times were associated with the Temples. The high ground where these groves are planted, commands a superb general view over the blue Pacific Ocean, and lovely peeps of the rugged coast line, both north and south. The planting of these trees in the future will be under the skillful care of our comrade, Mr. George Gowsell, late of the United States Geological Survey. At the edge of the bluff here, we find the quaint and cozy little temple-houses occupied by some of our faithful and loyal workers of many years standing.

LOMALAND SPORTS

Opposite these newly planted groves, and south-east of the drive, several acres of level ground have been laid out for athletic sports, and there, on Saturday afternoons, the members of the Senior Club and the

A Glimpse of Lomaland Life

boys of the Raja Yoga School hold their weekly base ball games and other manly sports.

The Greek Theatre at the northern end of the School of Antiquity grounds, with its firm and perfectly level arena, is an admirable spot for exercise or recreation, and is used daily by the Woman's League and the girls of the Raja Yoga Academy. As the players enjoy their basketball or other games, the musical sound of happy laughter fills the air. The system of physical recreation and athletics that Katherine Tingley is introducing, is being acknowledged as the most perfect method known for the upbuilding of the outer man. There is no strain, no excess, but a steady and healthy unfolding of the physical powers, and with this a strengthening and purifying of the moral nature also. A sound mind

in a sound body is the aim in view. Further developments of this most important branch of education upon lines of ancient Greek wisdom will follow in due course of time.

Half a mile or so south of the Greek Theatre, in a cozy secluded cañon leading down towards the ocean, the Lomaland Bee-farm is thriving. This has been a good year for honey and the students in charge of this rapidly increasing industry have been well occupied in keeping up with the growth of the Apiary. In this ideal climate many of the hindrances to successful bee-keeping are unknown, and this department is clearly destined to play a valuable part in the industrial life in Lomaland. The sympathetic study of the ways of the queen bee and her family of workers,

reveals most precious lessons in brotherhood and impersonality.

CAMP AND HOME LIFE

Almost under the shadow of the Aryan Memorial Temple and the Raja Yoga Academy, are groups of tents, facing the ocean, occupied by the Senior Boys, under the supervision of our old and tried comrade, Joseph H. Fussell. About half a mile further south, high up on the grounds of the School of Antiquity, is another unique touch of tent-life, for here members of the Literary staff, and a few other comrades, live and work the year round. They are quite emphatic in declaring that nothing could induce them to spend the rest of their lives shut up in houses after having tasted the healthy charm of this practically open-air-existence.

Midway between these two camps, on the west side of the Way to the School of Antiquity grounds, is a large, handsome building with quaint dormer windows and wide verandas, occupied by many of the lady-students of Lomaland. Here, surrounded by flowers and handsome eucalyptus trees, etc., the ideal home-life is lived in the atmosphere of altruistic endeavor. Further still to west of this large students' home, is a long row of pretty white tents, the homes of married students, and there other examples of the simple and beautiful are found. The convenient and elegant Bungalows, crowning the rising ground opposite the Academy and separated from its grounds by the Boulevard, form another attractive feature of Lomaland life. These Bungalows are also

KARNAK HOUSE, LOMALAND

occupied by married members, and the simple home life is followed in all particulars, save that the residents take their meals at the Refectory with the other students. Mr. Stevens, the able President of the Buffalo, N. Y., Center for many years past, occupies one of these Bungalows with his family. Many of the children rescued from lives of poverty, and perhaps crime, by the devoted work of that Center, are now thriving, bodily, mentally and spiritually, in the Lotus Home.

Across the great mulberry plantation, now a wilderness of rich green foliage, about a quarter of a mile north of the Bungalow homes, the long rows of permanent tented houses forming the Tent Village of Lomaland with its graceful music pavilion and pretty Refectory, glitter white among the trees and honeysuckles in the eternal sunshine. This restful spot has become a favorite resort for tourists who appreciate refined and quiet surroundings.

ARTS AND CRAFTS

A rapid development of this branch of activity has taken place. We now have four studios in full working order, and drawing, painting and designing, clay-modelling and wood-carving are being pushed ahead with enthusiasm. Many of the young folk are showing great promise, and, even in the cases of the few who are not naturally gifted in art, it has been found of great use in elevating the character. The Raja Yoga studio is a well-lighted and splendidly-appointed hall in the large Industrial Building, near the Lotus Home, where the older and more experienced workers help the younger students day by day to do their part in the useful and absorbingly interesting industries carried on here.

That busy mart, the Women's Industrial Building, is a perfect wonder-house from basement to attic. The Industrial Arts and Crafts department is housed in this building, and it is here that those exquisite creations of artistic taste and skill originate which have so rightly astonished and delighted the lovers of the esthetic and the practical. Many new features have been recently introduced.

A mile or so away from the International Headquarters toward the south, over twenty acres of land have been secured. Here is another group of industrial buildings and workshops, containing the newly built Constructive Building and Carpentry Shops with their machinery, the metal work, the painters and decorators stores, and the well-equipped tailoring department. Here also the publication department of the NEW CENTURY PATH has been placed, where on mailing days, a busy scene is enacted. Another spacious building near by, holds the studios and dark rooms of the Lomaland Photographic and Photo-Engraving departments. The fine examples of artistic process work published in the NEW CENTURY PATH in the last few months speak eloquently for this branch.

MUSIC

The musical work among the children and the adults is developing rapidly. The large audiences attending the Sunday meetings at the Isis Theatre, San Diego, (or Port Orient as we call it), show an increasing appreciation of the high class music provided by the Isis Conservatory. The public has learned to feel the difference between ordinary professionalism and the unselfish work of the Lomaland musicians, who are giving their whole time and artistic power for the furtherance of the cause of Universal Brotherhood. There is a something in the music of the students that touches the hearts of the people and carries an influence for good which reaches farther than is possibly imagined.

Then there is the choir-singing of the children. It can be said without exaggeration that not a single person has listened to the clear heart-tones of these pure and joyous souls without being stirred to the depths, and being the better for it. The orchestral and choral concerts given in the Rotunda of the Academy, are an inspiration to those who are privileged to hear them.

RAJA YOGA WORK

But of all the signs of growth and progress, the advancement of the children is foremost since the great change of last October, when the students vacated the Homestead Building and it was re-modeled and fitted out for its higher educational destiny as the Raja Yoga Academy. The older pupils are now developing into young men and women, well-equipped intellectually, accomplished and cultured, and with perfect poise and manners; but above all are they conscious of themselves as souls, and ardent with the desire (for which they have the ability) to help suffering humanity, regardless of self! This is no small result to have obtained in the few

years of the existence of the Raja Yoga system. The future developments under the fostering care of our Teacher will exceed our wildest hopes. Already the Raja Yoga work is firmly established in half a dozen centres, and at the present rate of increase, the earth will be covered with a network of these schools before ten years elapse—if all do their duty and act on the lightest hint of our great Leader. Think well, what other hope is there for humanity in this time of the break-up of all old ideas and the collapse of time-honored institutions! Every true worker must feel the ardent desire to help on this godlike work at any sacrifice. *Genuine devotion to humanity brings the power to help.*

Although the Academy building is well occupied by the pupils, the Lotus Home is still in full working order, and another spacious building has been called into use to house a large number of the smaller children, for the demands of parents for admission of their children increase daily. More and more teachers are being called for. But, truly, the growth of the Raja Yoga work cannot be adequately described in words. Even were every member of the Universal Brotherhood Organization to visit Point Loma and to remain for weeks, but a glimpse would be possible into the marvelous working of the system. But the results tell the story. One look at the healthy, rosy, and merry faces and the upright carriage of the children, or the sound of their cheerful voices with never a note of quarreling, is proof that their education, practical yet uplifting, is the basis of the New Order of the Ages to come.

Plans are even now being considered for the enlargement of the schools, and we shall see, in no far distant period, many surprising announcements in connection with the development of the Raja Yoga work, here and elsewhere.

DOMESTIC ECONOMY

The Refectory and School of Domestic Economy is quite a world in itself. The science, or art, of right living, is most thoroughly taught. The dignity of this important department is much accentuated by the educational aspect of the work. Katherine Tingley does not think any teacher fully qualified to train the children who has not worked in this branch. The study of dietary, or proper food, is given great attention, and the effects are marked in the general good health of the students, and the rosy faces and bright eyes of the children. Indeed, the success of the Raja Yoga system is in a large part due to the devoted and skillful work of the Refectory department.

This brief outline of the growth of the work here would be incomplete without a reference to the great progress made by the children at the San Diego City Raja Yoga School, which is now in its third year of active existence. It is impossible to keep pace with the demands for admittance, though additional teachers have been sent from time to time. The children have already gained a high conception of the meaning of Raja Yoga and the effect upon their home conduct is said by the parents to be very marked. These hundreds of future citizens of San Diego will be an entirely new factor in the life of the city, for they are learning that which will change the evil conditions of the day, and will, perforce, bring them to the front as reformers on practical common-sense lines.

Like the inscription on the tomb of Sir Christopher Wren, the architect of St. Paul's Cathedral, London, which gives, as the testimony of his greatness, the one word "Circumspice!"—"look around you"—so the pure love and spiritual illumination shining in the eyes of the thousands of children who look to Katherine Tingley for knowledge and inspiration, would be a sufficient monument to her itself, even if there were nothing else.

C. J. RYAN

THE world is shadowed or brightened by our own heart rather than by anything in itself. Our joy makes the cloudiest day glad, and our grief finds night in the sunniest sky.—*Joseph Parker*

For the Benefit of Enquirers

REGULAR weekly meetings of the Aryan Theosophical Society, established in New York City by William Q. Judge, the second Leader of the World's Theosophical Movement, are held every Thursday evening at 8 o'clock in Isis Hall, 1120 Fifth Street, San Diego, California. These meetings are intended to meet that large and growing body of earnest enquirers who desire to know more of the different tenets of the Theosophical philosophy. Students from the Universal Brotherhood Headquarters at Point Loma, California, conduct these interesting gatherings to which every truthseeker is cordially invited.

"GO ON."

Go on! Go on! the skies may lower,
The storm may burst;
Unshaken in the trial hour
Good purposes shall give the power
To brave the worst. Go on!

Go on! Go on! thou can'st not tell
Thy mission here;
Whate'er thou doest labour well,
Nor let a doubt within thee dwell
Or coward fear. Go on!

Go on! Go on! thy Master's car
And constant eye,
Observe each groan, each struggling tear,
He, midst the shadows dark and drear,
Is standing by. Go on!

Go on! Go on! thy onward way
Leads up to light.
The morning now begins to grey,
Aron the cheering beams of day
Shall chase the night. Go on!

— From "Great Thoughts"

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question What logical evidence can be offered for claiming that Theosophy is any more true than other religions and systems of philosophy?

Answer That Theosophy contains more of the same truth which vitalizes other religions and systems of philosophy is shown: *First*, in its entire consistency, and *second*, in its comprehensive scope which includes and harmonizes the real meaning of all the varying systems of thought which have heretofore stood for Truth.

Truth itself is unchanging and eternal; but the human consciousness is capable of an ever new and enlarged vision of it. It is only a figure of speech to say that a subject grows upon us. The subject matter remains the same: while we grow more conscious of it. The message of Theosophy is peculiarly suited to the present time of transition in the thought world, when outgrown and discarded beliefs have left many former believers to wander in a desert of doubt. As new phases of truth are unfolded and the old beliefs are proven not to be finalities, many minds are confused and unsettled with the changing views.

The vision of Truth may be compared to a mountain view which is seen by the human travelers who are climbing up its sides. Those who are at the foot of the mountain believe that the horizon which includes the visible landscape is the outer boundary of solid substance. The trees and buildings, the lake and the cattle, the broad meadow-land and the winding mountain path make up a familiar picture of what comes to be regarded as the world to those who see it continually. The traveler who leaves the lowlands and begins to climb the mountain of truth finds that the higher up he goes the wider his view becomes. The enlarged horizon adds new features to the familiar landscape, which loses nothing: but its details, though retained, assume a changed relationship and importance when combined with other features to compose a larger whole. The lake is no less clear and deep, the meadows are as broad and the human ties are no less real than they were when viewed from a lower level. But the lake is but a drop compared with the greater ocean of water whose shore line has been added to the enlarged view. The broad meadows are a mere grass plot to the great prairies spread out over added miles that help to round out a larger world. The close personal ties which meant so much in earlier pictures are even more significant as they come to stand for the greater tides of human feeling which make for brotherhood in the race.

There are many paths which lead up the mountain of truth. Some are broad and distinct and well worn with the touch of many feet; while here and there along their margin masses of people are encamped, content to make no further progress but rehearsing the details of the landscape from their point of view. The nearer the campers are to the earth level, the narrower is their horizon and the more widely separated are the paths. The higher up they go the broader becomes the view and the nearer the paths converge toward the common summit. Some travelers leave the first road they had chosen and wander from one path to another along the

same level. They see things differently as they move around and the view point of the campers they are with becomes, for the time, the reality to them. But because they are winding around the mountain instead of progressing upward, they are often confused with the ever changing pictures, as the first of the series are progressively lost sight of and finally become unreal. Sometimes a winding path does also progress upward and the traveler who takes this road is less disturbed with the changing scenes because he gradually sees more broadly. The higher up one goes the more lonely and ill-defined the path appears; yet there are always brave pioneer souls willing to blaze out a trail for those who shall follow after. The isolated travelers who reach the summit, in the fullness of time, meet each other face to face, and see the whole truth as it lies revealed on every side.

The Wisdom-Religion of Theosophy teaches truth from the standpoint of the summit. The various religious and philosophic camps which dot the paths along the mountain side, are each confident that their point of view is the true one. Each camp jealously guards its faith in the details which make up its landscape and seeks to proselyte, not in the name of progress, but by inducing desertion from other camps. From the narrow standpoints a change to a new view on a like level means a giving up of the old scene, and the change is painful from the sense of losing familiar things and of uncertainty and insecurity of the newer conditions.

Theosophy teaches that there are many ways leading to the goal, and that the best way for each man is to progress along his own line. Discarding nothing which has stood for truth to him, each is taught to find a wider knowledge by natural *extension* of his own field of thought and work. Theosophy does not encourage any believer in discarding his own religion but points out the vital germs of truth in it which are often overlooked and obscured by externals. Theosophy does not criticize the devotion of any believer nor belittle the sacredness of any one's aspiration, however poorly it may be expressed. So far from taking away a familiar Deity it gives to each one's God a meaning so sacred and supreme as to be worthy of all men's veneration. It is the universal essence of religion which makes better Buddhists and Christians, better Jews and Mohammedans, better scientists and nature worshipers.

Theosophy unites science and religion in a comprehensive study of man's three-fold nature, which can be understood only by properly relating the physical to the metaphysical nature. Thus it unites the half-truths which were held by the opposing schools of epicureans and of ascetics—the one disabling the body by indulgence the other crippling it with too rigid restraint. Both were right and both wrong. Neither by deprivation nor by indulgence is the body to be made strong and flexible and alert for the difficult journey up the mountain of truth. The balanced training of the physical, mental and moral nature not only gives strength and skill but the real joy of living which the epicurean lost in surfeit and the ascetic missed in starvation. Theosophy makes it plain that it is not the thing which is done but the spirit in which it is done that counts. Theosophy goes all around the thinking of the Greek philosophers who variously saw the universal substance in fire or air or water, in showing that the eternal essence is one behind its many forms of expression in matter. Thus it unifies the universals. Is any other system broad enough for that?

No one is ever converted into Theosophy. When a traveler outgrows his viewpoint, he moves on up the path and wins for himself the larger outlook which can no more be given to him unsought than it can be withheld from him when he is ready and moves on. The larger truth is no strange and mysterious thing but for each man is a progressive extension and enlargement and enlightenment of the knowledge which he already has. The test of truth is its ability to put more meaning and a larger purpose into whatever has previously been regarded as true. L. R.

THE great face was so sad, so earnest, so longing, so patient. There was a dignity not of earth in its mien, and in its countenance a benignity, such as never anything human wore. It was stone, but it seemed sentient. If ever image of stone thought, it was thinking. It was looking toward the verge of the landscape, but looking at nothing, nothing but distance and vacancy. It was looking over and beyond everything of the present, and far into the past. It was gazing over the ocean of time, over lines of century waves, which, farther and farther receding, closed nearer and nearer together, and blended at last into one unbroken tide, away toward the horizon of a remote antiquity. It was the type of an attribute of man—of a faculty of his heart and brain. It was memory—retrospection, wrought into visible, tangible form.—*Mark Twain, (on the Sphinx).*

Thibet "Opened Up"

PERCEVAL LANDON, who accompanied the British expedition to Thibet in 1903, gives a distinctly outside view of that land and its people and customs, such as might be expected from one following the fortunes of a military expedition. Travelers seem to find more or less, according to the degree of their sympathy and breadth of mind; and one gathers that the British mission did not get so far into Thibet as might have been, nor see anything that was out of sight. The people are "dirty and unwashed" on account of the extreme cold, and "gross superstition and priestly tyranny prevail." Yet did not Huc find cultured and refined people and speak highly of the character and disposition of the Thibetans generally? Thus to one observer, people are degraded and dirty, and to another joyous and noble-hearted, according to the point of view. All experience goes to show that the resources of a people are not to be known from the judgment of the passing observer.

Mr. Landon saw a monk immured in a dark cell in the solid rock, whose sole diversion was when he would thrust up through a hole a skinny hand and grope for the dole of food which charity bestowed. The state of such an individual's consciousness is inconceivable to a Western mind.

The expedition may nevertheless claim to have revealed that country to the world and to have proved the veracity of rumors and previous accounts of its wonders. And this in spite of the fact that persons of a certain class of mind are trying to make out that the opening up of Thibet has been a disillusionment.

The Potala or great lamasery is one of the most wonderful buildings in the world; and, while it rivals in massiveness the structures of ancient Egypt, its style is, so far as we know, unique. Perceval Landon, who accompanied the expedition, says in his book:

Sheer bulk and magnificent audacity could do no more in architecture than they have done in this huge palace-temple of the Grand Lama. Simplicity has wrought a marvel in stone, nine hundred feet in length and towering seventy feet higher than the golden cross of St. Paul's Cathedral. The Potala would dominate London. Lassa it simply eclipses.

The vivid white stretches of the buttressing curtains of stone, each a wilderness of close-ranked windows, strike a clean and harmonious note in the sea of green which washes up to their base. Once a year the walls of the Potala are washed with white, and no one can gainsay the effect; but there is yet the full chord of color to be sounded. The central building of the palace, the Phodang Marpo, the private home of the Grand Lama himself, stands out four-square upon and between the wide supporting bulks of masonry, a rich red crimson, and, most perfect touch of all, over it against the sky the glittering golden roofs—a note of glory added with the infinite taste and the sparing hand of the old illuminator—recompose the

color scheme from end to end, a sequence of green in three shades, of white, of maroon, of gold, and of pale blue.

A brown yak-hair curtain, eighty feet high and twenty-five feet across, hangs like a tress of hair down the very centre of the central sanctuary, hiding the central recess. Such is the Potala. STUDENT

In Europe

(By our special correspondent)

June 20th, 1905

A FEW weeks ago mention was made of a conference to be held at Rome dealing with international agriculture. This conference has taken place, and its results appear to be very hopeful. A permanent Institute has been founded, and there will be periodical meetings at Rome of delegates from the various countries interested. The first object of this Institute will be to gather the most precise information possible concerning the agriculture of all countries, and then to distribute such knowledge rapidly. The second object will be to encourage by all means in its power agricultural co-operation and credit.

One of the chief organizers of the scheme, is very sanguine as to its consequences. He says: "A great Institution is born, and it is called upon to acquire the highest and most happy influence upon the social destinies of all nations." May this be so. One gets tired of town-made and town restricted schemes for human betterment. To give intelligence and spirituality to life in the open country is a far nobler ideal. Much is said about the narrowness and stupidity of the rural mind. Here we have a plan for making the rural mind cosmopolitan in its outlook, and to place fresh knowledge of those subjects in which it is most interested within easy reach. A fresh note of Brotherhood has been struck.

Another scheme, which should fit in most admirably with the above, has just been originated in Paris. Under the title "L'Hygiène à l'Ecole," *Le Journal* lately gives a long report of a Congress of Doctors and men of Science recently held in the Amphitheatre of the School of Medicine.

The ideal of this gathering was physical health for the young. Their school-training should make for health. Therefore, the time given to purely mental studies ought to be lessened, and physical studies (*as far as possible in the open air*) should be systematically conducted. Moreover, the co-operation of parents and relatives in this work ought to be encouraged. The home should become sanitary as well as the school. This and much more of a like character was expressed by the various speakers. The President, M. Lavisse, speaking of professors and schoolmasters as gardeners of the human plant, concluded by saying that, "this little plant ought to be guarded with tenderness and love, since it is precious for the future of the race." Surely, Raja Yoga is in the air!

New Light on Evolution

THE theory of evolution of species states that different species, in the animal and vegetable kingdoms, are derived successively the one from the other by gradual and continuous change. But there is a well-known and serious objection to the theory, namely, that in familiar species, like the horse and the dog for example, the type seems invariable, no change whatever having taken place within recorded time. A dog is always a dog, and a horse a horse, nor has there been in the course of centuries any tendency whatever in either of these animals to become modified. If even a minute alteration had taken place within our own times, then the lapse of ages would suffice to multiply that change to the extent required by the theory. But, where the change is zero, no multiplication can increase it, and a type that does not change in a thousand years will not change in a million. This objection has

been answered (?) by M. Hugo de Vries lately, in the *Revue Scientifique*, by a theory which he somewhat clumsily calls "Evolution by Explosion." He thinks that evolutionary change is not continuous but periodic: each species remains unaltered for a long time and then has a period of rapid change during which the old form disappears and a group of derived and closely related forms takes its place. M. de Vries mentions some plants

Animals and Plants Are Included

which seem to be undergoing one of these periodic changes. There are a large number of closely-related varieties of wild rose, which, according to the theory, would be, as it were, tentative samples of the forthcoming pattern of rose. In short, the rose would seem to have reached one of the periods when the species changes. Butterflies are also instanced in the same connection, the species of this insect seeming to be more various than fixed at present.

Thus we have a new theory with regard to evolution, which removes one of the objections to the old theory. Species may remain invariable for a long time, and then change rapidly. We are reminded of the rival schools of Geologists—the Uniformitarians and the Cataclysmists. The former hold that the vast rock-movements traceable in the earth's crust took place continuously and gradually; the latter hold that they were wrought periodically by cataclysms. It is probable that, in this case, each school has a portion of the truth and errs only in pushing its theory too far. Nature works by both slow and rapid changes, both continuous and periodic movements. A cañon or valley is carved out partly by slow continuous wear and partly by sudden flood action. Observation shows that the land-

Too Narrow Views of Nature

level is slowly rising or sinking all the time, but this is no reason why there may not also be great and sudden risings and sinkings now and again. We must not take too narrow a view of Nature, nor seek to restrict her to one particular mode of conduct.

In evolution too there is probably room for all theories, and more also; and, rather than choose between two rival theories we should try to piece them together and get an outline of the truth. But what can be said about evolution of species from the standpoint of our philosophy?

To answer this question let us for a moment take a homely and perhaps ludicrous analogy. Let us consider the evolution of—say, hats! We observe on the earth a great variety of different species of hats, and the close analogies and graduated differences among them suggest that they were successively derived one from another; the whole variety perhaps emanating remotely from a single pattern. Yet we observe no measurable change in any given type of hat during ever so long a period of observation. A silk hat is always a silk hat, and there is no missing link between a straw hat and felt one. Perhaps the evolution is periodic, and takes place "by explosion" at intervals instead of gradually all the time.

Evolution Takes Place In the Mind

But we have a better theory; it is this. That the evolution takes place in the *mind of the hatter and the wearer*, and afterwards becomes materialized on the physical plane in the form of a new fashion. No individual hat grows; but the hatter evolves a new type in his mind, and then the old pattern dies out and the new one is made.

This, applied to animals and plants, is roughly the teaching of Theosophy and of common-sense. The mere *form* of the creature cannot change of itself; forms as such do not grow *per se*. It is the "living soul" that inhabits the form—it is this that grows. And when the "soul" has outgrown a particular form, then it no more incarnates in that form, but in another. Therefore the changing goes on out of our sight, and we see only the results—not the process. A dog is always a dog; we should not expect it to be a cow. But it does not follow that the intelligent being that gazes at me through those great brown eyes will enter forever into precisely the same forms. These ideas must be elaborated by the reader; but the point is this. Evolutionists have been studying the form instead of the spirit, the creation instead of the creator, the house instead of the builder. They are like people who should evolve a theory to account for the growth of cities, without ever suspecting the existence of men. It is not species that evolve, but the animals themselves. A species is not a living thing in itself, it is an abstraction. The whole confusion is one of the many sad consequences of trying to philosophize on the so-called "materialistic" basis. A philosophy which, instead of starting from mind as the one sure starting-point, starts from mere mental abstractions like "matter" and "force," always leads to chaos and confusion. Regard Nature as a living and intelligent soul, and we can construct a philosophy that will hang together and be reasonable. H. T. E.

The Thirteenth Alfonso

THE King of Spain is the only sovereign in Europe, almost the only one in history, who was born a King. His father, the twelfth Alfonso, had died some months previously, leaving his widow—a daughter of the Austrian house—regent for the elder of two little girls, of whom one was proclaimed interim Queen. The widow had hitherto kept herself quite in the background, and no one suspected her of the possession of the qualities she now evinced. Through the sixteen years of her son's minority she filled her difficult position with eminent tact and ability, supervised his education, and fostered in him many of the ideas which future years may see him develop into action.

Some difficulty arose over the young King's name. If he took that of his father, he must be Alfonso XIII, and to that number there was considerable objection from those who thought it unlucky. But it was also "the number of wisdom," and if through due exercise of wisdom, its tendency to bring ill luck could be surmounted, its other aspect came in view. So the mother's wishes prevailed and the infant King became Alfonso XIII. They prevailed in another matter too. The Pope had sent for the christening ceremony a most magnificent dress. But the Queen preferred that her baby should wear instead his own father's baptismal robe and sash, and her desire was yielded to.

The severity and completeness of King Alfonso's education do not seem to have injured his health or spirits. His training had to be finished by the time his coronation was due—at the age of sixteen—and so he was subjected to a sort of tutorial forcing process. He is as well educated a man as there is in his country and converses in several languages with ease. His English accent is said to be perfect.

His visit to England has produced the most favorable impression. Some pressure was brought to bear upon him not to go to that country. Anything rather than that there should be as good an understanding between Spain and England as between France and England. But he has his own views on high politics and the various "pressures" to which he is subjected appear to effect very little compression. C.

Cause of Plagues in India.

A MEDICAL man, who has recently visited India for the purpose of inquiring on the spot into the conditions connected with the plague, has given a report which seems to be based on common sense. He points out that the commission of inquiry in 1898 was hopelessly handicapped, from the fact that two of its members were bacteriologists who ignored all evidence that was not bacteriological; and that the other two were departmental officials who were not eager to admit errors in their sanitary administration.

Viewing the circumstances, however, with an unprejudiced eye, he finds the cause of the plague to lie in the poisoning of the soil, through too long habitation of the same spot. Villages are built on mounds of earth, the accumulation of organic refuse since the days when Alexander fought Porus. The soil has long since had its purifying powers overtaxed, so that the fresh additions of refuse merely sink in and rot. In the day, the heat of the sun and of the cooking fires warms up this mass, so that in the night, when the air cools and vapors arise from the ground—! Especially is this the case where, as is usually the case, the huts are of mud and have no floor.

He therefore advocates, as the best immediate measure for plague prevention, a precaution which even the natives themselves often adopt when the plague breaks out—namely the evacuation of such huts during the night; and, as a permanent measure, the total evacuation of all such sites. STUDENT

A Libel Punctured

LIBELS of the Japanese from various sources are becoming more and more frequent, and it is worth while to puncture them whenever one meets them. One of the latest asserts that the number of divorces among that people shows their standard of practised morals to be very low. The fact is that a Japanese divorce is usually the mere lapse of an engagement. When an infant, boy, or youth has been adopted into a family with a view to his future marriage of the daughter, taking then the family name, and this projected marriage for some reason does not take place, the lapse is officially registered as a "divorce."

A better test of Japanese morality is the fact that in one whole year, 1901, only 260 foundlings were registered, 91 being infants. What Western population of the same size could show such figures? C.

Changing Contour of Atlantic Coast

THE connection between elevation and depression of the earth on the one hand, and change of coast line on the other hand, is quite complex. For instance, on the New Jersey coast the land is rising; and yet in many parts the coast line is receding inwards, because the waves eat away the land faster than it rises. In other parts, however, the sea increases, not counteracts, the gain of land; for it deposits sediment instead of eroding. Again, the erection of jetties and breakwaters on a coast that is rising, saves the new soil from being washed away. In short there is a complicated interaction of various forces and conditions, such as can be studied very well on the small scale by a boy with pail and wooden spade on the beach.

Sandy Hook has now four times the area it had when surveyed by George Keith in 1665. The Sandy Hook light was placed, in 1764, 500 feet from the end of the point, but is now nearly a mile inland. In some parts of the Atlantic coast land is being gained, and in others lost, as shown by inland beaches and other familiar signs; so that the whole contour is continually changing.

As regards explanations of the causes and mechanism of earth-movements, we are too apt to reason as if the earth were a rigid solid. But when one compares the vast size of the earth with the coherence of its substance, one sees that molasses would be a better type of its rigidity. It is well known that ice in large masses behaves like molasses, as in glaciers; and even the most rigid substance known would, in blocks measured by the cubic mile, lose its rigidity. The earth would seem to be a flexible mobile mass held in shape by the resultant of various forces, and liable to changes of all kinds, sudden or gradual. STUDENT

The Awakening of China

COLONEL MANIFOLD, describing in the *Geographical Journal* a recent tour he made through the more rarely visited parts of China, gives many instances of the awakening of the people to modern influences. In the large towns were special buildings for instruction in western learning. In one province each town was sending at the government's expense three students to Japan for education on modern lines and in modern science. The foreign trade is also, he says, very swiftly growing and the need of railways is being acutely felt. But the people want to do the building themselves, and have indeed on a small scale already done it in many places. A railway is especially needed from Szechuen (the richest province of the Empire) to the sea. An official announcement invites subscriptions, and it contains the words, "and no foreign assistance is to be accepted." The Indian cotton-yarn trade of this same province has doubled in two years.

Perhaps such items of news as this may inspire us to treat the Chinese who come here, with a little more consideration. But perhaps also, the altered policy might be too late, and its motive too transparent. STUDENT

Eclipse Expedition

THE Lick observatory is sending out three expeditions to observe the eclipse of the sun on August 30th, one to Labrador, one to Egypt, and one to Spain. The one to Labrador will station itself on the eastern coast about three hundred miles north of Newfoundland. The one in Spain will be somewhere in the northeast, between Madrid and Saragossa. The intra-mercurial planet Vulcan, whose existence is suspected but which has never been seen, is to be looked for, in the hope that the suspicion may be justified. E.

Municipal Tramways

FIFTY-FIVE towns and cities in Great Britain now own and work their street railways. In thirty-six of these, the municipality has made a profit, ranging (in 1904) from \$262,000 down to \$3,700, and municipal taxes have been correspondingly reduced. This includes all the larger towns and cities, and in some the reduction of taxes has been so marked that no citizen now remains opposed to the scheme. In nineteen there has been a deficit, but they are all small towns, and the deficit has also been small.

The fares charged are as low as possible, mostly one and two cents, since profit-making is not the first object, and it is reasonably expected that the residential congestion of some of the cities will be markedly relieved. An incidental result of this relief will be a considerable improvement in health, and a lessened mortality from epidemic diseases. STUDENT

Some Views on XXth Century Problems

The Illusion of Sacrifice

MOST people who keep their eyes on current literature have read Lafcadio Hearn's little essay on the ant, and probably gained from it a number of new ideas. But to some, the limitations of the writer himself will appeal most strongly; and especially to the Theosophist.

The essay suggests that the human race must sometime advance to a level of evolution as high as that of the ant, an evolution so high that morality has become a matter of instinct and wrong doing no longer is a possibility. The individual will live for the race, care for his own welfare and health only to the extent that they will enable him better to serve the race, and pursue no private ends or pleasures.

The writer points out that among the ants, differentiation of function has become so complete that a special group is even told off for parenthood, all others foregoing that function that they may specialize some other.

He makes the picture depressing by insistent use of the word *sacrifice*. The individual *sacrifices* that the race may profit, puts on blinkers, lives a narrow and gloomy life that the *race* may have a rich life. And the assumption is that the individual loses by this.

But if the ant has grown to a perfect code of conduct, may it not—*must* it not—also have grown to a higher level of consciousness? After all, is not *consciousness* what nature is after? Is that not the real end of organization—a richer and more perfect, a fuller, consciousness? Is she after mere numbers, or mere form as such? Is man erect merely that he may be erect; or that his erectness may permit a larger brain and *therefore* a larger consciousness?

Nature's Aim

Two consciousnesses contend in us; one working for its own pleasure, the other for the welfare or pleasure of others. We get a pleasure in the pleasure of others, get it in that higher consciousness to which we sacrifice the pleasure of the lower. One may forget a neuralgia in the joy of a crowd of happy children. The electric essence called joy, making an atmosphere in each child, among them, and around them—almost visible—one enters into and is entered by it. One is then *part of that common consciousness*, whilst retaining individual being.

We sometimes speak of a "hive entity," or in the case of ants, of a "nest entity," either regarding ourselves as speaking metaphorically; or thinking of a sort of over-reigning Moloch in the nest, separate from the ants and demanding *their* sacrifice that *it* may profit and grow. But think again of the happy children. Is their joy an entity to which the bystander is made to contribute? May not the ants have a common consciousness so real that they have most of their life in it, only enough of their consciousness standing separate to enable their duties to be done?

Then "sacrifice" disappears. The unit contributes from one—the least—of his consciousnesses to the other, and feels only pure gain and enrichment and pleasure. In that larger consciousness, he feels, *shares in*, whatever the rest feel, whatever pleasure they gain in their fullness of action. This must be so, or evolution means nothing. And the "death" of an ant would not mean any loss to it of its race consciousness. Why should it? Via the egg next laid in its home, it would at once rejoin the band of workers.

Let us carry the idea, with a little care, to *man's* next stage. The very word "sacrifice" will disappear with the idea into a heretofore unimagined harmony and joy. The completeness of specialization of function may bring *all* activities into the consciousness of all. And into the divine harmony and full consciousness of the great human body, family, may come a Presence that has to wait for that harmony, the Presence whose thought has been nature's guide and whose overshadowing nearness man's inspiration and the source of his religion.

This is the case even with the individual body. Not until the cells have differentiated out, some assuming one function, some another, and all discharging their duties to one end—the welfare of the body and only *through that* gaining their own welfare, does the body become a fit and possible vehicle for the waiting and overshadowing soul. As above, so below. As on the greater scale, so on the smaller. STUDENT

Esthetics and Piety

AT a recent religious conference, the conferring reverends considered how they should now teach of God to a generation that does not want to learn.

One of the ways in which the ancients taught of God was as the Essence of the beautiful, and the Platonic quest for God was the quest for Absolute Beauty. With them, holiness had not become piety as we have flavored that word; and it *was* beautiful, having nothing to do with not whistling on the Sabbath.

All men perceive God in feeling the beauty of things really beautiful. But, as they do not know it, as the esthetic perceptions are in our education now kept absolutely distinct from religion, the path is almost closed. It is *the* Twentieth century problem to reopen it. As a man moves Godward, all things should become more beautiful; beauty will everywhere come up upon his horizon. He will get something new from flowers, music, youth, age, color, sound. His intellect will tune itself to a new and higher key. As he persists, old pleasures will fall away. A new graciousness comes upon him, a higher courtesy, a franker bearing. He is as one who carries in his breast some joyful and lofty secret, and with every pulse it floods him with its beauty. Vice falls from him, for it no longer attracts; the failings and faint-heartedness and weight of flesh are easily surmounted by the power of his new joy; the virtues and nobilities of character come naturally as the tones of the symphony within. His body and himself are transformed; and the Power that did it, unknown only as we now count knowledge, is ever beyond, yet within, calling him higher. What can he *tell* of so much fullness? Yet he can give, by radiation, and he can show the way to the path.

He will be silent on all unecessaries; but his silence will be above, not below, speech; fuller, not emptier, than it. He is as one rapt after the ceasing of great music, yet he will not let go of brain and body, holding these ready for service and registration and translation.

The Great Transformation

And all this, as the crown of long effort, may come upon him in a moment. He is in the flesh, yet the flesh responds to the soul as never before, in a wholly new and inexpressible fashion. He feels himself as always in the presence of that which he would not have see him do one ignoble thing or think one base thought. Now he has really entered upon the path to that "Absolute Beauty" from which, the real God, men have been turned to gaze upon the forbidding phantom fashioned by the theologians.

He can now see God everywhere, in all beauty, in all that is noble, in all that blooms, wherever life is passing to more life, and so in flowers and young animals and children. In the winds and the sea and the trees he hears God.

And wherever life is lacking or hindered, in those who suffer or are sick and need aid, he longs to give God from the godhood within him, to give life, establish growth, and stay the pain. In time he can do without music and color and all those things that awake men's perceptions of beauty; he has found all within himself, and now from the gladness of receiving he passes to the gladness of giving. He is the true teacher, and the children will come about him and the multitude hear him gladly. STUDENT

Revivalism and Insanity

ANYONE who studies the psychology of "revivals" will be prepared for an increase of insanity in the districts where these have taken place, but it is not often that proof can be obtained that such an increase does occur. But in Kansas, investigations have been made by the State Board of Control of Charitable Institutions. And the results of these show that the counties in which lengthy religious revivals have been held during the past year show a high record of insanity.

"Insanity," said H. C. Bowman, member of the board, "seems to have followed religious revivals like an epidemic. Reno county, where there was a protracted revival early last year, has sent fifty-two insane persons to the State asylum in Topeka in twelve months.

"I find this epidemic of insanity has also followed the revivals which were held in Topeka, Arkansas City, Winfield, Wichita and other places." STUDENT

A Vancouver Island Totem

THE wolf devouring a child signifies more than a mere ornamental carving. In the Indian mysteries human sacrifice and even cannibalism are reputed to have existed until very recent years. And in those ceremonies the characters wear such masks as wolves, bears, or other ferocious nature representations; sometimes, to all intents and purposes, becoming for the time being the thing they represent, so terrible a power of concentrated imagination do they throw into the part.

Of old many were the ideas symbolized by such means and afterwards, the meaning hidden, reduced to brutal materialistic dead-letter. The prevalent idea of absorbing a powerful foe's qualities, symbolized as eating him up; of making holy (*tabu* in the South Sea Islands) a visible representative of the deity, and then similarly attempting to gain some extra share of the divinity within, by outward material practices; of pacifying evil powers by the sacrifice to them of human beings still recognized as divine; all, all are degraded ideas, once abstract beautiful symbols. P. M.

Progress of Egyptology

THE works connected with the restoration of the Karnak temples have progressed well and rapidly. All the columns of the Great Hall, which collapsed in 1899, have now been rebuilt to their full height. It only remains to place the capitals and architraves in position.

The works necessitated by this restoration brought to light at the south end of the Hypostyle Hall a number of most interesting statues. A pit was discovered in which the architects, who restored the temples—during the reign of the earlier Ptolemies in the Third century before Christ—had buried a mass of statues belonging to the temples connected with the residence of the high Priests of Ammon. The excavation has not yet been terminated, but already some five hundred statues have been disinterred, some of which represent the highest known types of Egyptian art.

M. Legrain, who has been in charge of this work, as well as of the restoration of the Karnak columns, deserves very great credit for the zeal and energy which have led to this result. Nothing like the present find has been made since Mariette's excavation at the Serapeum. The historical value of these statues is immense.

Excavation and repairs to the temples have been carried on at the principal sites. The portion of the Kom Ombo Temple which fell in, and the great wall which collapsed at the west of the Edfou Temple have been rebuilt.

The general improvements in the arrangement of the collection in the new Museum have been continued. A statue and a monument to Mariette Pasha were inaugurated in March, 1904.

The great catalogue of the Museum is progressing. Eighteen volumes have been published, seven other are in progress, and eight more are under preparation. It is hoped that this work will be completed in about ten years' time.—*Extract from Lord Cromer's Annual Report.*

Ancient Homeric Art

THE British Museum has recently received one of the columns from the Treasury of Atreus, "taken from Argos" in 1812 by Lord Sligo. No record of the excavation made by him was made, but he brought the column home and set it up at his place.

The "Treasury of Atreus" at Mycenæ, to which the above item must

refer, is an ancient relic of Mycenaean architecture. The name is that assigned to it by the Roman antiquary Pausanias (about 160 A. D.) It is one of a number of treasure-houses, or dome-shaped, partly subterranean buildings, which are found in Greece. It consists of circular courses of evenly hewn and jointed stones, held by a keystone at the top; but the most remarkable features are the pilasters and tablets of colored marble, and the sheets of bronze with which the interior was plated.

As the nature and elaborateness of the ornamentation differ much from the simplicity of the familiar later Greek work, it is inferred that the builders at this early date (before Homer) were influenced by Oriental taste. But what is most noteworthy is the fact that this building answers to the descriptions given by Homer of the princely palaces, which he describes as plated with bronze and having cornices and pillars enriched with metal work.

Thus Homer is vindicated, and, says an authority, it is "reasonable to assume that his testimony elsewhere in matters of art was equally reliable." Perhaps in other matters too, and perhaps also the testimony of other ancient writers. At any rate we have Homer and the results of exploration concurring in the testimony that the prehistoric Greeks were a great and skilled people.

One notes, in passing, that the *Encyclopedia Britannica* writer solemnly puzzles over the problem why Homer attributed some of these works of art to Hephæstus. "That Homer should in the same breath speak of an object as Sidonian and the work of a Greek god, is a singular mistake," he says, and he infers a connection between the Greeks and Phœnicians. But was Hephæstus a god, or the Greek name for a divine-human power? STUDENT

TOTEM: WOLF EATING CHILD—FORT RUPERT, VANCOUVER ISLAND

Hidden Records

IN England a Royal Commission has been at work for years rummaging among the muniment-rooms and archives of the ancient houses of the aristocracy. Through its efforts priceless historical documents and records have been saved from the rats and the dust-bins. If only similar organized undertakings could be made in France, Germany, Spain and elsewhere through the world! In the crypts of the monasteries scattered through the countries that formed part of the Holy Roman Empire must be documents that would clear up for us the darkness that shrouds the early centuries of the Christian era, yes perhaps even that first century and a half during which such vitally important first-hand records disappeared.

The monasteries of Syria and Palestine must also be full of valuable matter whose existence is not even suspected by the sleepy custodians. The famous Sinaitic manuscript of part of the *Old Testament* was quite accidentally discovered by Tischendorf in one of these. He was visiting a convent at the foot of Mount Sinai in 1844, and in the middle of the great hall he saw a basket of old papers. The librarian told him that two such lots had already gone into the fire. These archaic looking sheets of manuscript were our Sinaitic manuscript, or the first installment of it. The monks became very wary as soon as they learned what a treasure they had in their charge, and it was not till fifteen years after that Tischendorf was able to get the rest of it. Large quantities of the teachings of Christ, at present absolutely unknown to us, are doubtless buried somewhere. Some of them may even be in a certain part of the Vatican Library which is neither shown nor spoken of.

"Chance" will bring them all to light at the proper time, and we shall discover that Christ was indeed a Master of Wisdom. STUDENT

The Trend of Twentieth Century Science

The Real Root of Disease

EVERY now and then the doctors favor us with lectures on disease, in terms simplified for public comprehension. They mean well; they want us to reform some habit which seems to them to stand as a cause of disease. The lectures perhaps do some little good; but how much farther-reaching *might* be the message!

A set of lectures has just been delivered by an English physician on the evolution and degeneration of the teeth. Teeth, it seems, are less and less perfectly formed, and decay earlier. And the cause? The increasing use of artificial foods.

Well, that may be a cause; but how far in does it go? Opticians and oculists are also lecturing here and there on the civilized man's failing eyesight or rather failing accommodation. The lens is getting as imperfect as the teeth. Aurists do not usually lecture, but if they did they would be telling us the same about the ear. As to the nose, we all know of the increasing prevalence of catarrh, polypi and so on. We are also getting bald. And we are becoming insane, in this country to the extent of one person in 400. Finally, cancer is increasing.

Our bad teeth are due to artificial foods; our bad sight to stooping at school, or artificial light; our bad hearing to—cause not yet given; our catarrh to sugar; our baldness to hats; our insanity and diseases of the nervous system to strain, competition, education, want of education, religion, want of religion—we can take our choice; our cancer to meat-eating or what not.

It may be all true, but a very curious fact will present itself to the doctor who will step outside of his specialty. The lecturer in England did not do this. But he ought to have done it, for he pointed out to his audience that the enamel of the teeth is really a portion of the skin. Those who study embryology know that the crystalline lens is also a portion of the skin specially developed. The specifically hearing part of the ear, the complicated internal membranous part is also developed from skin. The skin pits deeper and deeper, and the bottom of the pit becomes the inner organ of hearing. The catarrhally afflicted nasal membrane is also skin. And curious to say, the brain and spinal cord—the places where we keep our insanity and nerve diseases—are also formed from that same layer of embryonic cells which gives rise to the skin. And the skin itself is the most usual seat of cancer.

So we begin to see a relation between all these diseases, and to speculate whether their *real* cause must not be some inherent weakness, some failure in vitalization, of that first formed mass of embryonic cells from which all these increasingly diseased tissues arise? We may accept the causes offered by doctors, as contributory or superficial; but it is time to look deeper. And if the doctors *would* look deeper, and combine to tell the public the results of their looking, they could do more in the cause of health in a year than a century of prescriptions. They know of the enormous waste of vitality, in and out of marriage, cloaked by the silence of both the professions that might speak of it, and by consequence regarded as "natural" and necessary, which robs the developing cells of the life-force they need for their growth, often robs them years in advance of their existence. They have to begin business under-capitalized and half bankrupt.

When will the doctors read physiology with open eyes and tell us something about it? STUDENT

Spontaneous Generation

IT would seem that spontaneous generation has at last been persuaded to occur. Radium is of course responsible for the success. A Cambridge scientist, who has been experimenting for ten years, speculated that the forces radiated by radium might serve to awake sleeping monads into active life. That of course is not his phrase. He speaks of spontaneous generation, but unless he has induced *nothing* to create itself into *some things*, the term monads for those not-yet-some things seems a good one.

Diluted meat extract was sterilized by sufficient heat to destroy any forms of life now known. This was done in a sealed tube, under pressure so as to prevent it from bursting. Within this tube was also a

fragment of radium, contained in an inner tube.

After a fortnight it was opened and the contents, under very high magnification, showed extremely minute spheres ("diplococci") of living matter, nucleated, growing, and multiplying by subdivision. Other tubes, similarly treated but without radium, showed no change.

The experimenter suggests that these little bodies are the primitive form of life developing after countless generations into the bacteria we know, and that in the far past, when life began, this was the way of its beginning.

Science will have to come to the ancient theory which made the universe consist of countless monads ever evolving onward in response to the call. It seems that radio-activity, whether proceeding from radium or the sun or moon or whatever else, is that call for a certain stage. It is light, though to us invisible, saying: Awake; come up higher. And it is Light which is always calling to the soul of man: Awake; come up higher. May it not be another degree of the very same thing? STUDENT

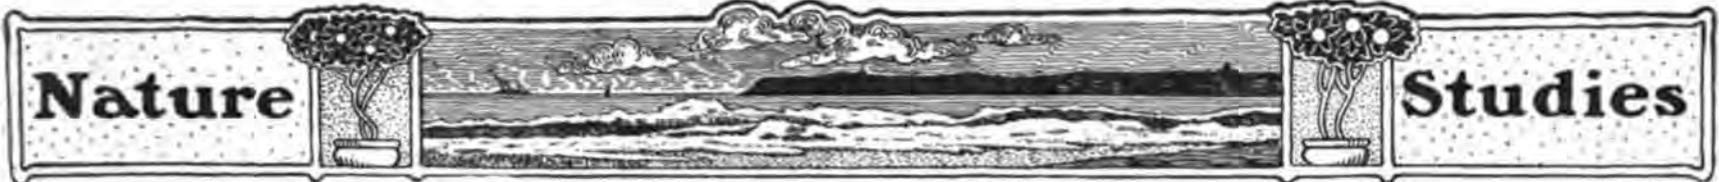

A Season's Keynote of Disease

PHYSICIANS notice that often the various diseases which prevail during a season or a year are marked with certain types of disability. It may be that catarrhal conditions affect the various mucous membranes, or neuralgic pains may be a marked feature of a season's general sickness, or there may be a tendency for even ordinary diseases to take on a septic type. The winter and spring of 1905 has seemed an unusually trying season for the nervous system. Among children the type of meningitis known as "spotted fever" has been wide-spread and in some places epidemic and severe. Coincident with this overwhelming of the child's impressionable nervous system, there has been an unusual number of cases of nervous exhaustion among adults. Neurasthenia is common enough at any time in these days of high-pressure living. Periodically, however, an increased number of busy, helpful, wholesome persons seem to reach a climax of nervous endurance in activities which had not previously been too severe a tax.

In treating these cases of "Americanitis," the use of nerve restoratives for the irritable and exhausted nerves is best supplemented by an entire change of surroundings. Life has become so one-sided with specialties and superficial activities, that these nervous patients show that the uneven wear and tear leaves the nervous system threadbare in spots. After a preliminary treatment of simple nourishing food and much sleep and rest, the nerve stability is best maintained by activities and interests along wholly new lines. Certain elements in the complex modern nature seem to be in a state of starvation, with the result that a physiological strike is ordered in the organization and a more just recognition of rights demanded. L. R., M. D.

Brain and Thought

THAT the brain cells are in some way fact-holders seems certain. But that each cell holds or corresponds to one fact can hardly be true. Some men must surely know more facts than they have brain cells. Mezzofanti, for instance, could read, write and speak in fifty languages. How many words does that imply? It is impossible to estimate, but surely more than he had cells. A contributor to a contemporary relates that Prof. Holden, he himself, and a friend, went through *Webster's Dictionary*, counting the words of which they knew the meaning. Each of them reached somewhere about 35,000. To these must be added myriads of other facts connected with their daily life, sciences known to them, history, and the matters of general education. One can hardly make even a guess at the total number. Probably the brain cells are doors to stored facts, but have no more relation to the number of facts stored than the number of doors in a house corresponds to the number of things in the rooms to which the doors give entry. The rooms, or rather the contents, may be in an ultra-physical world of substance; and memory the mind's power to look therein. At death the contents of all the rooms appear to be turned out into the central hall for a final inspection, so that whatever is of permanent value may be selected and taken on as part of the soul's luggage; whilst the rest, which is nothing but useless rubbish, goes to the ash-bin. STUDENT

A Flower That Beautifies Bare Places

THE dainty pink floweret, called the Canchalagua, that now covers field and hillside, teaches a real heart lesson.

Among the coarse growths of shrub and scrubby bush, it springs up in luxuriant profusion, as if its heart were the centre of infinite giving.

These plants select for their temporary abiding places the spots most hidden and barren of beauty. These they light up with a rich glow of warmth, as if glad to grow for the use and delight of man.

And so these myriads of dainty flowerets from Nature's heart bestow bounty, beauty and cheer, wherever they appear.

R. B.

Robin's Nest on a Train

A CONTEMPORARY mentions the case of a robin which has built its nest on one of the car trucks of a train that takes a daily trip from Providence to Blackstone and back. Despite these frequent journeys the bird finished the nest and laid eggs in it. Things like noises and jars do not seem to affect such birds, and safety is the main requisite.

E.

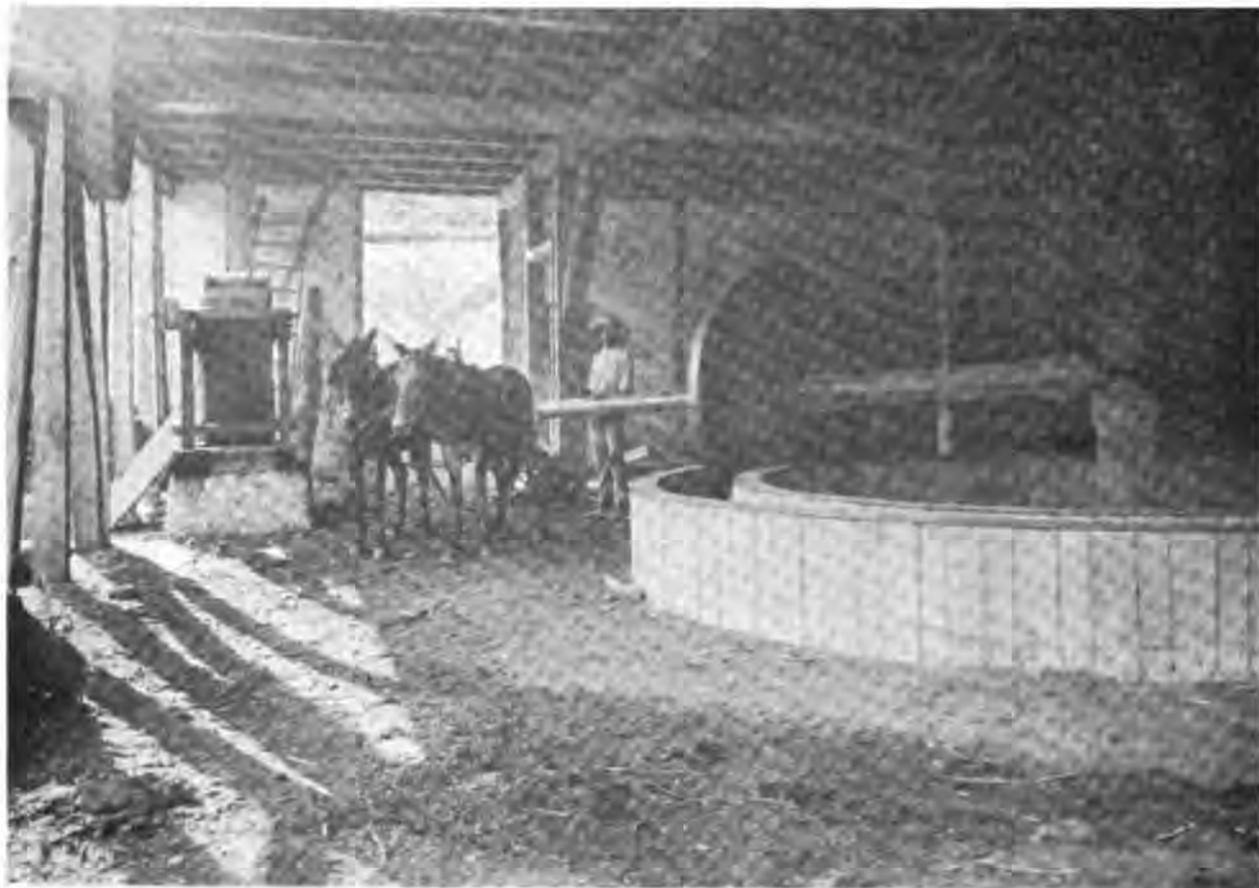

Fishing by Telephone

WITH regard to the invention, mentioned recently in the "Nature Notes," for detecting the presence of shoals of fish by means of a combination of telephone and microphone—further particulars state that the kind of fish can also be determined. The different sorts, when passing the submerged transmitter, produce in the receiver different kinds of sounds, according to the beat of the fins and the whistling of the water through the gills. Thus herring, for instance, can be distinguished from cod.

H.

Present at a Submarine Eruption

IN connection with the appearance of a new island in the Japanese seas, it may be remembered that it is not infrequent for islands to suddenly appear in the ocean, and also to as suddenly disappear. Sometimes this has been witnessed, as for instance, in the summer of 1783, a volcanic eruption took place about thirty miles from Cape Reykjanaes on the west coast of Iceland. An island was built up, from which fire and smoke continued to issue, but in less than a year the waves had washed the pumice away, leaving a submerged reef.

HULLING COFFEE-BERRIES IN CUBA

Lomaland Photo and Eng. Dept.

In 1831 Graham's Island was thrown up between Sicily and Africa. It reached a height of 200 feet above sea level, or 800 above sea-bottom, and a circumference of three miles; but it was similarly demolished. In 1811 an island was formed in the Azores, reached a height of 300 feet, and was destroyed.

These were hills of accumulation; but sometimes the sea-bottom itself has been raised, as at Santorin and Therasia in the Ægean Sea. The *Pall Mall Magazine*

relates the following experience of men who assisted at such a scene:

Our ship was out twenty-three days from Manilla to the Sandwich Islands. It was a silent, dead-black night. The lead showed deep sea. Suddenly we felt as if we had grounded. The mate suggested a sunken wreck, but the skipper stuck to the theory of earthquake. Subsequent events showed that he was right.

Daybreak revealed a low and misty sky. We lay as if becalmed in the midst of an oily sea, strangely discolored in patches. Suddenly the water trembled. I can use no other word. The ship rolled, and in the distance rose a huge, balloon-shaped mass of vapor, steam or smoke. There was not the slightest sound, but a long line of chafing water stretched across the streaky calmness. Then the vapor settled over all, and we could hear but not see the seething and pouring water all about us. The captain ordered a bucketful to be drawn up. It was hot, and smelled like gas works.

"H'm!" remarked the old skipper, as he sniffed it. "They're poking up a new continent. I wish we were out of it."

The air grew more oppressive every moment. The vessel gave a gentle side roll, and word was passed that we were aground. Over went the lead and came up covered with blue, oozy mud. We were wallowing in sludge, the darkness was pall-like and the atmosphere suffocatingly close. Then the air was rent with reports awful to hear in that blackness. There were three of the deafening, roaring blasts, and all was again still.

When the light came, red and unnatural, a strange sight met our eyes. It was as if the bottom of the Pacific was laid bare. We were helpless in a sea of thick mud. The sulphur fumes were choking, and we had to take refuge below. Hour after hour we gasped, facing the probability of a death by suffocation. Suddenly we felt that we were afloat. Whatever the bank of mud that held us, it had disappeared, and after a time we made our way out of the gruesome spot.

When we reached Honolulu the crew deserted. "There's no luck in a ship that has seen the bottom of the sea," they said.

DIVINE HARMONY INSPIRED BY NATURE

WORDSWORTH

THAT blessed mood
 In which the burthen of the mystery,
 In which the heavy and the weary weight
 Of all this unintelligible world
 Is lightened:— that serene and blessed mood
 In which the affections gently lead us on,
 Until the breath of this corporeal frame,
 And even the motion of our human blood,
 Almost suspended, we are laid asleep
 In body, and become a living soul;
 While with an eye made quiet by the power
 Of harmony and the deep power of joy,
 We see into the life of things.

Personal limitations must not obscure the possibilities of the hour, and the criticism of the cynic should not be allowed to paralyze our efforts.—*Katherine Tingley*

"K A whawhai tonu, ake, ake, ake," which, being translated, reads, "We will fight forever and ever and forever." This was the ancient Maori battle-cry.

The Women of the Maoris

race. This the young Chief did, with what results any who care to investigate from other than the mis-

itary standpoint, can easily ascertain.

To those who are content with seeing only fragments, and who have no power to relate fragments to the great whole, these words must seem the reverse of prophetic. To the few who are able to look beneath appearances to that hidden place where dwells the truth; to the few whose love for humanity makes clear many things that to others are seen but as through a glass and darkly, the words are prophetic in the deepest sense. It is true that the Maoris, within the few decades since their conquest by "civilization," have dwindled in number and in moral strength. Yet, beneath it all, the few who can judge of inner conditions, recognize a sustaining force, and those who have studied the question most closely declare this to be due to the influence of Maori women.

missionary standpoint, can easily ascertain.

For the women of the Maoris Katherine Tingley always expressed peculiar sympathy. She said, many years ago, "We shall help them and they shall help us. We shall yet clasp hands across the seas." It was some years later that she visited New Zealand when on the first Crusade around the world, and there met some of these women face to face. It was at that time, also, that she met the young Chief of the Maoris. Though much that occurred during that conversation has not yet been written, it is known that he listened to the friendly voice, which, in its message to his disheartened people, poured new courage into his soul. "You are not pagans, not savages," she said, "as a few so-called helpers have tried to make you believe; you are the scions of a mighty race. Today your real history has been obscured; your wisest priests know but little of the whole great truth. But the future will reveal it all and will show you why I appeal to you to call again upon the greatness still left in the souls of your people. You are descendants of the ancient Egyptians; you are greater than you know. Build upon that knowledge; take it back to your people, the knowledge that between you and the ancient great races of the world, such as those of pre-historic Central America, there exists a secret and imperishable, though as yet unrecognized, link."

The larger significance of this visit was revealed when, a year later, Katherine Tingley founded the International Brotherhood League, one of the objects of which was "To bring about a better understanding between so-called savage and civilized races, by promoting a closer and more sympathetic relationship between them." It was then that Katherine Tingley declared that she would yet reveal in all its purity the heart tie that actually exists between civilized races and certain finer types of those known today as "savages," such as the Maoris. And it was at this time that she said of the Maori women, "Their faces show, to those who can read discerningly, that to them must have been handed down some knowledge of the secret of physical life and health. They must have an intuitive knowledge, not only of the laws governing physical life but moral life as well. They have not had for centuries the advantages of what we term 'education.' Yet many show in their faces the heart force that most of our educated women have lost. The Maori women are a saving force among their own people. Studying their faces and thinking of the centuries that have passed since they dwelt in their traditional *Hawa iki*, it is with a sense of surprise that one notices how much they resemble, in contour, the finer Egyptian types. Would that they might be saved—and through them the Maori race—from the pernicious influence of certain so-called helpers of humanity who come with the white man's vices in one hand and dogmas in the other."

Katherine Tingley in that conversation urged the Chief to call about him the young people of his tribe, the young men and the young women, and to show them the folly of being led away by the vices of "civilization." She urged him to revive the ancient Maori customs, ceremonies and games and to keep sacred, above all, the religious traditions of his

According to Maori tradition the people anciently dwelt in the sacred land known as *Hawa iki* and in one part of that land, in a place known as *Mua*, stood the *whare-kura*, or Sacred College, where mythology and history, agriculture, medicine, mathematics, the arts and sciences, were taught to the sons of the people. The school itself was built by the priests, and it stood facing the rising sun. In this school were the neophytes educated, their teachers being the priests of the people; but over all, as their guardian, was a woman known as the "Sacred Woman," whose duty it was to guard the young students from evil during the period of their study. Some hint of the work and philosophy of this ancient school may be gained from the fact that it was not uncommon for neophytes to bind themselves to each other by vows of brotherhood, of mutual affection and eternal love.

Today almost the memory of the higher education of ancient days has been lost. A large proportion of the young men of the tribe have been

affected and debauched by the white man's example. The beautiful Maori arts and crafts are passing, the magnificent carvings are today but a relic of an almost lost art. But some Maori women still cling closely to the ancient crafts and traditional beliefs of their people, disturbed and dismayed doubtless by the attempts made to replace heart-truths by dogmas, but in their innermost souls not shaken. Grounded are they in belief in one supreme God, in reincarnation, in the existence of a "heaven-world," in a future life and in Eternal Justice.

And the Maoris are advancing. They have made undreamed of strides within the last few years, and one evidence of the reason for their new courage and new determination we can read in the message sent to Katherine Tingley by the Maori chieftain, at the time of the great congress held in Point Loma, April, 1899. The following is a close translation of the message sent, which was, of course, in the language spoken by the Maoris themselves:

AOTEAROA, NEW ZEALAND, Feb. 18, 1899.

An Affectionate Greeting (literally, *Sigib*) to Katherine Tingley, the Real Leader and Permanent Head of the Gathering together for the Universal Brotherhood (literally, *the causing to become one*) of the whole of the Races of the World, also called the Elder Brotherhood and the Younger Brotherhood of the Races of the World, under one Parent.

Salutations to you, Dear Old Lady (*Ekue*, a term of veneration and love used only with women of high rank):

Great, indeed, are the congratulations which proceed from us to you and our love to you and to our Elder and Younger Brothers of the whole World, assembled on the 13th day of April at Point Loma (*Looma*) at the Great School for the Revival of the Ancient Mysteries of the Priest Adepts who really Knew in former times. Salutations to you all; to you, our Elder Brothers and our Younger Brothers assembled there at Point Loma, America, to arrange for the Salvation of downcast Races of the whole Earth. Very great indeed is the love that proceeds forth from us to you, and very great is our rejoicing and congratulations at the good news, at the great news of your great work, of your strong work, of your strenuous work to assist the Races of the whole Earth, that they may receive the word (*message*) of the Great Enlightenment, and the enlightenment of truth and justice and of liberation and of the solidarity of discouraged humanity. (Note: It is difficult in English to convey the meaning in the intense force of the Maori words. *A ka whakapuina uga bibi* means that every race shall come together and cast all the burdens down in one heap to be shared or borne alike by all.) This is the Heartfelt Word (*Message*) of the remnant of the Maori race. The Aboriginal Race of the North Island (mystically *Aotea-roa* is the New Island or Dawn of the New Day; *Waipoumu*, the water of the green-stone, is the South Island, type of the everlasting Past.) Let us all be Very Strong, one united Body, to save all races sitting in Darkness; to consolidate or unite them under the Bond of Justice, that we may act to each other as Elder and Younger Brothers. Let us be exceedingly Strong. Let us be exceedingly Strong in everlasting Power for ever, and for ever more, that our efforts may become renowned for ever and for ever more.—
From T.—P.—, New Zealand, on behalf of Ngatipoua Tribe.

Macaulay once prophesied that some day a New Zealander would be found standing upon the ruins of London Bridge, sketching the yet more dilapidated ruins of St. Paul's. Was the vision before him that of the future Maori? To believe so would require no great stretch of the imagination. There is something Divine in the Soul-perseverance of this neglected and maligned race, something godlike in its patience and quiet faith. STUDENT

The Work of an Empress

ONE of the recent activities of the Dowager Empress of Russia contemplates the erection of a home for children's nurses, who, in their old age, have become destitute. It will be erected on the coast of the Gulf of Finland and it is said that it is due to the patient self-sacrifice of a certain woman who was head-nurse to the children of the present Emperor. According to time-honored custom, Nicholas II always presented this nurse with articles of jewelry and a goodly sum of money upon each birthday and, a few years ago, when making the customary present, he remarked "You must be a rich woman by this time." The nurse replied that she had nothing besides her clothes and a few articles of jewelry; and upon the Czar inquiring the reason she explained that in the Smolensk province she had no less than four bed-ridden aunts, who would be absolutely destitute except for her support. For nearly a decade her earnings had gone toward keeping the old aunts alive and in comfort. All four of these had been in their youth children's nurses. The Czar had them removed at once to one of his many homes and himself provided for their maintenance. The work now undertaken by the Dowager Empress was the next step.

MAORI WOMEN

PROBABLY no relationship has given rise to more litigation than the relationship of parent and child, particularly where touching upon the guardianship of children. In England the husband alone had power to make such an appointment down to within a very recent date. The mother could by will appoint a guardian for her dog, but not one to take care of her own child, even though her husband were dead. All this was altered by the Guardianship of Infants Act, which declared that on the death of the father the mother alone shall be the guardian of her child, provided, however, no other guardian had been appointed by the father. If, however, one has been appointed by him, the mother becomes, with this person, joint guardian; certainly a tremendous step in advance of Eighteenth century laws and ideals!

AT a recent civil service competitive examination for the position of bee-keeper in one of our New York parks, one young woman candidate, a school-teacher, headed the eligible list with a percentage of 97. She had made a study of bee-keeping and was an expert. But the appointment was given to a man who passed many marks below and the young woman was calmly notified that she could not be appointed because of her sex! *O tempora! O mores!*

Is the Hon. David J. Brewer a Prophet?

HONORABLE David J. Brewer, Associate Justice of the United States Supreme Court, in an address recently given before the graduates of Vassar College, said:

In this land we have no privileged class that comes to its opportunities by inheritance. You are a privileged class for you have had the privilege of a collegiate education. Do not give yourselves entirely to the enjoyment of literature, leaving the republic to take care of itself. You owe to your country the duty of serving it with all the advantages of your education. Who shall say that, before grey hairs shall come to your heads, a woman like Queen-Victoria shall not sit in the White House at Washington to glorify this nation as Queen Victoria glorified England?

THE CHILDREN'S HOUR

What Is True Freedom?

"MEG!" said Kathleen, "once you told us that great people always love freedom."

"Yes," replied Meg, "it is because they live near, and sometimes in, their true, beautiful selves. You see, as people become unselfish they are really blossoming—just like flowers—into that part of their nature that is free. It is truly free because it has the power and knowledge and the will to be so; there is no need for it being selfishly dependent on any one else. And it longs to give us this freedom and power and knowledge, so it guides and teaches us by awakening love and other feelings in our hearts. And one of the feelings it awakens, so as to teach us, is the feeling of—*freedom!*"

"Freedom!" echoed Kathleen.

"Yes, freedom," repeated Meg, "because from it springs honor, and that impels people to rely on themselves, and do things for themselves. Then they begin to use their own intelligence, and after that they value two things that help make them fit to know more about their true natures. The two things are *energy* and *time*; and this urges them to do their own work, their own duty, so well, that it will not take another person's time and energy to do it over again.

"And they begin to know, too, that doing one's own duty well, saves a great deal of trouble and confusion and avoids a very great danger; because then, you have no time to interfere with any one's else duty.

"You know," said Meg gravely, "it might keep them from using all their intelligence, and then they would not get to know their own strength and power and will! And that would be dreadful!

"And something else happens," she continued brightly, "from using intelligence and doing things for oneself, some of the truths that great people have taught and written about become as clear as crystal—and as beautiful! All the great people that have ever lived, no matter in what age, or in what country—the language they have spoken has never made any difference—all arrive at knowing the same thing. They know, that the only true way to live is to love a simple life, to have true Freedom within the heart."

ANNIE P. DICK

Now We Are Older

THIS picture was taken long ago when we were small but we asked the editor to put it in again so you could see what we were like then. That was one day when we had all our Christmas presents. My doll was the biggest, so we called her the Mama and we sat her on the rug all by herself, as you see in the picture. We have all our dollies still and yesterday we had them out for a game. Mama dollie did not seem nearly so big as she used to, but her dress was just right for her. But I cannot wear the dress I had on in the picture any more, nor can Alice, nor May, for we have been growing all the time.

We have been to school every day and learned how to read. Katie has a big history book and May knows all the countries in the world. Even little Robert can spell "Brotherhood." We like mental arithmetic.

You know that means seeing the sums in your head; and we can do even the hard numbers as quickly as our teacher can say them.

When we sing "Lullaby" in the Rotunda we have some beautiful big dollies, that really shut their eyes, and we hold them in our arms; but then they are not like our old dollies and we do not like to play with them so well. We were just having a lovely game and pretending our dollies were gone to sleep when Katie came in. Katie is the biggest of us all and she marches with the big girls now.

"Dollies cannot read books and they don't grow a bit, but always stay just the same. That is where its nicer to be a little girl."

Katie says that, and I think so, too.

RUTH

"TRUE FREEDOM can only come to those who work in harmony with the Law."

ONE CHRISTMAS DAY IN THE RAJA YOGA SCHOOL AT LOMALAND

AMERICA

Written in 1832 by
SAMUEL FRANCIS SMITH

MY country, 'tis of thee,
Sweet land of liberty,
Of thee I sing;
Land where my fathers died,
Land of the Pilgrims' pride,
From every mountain-side
Let Freedom ring.

Tante's Story of the Stork

"A STORY, a story, Tante, please, before bed-time," said Jamie and Anna together.

"A very short one, children, or you will be late to bed, and then not wake up with the lark in the morning," said Tante.

"Oh yes, we will, Tante, it is such fun to get up with the birds," said Jamie.

"The robins came to the window and sang, this morning, and woke me up," said Anna.

"In Germany the little children sing to the birds," said Tante. "In the spring time when the storks come, the children greet them with songs, and the older people go around saying to each other, 'The storks are here—do you know it?' just the way we say 'Merry Christmas.' Every one is so glad and happy to have the storks come.

"The stork likes best to build his nest on the gable end of the house, where people live. No one

would think of harming the stork for he brings good luck. Every year he comes back to his old nest. Early some morning he is seen, and then when he is sure things are all right, he brings the mother stork. And then how he does take care of his family! He stands guard like a sentinel over the mother stork at night, and in the daytime he helps to feed the five baby storks and teach them how to take care of themselves. They learn how to go to the meadows and marsh lands for food. They can easily wade in the water, they have such long legs. As tall as little children—three feet high—the

storks grow. They have white feathers all over the body and long neck. Part of the wing is black and the legs and bill are bright red. In September the stork takes his family to a warmer land, across the sea to the River Nile in Africa. Will that do for a story?"

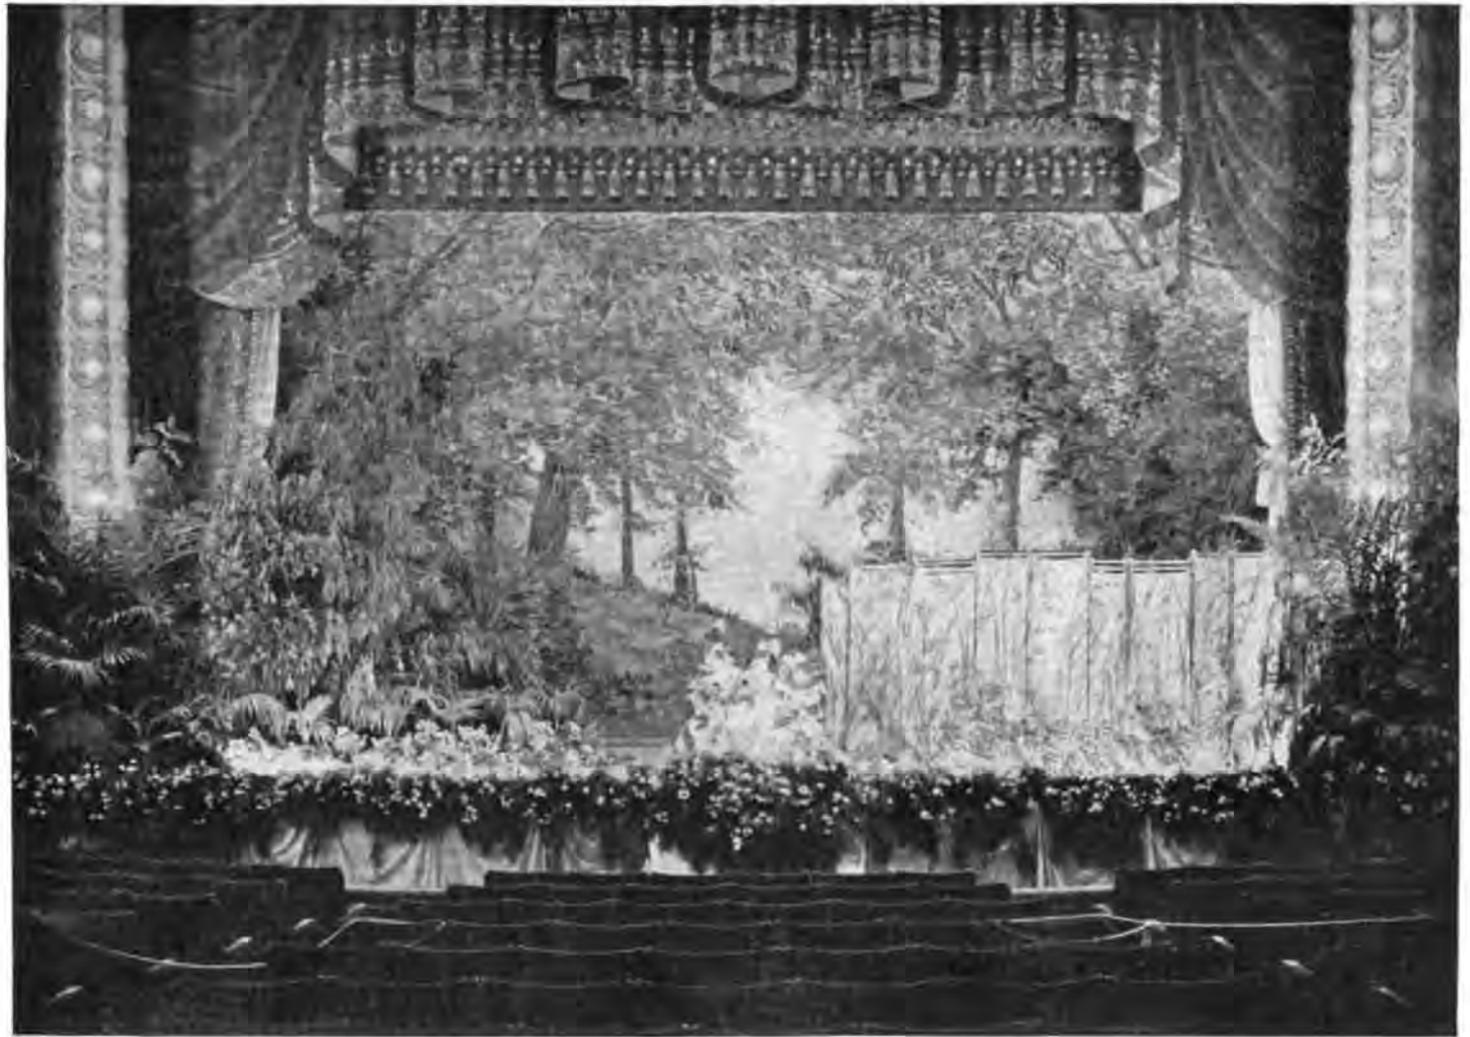

"Yes, yes, Tante, thank you. And now we must say good night."

E. W.

RECENTLY in San Diego, California, three bright little children, whose father and mother were beginning to build a new home, laid the corner-stone of the dwelling themselves. The ceremony was very simple and pretty and a step, it would seem, toward that ancient conception of a home as a Temple of all that is purest and best in life. A home so consecrated must always seem to these children as something more than just a place to eat and sleep in, I am sure. H.

THE THEOSOPHICAL FORUM, IN ISIS THEATRE

A LARGE and appreciative audience greeted the Theosophical students from Point Loma, at the Universal Brotherhood meeting at Isis Theatre, last Sunday evening. The musical numbers were, as usual, well selected and delightfully rendered.

The first paper of the evening was by Miss Elisabeth Bonn, her topic being: "The World's Regeneration." In part she said: "It is true that 'Rome was not built in a day'—it is also true that 'in the twinkling of an eye man may put on immortality'—for the relation of the higher nature, and the resolve to live in it, to raise the lower nature, can come in a moment—and then follow days of test and trial, years of upbuilding the character and purifying the personality, that we may prove its truth and strength. And the higher and stronger the resolve, be sure the more exacting will be the proof.

"O, the great, patient, noble souls who day by day and year by year have built and hoped and believed, most often with none to help, with none to encourage! It is always an inspiration to think of these great ones of earth, who have fought the glorious fight—with self and other foes—that they might not fail in their resolve. And when I say, to fail—I do not mean what the world calls failure—that is often for these warriors a victory of the soul, wherein they grew too great for this world's prizes—I mean what William Q. Judge meant when he said: 'To fail would be nothing, but to stop working for humanity would be awful.'

"Surely you must feel that the world needs regenerating. One need only look at the daily papers, at the horror, the crime, the suffering, the want that are told there—one need only look about them at the lives of acquaintances, friends, relations, at the failures, the selfishness, the ugly faults, the weak and diseased bodies, at the aching hearts we see—one need only look into their own lives and hearts, at the disappointments, the broken hopes, the lost ideals, look back into our childhood, which was pure and holy and might have always been so if the world had remained to us as beautiful as we thought it—and then say if it does not need regenerating, and if we can in any honor or honesty of conscience, free ourselves from the responsibility, the sacred trust, of helping to re-

generate it. Who that is anything more than a clod would wish to shake off this responsibility, and take life lightly, carelessly, selfishly, while the world cries out in pain! Is there one among us who has never had the desire to help another human being? And is not that desire itself a call to arms, to put aside self, and with all that is within us, battle gloriously for the world's redemption?

"This message of the world's regeneration is what Theosophy has brought, and those who heard the call and answered it are steadily working to that end—and they will reach it, for they have will and faith and a great purpose, and a Teacher who knows not what discouragement is."

Mr. W. Ross White read a paper on "Hypnotism," pointing out the dangers that lurk in the path of him who would seek to acquire the power to influence and control the minds of others without their knowledge, or against their will, by means of thought suggestion. "Hypnotism," he said, "is not the same force that makes the character of the self-conquered, self-liberated man, in whom the spiritual will is active. In such a man the lower nature is controlled by a higher will, so impersonal in character as to seem but the evidence of the universal law of the fitness of things. In him this sense of the fitness of things is so continuous that there is no opening by which another's will can enter into his mind to influence him nor is there any moment when a personal desire can get such control as to make the man the victim of his own passions or ambitions. Such a man will be anxious to help others to gain their freedom and become self-mastered, and will have no desire for the vulgar triumph of a treacherous victory over an unguarded mind."—*San Diego News*

Theosophical Meetings for Sunday Nights

Public Theosophical meetings are conducted every Sunday night in San Diego at 8:15, at the Isis Theatre, by the students of Lomaland.

Theosophical subjects pertaining to all departments of thought and bearing on all conditions of life are attractively and thoughtfully presented.

An interesting feature is the excellent music rendered by some of the students of the Isis Conservatory of Music of Lomaland. Theosophical literature may always be purchased at these meetings.

Art Music Literature and the Drama

The Increasing Number of Modern Musical Prodiges—What of the Future?

FROM the mysterious bosom of nature have come forth from time to time geniuses who have showed remarkable precocity.

Mozart was a musician of very rare accomplishments at the age of six; Beethoven was a "wonder child;" Schubert, Chopin, Mendelssohn and Rubinstein were musically promising almost in infancy.

Of late the number of prodigies is increasing with ominous rapidity. From all countries, notably, Germany, America, and Hungary, we hear of "wonder children" gifted with musical genius. There are dozens of the type of Josef Hofmann, Fritz Kreisler, Stefi Geyer, Moritz Rosenthal, Jean Gerardy, Kubelik, not to mention the children von Reuter and Elman, any one of whom would have been considered incomparable a century ago.

Richard Strauss, also phenomenally gifted when quite a boy, is today the greatest living composer. It is said that he surpasses Richard Wagner in versatility, nobility and depth of conception. When quite young he boldly stepped out with his remarkable ability in new and unexplored fields of human emotions, overthrowing old forms with masterly decision, and building anew with utmost freedom and that certainty which brooks no limitations to his grand ideas. The critics are a-gog over his innovations, but they are compelled to acknowledge his creative ability and the cultured public clamors loudly for his recognition.

There is Florizel von Reuter, the American "wonder child" of ten years. Of him writes a musical paper:

It is a problem, æsthetic, moral and social, this "wonder child" who flits across the contemporary canvas, a bewildering apparition, an upsetter of traditions, a deranger of critical values. Florizel who played at Carnegie Hall in New York, Tuesday of last week (February 4th,) that little cherub with the curly hair and conquering air of a virtuoso—what can we say about such a boy? Obviously the best advice is: "Take his fiddle, hide it, let him go into the fields and grow up with the birds, and trees." But advice is not always practical, and the youngster seems so sound in mind and limb, his cheeks so ruddy with health, his every movement indicative of vitality; he enjoys fiddling, he is not happy unless he fiddles, so let him fiddle to his heart's content. Is it healthy for a lad to bare thus the secrets of his little soul? Or is it only a trick of the nerves, the ears, the imitative faculty of a phenomenal being? We don't know. No psychologist knows. The thing is as disquieting as if some wandering Djinn had entered the body of Florizel and directed its every motion. He again astonished musicians with his skill. An army of small boys and girls, accompanied by parents and guardians, were there, and from the rapt attention of the little folk it was evident that many of them were students of music. Then every other grown person in the house was either violinist, 'cellist or pianist, not to omit the vocalists. Thus it will be seen that the audience was a musical one with a vengeance, and therefore, when Master Reuter played those familiar compositions like the Mendelssohn *Violin Concerto in E minor*, the *Rondo Capriccioso* by Saint-Saens, a *Tarantella* by Wieniawsky as an extra number, one-half of the house applauded because they were listening to favorites in the repertory of all modern violinists. The boy surmounted all technical difficulties with marvelous ease, and he accomplished it all with the dignity of a man. Who can solve the mystery of this child's extraordinary genius?

It has never been solved in the case of the other "wonder children." And this is not all. This child of ten years has composed three beautiful concertos for violin and orchestra, orchestrated by himself in manuscript.

Fritz Kreisler, another young violinist, who has been astonishing New York and Boston audiences with his extraordinary technique and the voluminous, rich and mature sympathy of his tone, is said to be equally accomplished as a pianist.

News comes also of a beautiful Mormon diva—to be—with a rose

fresh voice and style and exceptionally mature powers of tone, delivery and declamation.

It would be a long list if we were to name the prodigies who have already risen to considerable prominence in Europe during the last five or ten years; there are so many, and their talents so diversified that it forebodes a remarkable era of musical development in the near future. One of the most remarkable violinists in Europe is the young Hungarian, Arthur Hartman, whose playing is said to eclipse everything that has heretofore been heard.

Of one of the very numerous musical prodigies, a foreign writer has this to say:

Miecio Horsyowski, a wonder boy of eight, who has already composed, even for orchestra; who modulates and improvises, and who, though his feet do not reach the pedals and little hands barely reach an octave, plays Chopin Nocturnes like an artist, which he certainly is, and Bach Fugues and Inventions *à la* virtuoso. He cannot remember the time in his short life when he did not play. He has a magnificent sense of rhythm, and an abnormal finger facility, and a concentration of mind and purpose that many a grown man might envy; but he has more than and above all this, an innate love of and reverence for beauty. And he knows where to find the lovely goddess and make her seen of others. It is impossible to look at this child and not recognize genius of a high order, a genius which breaks forth even in his healthy childish games.

The woods are full of musical geniuses, and many are seeing the light in America. How and whence come they by this ripeness, this fullness of expression? All modern theorists are at a standstill in face of the facts. Heredity does not explain it, other strenuous theories fail utterly to account for such phenomena.

Is it not clear that these prodigies simply pick up the threads of former endeavor in the natural sequence of cause and effect? Some long delayed efforts are evidently coming to fruition. Nothing is ever lost. How many idealists have closed their eyes without having realized the fruits of their labors! What has become of all the work of years of concentration on one subject? Has it been lost? Ah no! what I have accomplished

in the way of mastering knowledge is mine indeed; *it is the only thing that is really mine*. No power on earth or in heaven can take it away. It is preserved by the all-wise dispensation of universal law and sooner or later it must become manifest. Neither has one any more than he has earned but: "Unto him that hath shall be given."

The soul cannot be cheated of what is its own. Gradually our ideals are builded and unfolded out of the mysterious depths of human life and endeavor and thus comes it that we reap every atom of what we have sown.

E. A. NERESHEIMER

MUCH may be laid at the door of some of our collectors of stringed instruments. We can forgive those who use, and encourage others to use, the glorious instruments which they collect, but it is difficult to see the utility of the effort made by others, as for instance by Gillott, the wealthy manufacturer of pens. He was not a musician, and it is a question whether or not he had any close appreciation of the intrinsic value of the instruments in his collection, but at one time he had about five hundred Italian violins and 'cellos, many of them stored away and condemned to utter silence; scarcely a logical way of serving humanity, surely.

IN the search for freedom there is eternal alliance between man and nature, and the voice of sea and wind can shout the battle-cry, as also they can sing the songs of peace, and whisper their dreams of the sunlit times to come.—*Katherine Tingley*.

A GLIMPSE INTO ONE OF THE CHILDREN'S STUDIOS—RAJA YOGA SCHOOL—POINT LOMA, CALIFORNIA

WHAT a comment on our life is the least strain of music! It lifts me above all the dust and mire of the Universe. I soar or hover with clean skirts over the field of my life. When I hear music, I fear no danger. I am invulnerable, I see no foe. I am related to the earliest times and to the latest.—*Thoreau*

Central Office Point Loma California

The Necessity for Action

THE necessity for action is very simple; only those who do the deed will know the doctrine. We never discover the truth about anything by merely talking about it. Theory is absolutely useless without practice, and remains an unproven abstraction. The true philosophy of life—Theosophy—is essentially a *practical* philosophy and it teaches *right action* as the sole and royal road to progress. It does not treat of physical objective deeds, as the *only* action, but teaches that *thought* also is action on the mental plane, and that *feeling* is another mode of action. *Thought* and *feeling* may be looked upon as the hidden activities of a man's nature, the seed and germ of what will later appear in his outward actions, and "by their fruits ye shall know them;" by the visible expression of this hidden action our characters, and the nature of our inner work is shown. And this is only reasonable; we use cotton for the fabrication of cotton goods, and silk for silken ones, and when we feed the machine with one kind of raw material we do not expect the finished fabric to consist of the other; so with ourselves. We form our characters in accord with our hourly thoughts and feelings, and express them in our daily outward actions; how trivial then and paltry must be many of our thoughts, how limited and selfish our feelings, since they find outlet in actions that degrade and not uplift humanity and leave us in the darkness of ignorance. How can we learn the Truth which is Universal and All-embracing, unless our mental, emotional and physical activities are such as enable us to grasp it? This is the task that lies before us for us to achieve.

UNIVERSAL BROTHERHOOD IS A FACT IN NATURE.

We can only individually know this to be the truth, as we think, feel, and act on brotherly lines. There is another aspect of the case, which is serious: we are never for one moment *inactive*. You cannot think of a living human being who neither acts, thinks, nor feels; his feeling towards other beings is either one of love, hate, or indifference, and each state of feeling will produce its fruit in outward action.

The great Souls think, feel, and act towards a definite purpose, their whole lives are given in service to humanity, and so they become wise.

Masters of right action, the book of life lies open before them and they gain true knowledge about man and his destiny. And what do they teach? Each and all—down to the present Teacher, Katherine Tingley—a steadfast adherence to these three things: *right thought*, *right feeling*, and *right action*, for, put into active use, they enable the Soul—our real self—to disentangle itself from the mesh of selfish desires which constitute our lower nature. We abdicate our rightful position as free men, and neglect our lawful duty, taking up the position of slaves and bondsmen to the animal bodies in which we dwell, when we permit the selfish, ignorant tendencies of our personal natures to guide our actions to the resulting misery of ourselves and others.

LAMPS UNTO THE FEET OF MEN.

There is not the slightest use in sitting down and grieving over the misery and wrong-doing in the world. If our hearts are touched by the pain of our fellow-beings, then let us set to work to reform ourselves, and each thought, feeling or act for brotherhood will lessen the sum of evil; each evil one increase it. Each man or woman who insists on his or her divine origin by soulful action is a lamp and a guide to the feet of brothers of less vigorous growth. Thus great Teachers can say with truth: "I am the way, the truth, and the life," and "No man cometh to the Father but through me," for they are identified consciously with the Christ-Spirit that dwelleth in the hearts of all men. It is only through making manifest our own inner God by right inner and outer action that we can fulfil the command of the Teacher of Nazareth: "Be ye also perfect." "The kingdom of heaven must be taken by violence," we are taught. To assert our divinity needs constant active effort, and he who conquers himself is greater than the taker of cities, because he is master over the evil forces of his nature, and becomes Godlike in his tenderness, courage, compassion, and knowledge. Hence his power to help; such an one has eaten of the fruit of the tree of knowledge of

good and evil, and has consciously chosen to ally himself with the Powers that work for righteousness. He has become part of that army of Light to which the Soul of Humanity belongs. It is in the power of each one of us to choose to walk aright, and unselfish action *alone* will unshackle our fetters and show us the true purpose of our existence and the real joy of life. STUDENT

The Advent of the Golden Age

IN all the stories and legends of ancient civilizations whether in the East or West, no matter how far apart they have been in time or place, there is one great similarity, which in itself is significant of the truth; and that is *the fancy of the race commenced with a Golden Age*, an age of purity, prosperity and happiness, in which there was no misery or wrong. Then life was joy and full of love and devotion to the welfare of all.

Divine men governed and taught the people perfectly, as wise fathers and elder brothers. In the childhood of the race, in its infant days of innocence and peace, it had the priceless truths taught to it in every department of life. These have never been wholly forgotten, though they have been misunderstood, mistaught and misused for ages.

HUMANITY'S DIVINE INSTRUCTORS

Music, sculpture, painting, the drama, architecture, and all arts had their Divine instructors, who imparted to the infant races the true meaning and purpose of them.

Religion was not then a separate profession. As all life was pure, innocent, happy and true, real religion entered into every thought and act, for each thought and act was the outcome of Divine instruction. Then, as a child has to grow out of its infant state and begin its own individual experience in life for the purpose of self-evolution, so humanity itself, and the great races of which it is composed, have naturally evolved on similar lines. Theosophy (the truth about life, that has been *kept pure* throughout every age and race by the Great Helpers of Humanity) is the teaching of the Golden Age, and it demonstrates to us the truth of these stories and legends of the early races of mankind.

THE NEW RACE-CYCLE

Theosophy shows that humanity has lived on earth for an immense period of time, but has practically only completed a part of its earth life; that there are still many races yet to be born in higher and nobler forms of civilization, and that we are now at the beginning of just such a new race-cycle. Many of the souls at the present time alive on earth, are the pioneers of this *new race* which is destined to take the lead in human affairs. Every new race has its periods of birth and infancy. In its infancy it has its Golden Age of purity, prosperity and happiness, receiving in its turn the great truths of life from its Divine instructors. This time also corresponds to that recorded in an ancient Scripture that says: "Whenever there is a decline of virtue and an insurrection of vice and injustice in the world then I (the Supreme Truth) incarnate from age to age for the preservation of the just, the destruction of the wicked, and the establishment of righteousness."

So this very insurrection of vice and injustice that we are now experiencing in the world, is a sure sign of the death of the old life and of the disappearance of a civilization built largely upon selfish lines. But with this is also to be seen the birth of the new and nobler life based on unselfish brotherly lines.

THE GUIDING STAR

A race can be divided into four ages: the Golden, Silver, Copper and Iron Ages, each showing different stages of evolution. The Iron Age is the opposite of the Golden Age, and represents the death of the race, as the Golden represents the birth and "perfection" of all humanity. It is the souls that have self-evolved and progressed in the Iron Age that begin the new race. So, each great race goes a step higher than the last.

To those who love the good, beautiful and true, a glorious time of joy and happiness is dawning, for they will see Right prevail. Point Loma, the heart and nursery of this true life, will extend its beneficent influence wherever a germ of good is living, and will be the land of Light for all that is Just and True, the *Guiding Star* of the New Race. T. W. W.

Students'

Path

GREAT ISSUES

JAMES RUSSELL LOWELL

O TRUTH! O freedom! how ye still are born
In the rude stable, in the manger nursed!
What humble hands unbar those gates of morn
Through which the splendours of the new day burst.

We stride the river daily at its spring,
Nor, in our childish thoughtlessness, foresee
What myriad vassal streams shall tribute bring,
How like an equal it shall greet the sea.

O small beginnings, ye are great and strong,
Based on a faithful heart and tireless brain!
Ye build the future fair, ye conquer wrong,
Ye earn the crown, and wear it not in vain.

The Influence of the Great International Centre of Theosophy at Point Loma

NO wonder that Point Loma is proving "a revelation to the peoples of the Earth"! For what are the principles of Theosophy, and wherein does the theosophic life differ from the life as ordinarily lived in the world? I think the case is not overstated if I say the life lived in that wonderful city upon the hill, overlooking the peaceful waters of the Pacific, is the *exact opposite* of life as lived apart from theosophical teaching. Point Loma is a place of peace and harmony, a community where Brotherhood as a *fact* in nature, and the *Spiritual Unity* of Mankind are recognized and *acted upon*. Each works there for the good of all, and there is no room for ambitious love of power or place. Under the wise guidance of Katherine Tingley each finds him or herself set at the work that will prove of the greatest benefit to all. People of many nations are gathered together at this wonderful place, all united in object and aim "to form the nucleus of a Universal Brotherhood," that the warmth and light of the "Heart Doctrine" may lighten the sorrow of the weary waiting world.

There is nothing *dreamy* or *speculative* about the practical application of Theosophy in action, so we find at Point Loma the Sciences, the Arts, and Industries, all woven into the strenuous life of Katherine Tingley's students.

An ideal life is unfolding before our eyes! Such a life as should be lived by human beings, for has not a human being the possibility locked up within his nature of becoming Godlike? "Ye are Gods," say the great teachers, those more learned in the mysteries of life than we are; and that is one of the teachings of Theosophy—the appeal to the divine in each—that is in practical application at Point Loma. Already the Raja Yoga School there is of world-wide fame. "Let me have," said Katherine Tingley some years ago, "a child from the time of its birth until it is seven years old, and all the temptations in the world will not move it, for it will have been taught the divinity of its own Soul. This is not a theory, it is a fact."

Katherine Tingley gathered together many little waifs and strays from their infancy who are now at the International Lotus Home at Point Loma; she went to the suffering Cubans and brought children from Cuba; children came from England and continental nations; and all these with the Americans make up an international family. Some of these children gathered together at the great centre are those of wealthy parents, others homeless waifs, but all alike receive the Raja Yoga training and in five years have become "a Revelation to the peoples of the Earth"—five short years!

There are some hundreds of children in Lomaland now, growing up in that marvelous atmosphere of unselfish love and work for others, where the key-note struck is not *to get* but *to give!*

What benefits may we not expect for poor humanity when these stalwart young warriors go forth into the world as the Messengers of the

New Golden Age now dawning, examples of the true dignity and nobility of human life lived upon natural lines in tune with the Divine in human nature; and making the soul controller and guide of their personal actions? One's thoughts turn naturally to the children there, because they have received a fuller benefit from the Raja Yoga training than the older students, and will carry on the work after their elders have passed away. Are not the children always the hope of the future?

But the Theosophical teachings applied from the Centre are a revelation in all departments of life; the whole life at Point Loma is educative on true lines. Music is given its true position; the Drama takes its old place in purifying the thoughts, and awakening the intuition; physical exercise has its due influence upon the lives of the students. Children and adults alike are brought into close touch with nature; the flowers blossoming, the birds filling the fragrant air with song, ever the picture before the eyes of wide sweep of sea, or distant mountains, nestling hills, and placid bay; is not such a home a fit training place for world-workers and helpers?

Could such work fail to influence the world for good? Is it possible that such an example could fail to benefit? Does not rather a great spiritual uplifting force of Brotherhood and Love flood the currents of thought and feeling, and find their way to the hearts of men, because of our inner unity, and by reason of our Universal Brotherhood? E. L. W.

HAD the great truths waited until the majority voted in their favor, they would never have been heard of in the world. Had they not found the place from which they are proclaimed at all times as sufficiently grand, they would be silent to this hour.—*Paul Cassel*

FRIENDS IN COUNSEL

DEAR COMRADES: The coming on of evening at the Homestead is a marked event in the procedure of the day. The slowly westering sun casts lengthening shadows of the buildings and the trees. The moon which all the afternoon hung like a pallid disc in the bright sky, begins to take a silver luster and to shine. The swallows softly chirping, cleave the quiet air, sweeping huge circles round the Homestead's dome. The vast Pacific stretched in level calm assumes a tint of steely blue, while in the further west grey bars of cloud obscure the sinking sun. But just before he disappears below the far horizon line, he shows his shining face flushed with a roseate hue and then descends by slow insensible degrees till the last glittering spark is screened from view. The twilight deepens till the afterglow sets all the western heaven aflame with yellow splendor, and ethereal flushes of a rosy pink gleam from behind the banks of cloud now of an inky blue.

The moon increases momentarily in her white brilliance. Now here, now there, a silver point pierces the soft blue dome that arches overhead as one by one the brighter stars appear. The ocean now displays a deep, rich, velvet, blue upon its distant stretches, while on the nearer waters rippled by dancing wavelets, may be seen strange sinuous markings like the wake left by a fairy fleet, extending from the kelp beds to the shore below. The air is vibrant with the strains of Nature's minstrelsy. A chorus of shrill crickets from afar and close at hand make the air tremulous with their sweet, cheerful cries. The tuneful hooting of the owls floats upwards from the cañon down below. How gracefully the forms of nighthawks print themselves with definition sharp and clear upon the glowing background of the western sky, as with their bold erratic flight they chase the beetles of the gloaming through the balmy air. The monotone of Ocean's voice now rises and now falls, but never wholly dies away, for even in the hush that intervenes between the breaking of the waves upon the shore below, the sound of breakers on the coastline to the North like muffled thunder falls upon the listening ear, borne by the fitful breeze.

But hark! The symphony of Nature is now superseded by the children's voices swelling out upon the evening air. It often is a great relief to turn from man's harsh dissonance to Nature's ceaseless song, but those who live in tune with that undying harmony on which all Nature rests can make a sweeter music still. No monster of the jungle utters cries more terrible than human voices wrecked and spoiled by selfishness and sin, nor can the sweetest songster of the glades outvie the human voice that thrills responsive to the master touch of the indwelling soul. STUDENT

NAPOLEON AND THE SPHINX

by CHARLES MACKAY

BENEATH him stretched the sands of Egypt's burning leads,
The desert panted to the sweltering ray;
The camel's plashing feet, with slow uneasy beat,
Threw up the scorching dust like arrowy spray;
And fierce the sunlight glowed, as young Napoleon rode
Around the Gallic camp, companionless that day.

High thoughts were in his mind, unspoken to his kind;
Calm was his face---his eyes were blank and chill;
His thin lips were compressed: the secrets of his breast
Those portals never passed, for good or ill;
And dreaded---yet adored---his hand upon his sword,
He mused on Destiny, to shape it to his will.

"Ye haughty Pyramids! Thou Sphinx! whose eyeless lids
On my presumptuous youth seem beat in scorn,
What though thou thus hast stood coeval with the flood---
Of all earth's monuments the earliest born;
And I so mean and small, with armies at my call,
Am recent in thy sight as grass of yester-morn!

"Yet in this soul of mine is strength as great as thine,
O dull-eyed Sphinx, that wouldst despise me now;
Is grandeur like thine own, O melancholy stone,
With forty centuries furrowed on thy brow:
Deep in my heart I feel what time shall yet reveal,
That I shall tower o'er men, as o'er these deserts thou.

"I shall rebuild a name of never-dying fame,
My deeds shall fill the world with their renown:
To all succeeding years, the populous hemispheres
Shall pass the record of my glories down;
And nations yet to be, surging from Time's deep sea,
Shall teach their babes the name of great Napoleon.

"On History's deathless page, from wondering age to age,
New light and reverence o'er that name shall glow.
My deeds already done are histories begun,
Whose great conclusion centuries shall not know.
O melancholy Sphinx! Present with Future links,
And both shall yet be mine. I feel it as I go!"

Over the mighty chief a shadow came of grief.
The lips gigantic seemed to move, and say---
"Know'st thou his name that bid arise yon Pyramid?
Know'st thou who placed me where I stand today?
Thy deeds are but as sand strewn on the heedless land:
Think, little mortal, think! and pass upon thy way!

"Pass, little mortal, pass! grow like the vernal grass---
The autumn sickle shall destroy thy prime.
Bid nations shout the word which ne'er before they heard,
The name of Glory, fearful yet sublime.
The Pharaohs are forgot, their works confess them not:
Pass, Hero! pass! poor straw upon the gulf of Time."—*Selected*

THEOSOPHICAL FORUM

Conducted by J. H. FUSSELL

Question If Karma means the certainty of retribution for every evil deed, how can you call it a doctrine of hope to the discouraged?

Answer In order to understand the question, a little insight into the meaning of Karma will be beneficial. Karma is the most important Law of Nature, so comprehensive in its sweep as to embrace at once the physical, mental and moral planes of being. It has been defined as the Law of Cause and Effect, the Law of Action and Re-action; and although these are good definitions, they are not sufficient to explain the beneficence as well as the undeviating justice of Karma.

William Q. Judge has given a definition so clear and all-embracing that any mind may grasp its meaning. He calls it "The Universal Law of Harmony, which unerringly restores all disturbance to equilibrium." It is not a being but a Law; beneficent and wholly merciful. Everything in the universe comes under its sway; Solar Systems, Planets, Worlds, and Man, as well as the tiniest atom.

Man is its focus and, as a race, a nation, or an individual, cannot escape its justice.

Being merciful as well as just, for neither true mercy nor true justice can exist the one apart from the other, its tendency is ever to restore perfect balance in the three realms of Nature, the mental, the moral and the physical. The immutable rule is that harmony must be restored if violated, and as the action of Karma is to resolve all discord into harmony, it can at once be seen how beneficent this Law of Nature is, and that herein lies the greatest hope to the discouraged.

We may regard the action of this Law on our individual lives as reward and punishment; but as it ever tends towards growth and progress, it may help us to look upon its action as discipline and opportunity—neither as a reward for good deeds, thoughts and acts, nor punishment for evil ones; but as a great lesson in the school of life, on our journey to a Divine Destiny.

The question has been asked, "Does the knowledge of Karma bring hope to the discouraged?"

We would answer that even a little study of Karma liberates the mind and frees it from the apparent injustice in the world. It brings with it an elevating and ennobling influence, that carries the soul through all dark and gloomy periods, lighted by the Star of Hope.

Through it man learns his power and freedom of will as a divine being, and that it is in his own hands to rule his destiny—thus giving a new courage and strength that kills out fear and despair.

Karma is the cause of birth and rebirth, and through rebirth the workings of the Law are made plain. In one short period of incarnation neither justice nor mercy would be possible. In order to work out man's divine destiny, many expressions of life, through many incarnations, must

be realized. The *Bhagavad Gita*, one of the ancient sacred books, says: "I myself never was not, nor thou, nor all the princes of the earth, nor shall we ever hereafter cease to be. As the lord of this mortal frame experienceth therein infancy, youth and old age, so in future incarnations will it meet the same. One who is confirmed in this belief is not disturbed by anything that may come to pass."

In the knowledge of Karma lies the hope of the world today. To know that man is the arbiter of his own destiny, that within him lies the power to mould conditions and circumstances of life, educes a dignity and self-respect that could never be attained by believing himself to be the puppet of some capricious deity, or that he was the creature of chance.

Knowledge is power; and the power to guide and direct his thoughts and actions in harmony with the great Law, is the rightful heritage of every man. It has been said of old that "whatsoever a man sows, that also shall he reap." This is a pure statement of Law; and it applies as well to the seeds of thought and act sown by man in his relation with his fellow-men, as it does to the seeds of barley or corn sown in the fields.

If barley is sown, barley will be reaped, and if man sows the seeds of kindness, charity, mercy and brotherhood, he will reap a harvest of such fruit and he will reap in the field of life where he has sown, not in some far away distant region apart from earth.

The world today is full of sin, suffering and sorrow, leading to despair and despondency. Is it not time to awaken and seek the knowledge which will bring hope where despair now reigns, and joy in place of despondency?

The knowledge of Karma would lift this heavy pall from the hearts of men, which has been laid upon them by false teaching. And today, as in the past, great teachers have come bringing the keys that unlock the doors to knowledge and wisdom.

The light shines for all who will turn to it; the truth is rewarded to all who seek it. Let us grasp the opportunity that Karma is now giving us and move forward in the grand progression of the races. The great souls who founded this movement, Madame Blavatsky, and William Q. Judge, and Katherine Tingley, their successor, have again proclaimed this message and themselves given the example of working in harmony with the Law, teaching men their divine birthright and their responsibility because of their Divinity, and bringing truth, light, and liberation to discouraged humanity.

The knowledge of Karma brings a hope that dissolves all discouragement, that fills the heart with new courage, faith and power, and leads on to a continually renewed effort on the path by which alone we can find true happiness.

E. L. I.

"WHAT! hear a German singer! I should as soon expect to derive pleasure from the neighing of my horse," was the remark made by Frederick the Great when asked to hear Mara sing. It gives a fair idea of the prejudice against German singers, even in their own country, then. There was but one school, and that, Italian. Truly times change and with them opinions.

General Maximo Gomez

THE death of Maximo Gomez on the evening of June 17 at Havana, Cuba, after a long illness arising out of a complicated liver trouble, was an event which cast sorrow over all Cuba and over his many friends in America.

His life was a strange one, one of those lives which must be judged from a higher standard than mere appearances might seem to justify. He was a Santo Domingan by birth, of good family, a lieutenant in the Spanish army, and an ardent patriot of his adopted country, Cuba, whither his family had emigrated to settle many years ago.

In 1868, when he was forty-five years of age, he withdrew from the service of Spain and threw himself with fiery earnestness into the cause of "Cuba Libre." From that time on he labored incessantly to attain and establish Cuban independence, and his personal courage, magnetism, and his remarkable tactics earned for him the name of the "Cuban Napoleon." It is said he was very proud of having never lost a battle.

General Gomez was a small man, five feet six or seven inches tall, and slenderly built. His eyes were keen and penetrating. During the last years of his life he suffered much from a gun-shot wound in the right leg.

Certainly as much as any other Cuban leader he enjoyed the trust and love of the people of his adopted country. Only the very morning of his death his son received a check for \$100,000 from the Cuban Secretary of Finance, voted by the government as a testimonial of its gratitude to him.

As General Gomez passed away, his wife, his six children, President Palma and the Secretary of State, with a few others, surrounded his bed. His passing was unconscious.

General Gomez's last visit to the United States was in 1903, when he visited the World's Fair at St. Louis.

Life in Ocean Depths

AFISHING net has been sunk to a depth of 23,000 feet, or over four miles, in the neighborhood of the Tonga Islands in the Pacific. The temperature at this depth was only just above freezing, and the pressure would be over 10,000 pounds to the square inch or about 70 atmospheres. Yet life was found. It took a whole day to sink the net and raise it. H.

Submarine Vulcanism

A MADRAS exchange reports the occurrence, off the Karachi coast, of a submarine disturbance which has resulted in curious electrical phenomena and the destruction of millions of fishes. E.

English Notes

(By Our London Correspondent)

June 20th, 1905

NOW that the youthful King of Spain is home again among his own people, one may begin to sum up impressions of his visit. I saw him in Oxford street on his way to the Guild hall.

There was a big crowd all along the route, although rain was threatening. The cheering was very hearty. His face attracted me; that is all I can say. For the procession moved swiftly—no doubt, because of the experience in Paris—and there was no time for more than a rapid glance. But it would be a pleasure to see Alfonso XIII again. As a rule public characters do not come up to one's anticipations.

One curious fact about the tour of King Alfonso is the number of narrow escapes he has had. First of all that abominable affair of the bomb throwing in Paris. Then, as the train carrying him to London approached a country station it had to be pulled up—a portion of the roof of the station had fallen across the line! When the train arrived in London, the king jumped out before it stopped, and was almost thrown into the arms of King Edward. A few days later he was riding in a motor-car when it caught fire. Lastly, only clever horsemanship saved him from an awkward fall during the Aldershot Review. Here, surely, is ample material for those who are given to speculating on "the otherness of things."

However, our Royal guest managed to reach Spain unharmed, and everybody is full of praise when talking about his stay among us. And what is more significant still is the fashion in which Spain is being talked about in the papers. Japan, for the moment, has suffered eclipse. Spanish literature; Spanish manners and customs; the past and future of Spain; its value as a coming force, etc., etc.—these subjects are being keenly discussed by English writers of all parties.

And in the current number of *The Week's Survey*, a very thoughtful periodical, is an article entitled: "A Plea for Spanish." Therein it is urged that this language "from some points of view is more important than French or German. . . . If we turn to the New World as the great opportunity for future trade, we find that there practically only two languages are spoken—English and Spanish, which is practically unknown in England. Spanish is also the trade language of parts of the East and of Africa." There is much more in the same strain. Yes, by all means let Englishmen learn Spanish, if they would keep abreast of the times. W. J.

IN Thibet the cremation ashes of lamas are often mixed with clay, and the mixture molded into various forms of images which are kept as relics.

Teaching Patriotism

HOW do we teach patriotism, and how do other nations teach it? The question comes to one's mind in reading an article on his own country and in one of his own country's journals by the Japanese statesman Count Okuma.

We can hardly be said to teach it at all. A feeling of the greatness of their country soon enters our children's minds as they read history and the newspapers. We do not teach that any special code of conduct is therefore proper, and the feeling usually contains hardly any higher element than vanity, vaingloriousness and egotism.

It is therefore not really patriotism at all, not love of country, but of self. It does not get recognized as such because it does not happen to interfere with our neighbor's feeling.

In Japan they do teach a very high form of the real thing, and it can stand a strain. A recent writer on the military aspects of the war dwells on the success of the Japanese in keeping the secret of Togo's whereabouts. "There was probably no information more eagerly sought for by the press of the entire world; and it is certain that to any one able to give it a price would have been paid which might well seem a fortune in itself. Yet out of the thousands of Japanese who could have said where that fleet was . . . not one told."

Japanese Not Tempted By Gold

Count Okuma points out that in the criminal code of Japan there is no punishment provided for treason for the simple reason that the crime has never once been known in the whole of Japanese history.

The children are not taught that their country is the greatest on earth, that it "rules the seas" or that it can "whip creation." They are taught that it was founded by the gods, that a set of sacred duties therefore devolve upon them, and that their life-conduct must correspond. As members of a State founded by the gods they must carry a high sense of honor into every act; they must be invincibly courteous; they must have courage to death; they must put their own interests after those of their country in every case; and their lives must always be ready to hand over. In other words their national consciousness is stronger than their individual consciousness; that is patriotism. The national vanity of the individuals of other nations is not a national consciousness at all; that is proved as well by acts as by omissions. In the eyes of the Spirit of Progress, Japan is therefore a nation; the others are—relatively speaking—mostly mere collections of individuals.

A national consciousness is a divine thing. We cannot do any nobler service to the children than evoke it. Not only is a nation made by it a unit, but a unit with the sense of justice alive, and compassion. It is not alone a home virtue. If we think we are justified in saying that America has more of it than any other Western nation, the proof will lie in our conduct as individuals as much as in our national policy. Some of its light is on the pages of our better journals. But we shall not achieve it in its fullness or even in any considerable measure till we begin with the children, till we rewrite the history books from which we teach them, and till we teach them that a dishonorable act is a sin against the Coming America. STUDENT

Latter Day Philosophy and Ancient Wisdom

If they hear not Moses and the prophets, neither will they be persuaded, though one rose from the dead. — Luke xvi: 31

A CERTAIN learned reviewer, trying to review in a prominent quarterly magazine a book on Hindu philosophy, asks the question, Why is it that the Indian philosophy is so like the Greek? and wonders which of them copied from the other, or whether both had a common source of inspiration; and concludes by remarking that anyone who could answer the question would confer a boon on humanity.

On the same page, but in an unrelated paragraph, the reviewer takes occasion to air his very vulgar and surely quite inexcusable ignorance of the very author who, above all others, could have, and has, thrown light on, and in fact cleared up, this very question. In short he repeats, parrot-fashion, some of the silly abuse which was levelled at H. P. Blavatsky in the days when she strove to blast an air-hole in the skull of modern culture. Surely he should have known better than to print, in a quarterly review of some pretensions to solidity and impressiveness, slang borrowed from the despised cheap press or the music hall; and that too, in these latter days when many of the very class of writers that contribute to such magazines are actually reading H. P. Blavatsky's works on the sly and printing the results as their own ideas.

Now such a mind as this reviewer's is either absurdly lacking in penetration, or else insincere. The latter alternative seems the more probable in view of the fact that he, at one and the same time, prates with the very aristocracy of culture and hoots with the music-hall gallery. In either case it will be useless to try to enlighten that mind.

So far as we can see, the chief point of similarity made out by this reviewer between Indian and Greek thought is the luminous contrast of both of them with the obfuscations of occidental "philosophy." The sun and moon are alike in comparison with a yellow fog.

But, apart from the fact that several Greek philosophers are known to have studied in India, there is the circumstance that the Egyptians had

philosophy, and the Chaldeans, and the Persians, and the Chinese, and the ancient Americans, and so on. The reviewer seems to be unaware that anybody has studied the similarity between all these philosophies and traced them back to a common origin. In fact he is unacquainted with the elements of his subject, and talks about the ancient Oriental tenets as if they were vague clumsy guesses at truth, like our own.

He thinks H. P. Blavatsky got her ideas about Mahatmas (*perfected men*) from the life of Apollonius; a remark which shews such a beggarly outfit of erudition that one marvels how such writers get their reputation.

And the same magazine contains articles offering timid amateur speculations about the mathematical laws underlying the universe, and solemn debates on philosophical questions, as if the ancients had never existed and no one had ever thought of such things before. STUDENT

The Argentine Republic

A PAPER on Argentina is contributed to the *American Review of Reviews* by John Barrett, formerly United States Minister to Argentina and to Panama, and now Minister to Colombia.

The object of the paper is to awaken the interest of the United States in Latin America generally and in the Argentine Republic in particular. The writer thinks that such an aroused interest:

Would exert a mighty influence in educating the North American people to a realization of the fact that we should devote more time and energy to making the intimate acquaintance of our Latin neighbors. It would demonstrate how ignorant many of us are of what Latin America can do and is doing under favorable conditions of temperate climate and national wealth. It might teach some critics of Spanish America to remove the "beams" from their own eyes before they point out the "motes" in those of their southern neighbors.

In commerce the Argentine Republic exceeds any other Latin nation; and, although its population is only 5,000,000, it exceeds Japan with her 40,000,000, and China with her 400,000,000. It is progressing by leaps and bounds. The United States comes fourth, after Great Britain, France and Germany, in the list of foreign dealers.

The area is equal to that of a slice of the eastern United States stretching from Canada to the Gulf of Mexico, and included between the coast and a line drawn just west of the first tier of States on the Pacific side of the Mississippi. The climate is temperate. A large railway system intersects the country, and even Patagonia is being reclaimed. The capital, Buenos Ayres, ranks among the great capitals of the world.

An interesting point is the author's belief that Argentina is becoming the home of a new, forceful, energetic and ambitious race; and that the Spanish blood is blending with that of the French and Italians, and with English, Irish and German strains, to evolve a new people, strong, energetic, and quick, versatile and graceful.

In commenting on the above, one or two points strike one. The first is that we are apt to forget that the United States is not America; and, while we are going on in our self-sufficiency, other American powers are developing and attracting the notice of the world.

Another point is that the Argentine Republic is at present trusting much to its great natural resources. Glowing descriptions of how the country is divided into rich men's farms of from 20 to 300 square miles each of grazing ground. Easy to beat Japan with such resources as these; but what would the Argentine people make of Japan's scanty acres?

But the chief point is that, unless Latin America can produce a better social and economic order of ages than the usual one, this prosperity will not last. And one is obliged to confess that, under present conditions, such a desirable end is not likely to be furthered by bringing Argentina into too close relation with United States methods of industrial development. For in our country, notwithstanding its wealth of space and natural resources, the pinch of hard times is felt, and the few alone are benefited. Are we to see those fertile square miles gathered in by the monopolist, and those products for export made to pour their tributary streams into the gigantic reservoirs of capitalists?

Existing industrial methods, polluted as they are by selfishness and individualism, can incredibly waste the most luxuriant resources, and burn up whole continents to get a few particles of dross from the ashes.

The question is, Is Latin America likely to profit by an introduction to Northern America? Can we teach it anything?

Nor can one help marvelling over the persistent blindness of people who can go on estimating the progress of a nation by its imports and exports,

its railroads and trolleys; not by its newspapers, but by the cost of the office-buildings of its newspapers; and, in short, not by quality, but by size and expensiveness and display; when we see that all this is the machinery of modern competitive industrialism, based on selfishness and materialism, and leading to huge monopolies, slums and tenements, strikes, and all the other evils with which we are so familiar.

Better leave Latin America alone than help it along such a path. And it is to be hoped that the new race that is developing there will find a better use for its fine qualities than to equip it for overreaching others in the destructive race for wealth. Otherwise one loses interest in the question and concludes the Argentine people might just as well be stupid and undersized.

Let us hope there are some noble hearts in those fine bodies, and that the people will evince a national character firm and independent enough to strike out a better path of civilization, and to accept from other nations that kind of help only that can really benefit them. Possibly it is the mission of Latin America to teach us something—say a less cold and calculating view of life, a more genial and generous social atmosphere, more chivalry and grace. And, accepting such aid, we might, in greater humility, be then privileged to give in return—not our *worst*, but our *best* qualities. STUDENT

The Other Man's Standpoint.

EPICTETUS advises us to turn the situation round when we are affronted, and look at it from the other man's point of view. We think we are confronted by a "Yellow Peril." Let us sit alongside of that Peril and see whether from *its* standpoint some of us Westerners were not previously a *White Peril*.

A French publicist has been doing this. M. Anatole France says: "Now we are discussing a menace to ourselves. If it exists, who created it? It was never the Japanese who intruded on Russia. It was never the Yellows who came intruding on the Whites. Now we are finding a Yellow Peril, but it was many years ago that the Asiatics began to see reason to fear a White Peril. The sacking of the Summer Palace, the Peking massacres, the drownings at Blagovestchensk, the dismemberment of China—were they never reason for disquietude to China? And did the Japanese feel perfectly safe under the guns of Port Arthur? We have made the White Peril. And the White Peril has created the Yellow Peril."

Says Mr. George Lynch in the *Nineteenth Century*. "As the White has created the Yellow Peril, so will the passing of the White Peril lay the ghost of the other. To anyone really familiar with the peaceful character of the Chinese people, and conversant with their history, the idea of their ever becoming aggressively warlike is thoroughly absurd."

Let us note—*aggressively* warlike. But what about Kiao-Chau, Wei-Hai-Wei, and Cochin China? Is a man aggressive who wrenches his finger from the grasp of another man? STUDENT

Is Mars Inhabited?

CAMILLE FLAMMARION, who has been studying the planet Mars for thirty years, feels certain that it is inhabited, and by a people probably more advanced than we. The climate, he says, is very mild; there are no gales and the atmosphere is very light, with scarcely any clouds. The Martian year is 730 days, and the force of gravity on the surface only a little more than one-third what it is here.

It is indeed difficult to think that our own is the only planet with human beings upon it. But there is no reason to confine our speculations within the limits of familiar experience; nor does the absence of conditions that on earth may be essential to human life, prove that life does not exist upon another planet. Teeming life—of kinds—is proved to be everywhere and often under—to us—impossible conditions. How then can it be for a moment doubted that organic life exists on other worlds? And, as wherever life is there is also change—which is another name for evolution—who can say "Life ends here," or "No further change is possible?" We ourselves are the product of myriad forces identical in generals with those which rule the Universe; logically, therefore, each planet is "inhabited"—by beings *naturally adapted to it*. Sometimes in moments of deep contemplation the mind reels amazed at the vastness of the universe. Let us enlarge our conceptions so as to realize that we on our world are children of the one Eternal, whose one attribute—if an attribute may be postulated of the Infinite—is infinite and eternal Motion—to us, or Life, and that no spot or sphere in space can be void of conscious, intelligent life proper to its surroundings. Eleusis and Its Mysteries

ALL that now remains of Eleusis are the ruins of the Temple of the Mysteries, and a small village called Lefkina. Eleusis is of unknown antiquity, one of the twelve old Attic cities, and anciently a rival of Athens. The Temple, sacred to Demeter and Core (Persephone), and considered one of the most beautiful masterpieces of Greek architecture, was founded by one or other of the early kings. It was burnt to the ground by the Persians when they invaded Greece, but immediately rebuilt by the Athenians. Pericles adorned it with the sculptures of Phidias. The city was finally destroyed by the hordes of Alaric in 396 A. D.

With regard to the Eleusinian Mysteries, it is impossible to give an adequate idea of what they were, since there is no institution in modern

The Heirloom of American Antiquity

WE Americans have not yet awoke to a sense of the tremendous heirloom bequeathed to us by the ancient civilizations that flourished on these two continents. All the centuries, nay millenniums, during which the Old World has been changing and developing (along lines at once downward and forward) America has been passing through corresponding phases. On both sides of the ocean were left offshoots of the great Atlantean civilization, and each World has followed independent lines of development.

But, while we have a certain acquaintance with the history of the Old World branches, we know practically nothing of what has gone on in the Americas during the many ages between their isolation and the day before yesterday when Columbus came.

But already we know enough to discern that in American antiquity we may expect to find ideals, equally lofty and potent, yet differing very much in their form of expression from those in the Old World; and even a European, with his veneration for old associations strong upon him, may feel that it would be a relief to harp upon a new string. There is that in the blood which, emanating from the untrammelled spirit that electrifies its corpuscles from within, hails and welcomes the prospect of *discovering a new world* in the universe of ideas and sentiments—a world new-born, yet ancient, as a blithe child may be older than a hoary patriarch.

Perhaps then, if we cannot any longer find sufficient inspiration in Old World models and conceptions, we may *dig deeper* and find what inspired the ancestors of our own soil. But we shall have to study with minds entirely free from preconception and open to the *facts*; for archeology and ethnology admit that the usual rules and reasons will not serve as

Lomaland Photo and Eng. Dept

A BIT OF ANCIENT ELEUSIS

times with which we can compare them. Historical writers may call them a feast in honor of the Gods, with the most erroneous idea as to what was meant either by "feast" or "Gods." If we describe them as "occult" or "magical," we at once bring in the absurd notions conveyed to modern ears by those terms—notions of self-aggrandizement and the acquisition of mysterious "powers." As explained by H. P. Blavatsky, the true magic consists in an evocation of the *divine* powers in human nature which manifest themselves only when self-interest and desire are entirely subordinated to a whole-souled devotion to the common interest.

What was carried on in the silence of those chambers was of a most sacred character—far more sacred than anything that pertains to our modern religion; and the symbolical ceremonies there enacted were no mere mummeries, as they appear to the profane and ignorant scholar, but invocations of power and wisdom which were effectual to the good of the nation, because the celebrants knew and believed what they were engaged in.

The mysteries were of course secret, to guard them against profanation; and, though in degenerate times some of the more public ceremonies may have been burlesqued, the real inner teachings have been withdrawn out of the reach of profanation. The Mysteries of Antiquity became lost, but can be restored when we have a basis in human character firm and just enough to establish them upon. H. T. EDGE

a key to the understanding of the Indians or their forerunners. The whole scheme of ideas and mental and moral atmosphere seem to have been entirely different—quite *sui generis*.

Of course history covering so much time and continental area will be variegated; races and manners will be numerous, as in the Old World. And the remains which we discover are certain to be miscellaneous and fragmentary. Therefore theories will have to be held in abeyance until a very large assortment of facts is available. Unless indeed we are sharp enough to avail ourselves of the key to antiquity furnished by Theosophy, which will enable us to fit the pieces of the puzzle into their places as we find them.

That vast and powerful empires have flourished here, and that they had the keys to the Ancient Knowledge, are matters already abundantly proven by the stupendous ruins of Central and South America and the signs and symbols carved thereon. A study of these, and of what others the future may reveal, in the light of Theosophical teachings, would open up a new world of thought and inspiration.

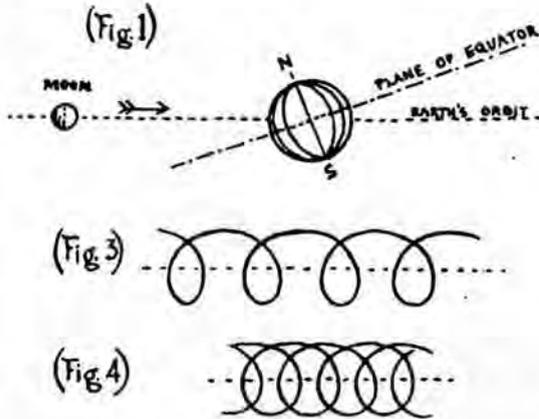

It might facilitate the bringing back to mankind of conceptions long lost to it. It might open up heights and depths of the human Soul utterly undreamt of, and reveal vast realms of life, such as once made life grand and may make it once again sublime. STUDENT

The Trend of Twentieth Century Science

Our Moon Is a Companion Planet

THOUGH not entirely ignored by astronomers little regard is paid to certain curious relationships between the Earth and the Moon which are not found in a similar combination in any of the other planetary systems. One of these is certainly unique, *i. e.*, the relative proportion of their sizes. The Earth's diameter is 7920 miles, the Moon's 2160, a little over a quarter. No other planet has a satellite approaching such a large relative proportion; for, although the principal moons of Jupiter and Saturn are very large (Jupiter's largest, Ganymede, being 3436 miles in diameter), yet, compared with the great bulk of those giant planets, they are insignificant specks. In this connection it is worth remembering that on at least ten occasions, and by many different observers, an object about the same size as our moon was seen near Venus. But since 1764 it has not been seen in spite of constant observation by trained observers using the finest modern instruments. This remains one of the enigmas of astronomy.

Again, if we imagine the path of the earth to lie on the surface of a sheet of water, the moon would be found to rise merely a very little above and to sink very little below such a level as it travels round the earth in its "nodical period" of 27 days 5 hours. But the earth's equator is "tilted up" considerably owing to the great inclination of the polar axis and so the moon's track is far from being in the

plane of the earth's equator. Fig. 1 will render this clear. Now the important satellites of the other planets travel in or very close to the planes of the equators of their respective primaries, and not in the level of their governing planets' paths round the sun, so in this respect there is a marked difference between their motion and that of our Moon. (See Fig. 2)

Compared with the other principal satellites our Moon shows another peculiar difference in its annual circuit. Beginners in astronomy usually conceive the Moon's path to be a cycloidal curve something like Fig. 3 or 4, but this is erroneous. Fig. 5 gives a truer idea of a portion of the Moon's track in space, though unless mapped on a very large scale the curvature must be exaggerated to be seen at all. In truth the Moon's path hardly differs from a regular ellipse. The curves of Figs. 3 and 4 would be correct for the satellites of Jupiter, Mars, etc.

It has been taught by H. P. Blavatsky that the Moon is a companion planet to the Earth, older than it, and not an offshoot—a cosmic splash into space. That Teacher gives many reasons for this idea, which may be referred to on another occasion, but the object of these remarks is to draw attention to the unique position the lunar globe holds in respect to its motion round the sun and earth, a combination which none of the other satellites can show, and which gives evidence in favor of a difference of origin.

Extraordinary Plant Mimicry

PROFESSOR BEAL of the Missouri Agricultural College, in a recent article, calls attention to some curious instances of plant mimicry. One of the most remarkable resemblances which any plant has ever undertaken to produce is that of the *sound of the rattlesnake*. There is a plant—the *Iris Missouriensis*—growing in regions much frequented by rattlesnakes, the rattle of whose pods, or rather of the seed in the pods, closely resembles the noise of that snake. A gra-

zing animal, hitting one of these pods, and thus educing the sound, will invariably step back and leave the plant undisturbed.

One might be inclined to call this chance, were it not for the extraordinary things which we know that plants will do to preserve themselves in the interests of their seed.

STUDENT

Progress in Telegraphy

MARCONI'S extraordinary success in bridging the Atlantic with wireless messages, reminds one of the significant steps that have been taken in telegraphy since the days when it was thought necessary to have two wires. Theory demanded a second wire to complete the circuit; accident showed that the earth, or something in the earth, would do as well as a second wire. Now no wire at all is needed. One naturally wonders how far other apparatus can be dispensed with, and one awaits the future favors of "accident" rather than invention to reveal further simplifications of the process of transmitting thought.

There are races of men who can communicate without any apparatus

whatever, unless the human organism can be considered an apparatus. This is a well-known fact.

Can it be possible after all that we have been looking at this problem of telegraphy and other scientific problems upside down? We set out with the assumption that men cannot communicate at a distance, and then go to

work to invent complicated means to overcome that disability. But perhaps it is natural and normal for men to communicate at a distance, and they are only prevented from doing so by barriers and obstacles which are abnormal. In other words, perhaps civilized men are deaf and "savages" have normal hearing. Are our apparatuses nothing but complicated substitutes for what ought to be simple and natural?

STUDENT

A New Local Anesthetic

IT seems that at last an alkaloid has been discovered which is capable of taking the place of cocain as a local anesthetic. It is obtained from a West African tree called by the natives Yohimbehe. The local insensibility caused by the hypodermic injection of it is much more prolonged than that of cocain, lasting two hours. Dropped on the cornea, the anesthesia lasts half an hour and neither affects the pupil nor the accommodation apparatus.

But from a wider point of view than the merely medical, the great advantage of the drug is that it is not poisonous. If the reports received concerning it up to now are accurate, it is also free from intoxicating qualities, and will claim no ever lengthening list of moral and physical ruins. Such a remedy has long been needed, and the medical profession would gladly see the last of cocain. The day of poisonous anesthetics seems in fact to be drawing to its close. One or two safe and efficient substitutes for chloroform and ether have been lately produced. The very latest is made from the Japanese belladonna. Before an operation is to be performed three injections of an extract of this plant are made hypodermically two, one, and one-half hours before the time. The patient passes into a sleep, and sensations of touch cannot arouse him; sounds, however, can and the operations must be performed in silence. But the simplest of all these novelties was the alternating electric current passed directly through the brain from front to back. M. D.

The Question of Destroying Animals

IN destroying most species of birds and some species of mammals, we are doing irreparable harm, said a recent authority on agriculture, who is doing what he can to call the attention of farmers to this fact. There are many fallacies, he says, about the habits of animals. Many varieties of hawk prey almost entirely on the farmer's foes—the gopher, grasshopper, field-mouse, etc. And yet, because six out of eighty varieties of hawk make an occasional raid on poultry yards, all hawks must be slaughtered! The same unreasoning prejudice exists against the coyote, the natural enemy of the rabbit, gopher and other destructive pests. State bounties for coyote scalps foster this delusion, and yet we complain of the rabbits and gophers.

It seems as if man were destined to make a mess of it when he interferes with the balance of life in nature. But what about the gophers and rabbits? It would seem as if any argument based on the principle of letting nature alone, must apply to them also; while an argument based on the idea of gentleness would apply even more strongly to the case of the herbivora than to that of their ferocious brethren.

The logical conclusion would seem to be that we must destroy, but destroy wisely, and recognize our friends from our enemies.

Or is it possible that a courageous reliance on the principle of mercy, and trust in its efficacy, carried to the extent of abstinence from the slaying of rats and mice, gophers and rabbits, would be found, in the long run and on the whole, to be to our advantage, in spite of immediate and temporary drawbacks?

A difficult question; and it probably means that our economy of life is based on such wrong principles that sometimes it is almost impossible to know what to do—so inextricably are our moral obligations and our necessities (real or apparent) entangled. However, let us love mercy, and practise it all we can, and pray for light to see our way to practise it more; and perhaps some day we shall see our way to patching up some kind of an *entente cordiale* with even the rabbits and the rats. These creatures may have virtues which we know not of. Any day some scientist may discover that they perform some hitherto unsuspected function of vital importance. H. T. E.

Man's Mind As a Creative Power in Vegetable Life

MOST people nowadays are pretty well acquainted with the means by which the gardener has evolved his new varieties of plants. We follow him in our imagination while he selects seedlings which most closely correspond with his ideal, sows their seed, and then again makes choice among their progeny for another sowing.

We commonly assume that the only part he plays in the production of new types is in the choice of "chance" varieties that Nature "happens" to produce. But is it true that "sports," as they are called, are due to Nature's spontaneity alone? and have we ever thought that man's intense desire may actually suggest the mode of variation to the plants beneath his care? Is man in fact a mere spectator of the evolutionary process or may he not to some extent control and guide?

The mind of man is, within the limits of his body, a potent force affecting the secretions and producing health and sickness in accordance with the emotions he encourages. Why then should not this power to modify extend beyond that tiny portion of the world enclosed within his skin, and have its operation in the natural world external to himself?

The bookish botanist will be inclined to look askance on the suggestion; but those whose study of plant life has reached the point of affectionate intercourse know that a very real exchange of thought and feeling is entirely possible. Those who know most say least however, partly because it is an almost sacred phase of their experience, and partly from the fear of ridicule from those who never have enjoyed such friendship with the vegetable world. STUDENT

Sicilian Lemon Industry—Important Discovery

CITRIC acid from lemon-waste, extracted by a new and direct process, is the discovery of Giovanni Restuccia of Sicily. He will thus raise the price of lemon-waste and immensely benefit Sicilian lemon growers.

Hitherto citric acid has been prepared by fermenting lemon-juice, slaking the acid with lime, and then decomposing the lime citrate with sulphuric acid. But Restuccia has discovered reagents which will precipitate the acid, or cause it to crystallize out, direct from the lemon "sack."

Says a consular report:

At a recent experiment made in the presence of Körner 54 boxes of Sicilian lemon-waste were used. Professor Körner, before whom experiments are made almost daily by chemists who think they have discovered new processes, was at first skeptical, but when he saw the substances which were dissolved in the lemon sack precipitated in their characteristic shapes by the reagents discovered by Restuccia he became enthusiastic. The scientists of Milan (including Manozzi, Morizani, and Gobba) were present at the experiments, and when at the first crystallization the results were manifestly excellent the venerable Professor Körner, turning to Professor Manozzi, exclaimed, "We have here the resurrection of Sicily." The King and the minister have congratulated the inventor.

The inventor, we are told, does not wish his invention to enrich speculators, but to benefit the farmers. May his wish prosper! But this is a greedy age, and a lazy age. The farmers may find it easier to sell their lemon-waste to the speculators than to make their own acid; and a large factory can undersell many small private ones. STUDENT

A CALIFORNIA ROSE

TO THE OCEAN

C. H. TOWNSEND

CHIEF of God's works! whether in grand repose,
Or majesty of turbulence, to me
Still art thou beautiful, most glorious sea;
Alike, when on thy mirror morning glows,
And twilight's curtains dimly round thee close;
How it expands the soul, to gaze on thee,
Stupendous emblem of eternity!
Where, its dilated glance the spirit throws
At once to heav'n, and, unimpeded, knows
That only for its boundless boundary—
And, oh, thy voice my lonely temper suits,
Whether, in thunders, it proclaim, and prove
The Deity's tremendous attributes,
Or softly whisper, that His name is Love!—Selected

Light exists, unknown to you. The epochs are in my bosom. I do not say anything evil in the abode of Truth: every day, I move through the Truth. Life is the enveloping of the evening.—From the Egyptian "Book of the Dead."

ONE of the rules for all disciples reads: "Kill out desire of comfort." He who lacks discrimination—and what quality is more rare—often misconstrues this to mean: "Cultivate discomfort." The latter course, however, lies as far away from the path of aspiration as the ways of the sensualist and of the sluggard. The object of killing out desire for mere physical comfort is to liberate force for use in satisfying the higher senses. Growth of the spiritual consciousness is retarded while the physical senses are emphasized—by pleasure or by pain.

Practical Occultism

The consciousness must make its own place among the higher impulses or it will be impelled to act along the

old familiar lines. The disciple can escape the confusion created by the struggle to arise and the constant tendency to gravitate into old habits only by cultivating the feeling of being "at home" upon the field of higher thought and action. The determination to make himself an individual center for good-will and sympathy and work can utilize the creative energies of his whole nature along altruistic lines.

Rigid asceticism for its own sake becomes at last a sort of sensuousness. The devotee who seeks to win liberation from his lower nature by constantly defying it is thereby strengthening its resistance. To so industriously despise the conventional vanities and hypocrisies in others as to cultivate the corresponding slovenliness and rudeness in oneself is simply choosing another extreme which is equidistant from the truth that liberates. Gentle, continuous effort is advised, using judgment withal.

The gospel of negation, of repression and of discomfort has had its day. The time has come for a glad, positive expression of the higher self. The burden of old sensations is to be replaced by the inheritance "which is not so much a compensation for these things surrendered as a state which simply blots out the memory of them."

The ascetic who aims to develop his spiritual will by grimly enduring the appeal of gross appetites would succeed more comfortably and more certainly by continued efforts to breathe the air of the higher life and to cultivate personal habits and hygiene which would not nourish the aggressive lower senses. Overcoming a gluttonous appetite may depend upon securing a dietary which preserves the balance between nutrition and waste. Overfeeding and improper diet usually go together. Lack of necessary elements in the food leaves certain physical cells so illy nourished as to prompt the palate to excesses in vainly seeking the needed supplies. To begin a journey of mysticism by the prosaic path of diet may not appeal to the romantic disciple. But to understand and to meet the wants of his own body, and to successfully supply them from the average menu, calls for an intelligent, honest, determined effort possible only to an active will.

The would-be occultist who desires to gain increased powers for his own benefit is prompted by his very selfishness to begin the wrong way. Impatient with the discipline which would purify his lower nature, he hastens toward the astral world, carrying the force of a bad physical make-up on to a more potent plane of action. Nothing more effectually subordinates the personal self than to sink it in wholesome interest in others. The desire for greater knowledge and power wherewith to give help, at once broadens out the interest, sympathy and understanding and enlarges the individual's mental horizon. With the sense of larger life thus gained comes the consciousness of greater power and helpfulness which belongs to those who work on broader lines.

Virtue should be sought for its own sake—willingly, positively. A consciousness of negative indulgence in, or a dogged abstention from, vice is not freedom. The forces which act through the nature demand expression and will not long be repressed. By the law of the conservation of energy, in time the aspirant can translate the troublesome force of his personal nature upon a higher plane—always remembering that force must be given expression. The injunction to "work out" salvation has a mystical meaning. The particular work to be done is determined by whatever the hand finds to do. The suffering world and the individual Karma offer rich opportunities for active, steady effort.

When the continued effort to grow is prompted by purity of motive then it is that even failures count for success. The routine of the daily life becomes a service with a harmonious key-note which is finally repeated by the physical tissues. The morning bath, the usual meals, the kindly human relations, the round of common duties, can be made the means of spiritual unfoldment.

To begin the day with the purifying touch of water; to consciously eat for renewed strength and helpfulness; to recognize the claims of near-by souls, this working out the Karma of which present duties are but the stage setting—this is the simple, natural, dignified course of occultism. The mind and senses are gradually drawn away from the body while they operate from higher motives with more lasting satisfaction. The food thus eaten builds up a finer quality of flesh, less gross and more enduring. The forces of the nature which sought expression through the physical appetites are utilized in gratifying the finer senses, while the domination of the physical is overcome naturally and gently.

The secret of killing out the lower desires is to learn the enjoyment of the higher. Indifference or dislike do not work for advancement. Simply to do the right thing is not enough: one must do it willingly, cheerfully, with an honest feeling of joy. LYDIA ROSS, M. D.

A CONTEMPORARY refers to what he terms "the modern fad of gambling among women, which is rapidly becoming the worst of modern debaucheries." But gambling could hardly be called a modern fad, when we read in the quaint old diary of Pepys, that gossip preëminent who lived in the Stuart days, long and savory accounts of the gambling propensities of countesses, duchesses and even queens. Pepys also records an occasion upon which "great scandal was caused by the fact that several of the ladies cheated!" All of which shows nothing in favor of gambling and much in its disfavor. The point at issue is that the disease, or fad, or debauchery—by whatever name one chooses to call it—is by no means modern, but appears to be merely a relic of those medieval days of which, sentiment aside, the race cannot be so very proud. Pity it is that even a few members of our sex, in these days of sorrow and bloodshed, of war and famine and fever, can find no gentler outlet for their energy, no interest more compassionate in its tendencies, no occupation more refined and uplifting in its tone than—gambling.

ONE of Germany's exponents of "Womans' Rights" has recently submitted, in a letter to the German Emperor, a plan by which she hopes to improve mankind by more properly employing men. To quote one extract: "There are too many idle men and there would be none if they would take to their proper sphere, which is the kitchen. There should be a law compelling boys to learn cooking, for men make the best cooks in the world, women the worst. Many of them, now posing as failures in other professions, would become masters in this noble art." The petitioner, of course, thinks the Emperor could and should change all this!

AND now they say that if you would be fashionable in Paris you must have your gown harmonize with the colors of your pet dog! It is related that a recent toilet of this kind was little less than sensational. The wearer of it appeared with one of her favorite coach dogs, herself wearing a gown of white cloth picked out with irregular black velvet disks in exact imitation of the dog's markings. She wore around her neck a little silver dog collar set with turquoise, exactly like the collar of her dog. One wonders what the dogs themselves may possibly think of this.

FOR the first time in history the Académie Française has honored a woman writer by awarding her the full amount of literary burysary, known as the *Prix Vitet*. The happy laureate is Mme. Henri LaPauze, better known under her pen name, "Daniel Lesueur," whose novel, *La Force du Passé*, has been the literary hit of the season.

The *Vitet* prize is unique and doubly valuable because it is not awarded for any single work but for the whole sum of one's literary production to date. It goes without saying that the morbid and erratic *littérateur*, who alternates high soaring with very low grovelling, (and of this type France has had her share) has deservedly little chance to win in a competition which demands a whole lifetime of sane and level literary excellence. On one previous occasion this prize was divided, but only the work of "Daniel Lesueur" has been able to convince the Forty Immortals that men might justly for the nonce, be set aside, in justice to a woman.

For many years this gifted woman has held a distinguished place in the literary world of France. Her first attempts at fiction followed close upon a scholarly translation of Byron's poems, and her work soon won for her high place. Her tales have been uniformly pure and wholesome in tone, free from "goody-goodyness" as well as untainted by the least literary carelessness, being remarkable in their delineation of character. Among those who formerly won this prize are Pierre Loti, François Coppée, André Theuriet, Anatole France and Jules Lemaitre.

The Money Spirit in the Teaching Profession

AT the annual banquet given by the graduates of a certain Normal School Dr. Emil G. Hirsch, a Jewish Rabbi, responded to the toast "The Spirit of the Teacher." His words were a positive protest against the *money spirit*, which permeates the profession of school-teaching today. To quote from the newspaper account:

Dr. Hirsch opened his attack on the Teachers' Federation by asserting that no instructor ever has received recompense in dollars and cents in proportion to the work done for humanity.

"The teacher," he said, "is excluded from the ranks of the army that marches to the tune of clinking gold. But we find recompense in the teachers' profession that outweighs all the recompense of other and more material characters. Teachers work with the raw material which is to be made over into dignified and self-dependent humanity. The true teacher should find the greatest compensation in the realization of a work well done.

"The true teacher must remember that in becoming a teacher she must consecrate herself to her work. Most have forgotten this. There is a scramble for salary, and often the term 'salary' has been regarded as too dignified and the word 'wage' has been substituted as if the teacher were a hired man. Perhaps the teachers are underpaid. They are. The minimum should be raised, but if the circumstances are such that it cannot be, the teachers should be willing to make the sacrifice, and not band together for salary and that alone."

The speaker enjoined the school-teachers to remember that the great Teacher of the Christians received no pay and made a great sacrifice. Then he said:

"Teaching is a divine profession. Its value to civilization and to humanity cannot be measured by the banking-house standards. The true teacher must to a certain extent efface herself. The true teacher must be a servant to others. The true teacher never has asked 'What is the school to me?' but she has asked and should ask, 'What am I to the school?'

The teachers must be proud of their profession and glad to enter it, and must find their return, not in what the schools give to them, but in what they give to the schools. The schools are not for the teachers, but for the children. The teachers belong to the children."

This is surely a new way of looking at the work upon which depends the character of humanity, but let it not fail to remind us of the fact that there is even now with us a Teacher of humanity, who takes no pay and shrinks at no sacrifices. Nay—more than that—she is now training her pupils to do likewise, teaching them to look not only upon the profession of the teacher as Divine, but upon all work done for the purpose of helping humanity upward; upon any effort to bring good into the world and make life better and nobler. Who shall say that earth holds altruism purer than this or wisdom greater? Who shall say but that in this fact alone lies the promise—the assurance—of a better world and a kinder humanity within it? RAY BERNSTEIN

MRS. CRAIGIE (better known by her pen name "John Oliver Hobbes") wrote recently in regard to the native women of India: "Women are believed to be in the background in India and yet they wield a tremendous influence, far more than they would have if they sat on all the Boards, Committees and Juries in the land. More than one native Prince who has practically concluded a treaty one day will come back the next, after seeing his wife, and require it to be revised—often greatly to his advantage. The English will never control the East because they cannot get at the women."

JENNY LIND must have been the most simple, unpretending prima donna that ever lived. When she first came to England she was bound to sing only at the Royal Italian Opera House, and when commanded to sing at the queen's concert she was obliged to refuse. Very sorry to be compelled to notify this, she ordered her carriage and drove straight to Buckingham palace. She handed her card to an official, who, not unnaturally, declined to take it. A higher authority happened to pass and took it upon himself to present it. As soon as her majesty saw it she said, "Admit her by all means." Jenny Lind appeared and said simply that she was so very sorry to be unable to sing at her majesty's concert that she thought it better to call herself and explain. The queen was charmed with her natural manner, gave her a cordial reception and promised to be her friend.—*Exchange*

"BIRDS, the symbol and glyph of the higher divinities and angels."—*H. P. Blavatsky*

THE BIRDS

DO you e'er think what wondrous beings these!
Do you e'er think who made them, and who taught
The dialect they speak, whose melodies
Alone are the interpreters of thought!
Whose household words are songs in many keys,
Sweeter than instrument of man e'er caught!
Whose habitations in the tree-tops even
Are half-way houses on the road to Heaven!—*Selected*
