HOW much we owe to students of science who look deep into Nature's ways, and search out the wonderful truths about the earth and all the creatures.

1 Who was Charles Darwin?

ANSWER—Charles Darwin was a great English scientist. When he was a boy he was fond of natural history and of collecting specimens. Darwin went on a scientific expedition around the world, and had a chance to study the rocks and the animal life of many countries. After this he devoted his life to patient study of plants and animals. In his books he tells about the wonderful things which he learned about the workings of Nature. Darwin's life was serene and happy. He was a man of gentle kindly nature.

2 Who was Audubon?

ANSWER—John James Audubon was an American naturalist. He was sent to France to be educated, and studied designing in the studio of the great French artist, David. When Audubon came back to America he wandered about in the forests, noting the plumage and the habits of birds. He always carried pencil and paints, and made color studies of the birds which he was watching. At last he made his notes and sketches into a beautiful book, all about the birds of America. Audubon was always bright and happy, and full of enthusiasm about his work. He went into the woods again, to gather notes and sketches for a book about quadrupeds. This time his two sons went with him, and helped him with his work.

JULY

WHEN the scarlet cardinal tells
Her dream to the dragon fly,
And the lazy breeze makes a nest in the trees,
And murmurs a lullaby,
It is July.

When the tangled cobweb pulls
The coraflower's cap awry,
And the lilies tall lean over the wall
To bow to the butterfly,
It is July.

When the heat like a mist-veil floats,
And poppies flame in the rye,
And the silver note in the streamlet's throat
Has softened almost to a sigh,
It is July.

When the hours are so still that time
Forgets them, and lets them lie
'Neath petals pink till the night stars wink
At the sunset in the sky,
It is July.—Selected

Indian Braves of the South

THIS young warrior is the son of Guilprau, a Chieftain of the Araucanian tribe of South American Indians. Does he not look a worthy representative of this proud and dauntless old race, as he stands there like a little Captain about to give a command?

Perhaps you have not all heard about this interesting tribe of Indians. The name Araucanian comes from an Indian word which means frank or free. They belong to the same race as the North American Indians, and are a remnant of that ancient civilization which flourished in South America before the Spanish invasion. When the Spaniards first landed in Peru they were surprised to find, instead of the barbarous tribes they expected, an industrious, contented people, well advanced in civilization and living under a remarkable system of government. They called themselves Children of the Sun. According to the tradition of their origin, the Sun had sent two of his children to teach them the arts of civilization and to rule over them, and from this heavenly pair their Incas, or Kings, were believed to be descended. From the Inca, who represented the Sun to them, all things flowed. He watched over his people like a father and personally examined into their condition. The land was divided equally among the people, and wool from the great flocks of sheep was dealt out to each family according to its needs. There were no "poor" in this ancient land; all had enough. But all who were able were expected to work, for idleness was considered a crime. They must have known about Brotherhood, too, for we are told how the land was cultivated by the people; that first they attended to that about the Temple of the Sun, and next what belonged to the old

YOUNG INDIAN, SON OF ARAUCANIAN CHIEFTAIN
GUILPRAU, SOUTHERN CHILI

and sick, the widows and orphans and soldiers in active service, before they worked on their own. Last of all, the people joined together and cultivated the lands of the Inca. This was done in a body and with great ceremony. They gathered at day-break, in their gayest attire, as for a festival, and went through this labor joyously, chanting their favorite songs as they worked.

The Araucanians resisted the Spanish for nearly a hundred years, and at last Spain acknowledged their independence—the one tribe in that vast country which she could not conquer.

It is no wonder that this young Araucanian looks a born soldier, fearless and unconquerable. A RAJA YOGA TEACHER

A Letter from Sheffield

DEAR BOYS AND GIRLS: A line of greeting from the city of soot. From a house on a hill I look across the valley in which the city lies. A dense cloud of smoke is perpetually rising from numberless chimneys, pouring grime over the streets and buildings. Sheffield is a type of city of which there are many in the world.

I look over to the hills on the opposite side of the valley, and, just on the horizon, I see what looks like a little white path, coming from the unknown. On that path I see, just appearing, a little orderly line of children, bearing a banner, and led by the smallest child. Quietly, steadily, unbeknown to the grime-buried thousands, they march, they descend into the valley of darkness, with their banner of the strange device. Each carries a torch, and the lower the band descends into the darkness, the brighter the torches appear. Other torches are lighted—a glorious message is delivered, and in the hearts of the grimy ones a new life has arisen.

Surely this will come to Sheffield before many more years are over. How many in ten thousand, or per fifty thousand, yet know of a certain City of Promise placed upon a hill in America, and that with it a new age has dawned for humanity? Yet those who know it, who are overflowing with the unkeepable knowledge, cannot impart it direct. They must be patient and work on, knowing that the right time will come, bringing Raja Yoga to the children of many such cities. H. C. B.

A Fact Worth Knowing

INVESTIGATIONS have proved that the vast floor of the Pacific Ocean is thickly strewn with mineral deposits. Man has lived on the earth for millions of years, but here are great treasure fields yet unexplored by him. Who will invent a safe method of mining under the sea?

THE CHILDREN'S HOUR

QUESTIONS

Can you put the spider's web back in place,
That once has been swept away?
Can you put the apple again on the bough,
Which fell at our feet today?

Can you put the lily-cap back in the stem,
And cause it to live and grow?
Can you mend the butterfly's broken wing,
That you crushed with a hasty blow?

Can you put the bloom again on the grape,
And the grape again on the vine?
Can you put the dew-drops back on the flowers,
And make them sparkle and shine?

Can you put the petals back on the rose,
If you could, would it smell as sweet?
Can you put the flowers again on the husk,
And show me the ripened wheat?

You think my questions are trifling, dear?
Let me ask another one.

Can a hasty word ever be unsaid,
Or an unkind deed undone?—Selected

life. She often thought of these "nature-fairies" and wondered if she might not some day hear them speak, and yet perhaps not, for the grown-ups said there were no fairies. Could this be really true?

One afternoon she had wandered far into the forest and, sitting down to rest close beside a little brook, she soon fell soundly asleep; and this is the dream that came to little Gretel while she slept.

She dreamed that while walking in the forest she met a number of beautiful fairies with pretty butterfly wings. They were all singing a fairy song about Nature and Beauty and Life's Joy. Gretel smiled—and the fairies smiled—and asked her to go along with them.

"How is it," said Gretel, "that the world is so full of suffering, instead of being full of beauty and life's joy, as you say?"

And the wisest fairy answered. "It is because so many people use selfishly all the good that comes to them."

"Why," said Gretel, "some people never have any good come to them. Some people are *always* in trouble and suffering."

"Yes," replied the fairy, "I know it *seems* so, Gretel, but—wouldn't you like to spend a day with us?"

"O, my!" said Gretel, "but I am so big!"

"That is nothing, for now you are in fairyland, you know," was the reply, and just as quick as a wink she threw on Gretel's shoulders a little fairy cloak which made her invisible except to the fairies themselves. How tiny and beautiful she seemed to be!

By and by the little troupe came to a great oak tree. Underneath was the fairies' home and from a little room in it the fairy Leader took a silver box, beautifully carved and filled with delicious fruit; but it was fairy fruit, as we shall see. Then she placed the box down by the roadway leading to the village and she said to Gretel, "Watch, and see what becomes of the box."

So Gretel watched and early in the morning she saw a poor old woman come out of the village to pick up firewood.

"Ah!" she exclaimed, as she saw the box and the delicious fruit, "What a feast this will make! But I mustn't let the neighbors know or they will be wanting a share themselves."

So she hid the box beneath her apron and hurried home with it. The fairies followed, with Gretel, all unseen.

That evening, after all the lights in the village were out, the old woman called her husband and showed him the box of fruit. It was more delicious, apparently, than any they had ever seen, but as soon as they commenced to eat they started back in disgust, for the apples and peaches were full of wriggling worms! The man blamed his wife for deceiving

Gretel's Dream

GRETTEL lived in a little village on the borders of the *Schwartzwald*, one of Germany's great forests. She was a happy, thoughtful child, and often used to stroll through the wooded paths of the forest, talking to the beautiful wild flowers, the curious insects and little animals that were never afraid of her. Most of all she loved the gorgeous butterflies and the sweet-voiced birds. In her simple way she was a child of nature, for she truly believed that every leaf and twig was the home of some fairy and that even the smallest wildflower harbored some little

him; the woman began to scold about her husband's ingratitude and very soon they were in the midst of a violent quarrel.

While they quarreled two little elves slipped in and took away the magic box and went back with it to its little nest under the oak tree. At midnight the fairies once more placed the box in the roadway and, with Gretel, remained near to watch. Soon it was picked up by a young farmer, who hid it carefully in a large bag, first looking about to make sure that no one saw him; but the fairies saw, and they hurried with him to the little house where he lived. He hurriedly threw out the fruit, saying:

"Ah! I will melt this box and sell the silver to the silversmith. It must be worth a great deal." Then he carefully locked the door, carried the box to the fire and put it to melt in a little pot. But just then, to his surprise, the magic box disappeared. The truth was, as Gretel saw in her dream, one of the little elves carried it off, leaving the young boy wondering and bemoaning his bad luck.

The third night the box was again placed in the road and this time it was found by a poor old man who took the box under his arm; then, going back to the village, he walked from house to house, asking of every one, "Did you lose this box of delicious fruit?"

But as he couldn't find an owner he said to himself, "Well, such delicious fruit deserves to be eaten, and I will just invite all the villagers to share it with me."

So the villagers gathered at the old man's house at the appointed time and he began to give them of the fruit. And he gave and gave and gave—and then found that the magic box was as full as ever! The more he gave away the more fruit there seemed to be, and it grew more delicious and more beautiful all the time.

Gretel was so happy that she laughed aloud and awakened! Then there came into her heart the words that she once found in a certain very ancient book: "There is that giveth and yet increaseth, and there is that which withholdeth, but it tendeth to poverty."

And Gretel felt sure that she understood why the world held sorrow instead of joy. A FRIEND

WHEN a Chinese farmer goes to market, he carries his baskets on a rod which he holds on his shoulders. And what do you think, children? Very often, one basket will be packed full of farm produce, but if you looked into the other you would see neither fruit nor vegetables, but—the farmer's little five-year-old child. The father takes his little one along for a companion, and thinks nothing of the extra burden, he is so glad to have his child with him. Don't you think it must be a queer ride, to jog along in a basket all the way to market and home again?

M. M.

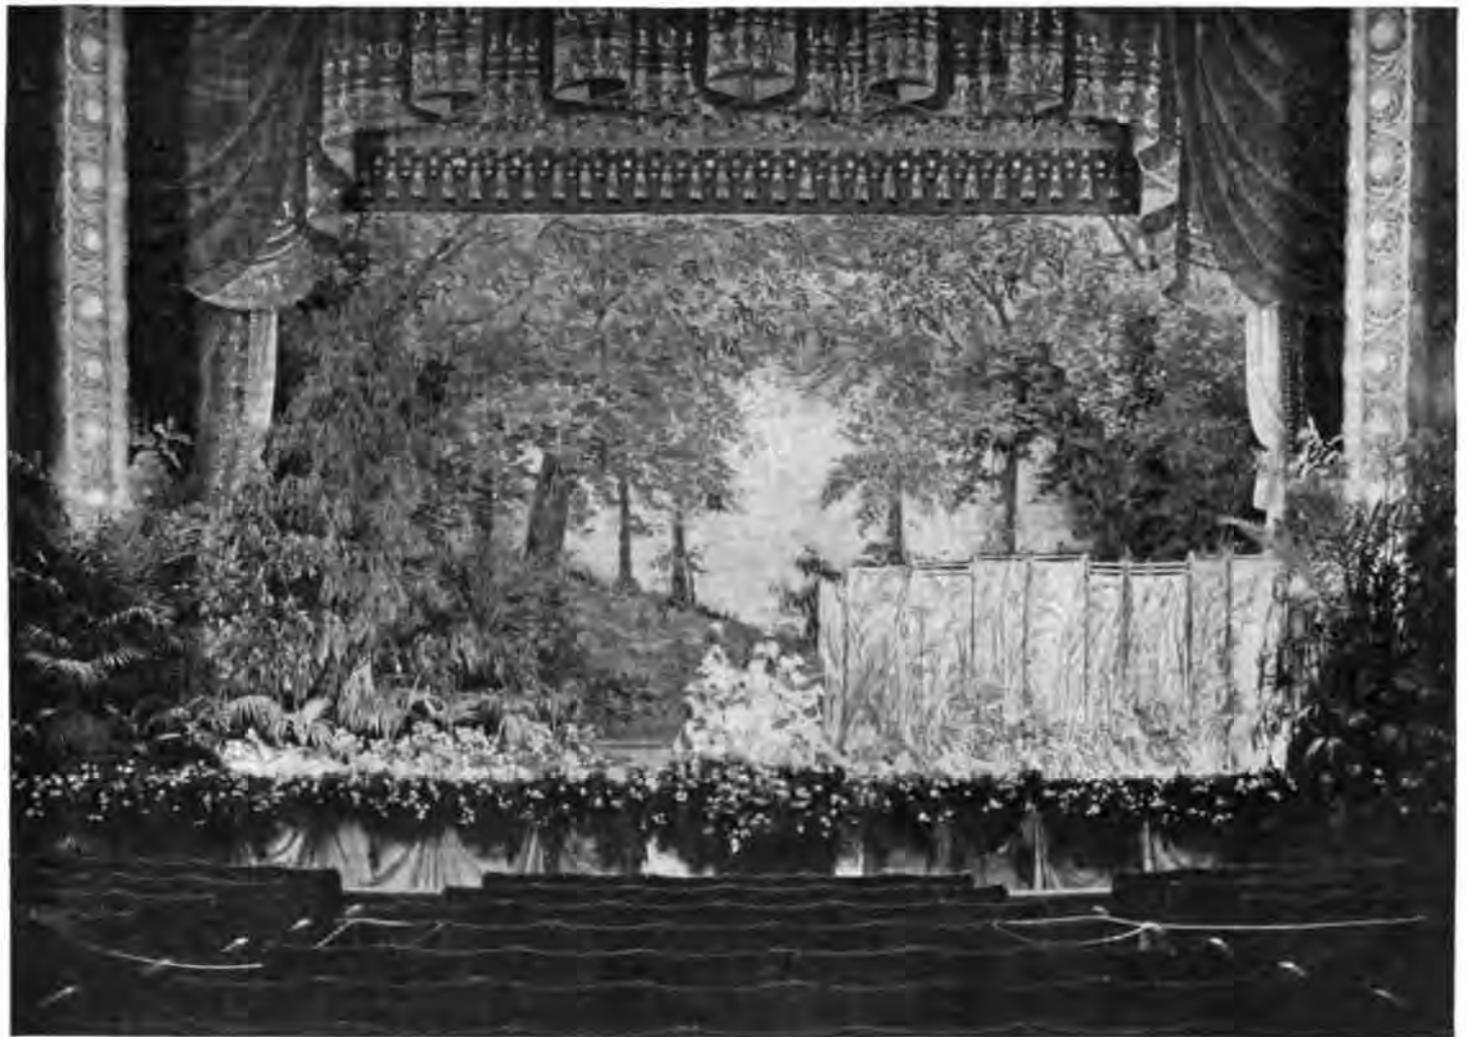

It is said that some kinds of fish, reptiles and insects never go to sleep. It is easy to believe that our little gold fish know nothing about bed time, but then, they never have to get up in the morning; they are always up! Fishermen say that pike and salmon never sleep. Shouldn't you think they would get very tired once in a while and long to take a little nap?

CHILDREN OF THE RAJA YOGA SCHOOL OF POINT LOMA, OFF FOR A HOLIDAY EXCURSION

Isis
Theatre
San
Diego
California

THE THEOSOPHICAL FORUM, IN ISIS THEATRE

LAST evening at the Memorial Service, in memory of the dead and as a tribute to the survivors of U. S. S. Bennington, Isis Theatre was crowded to its full capacity. The stage and boxes were beautifully decorated with flowers and foliage and a large American flag with a white wreath was draped over the orchestra pit.

After a musical selection, Händel's *Largo*, a number of the Raja Yoga boys and girls entered upon the stage bearing wreaths. A tiny child first placed her wreath on the memorial altar with the words, "A tribute of love to the absent ones of the Bennington." She then took the wreaths from all the other children and placed them on the altar. The children then recited appropriate quotations and afterwards sang three of their exquisite choruses. Then followed music and a short address from the Rev. S. J. Neill, and after more music, Katherine Tingley came upon the stage, carrying a bunch of beautiful lotus flowers and several garlands, and placed them on the altar, reciting the following lines from "The Song Celestial":

Nay, but as one layeth
His worn-out robes away,
And, taking new ones, sayeth
These will I wear today;
So, putteth by the Spirit
Lightly its garb of flesh,
And passeth to inherit
A residence afreah.

She then spoke of the sad event that had filled the hearts of all the people of San Diego and of this country with grief, and that at such a time all differences of sect and belief were lost sight of in the feeling of sympathy for those who were suffering, and for the bereaved, and that men were brought to a realization of the kinship of all.

"Surely," she said, "the compassion which is in our hearts must be felt by those who, at a distance, are bowed down with sorrow, and it must carry comfort to them. The divine law, under which man lays aside his physical body and steps forth into the wider and fuller life beyond, is a beneficent one. The soul in stepping out from its physical and material life, does not go into the darkness of oblivion, but passes into the radiance of its own divine light. What we call death is not the end of life but the beginning of another chapter in life.

"Those who have thus been torn from this life may feel lost for a time, dazed by the shock of the violent separation from the physical body, but they will awake into a new life and a new light and peace, and whatever the circumstances of leaving this life, the soul always sees the light beyond.

"All the great teachers of the world have taught the divinity of man, and if in a former life I had gained the knowledge of the mysteries of life and death, I might

be able so to touch your hearts that you might know something of the deeper meaning of this change called death, and that you might realize the peace that underlies it.

"We stand appalled at such a calamity as this and at the suffering we see on every hand. But not until man has raised himself to that point where his intuition will be fully operative can he have the premonition of such events, and will he be able to guard against them.

"Yesterday I read a message that seemed like a gleam of light in the midst of the gloom of sorrow. It was a telegram dictated by one of the fatally injured to a dear companion. In it he said, 'I am all right.' To me this had a very deep and profound meaning and was not simply a reference to the physical condition. It was as if the soul were speaking and had caught a glimpse of the change that was coming, and had sent this message to the bereaved loved one. He said, 'I am all right,' but he meant 'We are all right'—it was a message, not only from himself but from all his fellow sufferers who, with him, were passing into the Beyond. In such a death there was the glory of victory, a victory of the soul.

"That which we love is the soul, and we can take comfort in this, that the soul stands above and beyond all physical pain.

"In times such as this when the heart is stirred to its depths, and all thought of self is lost in sympathy for others, it must be that the distance is spanned between those who have passed on and those who are left behind, whose hearts must feel that their loved ones are enfolded in the arms of the merciful law. From the mountain tops, in the light of the life beyond, they send down a message of hope and trust to those who are still in this valley of sorrow.

"Could we more fully realize our divine natures we would have somewhat of the power to bridge the gulf that separates this life from the next and realize the tender justice of the divine law. The limitations which we find in our lives come from ourselves; it is not the law that limits us."

The speaker then pursued her subject with masterly feeling and eloquence. One of her last thoughts was the following:

"Such a terrible calamity as this brings with it one of the great lessons in life. It makes us feel the deeper ties that bind all souls together. When we are thus brought face to face with the divinity of our higher nature, we realize that we are our brother's keeper, and if we do not challenge the law, the law will challenge us."

In all that Katherine Tingley said, she lifted her hearers above the scenes of horror to a glimpse of the higher life of the soul, and all her words were listened to with the most profound attention. It was the general feeling that it was not a memorial in the ordinary sense but that it had a deeper significance. After the conclusion of the service, the wreaths and flowers were sent with a greeting from Mrs. Tingley to the wounded survivors in the hospitals. OBSERVER

Saracenic Architecture in Egypt—Its Beauty and Originality

AFTER the disappearance of the stately architecture of the Pharaohs and the break-up of the corrupt Byzantine Empire of the East, the enthusiastic zeal of the Mohammedan conquerors quickly developed a vital and dignified form of art, original in many of its larger features as well as in most of the finer details, though its derivation from the Byzantine style is traceable. The Arabs possessed no national art of their own, originally, as they were half-nomadic and had little or no higher culture. At first the Mohammedans in Egypt, Spain and elsewhere made extensive use of the multitude of Roman and Byzantine pillars that remained, and frequently used the Christian churches almost as they found them. In Cairo they did not incorporate the carved work of the old Egyptian Empire, though they desecrated many of the remains that the fanatical monks had left intact by turning them into quarries of hewn stone.

In Mohammedan Egypt we find the first general adoption of the pointed arch, though it had been occasionally used for ages in Egypt, Crete and elsewhere. The Saracens employed it early in the Eighth century, A. D. Their fear of idolatry partly prevented them from making representations of animal life, and their abstract bent of mind led them into the creation of the exquisite geometrical traceries we call *arabesques*. The beauty of many of the traceries, cut in stone, which fill the pointed windows of the mosques has not been excelled by anything of the later Gothic designers of Western Europe, even in the Fourteenth and Fifteenth centuries.

The influence of the ancient Egyptian style is well-marked in the splendid group of Mosques at Cairo which made it one of the handsomest cities in the world. A near approach to the massive, impressive solidity of the antique work is there, and in at least one Mosque (A. D. 1149) a series of great sepulchral chambers betrays a lingering tradition of the past.

The Egyptian Mosques of the best period (from about A. D. 885 to the end of the Fifteenth century, when a decline set in to the present day of utter corruption) have the same grandeur and simplicity of design, perfect balance of parts and concentration of lovely detail in a few focalized spots characteristic of the ancient style and eminently suitable to the perpetual sunshine of the country. The designers felt the need of large, cool shadows and broad effects, in contrast to the best architectural work of Northern and Western climes, where the grey diffused light demands a greater extent of fine detail to give interesting light and shade. Exquisitely delicate and complex ornament in color and form was used lavishly in the interiors of the Saracenic buildings where it could be justly appreciated.

We are inclined to pride ourselves upon the unique beauty of the Gothic towers and spires, and the majesty of the domes of the Renaissance churches of Rome, Florence, etc., but it is doubtful if the grace and originality of some of the minarets of the Egyptian Mosques or the noble contour of their domes have been excelled in the West. There is a deep sincerity in the very lines that must impress all save the mere onlooker.

A Mohammedan Mosque differs in many particulars from a Christian Church or a Classic Temple. The essential features are a hall for prayer and a special holy place to hold the sacred volume of the Koran. There is no altar, no choir nor pulpit; but a large court with a fountain for the ablutions of the pilgrims and one or more tall, slender towers, the symbolic minarets, from whose summits the muezzin's voice may summon the faithful to prayer; and sometimes the mausoleum of the founder completes the equipment of a well-appointed Mosque. The Mosque is, above all, a house of prayer. The Mosque of Emir Akhur at Cairo, herewith engraved, well illustrates the simple dignity to which the Saracenic style had attained before its decadence. STUDENT

THE vicissitudes of the harp that once belonged to Queen Marie Antoinette—what a fascinating tale they make! The harp is now owned by a young Swedish woman in this country, to whom it descended through a long line of ancestors, and there is said to be no doubt as to its authenticity. It is still exquisitely beautiful, having been the work of that great maker of harps, Naderman of Vienna, who fashioned it in 1720. All but the sounding-board is of the finest mahogany and it has never been polished or varnished as such instruments usually are.

Lomaland Photo and Eng. Dept.

MOSQUE OF THE EMIR AKHUR, CAIRO, EGYPT—SARACENIC DESIGN

When Marie Antoinette became the bride of Louis XVI of France she took this harp from her royal home in Austria and brought it with her to Paris. Later, when the royal palace was sacked and the King and Queen thrown into prison, "*La belle Autrichienne*" pined for her harp, and at last one jailer, kinder hearted than the others, secured it for her. Then came that terrible day when the beautiful Queen followed her husband to the guillotine and the harp disappeared. But a record of it was kept, as well as a description, which made possible, later, its identification. For years it lay in a garret and then was discovered by a Swedish nobleman, ancestor of the young woman who owns it today. STUDENT

THE Taj Mahal is considered, and rightly, to be one of the most beautiful buildings in the world. But is its meaning clear? Do we fully understand the motive of the one who erected it and is it not possible that in the future it may have for us a new message?

Universal Brotherhood Organization

Central Office Point Loma California

The Year's Work

THE year 1905 will witness the completion of the third decade and the beginning of the fourth in the history of the organized Theosophical movement of this age.

The year 1875 saw the meeting of H. P. Blavatsky and William Q. Judge, and the organizing of the Theosophical Society and Universal Brotherhood.

In 1885, H. P. Blavatsky began her stupendous work, *The Secret Doctrine*.

The year 1895 was one of stress and conflict, and of victory in the triumphant vindication of William Q. Judge, in the recognition of him as President for life and Leader of the Theosophical Movement throughout the world.

Each of these events was epoch-marking, and when we can look back upon the present year of 1905, through the perspective of another decade, we shall, no doubt, be better able to judge the importance of the events now taking place; but we can see even now, in the very midst of them, that they are alike epoch-marking and world-wide in their effect and influence.

THE CRUSADE OF 1905

Standing out as a landmark in the march of events is the acquisition of the new European Headquarters and the opening of the Raja Yoga Institute at 91 Avenue Road, London—the formation of a new synthetic center of pulsating heart-life for the whole of Europe, a reincarnation in a new body of the spirit of the old H. P. B. Headquarters, and a new focus for the out-streaming energies from Point Loma. Taken in connection with this, how significant is the record of the European Crusade, planned by our Leader, and carried out by Comrades Dick of Dublin and Crooke of London, laying down, on the inner and outer planes, new channels of communication and forging new links of wide-reaching import between the countries visited and among the many comrades of those countries.

Just as the results of the acquisition of the new European Headquarters will be unfolded as the years roll by, so the results of the Crusade cannot yet be told but will be revealed in the events of the future. Yet we can see a little of the deep meaning of the Crusade at such a time as this, and though some of the countries visited may relatively be free from the terrible throes that are agitating some parts of Europe, the dark cloud hangs over the whole of the continent. How much then does it mean for the future of the human race, that in the midst of the turmoil there should be such a holding center as that at Avenue Road, where the children are being trained on lines that will ensure the future welfare and peace of the nations; and that the comrades in England, Ireland, Sweden, Germany and Holland and other countries should have been fired with a new zeal to work for the Brotherhood of the race, and should be united as never before in loyalty and devotion to our glorious Cause and to our great Leader?

A DEEPER RESPONSIBILITY—A NEWER HOPE

Details of the work, such as new members admitted, new Centers formed, the many enquiries from earnest, intelligent people—not alone in the countries named, but from all over the continent—are but the outer indications of the work accomplished during the past year. To understand the real progress, one must be able to look deeper, see the effect in the heart of the people, and note there the almost universal promptings after a higher life.

And just as with the advance of the Movement on all lines, a deeper responsibility has been laid upon each of us here, so to our Comrades in Europe, to those directly connected with the European Headquarters, and those in the various Centers in the countries visited by the Crusade, and the other Centers in the other countries, and to all the individual members, there has been given a new and deeper trust, as well as a new power to fulfil that trust and a new and sustaining hope. Comrades, we here in Lomaland do feel this and we feel, too, that you do. And because of this mutual realization of our higher duties, and of our confi-

dence in the wise guidance of our Leader, we can look forward into the future and see our Cause each year ever more and more triumphant.

THE RESURRECTION OF INDIA

Of the other countries of the world, others will recount the progress achieved, but there is one matter that comes to mind of which brief mention should be made. The wave of progress has also touched the ancient land of India—ancient Bharatavarsha—where H. P. B. worked so hard, and where such efforts have been made to stifle that work. There are those in that vast country with its teeming millions who have been, and *are* faithful, to the memory of H. P. B. and W. Q. J. and to Katherine Tingley today, and who are linked with us in the closest ties of Brotherhood. It now rests upon them to spread the truth!

J. H. FUSSELL

Universal Brotherhood

FOR a very long time man has done with what must be called a substitute for morality. And it has not only not made him happy, but it has filled the world with an unimaginable ocean of crime and misery. He has split up the one virtue into the virtues, and in the process all the life has gone out of them. Thou shalt love thy neighbor as thyself, said our great Western Teacher, preceding this with the injunction to love "the Lord thy God." This is the whole canon; nothing in it about loving thyself, or looking after thine own interests, temporary or eternal. The reward of following this out is that "*thou shalt live.*" Which means the real life, the one that death cannot touch.

Probably this simple canon was made effective by the early Christians, and they got the joy of it. But very soon the enemy got hold of it and began to distort it. The loving thy neighbor part, dropped out of sight. Therefore so did the other. But it did not at first seem to have done so. Unselfish love of God changed into self-love; and that true service of God which consists in work in the world, changed into various forms of the attempt to curry favor with God. And the high conception of God lowered down into the conception of a personality with whom favor could be carried by appropriate methods. The change was so gradual that it was almost unnoticed.

The change—the idea that God could be served in any other way than by work in and for the world—has almost brought about the wreck of the world.

Some situations can best be conceived by conceiving their contraries. A Howard, a Sister Dora, a Florence Nightingale, stand out like lights just because they are so few. Suppose there had never been less than thousands of them since the time of Christ. A thousand times more pain is relieved, more crime averted, by the *heart* of a philanthropist than by his hands. He sends out continually a warmth of compassionate feeling, an actual radiation from his heart, which, wherever it touches, lifts something of that sense of loneliness which constitutes the greater part of the misery of those outcasts of great cities who are miserable, which is always saving from crime some poor wretch who is about to commit it because "who the devil cares, anyway?"

Suppose there had been from the time of Christ, say but thousands only—but an uninterrupted succession—of persons consciously taking the needs of humanity into their minds and hearts, loving their "neighbor" as themselves and in that forgetting themselves, and radiating back into the general human field from their hearts the warmth of compassion—how much crime, how much misery, would there now be?

Suppose that the inventor did his inventing that human life might be enriched; the musician his composing to the same end; suppose even that the financier amassed his money in order that he might with it obey the compassion in his heart; suppose that all duties and proper activities were done from the basis of world-love instead of self-love; can any imagination stretch itself to a conception of the splendor of human life?

All virtues are involved in this one virtue—compassion. Separate them from that and you have separated them from their light.

The spirit of God broods as ever over the world; but it must have voluntarily-offered human hearts for its channel. It is to that voluntary offering of *themselves*, their *lives*, their *imagination*s, that the *members of the Universal Brotherhood are pledged.*

THE WORTH OF HOURS

LORD HOUGHTON

BELIEVE not that your inner eye
Can ever in just measure try
The worth of hours as they go by.

For every man's weak self, alas!
Makes him to see them, while they pass,
As through a dim or tinted glass.

But if in earnest care you would
Metre out to each its part of good,
Trust rather to your after-mood.

Those surely are not fairly spent
That leave your spirit bowed and beat
In sad unrest and ill-content.

And more, though free from seeming harm,
You rest from toil of mind or arm,
Or slow retire from Pleasure's charm---

If then a painful sense comes on
Of something wholly lost and gone,
Vainly enjoyed, or vainly done---

Of something from your being's chain
Broke off, nor to be linked again
By all mere Memory can retain---

Upon your heart this truth may rise,
Nothing that altogether dies
Suffices man's just destinies.

So should we live, that every hour
May die as dies the natural flower,
A self-reviving thing of power.

That every thought and every deed
May hold within itself the seed
Of future good and future need.

Esteeming sorrow, whose employ
Is to develop not destroy,
Far better than a barren joy.—*Selected*

More Life, More Light

IN their universal quest of more life, men forget that the way lies through more *light*. Forgetting that life, and light, and joy, are one, and needing more life, they know not how to get it. More life means not only *length* of days, though it includes that; but fullness, radiance. First must come a clear conception of more life, and if we only conceive of more days we have done very little, have hardly even caught sight of the path we want to enter. We do not know what life in the body *could* be, how the cells might act instead of stagnate.

At least we might stop killing ourselves. Almost every moment we are committing suicide. A sneer, a sarcasm, *may* darken the life of another, diminish it, chill it at the moment and therefore in the end shorten it. But it *does*, must, darken and narrow the life of the man who permits it to come to his lips. It is a contraction, a withdrawal from the general tide of life flowing in space.

To accept a gift without gratitude is also to hack at the trunk of one's own life. It is a folding in of the channels through which life reaches us. Gratitude on the contrary, lets more of the life-light in, in even to the body.

Habits may easily absorb our life, and even single deeds done for self-interest and self-amusement. To gain life from a deed, do it in the spirit of giving. Any act of duty whatever may thus be made to yield some life to the doer, if he will *give it to the universe*. It will be accepted in the right quarter, and payment made in life and light. But conversely it is easy and common for men to pour their life into a hobby, to make the hobby a sort of exacting entity in consciousness, absorbing the richness and possible luminousness of life even when lengthening it. Nevertheless for many men an innocent hobby may be much

the lesser of two evils. They do not know how to reach the height where giving is a continuous *state* as well as a set of acts.

Many people create a sort of entity of the eating necessity, an entity which, unseen by day and night, is continuously absorbing their life, and whose injuries are on another plane than that of the physical injury or poisoning which comes from excess.

All these are but by way of example—the habits of personal ambition, sarcasm, acrid criticism, greed, unkindness, which constantly poison life as well as narrow or obliterate the channels from the universe which replenish it; and also all other habits centering around the self, which become vampires. So it is obvious that the causes of death named on the last medical certificate are far away from the real ones! The real ones are the thieves that we allow to work in secret, year in and year out, and finally steal all the life there is; and the poisoners who spoil it and ferment it whilst any remains for them to work on.

There is no need to be involved in mental difficulties about this, or be pondering whether this or that is poisoning or stealing life. Let us leave the problems and difficulties to themselves. All will become plain, all will be lit up, by another method. Our task is to give, and to enter and live in the state of readiness to give, till we have found the great truth that it is not only more blessed, but more joyful and more lifeful for ourselves, to give than to receive or take. We must think of ourselves in the body as *light*, for the essence of light is to shine around every-way. That thought *is* an act, and it leads to those visible acts to which alone we apply the word *act*. Such an attitude and thought will draw life, will thrill the body, burn up seeds of disease, and at last become a beneficent habit to which no further conscious attention need be given. And life will not only be lengthened out but filled and enriched beyond any present conception we can make. But it can only be done by *self-forgetfulness*.

STUDENT

FRIENDS IN COUNSEL

DEAR COMRADES: The minds of pupils at the Raja Yoga Academy are not looked upon as mere receptacles for storing facts, nor as machines which, from particulars supplied, educe opinions by a formal rule. The mind is here regarded more as an instrument of vision for gazing at the truth firsthand, or as a mirror for reflecting images from the ideal world.

To know what Plato taught and Shakespeare wrote is well, but better far to let the light of Wisdom which illumined them shine through our minds and radiate upon a world in gloom the warmth and brightness of eternal Truth. To clear the intellect from dark, obscuring clouds of passion and desire, is the first care of teachers in the system followed here. That truth is hard to find is not because it lies remote, but for the reason that our minds are so encumbered with erroneous preconceptions that new light can hardly find an entrance there.

A leading factor in successful training of the intellect is the impersonal end in view. When truth is sought by narrow, selfish minds for private gain, the very motive is a barrier to clear apprehension. The walls and fences which such seekers have erected round their minds, to screen their hoarded knowledge from the public view, serve to exclude the entrance of fresh light; while the devoted and magnanimous do, by their pure intention, open up the mind to such a flood of new ideas pouring in, they almost are embarrassed to select what they require.

The view of mind thus briefly indicated may do something to reduce the stupefaction of astonishment which overwhelms the thoughtful student of the life of Joan of Arc. A village maiden herding cattle in provincial France is suddenly promoted to become advisor of the King and the victorious leader of her country's army! We must remember that her understanding was not crusted with an overgrowth of rigid preconceptions, but clarified and molten with the white flame of a selfless patriotism. In the unsullied mirror of her mind the Oversoul cast its full image clear. She always had so yielded swift obedience to the lightest indication of the Law that she found herself its ready servitor. She now became an agent of the Universal Mind, and that Impersonal Wisdom which inspires whatever has been great in human life was bodied forth and found expression through her youthful frame.

No claim is made at the Academy for patent and peculiar wisdom. The training merely is of such a kind that students' minds grow porous and pellucid, so that what is known to all as "flashes of common sense," in them become habitual and continuous. The same intelligence which guides the honey-bee and paints the rose, streams in upon their daily lives, and glorifies the doing of the simplest duties with something of eternal fitness and that magic touch of soul which must forevermore escape our coarse analysis and lame descriptive power.

STUDENT

CRITICISM

ALEXANDER POPE

WHOEVER thinks a faultless piece to see
 Thinks what ne'er was, nor is, nor e'er shall be.
 In every work regard the writer's end;
 Since none can compass more than they intend;
 And, if the means be just, the conduct true,
 Applause, in spite of trivial faults, is due.
 As men of breeding, sometimes men of wit,
 To avoid great errors, must the less commit;
 Neglect the rules each verbal critic lays;
 For not to know some trifles, is a praise.
 Most critics, fond of some subservient art,
 Still make the whole depend upon a part:
 They talk of principles, but notions prize,
 And all to one loved folly sacrifice.

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question

Is it not true that most of the obstacles of this life are due to the acts of past lives, and that we bring with us a lot of debts each time we come back to earth? How can we pay our Karmic debts as we go, and not carry them over to the next or a future incarnation?

Answer

It is one of the explanations that Theosophy offers to the inequalities of life and its many hardships, for which we can trace no cause in our present short existence, that now and here we are reaping the result of deeds and thoughts of previous lives. And it is a fact that we ordinary mortals bring back with us a lot of Karmic debts—but not debts only but credits too, for much of what we call good fortune in any one life is also the result of the past.

Certain circumstances, and events, and characteristics of mind or body, at one time help and at another time hinder. And so the question arises, how can we become free from this Karmic debt? Is it possible so to live that we shall not make obstacles for our future lives?

This must surely be possible, else all our efforts after greater perfection would be vain. And the whole secret of how to pay one's Karmic debts as we go is, I think, given in the *Bhagavad Gita*, a little book which is truly one of the world's sacred scriptures, and a mine of inexhaustible wealth and spiritual teaching.

The following are a few extracts bearing on the question:

"A man enjoyeth not freedom from action from the non-commencement of that which he hath to do; nor doth he obtain happiness from a total abandonment of action. . . . But he who, having subdued all his passions, performeth with his active faculties all the duties of life, unconcerned as to their result, is to be esteemed. Do thou perform the proper actions: action is superior to inaction. The journey of thy mortal frame cannot be accomplished by inaction. All actions performed other than as sacrifice unto the supreme make the actor bound by action."

"But the man who only taketh delight in the Self within, is satisfied with that and content with that alone, hath no selfish interest in action. . . . Therefore perform that which thou hast to do, at all times unmindful of the event: for the man who doeth that which he hath to do without attachment to the result, obtaineth the Supreme. . . . As the ignorant perform the duties of life from the hope of reward, so the wise man, from the wish to bring the world to duty and benefit mankind, should perform his actions without motives of interest."

"Those who have spiritual discrimination call him wise whose undertakings are all free from desire, for his actions are consumed in the fire of knowledge. . . . All the actions of such a man who is free from self-interest, who is devoted, with heart set upon spiritual knowledge, and whose acts are sacrifices for the sake of the Supreme, are dissolved and left without effect upon him."

"Men being contented and devoted to their own proper duties attain perfection."

"With thy heart place all thy works on me, prefer me to all else, exercise mental devotion continually, and think constantly of me. By so doing thou shalt by my divine favor surmount every difficulty which surroundeth thee."

We have then as the key to freedom from Karmic debt, first, the performance of duty, and the right performance of action; second, disin-

terestedness in action, the performance of action unattached to its result (this does not mean careless of results, but having done one's best to leave the results to the law, passing on free and untrammelled to the next duty); and third, devotion to the Supreme, which is mirrored in the heart of everyone, the divine Self within.

"Whoever in acting dedicates his actions to the Supreme Spirit and puts aside all selfish interest in their result is untouched by sin even as the leaf of the Lotus is unaffected by the waters. The truly devoted, for the purification of the heart perform actions with their bodies, their minds, their understanding, and their senses, putting away all self-interest. The man who is devoted and not attached to the fruit of his actions obtains tranquillity; whilst he who through desire has attachment for the fruit of action is bound down thereby."

And in another of the world's scriptures, in the words of Paul to the Corinthians:

"Whether therefore ye eat, or drink, or whatsoever ye do, do all to the glory of God."
 STUDENT

Question

In view of the thorough education to be obtained at our standard colleges and universities, what advantage does the Raja Yoga system of education offer?

Answer

In the first place, we question if a *thorough* education be possible at any established institution other than the Raja Yoga Schools. From the primary grade, through High School, College, and University, alike, the custom maintains of getting through a prescribed course of book study in a given time, after which the graduates are said to be prepared "to begin life." Instead of having lived themselves, or learned their own strength, instead of having practiced their own power to think, for some eighteen, twenty, and in some cases twenty-two or three years, they have faced the world with a more or less imperfect memory of what other people have thought and done. In this defective armor how many are beaten in the first contest; how many become disheartened and add so many more annually to the world's people described by Emerson as "afraid of truth, afraid of fortune, afraid of death and afraid of each other."

Raja Yoga trains the child to begin life at the beginning, and to continue living *himself*, manifesting his own talent with daily cumulating force, and growing at once physically, mentally, morally, and spiritually. During the short five years of their existence, the Raja Yoga Schools, under the guidance of Katherine Tingley, have abundantly proven the ability and power of the Raja Yoga System of Education. Each child is dealt with individually, and in the words of H. P. Blavatsky, they are "taught self-reliance, love for all men, mutual charity, and especially to think and reason for themselves." Mere memory work is advocated as little as possible, thus giving time for the development of the faculties and latent capacities. The very freedom in which a Raja Yoga child studies carries with it a living knowledge that can be acquired in no other way, even by the brightest genius, in any school in the land.

The aim of the Raja Yoga School is to send forth free men and women, unprejudiced, and unselfish, who will not ask for opportunities but create them.

J. D. McA.

Question

As a Theosophist, what do you consider is most needed in the world at the present time?

Answer

First, Brotherhood; a knowledge that all men possess all interests in common, and that the true welfare of one depends upon the welfare of all. And next, I would say that the world needs Theosophy. I put Brotherhood first, because every one knows to some extent what that means, but may never have heard of Theosophy. But in fact, Brotherhood is the first step in practical Theosophy; and so we might answer the question in one word—Theosophy.

Or, to put it in another way, we might say that what is most needed in the World today is Raja Yoga, balance, the perfect balance of the whole nature, physical, mental, moral and spiritual. This again is practical Theosophy, and cannot fail of finding its expression in Brotherhood.

And the cardinal teachings of Theosophy and Raja Yoga are, that man is divine in his innermost being; that he has a higher and a lower nature, and that the lower must be controlled by the higher. With this knowledge will come a deeper sense of responsibility, as well as a more complete realization of the meaning and sense of life—and true happiness. STUDENT

Panem et Circense

“**B**READ and Games:” this was the incessant cry of the Roman mob in the declining days of the Empire, when the Emperors kept their tottering seats only by a continued and ever-increasing compliance with the appetites of that idle and indifferent populace that filled the capital.

The negative virtues of peaceableness, respectability, and staidness, so admirable in times of safety, are seen in times of stress to be sometimes dangerous vices. Of what use is it to blame corrupt administrations, when these but reflect the flabby and vacuous mind of the people? The people is fond of saying that it rules itself, its administrators being merely delegates for the public will; but if the people in the heaviness of indulgence, drops the reins, they will be grabbed by incompetent hands; and it will be of little use to lie grumbling in the bottom of the chariot as it swerves and reels on its mad career.

It is but the repetition of a familiar historical fact: that nations in their small beginnings are united and solid, the individual units being cemented by the strong mortar of public spirit. Having by their prowess achieved success and earned long years of secured peace and prosperity, indulgence and individualism set in, and the nation as a corporate body disintegrates, being resolved into a multitude of people. Then a younger power steps in and establishes itself on the ruins of the older.

This process does not, however, always proceed to its final result. If decay has not too far gone, imminent danger may arouse the slumbering sense of duty and save the nation. Before the Roman Empire finally fell, it had passed through many such an averted catastrophe, and had witnessed the rise of dictators and emperors able to lead the people out of their difficulties.

Will this be the case with certain of our peoples, and is there enough public spirit left to call for a determined lead towards regeneration and efficiency? Without doubt this is the case, but perchance the time will not come until after privation and restriction have rendered the existence of an idle populace no longer possible.

The causes that have bred such a populace are deep-seated and involved. Starting in life as mere indistinguished units, results of heedless procreation, they are educated in schools that train the faculties to highly specialized accomplishments, and leave the mind shallow and ignorant of life and the world. To earn and spend their wages is their aim; they are not citizens, they are street-fillers.

And so this class, this spirit, will follow the fortunes of the false education and all the other shams that the scythe of Time is now mowing down. These things will, like the microbes, perish from their own ex-

cretions; they will bankrupt themselves by their own extravagance. They are the remoter effects of that lack of ideals and decay of faith and aspiration that mark the passing of old beliefs. But, with the returning recognition by men of their own divinity, will arise a new faith and reverence that will build institutions on the ruins of those that are tottering. Let us who are full of hope and faith look on this side of the problem, and be sowers of seeds and layers of foundations. H. T. E.

John Hay

PRESIDENT ROOSEVELT'S fine pronouncement on the death of John Hay is worth quoting:

John Hay, Secretary of State of the United States, died July 1. His death, a crushing sorrow to his friends, is to the President of this country a national bereavement, and in addition it is a serious loss to mankind, for to him it was given to stand as a leader in the effort to better world conditions by striving to advance the cause of international peace and justice. He entered the public service as the trusted and intimate companion of Abraham Lincoln, and for well-nigh 40 years he served his country with loyal devotion and high ability in many positions of honor and trust; and finally he crowned his lifework by serving as Secretary of the State with such farsightedness of the future and such loyalty to lofty ideas as to confer benefits not only upon our own country, but upon all the nations of the earth.

This is in no way too strong. The death of John Hay is a loss to mankind. He represented the very highest type of American statesman, and than that there is no higher. He had at heart not only America's welfare but the world's welfare, and his public life was the rendering of his high ideals into action. The world will always be the better because this man lived and worked in it. Of how many others now upon the world's stage will it hereafter be possible to say that? STUDENT

New Efforts of Pious Invention

ACERTAIN Eastern clergyman has been favoring his congregation with a story doubtless designed for their spiritual benefit. The story is that a man in Indiana twenty-four years ago cursed God and immediately became a heated mass, so hot that no one could come within one hundred feet of him. Everything about him burned, the minister said. The heat remained with the man seven days, when his neighbors dug a hole back of him and buried him.

There are several points about this story that need elucidation, and we are informed that in the absence of sworn testimony it is discredited. C.

In the drifting sands of Chinese Turkestan, now being explored by archeologists, some of the documents found, written on parchment, wood, and leaf, have as their seals Pallas with the Ægis and a Greek Eros. And these documents are said by critics to be two thousand years old.

THE MYSTERIES OF THE HEART DOCTRINE

Prepared by
KATHERINE TINGLEY
 AND HER PUPILS

The Theosophical book of the Twentieth century

Tells the story and the history of the Theosophical Movement Throughout the World.

The prices are \$2 in cloth and \$1.50 in paper, which barely cover the cost, for it is printed and bound, not gaudily, but with such carefulness and thoroughness of art and craft as to make it unique among modern edition books.

Order now from
 THE THEOSOPHICAL PUBLISHING COMPANY
 POINT LOMA, CAL.

The Mysteries of the Heart Doctrine

In pamphlet form. Illustrated. First and second pamphlets now ready. First pamphlet contains
REVIEW AND OUTLOOK of the THEOSOPHICAL MOVEMENT
 with a Chronology

Second pamphlet contains
WORLD TEACHERS
THE ENEMIES OF THE THEOSOPHICAL MOVEMENT
GROTESQUE THEOSOPHISTS

Each pamphlet is tastefully bound in paper and will contain a selection of different articles from the single volume. See above advertisement : So many readers prefer the pamphlet to the book, that this series will respond to a long-felt want.
 Each : : : : : : : : : :

A Russian on Chinese Troubles

IT may be taken for granted that as a result of the present Eastern war, there will be no more annexations by the Great Powers, of bits of China. That source of danger to the peace both of Europe and Asia is over. According to M. Lessar, late Russian ambassador to Peking, it was these predatory nibblings at Chinese territory that brought about the Boxer rising.

When the Japanese war seemed to prove that China was weak, every Power went to seize what she could get. For Russians, perhaps, there was more excuse, for the railway to Port Arthur was a necessity in order to enable us to bring the Transcontinental line to an ice-free port. But all the Powers were the same. Every one looked about to see what he could steal, and it was this policy which brought about the Boxer insurrection. It was a natural national movement, directed against the exploitation and aggression of the foreigners.

But he mentioned, in the same interview, a contributory cause—irri-

tation at certain results of missionary work, not necessary results, not due to Christianity as such, easily remedied. Special protection is given to converts. That fact, and another at which M. Lessar only hints—the secret interference of missionaries in Chinese politics—are the real source of irritation, not Chinese objection to Christianity. According to M. Lessar:

Missionaries Meddle in Outside Affairs

The Chinese are most tolerant on matters of religious opinion, but when they find the profession of Christianity used as a cloak to screen criminals and to confer upon them exceptional privileges and protection, they object. Hence the trouble.

It is more than likely, however, that other risings will take place in China, due to a multiplication of causes, for China is stirring.

M. Lessar thinks that a missionary should renounce his right to the protection of his home government. He was not invited to come. He preaches the Gospel of a Teacher who enjoined individual non-resistance to evil, and who sent out disciples unprotected, unfurnished with tomorrow's necessities, and without the smallest intention to invoke the Roman power if they got into danger.

"If you ask me," says M. Lessar,

For my own views upon the missionary question, I would say at once, when a man becomes a missionary he should cease to belong to any nationality. Jesus Christ should be his only Consul, the Kingdom of Heaven his only country; and if he should have the misfortune to be slain, then he will become a blessed martyr, and his blood will become the seed of the Church. If this principle be carried out, it is possible Christianity might make great progress in China, progress which

Present System Needs Gunboats

I don't expect so long as the present system continues, in which men become missionaries as a kind of business, and women go into it as a kind of excitement and from a love of travel, knowing that if they get into trouble there is always the Consul and the gunboat.

Without taking M. Lessar's extreme view as to the personnel of the missionary body, we may yet wish that as a whole it were animated by much more of the real missionary spirit, and that Christianity might be presented in act as well as in word, especially when the word comes so variously from so many competing sects.

The Promise of Greece

THE Greek Society for the Dissemination of Useful Books is doing a splendidly patriotic work for the poorer classes of Greece. For some years past it has issued month by month, at a nominal price, little booklets on elementary science, history, geography; detached chapters dealing with special points from noted books; tracts on agriculture, bee-keeping, the care of health, and so on. Seventy of these have now been issued, amounting to 600,000, and they are eagerly bought by the people. As—thanks in part to the work of some Americans eighty years ago—there is a complete system of national education, everybody can read, and the average intelligence of the working classes is exceedingly alert and acute. Their long subjection to the infamous rule of the Turk seems indeed to have acted as a tonic alike to mind and character. The fight for freedom which they made nearly a century ago might well rank with anything recorded in their older annals.

The little books find their way far beyond the country, into Crete, Cyprus, Asia Minor, wherever Greek is spoken. They thus have to pass the Turkish censorship, and that is not always so easy. A primer of agriculture was recently seized because of the part relating to the bees. The occasional killing of the queen bee therein prescribed was considered as likely to create a tendency to regicide!

The Society has also been founding libraries in connection with the primary schools. These are placed at the service also of the people of the neighborhood, and are constantly used by them.

So Greece is ready for whatever new things are in the air or may come into it.

STUDENT

The Health of Cuba

PRESIDENT Palma does not propose to allow any Cuban towns or cities to lapse into an insanitary state. Neither the local city governments nor the Cuban Congress having provided means to carry on the necessary sanitary work, the President has issued a decree directing that this shall go on upon the same basis as during the last fiscal year. He rightly holds that his country would be utterly condemned by other powers if she fell short of the highest modern standards in this matter. The present prevalence of yellow fever shows his foresight. H.

A Still-Born Declaration

A CONTEMPORARY gives the curious story of the North Carolina Declaration of Independence, but without giving or perhaps suspecting what we regard as the real reason for its having been put aside and forgotten, a reason lying in the nature of things, and not merely in the brain of a man.

As everybody knows, the great Declaration, inspired by Paine and drawn up by Jefferson, bears the date July 4, 1776. This preliminary Declaration bears the date May 20, 1775. It is therefore more than a year ahead of the other. The thirty-one signatories were Scotch-Irish Presbyterians, assembled at Charlotte, Mecklenburg County, North Carolina.

It consists of three Resolutions. The first contains the phrase—"The inherent and inalienable rights of man." The second declares the dissolution of "the political bands which have connected us to the mother country." The third again declares independence, and adds—"to the maintenance of which independence we solemnly pledge to each other our mutual coöperation, our lives, our fortunes, and our most sacred honor."

They were brought to the notice of Jefferson and others. But though there is an echo from them in the great Declaration, as a whole they were regarded as premature, put aside and forgotten.

Why was this? Has anybody any grievance? The signatories of the great Declaration were, practically to a man, Masons. The signatories of this preliminary affair were Scotch-Irish Presbyterians.

This nation was born under the inspiration of men who were Masons, *Builders*. Does it mean nothing that the suddenly formed consciousness of the nation found its voice and representing expression through a body of Masons? Must it not have been that its then keynote, and the keynote of Masonry, were the same? Could that same keynote have possibly found expression through a body of Scotch-Irish Presbyterians? We are in no way sneering at that religious body. But the life-force of a nation, whilst it feels itself a nation—as America assuredly did then—is in a sense a unit, a personality on a great scale. *And the personality of America was Masonic.* It felt its freedom and its right to freedom, freedom of action and thought. That, and growth of character, are the keystones of Masonry.

To freedom, and to greatness of character to be achieved by noble effort, this nation was and remains pledged. The pledge remains in its midst as a working force, sometime to come forth in full and splendid manifestation. Within, underneath, the Declaration, the pledge, the vow, may be heard. That is the essence of it. And it is because it is there, and not in the other, that the other failed to live. *That* was only a shout of defiance. *This* looks to a future spiritual manhood of a whole people for the universal benefit.

MASON

Hypnotism versus Education

DOCTOR BÉRILLON, in a recent communication to the Paris Society of Hypnology and Psychology, unfolded his scheme for banishing fear from the human heart by means of hypnotism. Not only is fear to be banished, but all other failings. "One can thus remedy, in the infant as in the adult, vicious impulses and also in general all anti-social impulses which can possibly arise. One kills fear and vice; a true remodeling of character is achieved."

Obviously we are in reach at last of that ideal of human life for which the world and all world-reformers have agonized for ages. Each child, on reaching a certain age, is sent to the character-factory where he is once and for all hypnotised not only out of all the failings which he may be already showing, but also vaccinated in advance against all which he may hereafter show. He grows up a perfect citizen, friend and parent. In a generation we have remade the garden of Eden and stocked it with the whole human family. Adam, looking on from the upper regions, finds that all the effects of his "fall" have been wiped away—and it was not Christ that had done it, but Doctor Bérillon!

This is obvious nonsense, yet it follows logically from the principle. To hypnotise a child is to do for its mind what the Chinese do for the feet of their women. Muzzling a dog so that it cannot bite is also muzzling it so that it cannot take food. Hypnotising a child against a vice is muzzling its mind, bandaging it against its growth. True education has nothing to do with bandaging a child's will, but with *stimulating* it to right use. And this process, in perfection, the world will soon know as Raja Yoga, the method of the schools at Point Loma.

STUDENT

How Japan is Arousing China

THE Japanese are making quiet but strenuous efforts to leaven the lump of Chinese national inertia, by diffusing broadcast in China sentiments favorable to Japan as the leader of progress in Asia. Agents from Japan settle in China and endeavor to win good-will for their country. One method is to found newspapers, printed in Chinese, and favorable to Japanese ideas. These papers advocate the employment of Japanese teachers in the schools and Japanese military instructors for the troops. The Buddhists are also in China, reviving and consolidating their religion, and exercising an influence at once religious and political. Thus the spirit of progress which has awakened in Japan gathers body, and since it is a peaceful and reasonable spirit, there will be no "yellow peril" except for such as have reason to dread such a spirit.

STUDENT

Our Black Sand

CALIFORNIA has never fully appreciated the wealth that lies at her feet—or rather under her feet—in the famous black sands. They are the washings of serpentine mountains and are found all around the bases of these. On the coast the sea has carried away the larger and lighter particles originally mixed with the sand and left only the heavier, richer, metallic sediment. There remains only the task of separating the various metals contained therein. A serpentine mountain is one in which, by great heat accompanied by pressure, the originally diffused metals have been run together in long seams and pockets. Originally glassy, they are now in long serpentine streaks. The action of frost and rain wears them down into sand, and from the sand the ocean removes all but the metallically rich fragments.

Besides gold and iron, several other valuable metals are contained in these grains. There is platinum, worth more than gold. There is tantalum, about to take the place of carbon for lamp filaments; and osmium, used in the same way. There are nickel, chromium, iridium, used for pointing gold pens; zirconium, thorium, and others still rarer. And lastly there are certain gems such as garnets and topazes.

At the Lewis and Clark Exposition there is a department in which the process of extracting all these is demonstrated. It is under government supervision, and the aim is to teach the ordinary miner how to open up a wholly new source of wealth from a natural product which has hitherto been left to sleep in peace. It is hoped that the "discovery" of black sand will mean as great an accession to the wealth and importance of our State as was the discovery of gold.

STUDENT

Life and Diet

A NEW YORK paper very properly objects to the laying of the whole blame for "heat deaths" upon the heat. "In various parts of the world people live in greater heat and greater humidity than ever affects us and are not prostrated. They do not live at high pressure, even in cool weather, as we do, keeping close to the breaking point. The people of this country do not dress, they do not eat, and they do not work with any due regard for the weather. They eat impossible things in haste, drink vast quantities of all sorts of concoctions and rush on. Then they wonder when they have 'heat prostration.'"

But how are they to know what to eat? If they were told they would not believe it; if they believed it they would not practise it; and if they wished to practise it there is no opportunity. The ordinary restaurant meets the requirements of summer by putting more ice in the "concoctions" and by adding melons to the bill of fare. There are few vegetarian restaurants in this country, and nine out of ten of the people who try vegetarianism have not the least idea how to proceed. The vast subject of diet is hardly understood anywhere, but little more by the authorities than by the laity, and in the ignorance of the authorities the cranks and faddists have it their own way. What is the ordinary man to do when he hears on the same day that raw fruit is injurious; that anything but raw fruit is injurious; that he must not eat meat; that meat is the only food that does not ferment; that whole-meal bread is the ideal food, and that it is poison? Each man's instinct should of course be his guide, as it is that of animals; but instinct has long been smothered. It would begin to awake if we would eat very slowly, always less than we are sure we need, of very few things at the same meal, and avoid all the "concoctions."

But the real word on diet has yet to be spoken. The subject has a profounder bearing on our lives than anyone suspects.

STUDENT

Some Views on XXth Century Problems

Emotional Religion

WHILST the Professor in Sociology at Hamilton College was writing, in his recent book on religious "revivals," that the day for the more emotional species of these was forever gone by, Wales was aflame with that very fever; the infection was spreading to the rest of England; and this country was beginning to take her share in the same.

But even if the day for them *were* gone by, there are other manifestations of the same malady more than competent to replace them. They are modes of getting intense tones from the strings of the emotional nature. If these modes do get out of date there are plenty of others. We know other ways of letting the vital creative force, essentially divine, run riot through the nervous system. The pursuit of the ecstasy of sensation can be conducted along many paths. There is morphinism, private vice, the "psychic development" practised taught by the various Swamis and Gurus of East and West, the prize and bull-rings, gambling, and the infliction of inhuman torture on men or animals.

Some of these may seem to have no relation to each other. But they are related as modes of getting intense sensation, all of which lead to exhaustion and reaction. Man has found several ways, unknown and impossible to animals, of flooding the apparatus of sensation with his whole vitality.

Physicians wonder at the increase of epilepsy. It is only the motor side of the same thing. The deranged vital current, loosened from its proper channel, may as well suddenly pour itself into the motor as into the sensational side; and then there is a motor ecstasy, a convulsion, instead of a sensual ecstasy.

The reason for the reaction into debauchery following revivals, is easily understood. The exhausted nerves will not now yield even ordinary sensation, do not respond to the simple and proper pleasures, those of sunlight, of fresh air, of food, of mere life. So they must be waked by stimulants, vice, morphine, by anything that will get a thrill from them.

The imagination is exhausted, drained, and lies half dead. It cannot create the pictures upon which hope and faith depend. It cannot fill tomorrow with its light. There is nothing but today and the room's four walls and ceiling. There is nothing but the morose and selfish self, for the unstrung harp cannot respond sympathetically to any other touch. The glowing pictures of last night, that seemed as if they would stay forever, cannot for a moment be called up.

Any pleasure that involves a reaction must have contained, or consisted of, poison. The subtlest and most poisonous of all these, because it masquerades as true mysticism and spirituality, depends upon a transcendentalizing of the sex impulse. But it belongs to the group, and in the same nature at different periods it will be found alternating with or mixed with some of the others. Its reaction is always finally into the lowest terms of itself.

Those whose aim is really upward need never be misled. Progress is never real from the moment that self-consciousness begins to cease to be dominator of all below it, begins to be in the least submerged by emotion. Perception of truth, consciousness of the touch of God upon the heart, of the presence of God in nature, consciousness of the needs of humanity, compassion and real universal love, have nothing to do with emotion; and so far from leading to any reaction, are the only safeguards against the emotions that do.

STUDENT

Humanity's Nervous System

THE *Spectator* thinks there is no doubt of the progress of mankind, because of the development of the faculty of sympathy. We sympathize more and therefore act better.

It is not easy to come to an opinion. A few years ago the great Powers of Europe stood round in a ring, preserving their "Concert" while scores of thousands of Armenians were massacred. A few centuries ago the scant population of Europe again and again swarmed to the same spot to rescue the Holy Tomb, offering their lives for an ideal.

Great Trusts and Combinations are daily formed, collections of people, which work in absolute disregard of the welfare of their district or nation, of any poverty and misery they may cause. There is never a war but contractors in any number are found sacrificing the lives and health of soldiers to their own pockets. The nations put duties on each

others' products, entirely careless whether thousands of each others' peoples are at once thrown into starvation. It looks doubtful enough whether selfishness was ever any worse than it is now. And it is hardly doubtful at all that we will sacrifice less for an ideal, and have fewer ideals to sacrifice for, than at many other bygone times in human history.

Nevertheless humanity is becoming an organism despite itself. The iron nervous system of telegraph wires which make the globe the area of a newspaper, are a type and showing of a deeper nervous system which is linking men's feeling into one body of feeling. Each now receives into his consciousness more and more from all other consciousnesses, units and nations. So our moods are, we know not why, a thousand-fold complexer in color and swifter in change. We did not effect this by any wish or deed of our own. It is the work of evolution, of the spirit of progress moving to its own great ends. We may resist; hedge ourselves in; the painful ache of consciousness may drive us to more selfish manœuvres to narcotize it, to worse excesses of egotism to get pleasures and sensations to overlay it. But it is all futile. And when the unity, the spiritual nervous system, has reached a point now certainly drawing near, it will be possible to thrill the whole new organism of human feeling with a new and suddenly realised ideal, thus become a fact—the idea and ideal of human brotherhood. Then, "in the twinkling of an eye" the old order will melt before a new.

The *Spectator*, in striving to find reasons for its hope, missed the reason.

STUDENT

The West-ering Star

WHERE is going to be the center of intellectual life in this country? A little while ago it might have seemed impossible to answer such a question. But some recent library statistics throw a very interesting light upon it. A contemporary publishes a map showing the actual number of libraries in each State, and also the number of volumes therein to every hundred inhabitants.

California has 202 libraries, and more than 100 volumes per 100 people. In those two respects taken together, this, one of the youngest States, is equalled by no other from west to east of the continent till we come to New York and the States east of that, the oldest States, and doubtfully there.

Thus Oregon has but between 25 and 50 books per 100 people. So Washington. So Utah, Idaho and Arizona have between 10 and 25 books. Of the next layer of States going eastward, New Mexico stands with Arizona; Montana and Wyoming with Oregon; Colorado has between 50 and 100.

As to number of libraries, New York with five times California's population, has little more than three times California's libraries. Nevada has but 6 libraries; Washington 31. Minnesota and Illinois have more of them than California, but fewer books in them per 100 of the population.

There would seem to be little doubt of the answer to our question. "Westward the star of (intellectual) Empire takes its way." A certain prophecy that Port Orient (San Diego) would be the Athens of the New World may not be so far from its fulfillment. But to spare the feelings of eastern cities we keep this prophecy very secret.

STUDENT

Premature Moves

THE Boston College of Liberal Arts is moving to get together an international conference to determine upon some universal system of phonetic spelling. It is a sort of echo of the move in favor of a universal language, and is a member of that set of schemes which includes universal disarmament, a Parliament of Nations, and a World's Capital.

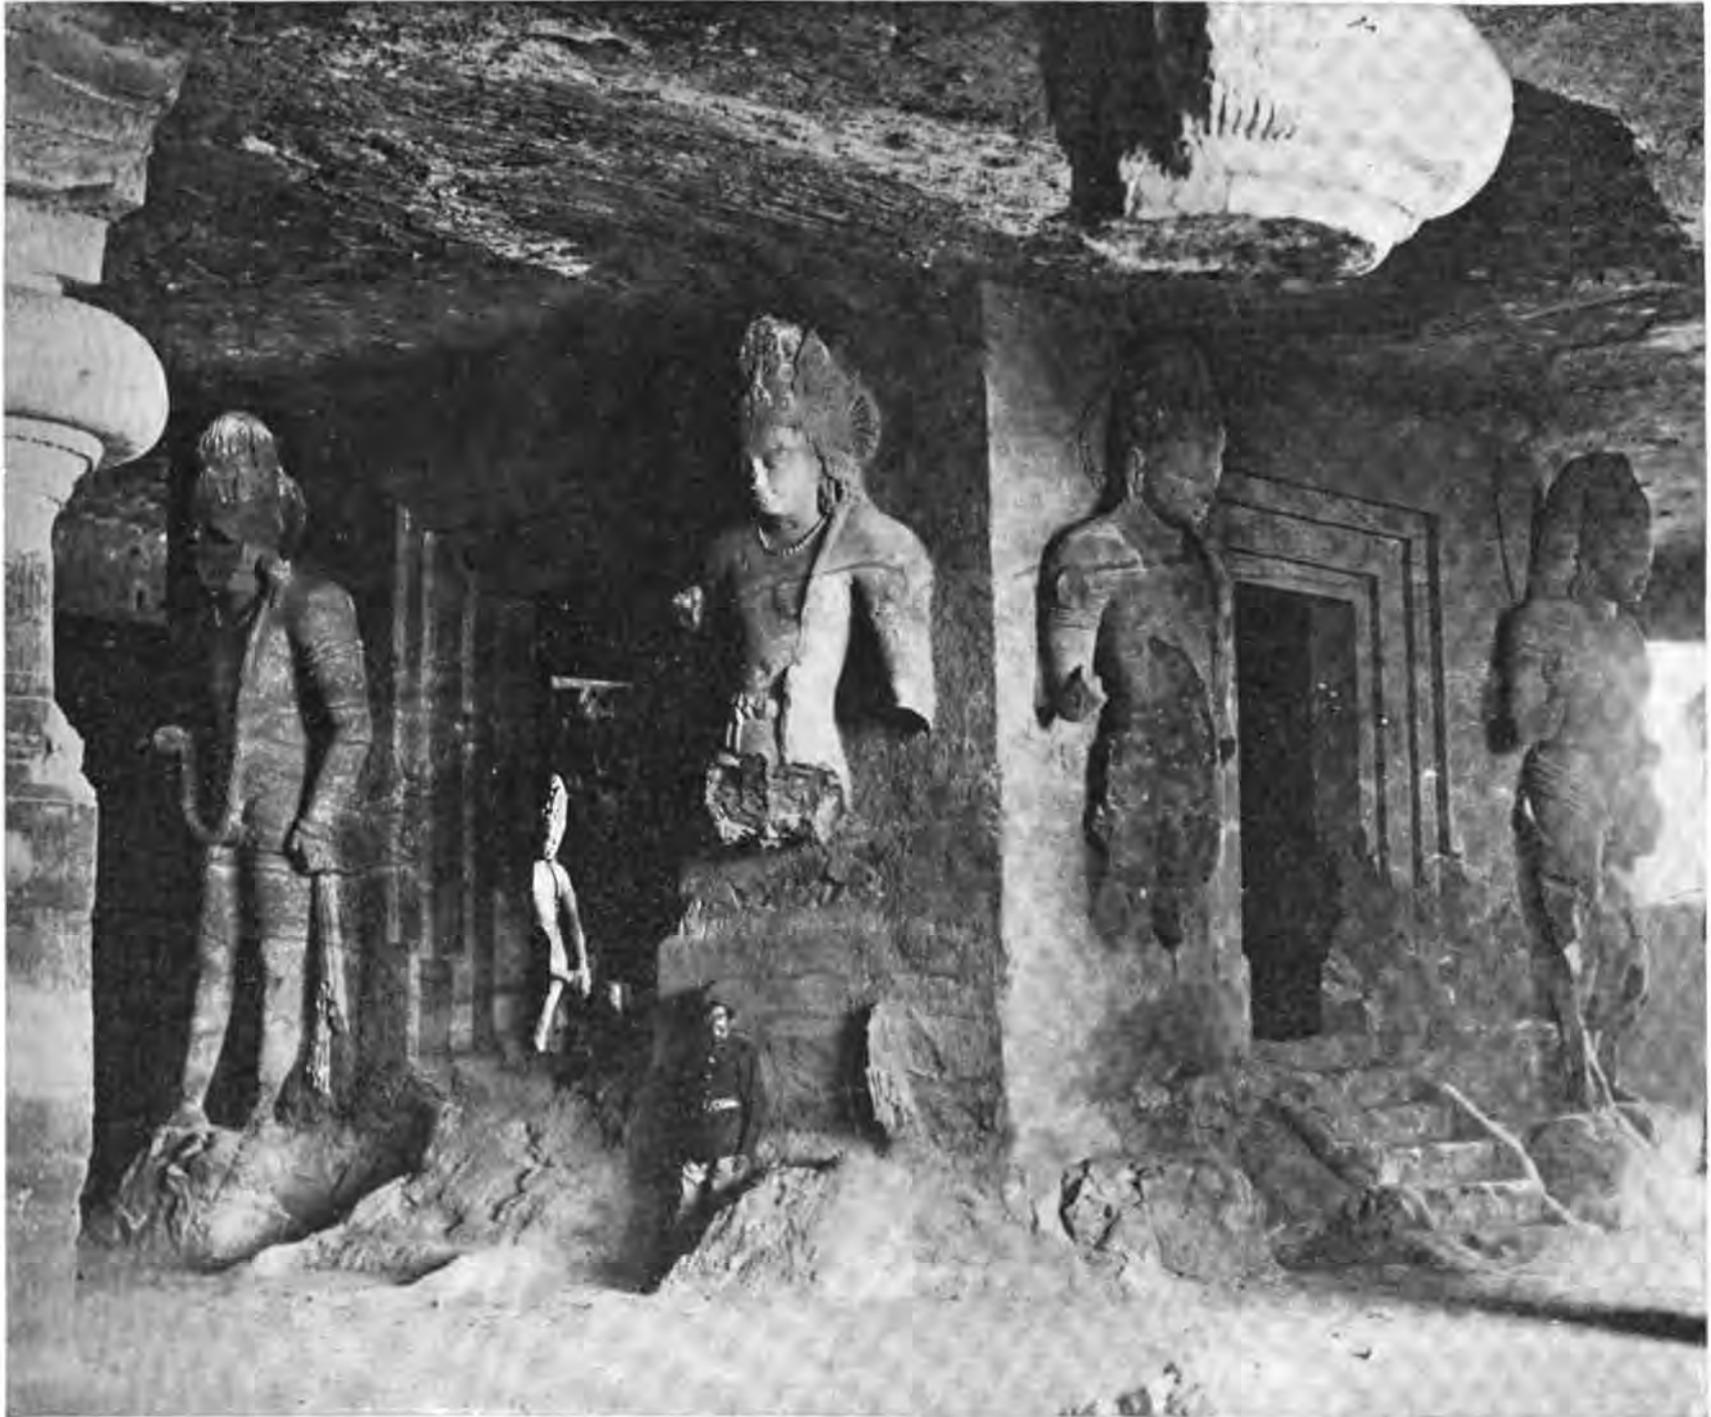

All of them are excellent, and in time will be born into the world of fact. But as yet there is no force, no life, in them. They are ideas only, perceived coldly as desirables.

These fine ideas can only come to life when warmed by the spirit of international brotherhood, when that breath sweeps over the heart of humanity. Till then, no ingenuity in their fabrication, no urgency of their convenience, can make them more than ideas or toys. And we must add our belief that when they are actually born, they will come from that Body which alone carries the unlimited ideal of Universal Brotherhood. That is their true parent.

ROCKCUT TEMPLE—INDIA

The Rock Cut Temples of India

At least one thousand rock-cut temples in India are known, of which one-tenth are attributed to the Brahmins and Jains, and the rest are Buddhistic. The oldest are claimed by the Jains, who, as H. P. Blavatsky tells us, are the descendants of those original inhabitants of India whom the white-skinned Brahmanas dispossessed. They have preserved in their religion, as in the symbolism of these temples, much of the ancient worship.

According to archeology, the oldest, in Behar, date 200 years B. C.; while those at Ellora are said to have been proved to be no older than the Seventh or Eighth century A. D. One at Karli has the exact features of an early Roman Christian Church; a circumstance which will enable the ecclesiastical enthusiast to claim a missionizing influence, but which merely confirms the fact (already proven from numerous sources), that the early Church adopted a judicious assortment of "heathen" rites, doctrines, and symbols.

The caves at Ellora, already described and illustrated in the NEW CENTURY PATH, are the most wonderful specimens of cave architecture and symbology. The temple illustrated is that of Elephanta; the columns with cushion capitals and square abaci, and the colossal figures supporting the roof of the inner chamber, will be noticed. The height is shown by the man in the foreground. E.

The Griffin

THE Griffin is usually regarded as a purely symbolical monster, his like in the flesh not being found in the known parts of the earth at the present day.

That he is symbolical cannot be questioned; but he may also represent one of those ancient animals now extinct, some of whose petrified bones we dig up. *Leo heraldicus* is a mythical monster, yet there are such things as real lions.

The griffin is a combination of the lion and the eagle, and thus represents courage combined with aspiration. Sometimes the head is that of a lion and the rest of the body that of an eagle. Curiously enough a *Punch* cartoonist not long ago drew such an animal as the result of the union of the American eagle with the *Leo Britannicus*. But the two animals are found combined in various ways, and the tail of the serpent is sometimes added. Griffins stood guard over the "lands abounding in gold and precious stones." Those who tried to take these precious things without first having mastered avarice were torn to pieces by the griffins.

Thus the griffin may perhaps represent powers of the soul which are dangerous until mastered, but which are the powerful allies of the wise and self-subdued. The Assyrian and Persian winged griffins are the same symbol, and the Greeks and Romans used it in sculpture. It has long been a favorite coat-of-arms for the chivalric nations of Europe. It was sacred to the sun and is spoken of as "guardian of the golden mountain." Blessed is he who can master his temper. STUDENT

The Trend of Twentieth Century Science

About Earthquakes

OF late years, with increasingly perfect systems of registration, the subject of earthquakes has been fairly entered upon. And it is more than probable that by this method, and not through geology, we shall come to an understanding of the deeper structure of the earth. A vast metallic nucleus, with a film of crust, is the present scientifically drawn picture.

An earthquake registers a bewildering number of vibrations on a recording plate. Yet they must be read and disentangled if there is to be any understanding of what went on.

The deepest point from which earthquakes are supposed to start is about thirty miles, where the core is passing into crust. The nearer the surface, the more limited the area of disturbance. This deep point is called the centre. The point at which the disturbance reaches the crust and does the visible damage, is called the epi-centre. The vibrations which are recorded all over the world start from the epi-centre, and also, in less degree all along the line from centre to epi-centre. At present, three sets of these are known. The first run over the surface of the earth, as sound-waves would do; but much faster. But as they pass along they throw off actual sound waves into the air, sounds very variously heard by different people and nations. Probably they begin to be heard by animals hours before man can hear them. Animals often behave very strangely long before the occurrence of an earthquake.

But before these waves have reached some distant recording instrument, at least two other sets have arrived. They come quicker because they come direct through the mass of the earth instead of trickling over its crust. Through study of these two sets, the conclusion has been reached that the core of the earth is uniformly elastic (twice as elastic as steel) and uniformly dense throughout; but increasingly rigid. The first of these sets of vibrations are similar to those of sound—to and fro along the path of the thrill from the centre to the registration instrument; the second are like those of light—to and fro across the path of the thrill. If a receiving instrument is at a point on the earth's crust exactly opposite to the centre of the earthquake, both these sets of thrills have to run through the centre to get registered. The second set is believed to increase its speed as it goes along. Hence it is argued that the earth's rigidity increases the nearer the centre, increases without corresponding increase in the density. The first set remains of constant speed.

Beyond these sets of vibrations there are others not yet recorded, electric and magnetic sets; as well as radiations belonging to the higher octaves of invisible light. If we were sensitive to all these, (as perhaps we ought to be,) since they never entirely cease, our physical consciousness would never be quite the same for two seconds in succession. We should be true conscious sharers of the life of the earth. Science has not yet reached the view that the earth is herself conscious of her own changes; but she may be nevertheless; indeed she may of her own conscious will initiate some of them—which may be one reason why science is so entirely in the dark as to the causes of earthquakes and volcanic eruptions. STUDENT

The Freaks of Lightning

FRENCH scientists do seem to grant themselves a freedom of speculation, of imagination, almost unknown to those of other nations. Maybe they get the reward of an earlier and fuller glimpse of truth. It may be also that the speculations which they do venture to utter are considerably surpassed in brilliancy and freedom by those which they do not.

The astronomer Flammarion has been saying very curious things about lightning. He speculates that it may be "a subtle being whose nature comes between the unconscious force of plants and the conscious force of animals."

One might demur to the phrase "unconscious" force of plants and suggest an emendation of the idea: namely that lightning, from the electric spark of the laboratory battery upward, is a momentary breaking forth into vivid consciousness of the previously "unconscious consciousness", the bare consciousness of being, of the atoms of the inorganic world.

He goes on: "It is like an elementary spirit"—surely an echo here of the medieval Kabalists and Rosicrucians, who used that very phrase—"eccentric or rational, clever or silly, farseeing or blind, headstrong or indifferent, passing from one extreme to the other." He speaks of it as sometimes "absolutely frolicking." "Sometimes it gives rise to the hypothesis that it is a thought, which, instead of being attached to a brain, is attached to an electric current." Referring to, and instancing, some of the fantastic freaks of lightning, he says: "The plea of chance is sought as a refuge for our ignorance, but it cannot explain these fantastical phenomena." He is entitled to speak thus, for each year he receives from the ministry of justice official accounts of all accidents from lightning that have been reported during the year.

Particularly, he says, does the behaviour of ball lightning elude our application of any theories. Of these almost nothing is yet known. They are luminous spheres, usually appearing to drop from a thunder-cloud, and of any size up to 15 or 18 inches in diameter. After touching the ground they may bound about, two or three times, disappear quietly, or explode and liberate lightning as a flash. Says the electrician-astronomer: "It sometimes behaves like a small animal with the most evil nature."—Query; were these the "elemental spirits" of the Rosicrucians?—"And yet its cruelty is not necessarily pushed to the extent of death; fainting, fright, looting a house or destroying a building sometimes suffice to quiet it." Then he enumerates a few of these inexplicable freaks.

Possibly he was not wholly serious in all this, but a Twentieth century man of science ascribing consciousness to a great nature-force and entirely unhampered by materialism in his speculations, is a very remarkable phenomenon. STUDENT

Electricity and Plant Life

A FINLAND Professor has been trying to account for the brilliant floral vegetation produced annually in the very short summer of North Polar regions. He thinks that the cause is the stimulating effect of the Aurora Borealis, or rather electricity. He has found a connection between the amount of the electrical display and the luxuriance of the vegetation. The discharge is collected on the spines and sharp points of grasses and leaves. May not that be the explanation of the astonishing vitality of the cactus? And if so, the spineless cactus of Luther Burbank will have less endurance than its uncultured original.

Professor Lemstrom found that a field of barley treated by electricity gave a crop 37 per cent better than the rest. Other vegetables showed the same phenomenon, sometimes in much greater degree. Perhaps the electricity played the part of the nitrogen-fixing bacteria, enabling the plants to fix the free nitrogen of the air as nitrate of ammonia or something more complex.

Conversely plants so covered with wire netting as to keep off the natural atmospheric electricity were far inferior in growth to those that were left to nature.

It is possible that they can have too much electricity as they can have too much light; but we do not know how, if that is true, they guard themselves. The grey tint taken on by the foliage of the Mediterranean shores, and the greyish film with which some plants in very exposed places, as on white sun-glaring cliffs, cover their leaves, is a provision for preventing too intense light from injuring the green chlorophyll. It has been described as their way of "pulling down their blinds." On the other hand the red pigment of some sea-weeds is their method of making the very most of all the scanty light that reaches them. They are thus enabled not only to make use of the red that is in the white light, but to translate the higher-colored rays down into the usable red. STUDENT

The Canals of Mars

The dispute about the existence of these "canals" appears at last to have been settled by the camera. They do exist. Professor Lowell says: "The negatives thoroughly confirm the eye in showing not only the existence of the canals but reveal them as continuous lines of tens and even hundreds of miles in length."

Whether they are natural or artificial remains to be seen. STUDENT

"Flowers preach to us if we will but hear."

—Christina G. Rossetti

THROUGH the white gate and down the road to the seashore. Before us stretch and rise and fall in their large, calm, majestic beauty, the "lands of the Western shore."

The hills with their rounding outlines, long after bright springtime dressed in soft green, recalling the purple, white and yellow wild flowers thrown on their sides,—the cañons between the hills, and from these the downward slope of all to the vast and fathomless Pacific.

Nature is rejoicing,—the birds sing and twitter, the leaves and grasses rustle, there is a murmur from the sea, as the waves break into foam far down below, where the laughing, dancing ocean meets the land. Soft white clouds drift on an azure sky, and far out their cousins, the little white sailboats, float on the blue water.

The elixir of life is in the air. The wondrous atmosphere of California clothes land and sky and sea and distant hills with its magic beauty, and over all floods the golden sunshine.

"Hence loathed Melancholy
Of Cerberus and blackest midnight born,"—

hence all forms of darkness and ignorance and retrogression,—hence all selfishness and small desires,—and come, ye spirits of light and air, come, and evoke joy and hope and love, and pour into men's hearts the gold of brotherhood, for on this Californian land is first to be fulfilled the promise of the nations!

Down the winding road we go, the song of the morning in our hearts. And, as in answer to our call, there springs up at our feet a flower of gold, of light, of promise,—California's flower, the poppy. Here and there they come as nearer to the sea we go, until we recall the glorious Springtime with its great fields of shining yellow.

Did they bring their gold from buried treasures in the earth, where secrets sleep, waiting to tell of California's past, or did they draw their beauty from the sun? The legends tell that in ancient days a great and mighty queen ruled o'er this land—a queen of power and beauty—and perhaps 'tis fragments of her garments that the poppies wear.

How many suns have risen and set upon this land before men came! How many days, in silence and calm solitude, Point Loma stretched into the ocean blue, and winds and waves and sea and earth built up their "silent cyclic chemistry!"

But back of this, far in the misty past, there lies a story yet to be revealed—of days when men were heroes—and the earth their fit abiding place. Great deeds and high ideals there were to make this land so beautiful.

The Symbology and Influence of the California Poppy

From old Lemuria comes the thread of gold, the gold of a high life, and here again men have begun to strive for that which naught can tarnish, and their hearts will turn to gold,—

that is purified of all dross, that they themselves have cleansed in the fire of life. Here in this new, old land the seed is sown and fostered with a tender care, and here, as in the past, a mighty race shall come, whose sons shall raise humanity.

The little poppy symbolizes this. It is the color of the gold that brought men to the state. In the mad rush for wealth they came, and fought and sacrificed their all to get this gold from out the earth. As time wore on, after disappointments, hardships, perils, they saw the other gold this state contained, that came from honest toil with grapes and grain and fruit and flowers. And now the eyes of all the world are turned to this far southern "Point," in search of gold the highest yet—the gold of heart and spirit, the gold of education broad and free, the gold of happy childhood growing to a glorious manhood; not for themselves to hoard and covet, but to scatter broadcast and give generously to all other lands.

This is the promise that the poppies bring, as year by year they deck the hills and valleys, and make the old earth young and lovely,—and, as we look, we too rejoice, the sunshine and the gold are ours, and earth is very beautiful.

"But more in you than these, lands of the Western shore,
(These but the means, the implements, the standing ground,)
I see in you, certain to come, the promise of thousands of years till now deferr'd,
Promis'd to be fulfill'd, our common kind, the race.

The new society at last, proportionate to Nature,
In man of you, more than your mountain peaks or stalwart trees imperial,
In woman more, far more, than all your gold or vines, or vital air.

Fresh come, to a new world indeed yet long prepared,
I see the genius of the modern, child of the real and ideal,
Clearing the ground for broad humanity, the true America, heir of the past so grand,
To build a grander future."

The best of all the past is ours, its greatness and its strength, its deep lessons of experience. This in one hand, and in the other, the promise and the glory, the future yet to come—so we go forth. No more shall the poppy mean to us the drowsy languor of ease and idleness, of pleasures sought for and of work forgot. When next we see upon the Californian hills its bloom and beauty, we shall remember and make it ours,—the gold of service, the forgetfulness of self. ELIZABETH BONN

Morning and Evening

AT Point Loma one wakes in the morning with the feeling of kinship with the birds and flowers. Delicious odors fill the air, and sweet sounds, that make one glad to be a part of it all.

Has nature a song for humanity? One needs only to live at Point Loma to find that nature sings a tune of its own, a Lomaland tune that carries such a message of hope, joy and love in its voice that those who hear it join in the refrain and sound its echoes over the world to build a universal folk-song.

The city also has its own tune. In San Diego to-day one does not hear the hum of a great metropolis but there is the tuning of instruments, as in a great orchestra, giving promise of the future production. One cannot spend a day in San Diego, (Port Orient seems the name designed for it by nature), without realizing that its future is planned on a grand scale along commercial and educational lines.

After a day of activity in San Diego one turns homeward to Point Loma. Steaming over the bay one looks back at the city and the picture of its possibilities as a great nature garden, the paradise of earth, become a living reality in imagination. Warships in the bay suggest international activities on a high basis of mutual service. On the shoreline one pictures the great shipyards, with the sound of ringing hammers, and the freight stations, for the commerce of the nations in the future.

Out of the great waters of bay and ocean rises Lomaland, like a state-ly ship. Driving up the cañon from the boat, Nature opens her heart to one, and the white tents of the village, and the shining domes of the great buildings, greet one with a welcome for all time. The glowing sunset lights up the Bungalows, which embody the peace and beauty of ideal family life. The great gates of the Homestead swing open and within their enclosure one feels a new thrill of happiness. The security of home, the knowledge of care, protection, comfort and true liberation it brings; the sound of children's voices, glad sounds that vibrate in unison, these give the heart touch that is to save humanity.

In the great silence of nature one feels the throb of awakening activity as in the spring time, and sees as in the bloom that follows the seed planting, the thousands upon thousands of children who are waiting their chance to learn on Loma Hill nature's secret of comradeship.

ELIZABETH WHITNEY

A GENEROUS-HEARTED Maine woman, who loves humanity, has adopted a novel way of giving happiness to others. She has a large garden of flowers and for several summers has carried out this plan of using them:

"She puts in a can bouquet and loose flowers and places the can near the sidewalk, so that any passer-by may help himself, or herself, from the floral surplus of the kind hearted lady's flower beds. When Miss Huston first instituted the scheme, the plan not being understood, the flowers would remain for the most part undisturbed, but now that the scheme is more generally known people passing by make more free with the contents of the can.

"Those who take most of the flowers are laboring men, who help themselves to single flowers on the way to work in the early morning. These they generally put in the buttonholes of their coats. Children are the next best patrons."

IT IS SAID that Belgium has been freed from the evils of capital punishment because of the promise King Leopold gave to his dying mother. This was to the effect that no death warrant should ever receive his signature. The worst criminal in that land meets his doom by a life-long imprisonment.

ACCORDING to the official report, the Board of Lady Managers of the Louisiana Purchase Exposition administered its trust so carefully that nearly thirty thousand dollars of the one hundred thousand dollars appropriated by Congress remain unexpended. Nothing was neglected; all plans were carried out to the last detail; moreover, the accounts were found to be correct! What a contrast this presents to some recent examples—*some only*—of masculine financiering!

ACCORDING to statistics, the United States leads Europe in the number of divorces. In Paris the records show nineteen marriages to every divorce, while no less than four of the largest cities west of the Mississippi, it is said, count their divorces at the rate of one to every four marriages.

THE CALIFORNIA POPPY

A Japanese Poem

A LEGEND OF THE DANCE

From the Tokio Sanitary Journal

'Twas a day in spring most bright and beautiful,
Luminous th' air and wonderfully soft,
A maid celestial downward came to earth,
Leisurely floating in her feathered robe,
Upon the silken rays of the spring sun.

To the right doth Holy Fuji high uprear
His mighty tower of snow perpetual;
The beach of Tago to the left outspreads
Her gown of satin widely in the sun;
Bedecked with dancing pines, doth wave washed
Mlo

Thrust a long arm into the purple sea.
On this blest beach, amid the graceful pines
The maid celestial lighted first on earth.

Now, only the white cone rests in midsky,
Hung as an "opened fan" in heaven's blue,
The azure body lost in th' azure vault,
Look up! for Holy Fuji teacheth man
To crave and seek for heav'nly things immortal,
Leaving the dust and care, the world below.

Now, fleecy mists, like wreaths of incense
smoke,

Come curling, curling over highest peaks,
And reach at length the foot of Holy Mount.
In humble act of worship; costly, yea,
The costliest of all earth's costly things.

On Moi-no-matsubara's coral beach,
The wavelets murmur every day, agog
In hope to mirror fair the bending pines
And sacred likeness of the Peerless Mount,
And limn'ed in liquid colors bear they back
Each day a myriad picture of the scene
To adorn the Palace of Otohime,
The fairest daughter of the Dragon king.

Of Heaven though she was, the Maiden found
The scene most fair, most witching fair, and she
Hanging her robe of feathers on a bough,
Walked lightly on the smoothly beaten beach,
In admiration rapt, among the pines
Forgetful of her waiting home above.

A fragrance more than earthly fills the air,
A wond'ring fisher lad on home intent
Sees hanging on a branch a beauteous robe,
A robe of feathers, takes it down and tucks
'Neath his arm, and as he homeward wends,
'Thinks what a stroke of luck is his, and how
This robe shall be an heirloom to his line.

The maiden saw it from afar, and sped
In fear and trembling after him and called
To him as softly as the moonbeams fall:
"Mine is the robe. O, prithee, let it be!"
"What proof hast thou to show the robe is thine?"
"Trust me, the thing is mine, and can belong
Only to one, a denizen of Heav'n."
"Woe be to me, if I steal aught divine,
I yield the robe. But pray thee, in return,
Grant me one boon. May I not see thee dance?"

Thrice happy he, the man who once hath seen
A maid celestial dance—so runs of old
A legend of Japan—for such a one
Shall blessed be with peaceful life and long.

"Right gladly will I dance, and thou shalt see
A dance of Heav'n! but first, return to me
The feathered robe, that I may dance in it."
"I doubt thee, maiden; when thou donn'st thy robe,
Thou'lt fly away and leave me here repining,
Bereft of robe and dance, so precious, rare."
"Alone with mortal men doubt has a place;
Lies and Deception are not found in Heaven."
"Black shame on me; of earth am I, forgive,
Take thou thy rainbow robe and dance for me."

Soon she was floating in her magic robe,
Poised o'er the pines, that grew in myriad shapes,
As slowly down she swept upon the sand—
The coral sand that stayed the sea's advance—
Her every motion showed a godlike grace;
From her the eagles learned how to soar.
Lightly she fluttered o'er the whisp'ring waves,
Turning, returning, flinging wide her sleeves;
The swallows for their wings the lightness seized,
Easy and beautiful to see the curves
She made in pirouettes from pine to pine;
From her their grace the maids of Japan draw.
Her face was lustrous with the light of heaven;
Unearthly fragrance from her robe exhaled.

Upon the velvet strand, 'neath Fuji's shade
Among the pines of Mlo by the purple waves,
Left she the fisher lad amazed and dazed
Who saw the wondrous grace of Dance Divine.

The graceful art was handed down by him
To all the dancers of this beauteous land.

'Twas a day in spring most bright and beautiful,
Luminous th' air and wonderfully soft,
In robe of feathers clad, a heav'nly maid,
Most leisurely went floating up the sky,
Upon the silken rays of the spring sun.

OUR YOUNG FOLK

The Raja Yoga Question Box

THREE happy are the statesmen who, with sincerity and enthusiasm and unsullied honor, devote their talents to the welfare of the country which they love.

1 Who was William E. Gladstone?

ANSWER—William Ewart Gladstone was a famous British statesman of the nineteenth century. He first earned distinction as a student, for he took his degree at Oxford University with rare honor, being a "double-first-class man," that is, in classics and also in mathematics. At twenty-two he entered parliament, and for over sixty years was active in affairs of state. Gladstone was an able financier, and a brilliant debater. He could speak in a ringing voice for hours, and win the support of his hearers. Some of his most famous speeches were made in the heat

of debate. Gladstone was four times Premier of England. He found time to be an author as well. In two of his books he writes about Homer and the heroic age of Greece. Gladstone was brave and manly and thoroughly sincere.

2 Who was Theodore Delyannis?

ANSWER—Theodore Delyannis was a statesman of modern Greece. He was born in 1826, before Greece was declared independent, and when his countrymen were still fighting the Turks. Delyannis was an ardent patriot; he devoted his whole life to the service of Greece. He was Prime Minister five times. His great hope was to restore to Greece some of her ancient greatness. Delyannis was an orator of great ability and often addressed the Athenians on questions of the day. He had high ideals, and was a zealous worker in the cause of social reform. He died by the hand of an assassin in June, 1905.

MODERN GREECE

FELECIA HERMANS

BRIGHT age of Pericles! let fancy still
Through time's deep shadows all thy splendor trace,
And in each work of art's consummate skill
Hail the free spirit of thy lofty race.

Glory to those whose relics thus arrest
The gaze of ages! Glory to the free!
For they, they only, could have thus imprest
Their mighty image on the years to be.

Greece Once More

WHAT a wealth of inspiration has gone forth to the world from Greece! The very name of Salamis recalls valor and prowess. Homer and Æschylus, Socrates and Plato, call up thoughts of noble poetry and lofty teachings, and the name of Phidias stands ever for power and thought in art. The spirit of the superb national life of the ancient Greeks must linger in their native land, and must surely blossom forth again in forms of truth and beauty.

The united life of the Greeks was fostered by great national gatherings. The people assembled with joy and enthusiasm. Hearts beat high, hopes were strong, a host of noble impulses were felt.

The Greeks had their Initiate Teachers also, who, in the great mystery-dramas, brought before them the sacred teachings of wisdom. Had they but heeded these pure teachings they might have remained free, the dark days need never have fallen upon their country. But side by side with the noble impulses were selfishness and ambition. Their hearts beat high, it is true, but not for all humanity. The fulfillment of their proudest hopes often meant the downfall and ruin of other men. And so the light faded for them. The bright festival days were followed, in time, by long centuries of darkness and despair.

The Greeks were conquered and trampled on by Turkish tyrants who had no love for beauty and truth. The Greek spirit was crushed, the people forgot the glorious past, they became serfs. They suffered the last indignity of hearing other languages spoken in place of Greek, even in the courts of justice. In the eighteenth century national life was at this low ebb in Greece.

Towards the end of the century, however, there was an awakening of the ancient spirit. The Greek youths began to speak of the glories of the past. One of the young patriots, Konstantine Rhigas, was a poet, and by his songs he stirred the hearts of the people. He encouraged them to speak and write in their own language; he helped them by founding a newspaper printed in Greek. This was a magic touch; they could not speak and read that language in its purity and remain slaves.

Lomaland Photo and Eng. Dept
GREEK PEASANT GIRL—SALAMIS

The Greeks entered bravely upon the struggle for their freedom and at last won it; Greece was recognized as an independent power; and the Greek language asserted its supremacy over the foreign tongues that had usurped its place. Today the nations, who owe so much to the influence of ancient Greek art and wisdom look to see a new Greece rising on the ruins of the old.

STUDENT

Facts Worth Knowing

ONE of the ideas suggested lately as a means toward the promulgation of universal peace is somewhat unique. The president of a Peace Society in an eastern city believes that military toys, which are so popular with children, foster the warlike spirit in the race. He is resolved to do what he can to remedy the evil. He will personally visit the toy manufactures of Nürnberg this summer, in an endeavor to have the manufacture of tin soldiers, toy cannon and pistols, warships, etc., discontinued. He would have in their place toys of a harmless and peaceful nature. Reform is truly touching the heart of things when reformers begin to have a care for the vital welfare of the children.

AFTER waiting thousands of years, agriculture is at last becoming, in our own day, a scientific industry. It would be difficult to say how much we owe as a nation, and how much other nations owe too, because of its example, to the United States Department of Agriculture. Through its efforts we are now finding out the secrets of the soil, what crops are adapted to certain soils, the secret of a wiser rotation of crops, of economical fertilization, of how to introduce new crops, of how to get rid of insect pests and plant diseases, of how to intelligently use machinery and of how to *save* the resources of the soil instead of wasting them. It is not only more profitable and more satisfactory—and more honest to nature, as it were—to cultivate fruits, grains and vegetables scientifically, but it is vastly easier as well. Then, too, a marvelous work has been done in reclaiming alkali soils, hitherto barren, not to speak of inexpensive means by which other kinds of barren soils may be rendered fertile. It ought not to be many years before "worn out land" and "abandoned farms" will be unknown. Certainly it will not be if we live up to our opportunities. Think what a glorious thing it is to be a real comrade, a real co-worker, with Mother Nature. A very ancient manuscript—many thousands of years older than the Old Testament even—says: "Help Nature and work with her and Nature will regard thee as one of her Creators and make obeisance." What a glorious world we might fashion *if we only would become creators.*

THE CHILDREN'S HOUR

THE FLOWERS WITH WINGS

SUCH a lot of buttercups all in a meadow grew.
So many, many years ago, when all the world was new,
And you'd thought they'd be the happiest things with
nothing else to do
But be caddled up by Father Sun and fed by Mother Dew.
But I hate to say, it wasn't so! For when the birds would fly
High up among the mighty trees that towered to the sky,
They would watch them with such envy, and lament and
mope and sigh,
"Oh, dear, just see them skim along! Oh, why can't you
and I?"

Now the fairy of the flowers once was passing by that way---
To nurse a little primrose that was sickly, so they say---
And she heard them all bewailing to a blackbird on a spray,
"Oh, won't you let us have your wings a little while today?"
So the kindly fairy listened, and they told her all their woe,
And she summoned all the fairy knights, whose wings are
white as snow,
And begged and borrowed every one---they've several pairs,
you know---
And put them on the buttercups, the poor things pleaded so.
Oh, high they flew and low they flew---the old sun blinked
his eyes.
The breezes came a-chasing them, all laughing with surprise,
And ever since that day when first they fluttered 'neath the
skies,
We've had the buttercups with wings and called them but-
terflies!

—Selected

A Yankee Cat

DEAR CHILDREN: I had my picture taken the other day and thought I would like to send you one. I live in the upper corner of Massachusetts, so near the Atlantic Ocean that we can sniff the salt in the breeze. By "we" I mean, besides myself, the two little golden-haired girls who say I belong to them, and Leonillo, the big black English setter.

The Raja Yoga Messenger and the *NEW CENTURY PATH* come to our house. Alice and Vona read out loud to each other from them. So I have learned about Raja Yoga and the School, and the boys and girls and all the beautiful things in Lomaland.

Our yard is shaded by two great tall New England elms. In one is a bird-house made of a cheese box and painted green, just the color of the leaves. When I was a kitten I liked to catch the birds. But now I never do. Something inside tells me it is wrong.

Alice is fond of dressing me up and taking me to ride in her doll's carriage. I think it is more fun to play with the grasshoppers on the lawn. But I try to be patient and sit still for one can't always do just what one likes best, you know.

I love music dearly. When the girls play duets on the piano I listen with all my might. And when the piano is all still and no one about, I like to jump up on the stool and sit close to where the music comes from. This is where I was when Vona came in with a funny-looking black box under her arm. Pretty soon something clicked in the box and before I knew it my picture was taken! One lady who saw it said: "She looks like a millionaire cat." That did not please me. I would rather look like a brotherhood cat than a millionaire cat. Wouldn't you? *PERDITA*

DEAR CHILDREN: A friend writes me from Japan about the little Jap children and, among other things, about the way they keep birthdays. The Japanese have many customs which tend to make them a united people, and I think that the way the children celebrate birthdays is one of them.

Each girl does not have a birthday celebration for herself, but all girls have one big birthday celebration on the same day. Every little girl receives her gifts of dolls and other things, and then they all have one great, happy birthday party together.

When the day is over all the pretty presents are put away, not to be taken out again till the next celebration. *A RAJA YOGA TEACHER*

Did Gip Understand?

LOTTIE!" cried Gwen excitedly as she burst into the sitting-room, "mother says we may go and see grandma this afternoon! Auntie will take us; and we will look for bird's nests all the way!"

"Hurrah!" shouted Lottie, dancing around the table in her delight, "and we will take you with us," said she, stopping in front of an intelligent-looking little terrier.

"Bow-ow!" replied Gip, wagging his tail and joining in the enthusiasm.

"No," said a quiet voice from the doorway, "Gip cannot go. You know the trouble he gave us last time, chasing cats."

"Auntie!" exclaimed Lottie in dismay, "but perhaps he wouldn't today."

"My dear, he always does it; he must stay at home," replied Auntie decisively—"people would soon dread the very sight of us," she added looking at Gip with by no means peaceful recollections in her mind.

"Gip, why can't you love cats?" demanded Lottie despondently. "You are very naughty! but of course people are stupid; they can't understand you won't hurt their precious cats.

You only like to make the cats think so."

"Bow-ow," agreed Gip. And it really seemed as if Gip understood.

At last all preparations were made and they were ready to start.

"I am so glad to get away without Gip seeing us," remarked Auntie, with placid satisfaction; "but do you know where he is, Gwen?"

"No, Auntie, I haven't seen him for some time. I expect he is asleep somewhere."

Soon they left the outskirts of the pretty village behind, and walked along a footpath, through shady woods.

The birds were singing! The sunlight shone through between the branches, making tremulous patterns over the green mossy ground.

"Why there is Gip!" exclaimed Lottie suddenly.

"Gip!" repeated Auntie in bewildered amazement; and Gip it surely was—coming towards them in guilty triumph.

"However did he get here?" said Auntie, looking much disconcerted, "he will just get us into trouble again."

"I will look after him," said Lottie, doing her best not to appear too delighted, "but Auntie," she continued, "if you don't want Gip to know anything, you shouldn't talk about it before him. He knows every word we say. He heard us say we were coming, and you said we wouldn't bring him—but you see he wanted to come."

And, children, this story is true.

ANNIE P. DICK

IN the densely wooded country, along the Gulf coast of Mexico, live many beautiful wild birds. All kinds of parrots and many other tropical birds are found there.

In this country, a parrot ranch has been started. Wire netting has been placed over many trees and under these trees the birds are kept.

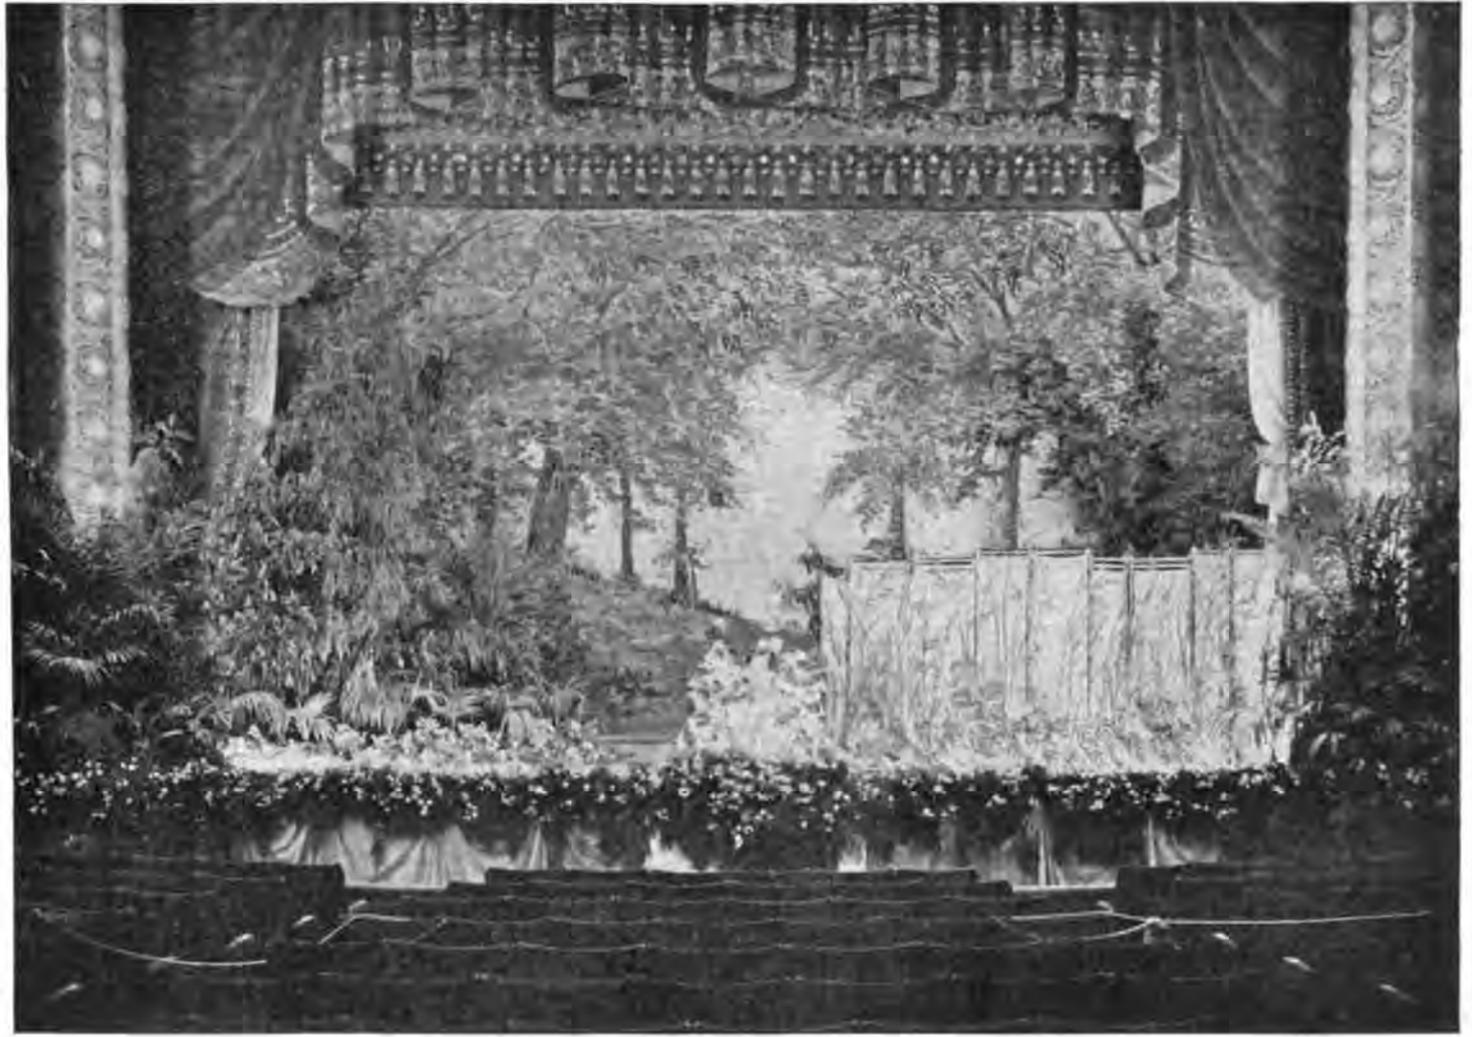

The birds are divided into four classes, flocks of about a thousand each. Each class is taught a different language. The man who teaches them speaks English, Spanish, French and German fluently. He does not undertake to teach each parrot separately but takes a few of the brightest birds from each division and teaches them. After they have learned to talk he places them among the others and they teach the rest.

It only takes a few months to teach quite a number of birds to talk well, and some can carry on a conversation which lasts a half an hour. The other birds learn very quickly from them, it is said.

Their teacher says they have wonderful intelligence and many times seem almost to use reasoning power. Well, why not? *COUSIN EDYTHE*

Isis
Theatre
San
Diego
California

THE THEOSOPHICAL FORUM, IN ISIS THEATRE

THE Universal Brotherhood meeting conducted by Point Loma students at Isis Theatre last Sunday evening, included two interesting papers and the following musical program: "Preislied," from *Die Meistersinger* (Wagner); Prelude, *Lohengrin* (Wagner); Nocturne (Chopin); March (Kretschmer).

Miss Alice Bolting, in a paper on the "Future of Cuba," declared that it was manifestly unjust to judge the great mass of the Cuban people by a few illiterate and degenerate examples, such as may be met in any nation.

"Freedom-loving by nature," she said, "they resent rules that are not compassionate. Rebellious to laws, because of their personal experiences and hereditary tendencies, they appear to a casual observer uncontrollable. But they are not. But let this be understood. By force of the law of opposition and bitter experience, they know the difference between justice and injustice; truth and untruth; honor and intrigue; and their deeply emotional natures often express the keenest sense of loyalty and gratitude where the response to their yearnings and appeals has assured them that their struggle for light and liberty were not in vain; and thousands now recognize that the hour is at hand when a new hope and inspiration are flooding their land.

"The Raja Yoga Academy in the suburbs of Santiago and the free day-school in Santiago have grown so rapidly that more teachers have been added to the staff. The influence of the work is now affecting the whole island, and calls are coming in from other provinces for more Raja Yoga schools. The financial support given to these schools is entirely from the treasury of the International Theosophical Center at Point Loma, California; and all this work is under the personal direction of our Leader."

"Sowing and Reaping," was the subject of a practical and helpful paper by W. Ross White. In part he said:

"Nature works with great regularity and great impartiality. It is one of the earliest generalizations of the human mind that 'summer and winter, seedtime and harvest, shall not cease;' or 'whatsoever a man soweth that shall he also reap.' Not even the most stupid would expect to reap wheat if he planted potatoes. But, strange to say, nations and individuals have not yet thoroughly learnt this lesson as applied to the moral world. Mankind, as a whole, has failed to translate into terms of the moral world,

the natural lessons which the rudest savage well knew in the dateless past. 'Each thing after its kind: each thing having its seed in itself;' this was the ancient teaching, but men have not yet laid this to heart in their dealings with each other. We know that darkness follows the withdrawal of the sun, but we do not seem able to realize that the sun of truth and love, if withdrawn, must leave us cold, and dark, and loveless. We know that a cloud obscuring the sun produces gloom and chill, but we do not transfer this lesson to the moral world and realize that hate, and anger, and insincerity, in like manner, chill our better energies and enshroud our steps in gloom.

"Men and nations are every year and every day opposing their puny strength against the forces of the universe. They lie and dissemble; they cheat and steal, and do not realize that these things must come back to them. In a word, men have not yet attained a full belief in, and realization of, natural law as applied to the moral or spiritual world. 'Whose seed is in itself,' is a thing men know to be true in regard to things physical; but they believe that a crooked policy will somehow produce straight results; and that the seed of moral thorns and thistles will, somehow, spring up wheat and roses.

"The wrong-doer is one who has no practical faith in the law of harvest. He thinks he can cheat divine justice, and escape the all-seeing eye. It has always been so to some extent. Men have said in their hearts, 'We can do wrong and not suffer, hence it is that the apostle uses the words, 'Be not deceived, God is not mocked, for whatsoever a man soweth, that shall he also reap.'"

For the Benefit of Enquirers

REGULAR weekly meetings of the Aryan Theosophical Society, established in New York City by William Q. Judge, the second Leader of the World's Theosophical Movement, are held every Thursday evening at 8 o'clock in Isis Hall, 1120 Fifth Street, San Diego, California. These meetings are intended to meet that large and growing body of earnest enquirers who desire to know more of the different tenets of the Theosophical philosophy. Students from the Universal Brotherhood Headquarters at Point Loma, California, conduct these interesting gatherings, to which every truthseeker is cordially invited.

✻ Art Music Literature and the Drama ✻

R. W. Machell—One of the Artists of Lomaland

VISITORS to the Raja Yoga Academy at the world's Center of the Theosophical Movement, Point Loma, California, are always profoundly impressed by the pictorial and decorative work which fittingly adorns the great Rotunda of this remarkable building. A short account of the career of the artist, Mr. Machell, will be of interest to that large section of the public which has been delighted and uplifted by his mystical pictures, whether from the study of the originals or reproductions.

Mr. Machell was born in Lincolnshire, England, but the family home is in picturesque Westmoreland, where the Machells have held their position since the Roman period. During this long period the family produced distinguished members, and the arts have been well represented. Mr. Machell's great grandfather, who, curiously enough, was wounded at Bunker Hill, was a skillful water-color painter in the early days of the art, and his sister has a well-merited reputation as a musical composer; his brother has held for many years the high and responsible office of British Adviser to the Ministry of the Interior of Egypt.

Mr. Machell was educated at Uppingham College where his successful career was distinguished by the winning of many prizes, chiefly for drawing and gymnastics. His passion for art was so strong that after completing his education he commenced to study painting in London under a pupil of the celebrated French painter, Paul Delaroche. The attraction which Paris exerts on all young artists became irresistible and in 1875 he established himself there, married, and remained for five years. He studied under Professors Gustave Boulanger and Lefebvre at "Julian's" atelier, with such pronounced success that he gained several medals and in 1879 his first picture was accepted by the jury of the Salon. Returning to England he was equally successful in gaining admittance for his work to the Royal Academy. Portrait painting occupied much of his attention at this time, but he had commenced an allegorical subject, "Despair," when the turning point in his life occurred, i. e., the meeting with the Foundress of the Theosophical Society, H. P. Blavatsky, at the opening of the Blavatsky Lodge in London. His picture "Despair" was quickly transformed, after the reading of Madame Blavatsky's *Secret Doctrine*, into "The Dweller on the Threshold," a work well known by reproductions to thousands who have never had the opportunity of enjoying the beauty and fascination of the original.

Following this success and instinct with the same inspiration came "The Birth of a Planet," now hanging in the Pioneer Club, London, "The Path," "The Bard" and a number of other striking works, many of which are now in Lomaland, being part of the private collection of Katherine Tingley.

During this period, as the artist's reputation was being built up by the production of those mystical pictures, distinguished both by profound thought in the choice of subject and charm of color and design, he was elected a member of the Royal Society of British Artists, and has exhibited most of his later works in the galleries of that society.

To many young men who are breaking through the worn-out forms of theology, the student life of Paris has an agnostic tendency, but in Mr. Machell's case this made him the quicker to receive the message of Theosophy. It was to that remarkable woman, Lady Malcolm of Poltalloch, that he was indebted for that boon. She was an old friend of the family, and she lent him Theosophical literature and showed him

its application to the practical work of Brotherhood, without which all theories are useless. Lady Malcolm was of extremely retiring disposition, never seeking recognition or acknowledgment, but an indefatigable worker for Brotherhood and always ready to help a soul struggling for glimpses of the light.

Mr. Machell was a firm supporter of the Theosophical work during the troublous times when Wm. Q. Judge was defending it against internal and external attacks, and he has never faltered in giving enthusiastic support to Katherine Tingley. After many years of steady work in Theosophy and art he came to Point Loma with his younger son to commence a new life at the opening of the New Century. Before leaving London he completed a series of mural paintings which now adorn the walls of the Raja Yoga Institute, Avenue Road, London.

Mr. Machell's life in Lomaland is an intensely active one. Besides

R. W. MACHELL AT WORK IN THE GARDEN OF
H. P. BLAVATSKY'S HOME, 19 AVENUE ROAD, LONDON

the exquisite decorative work in the Rotunda and the Aryan Memorial Temple, he has executed a number of massive and original wood carvings. He is an effective public speaker, a frequent contributor of articles to the NEW CENTURY PATH and other publications of the Universal Brotherhood organization, and is also connected with the Art Department of the Raja Yoga Academy. Artistic power is well marked in his son, Montague, a student in the Academy, who is showing great promise as a 'cellist, as well.

C. J. R.

THE Taj Mahal was erected by the Mogul Emperor Shah Jehan, in the Seventeenth century, as a mausoleum for his favorite wife. It was designed to become also, later, his own tomb. Standing, as it does, about two miles from Agra, on the banks of one of the most beautiful rivers in British India, only to be approached through magnificent gardens, with the usual long strip of water in the center, it is indeed an imposing sight. The three gateways are of red sandstone, the Taj Mahal itself being of pure white marble. The interior contains most exquisitely beautiful work, mainly relief carving, marbles inlaid with agate, turquoise, jade and other precious stones, the light being admitted only through open lattice-work. It is impossible to overstate the charm and loveliness of the exterior of this building, its domes and minarets reflected in the water, particularly when softened by the shadows of sunset or moonlight. Can it be that the Taj Mahal holds a message for us, not of death, but of life?—Extract from recent correspondence

Universal Brotherhood Organization

Central Office Point Loma California

THERE was once a time which was as the year one, and it was a time of great strife, and

I was alone in the darkness and in the strife, yet knew not why I fought, and my soul was weary and sore perplexed in that it knew not the nature of the strife, and my mind was full of misgivings for fear that my arm was set against the right, for in the darkness I could in no wise perceive that which was true or false.

But verily I desired in my soul to do battle for the cause which was mine, even all mankind's. And I fell asleep and dreamed a dream, and it was in this wise:—

I dreamed that I wandered into the heart of a great city, and I knew that city, yet it resembled not the city of mine own dwelling, nor any other abode of men on earth; and I questioned my "heart" which answered: "This is the city of the *World of Men*." And as I wandered, I heard a distant chorus of many voices blended into a splendid harmony, and I approached this sound. As I drew nearer, I perceived that those who were in the streets about me were also singing and approaching; and behold! at last I found myself among a congregation of singers, singing in the *square* in the center of the city. And, I perceived that they were all led by a Bard, whose voice seemed to penetrate into the uttermost recesses of the city, energizing into music all who heard. But so frequently did he move from one place to another that he seemed to be in all places at once, and no man knew quite where he was, although his voice always led this grand chorus.

And lo! a woman stepped forth into the midst of the people and sang a song of great power; she sang of truth, of justice, of immortality; she sang of another world, of an *inner* world; she sang of demons and of gods. And the people flocked about her, to listen to her wonderful song and to sing with her; and they sang with great harmony and power for awhile; and when she had finished and stepped back, some of the people who had sung the strongest with her, departed from the *square* still singing loudly the song which they believed they had learned; and some followed them hoping the songstress was among them.

But some still hearing the Bard in the square, remained and sang with him. And a friendly man stepped forth and sang a song, and he sang a song of prophecy; he sang of battle; he sang of the "Warrior of Light;" he sang of the power of thought. And the people sang with him; they sang of the power of thought, and some sang wrong, and as they sang and their song waxed louder, it caused the Bard's singers much pain to sing, although no discord could be heard with the ears. And I saw that the man singer was in great pain in that some of the people sang wrong. And I waxed wroth at those people, but the song of the singer was good, and ere he had ended a third stepped forth and sang with the Bard. This was a woman, and she was clad in armor and a coat of mail, and the coat of mail was like unto many human hearts, but her countenance was full of love and compassion. She sang of Truth, of Light and of Liberation, of Brotherhood and of a Golden Age, and the people sang

The Great Bard

with her, they sang of the Golden Age. Then her song grew more and more wonderful; she sang of Help-

ing and Sharing; she sang of *deeds* as well as thoughts; and some could sing with her of deeds and some could not. Those who could not, tried to appear to sing of deeds, but their voices would not sound and they turned away—when lo! the song sounded fainter and fainter till it seemed to float away into the skies.

And I saw the Bard with arms outstretched pleading for recognition; and my head reeled as if in a great earthquake, and my "heart" told me that the world was in great danger. And I looked and beheld the songstress in the armor go up beside the Bard and stand with him, but the people who could not sing of deeds departed from them, and scoffed at

STUDY ROOM OF THE NUERNBERG (GERMANY) CENTRE OF THE UNIVERSAL BROTHERHOOD ORGANIZATION—AN OLD PATRICIAN RESIDENCE

Lomaland Photo and Eng. Dept.

the songstress and the Bard. But some still heard the song, which, tho' faint, was an hundred fold more beautiful, and but few could hear it, and the few gathered close around the singers and chanted with them.

And I looked, and I saw about them a cloud of light—a radiance of purple. And the Bard and the songstress in the armor of shining hearts and the sweet singers were in this radiance of purple, and their song was: "Seek to render noble service to all that lives." And I awoke and vowed a vow and wrote this dream.

STUDENT

Theosophical Meetings for Sunday Nights

Public Theosophical meetings are conducted every Sunday night in San Diego at 8:15, at the Isis Theatre, by the students of Lomaland.

Theosophical subjects pertaining to all departments of thought and bearing on all conditions of life are attractively and thoughtfully presented.

An interesting feature is the excellent music rendered by some of the students of the Isis Conservatory of Music of Lomaland. Theosophical literature may always be purchased at these meetings.

Students'

Path

.. FREEDOM, GOD AND RIGHT ..

The old Welsh Swansea Motto, Usually Sung to the Ancient Tune of "Men of Harlech, in the Hollow."

[Hezekiah Butterworth's Poem for the Myles Monument Dedication, Barrington, Rhode Island]

MEN of Harlech, in the hollow,
Men of Swansea on the billow,
Men who made the pines their pillow,
'Neath the snow sheets white,
Men of faith who never doubted,
Men whose banners ac'er were rosted,
Loud the cry of Wales they shouted---
"Freedom, God and Right!"

CHORUS:

Men of Swansea glorious,
O'er each wrong victorious,
Still, still the air bright and fair
Shall spread your motto o'er us!
Onward then like Cambrian yeomen,
Cambrian spearmen, Cambrian bowmen,
With the motto 'gainst each foe-man---
"Freedom, God and Right!"

Green the groves that rose to meet them,
Strong the oaks spread out to greet them,
Tall the pines 'mid winds that beat them,
Shoat like Cambrian towers,
Wheeled the ospreys there in wonder,
O'er the old rocks rest asunder
In the weirs of flowers.

Hail, John Myles! each roof tree turning
Into cabin'd schools of learning,
In each falling grove discerning
Freedom's wider light!
Men who read Semitic story,
Men who changed their dreams to glory,
Sang as once the Welsh bards hoary,
"Freedom, God and Right!"

'Mid their axes boldly swinging,
Wars of Hallelujahs singing,
To Llewellyn's legends clinging
In their strength bedight,
Men who gave to men their birthright,
Men who gave to toil its carthright,
Men who honored men for worth-right,
Men in virtue white.

Sing with them, your new hopes sounding,
March with them, a new age founding,
With their motto still resounding,
Lead, in Freedom's van,
Theirs the folk-note, theirs in station,
First in counsels of the nation,
Pioneers of education,
For the rights of man.

CHORUS.

The Crucified Teacher

An Attempted Rendering Into English from an Old French Manuscript, XVIIIth Century.

"I do not speak now of those who teach in the common sense, but of those who teach through their giving of a spiritual life essence.

"The particular essence is not the germ, but its nearest vesture, containing (and indeed being) the force of its growth.

"Yet I shall not here err in calling its particles the germs.

"What is now this crucifixion; what the cross?

"Not the coldness, not the hostility, of the world. *That* was already discounted.

"The true Teacher consents to be, so to say, the matrix, the fruit, in whose very heart the seeds mature, on whose essence and being they feed, in which they are born.

"This primary Teacher is therefore to be called 'mother,' indeed the symbolic Mary of many Christs, when the time of the anointment is, for each.

"And upon this Mary is the pain; it is 'she' who is 'crucified.' She feels the first stirrs of life and all after, until the last, for the life is her own.

"It is still her own, of her heart's soul, though the pupils misuse it, debauch it, take it forth in the world of sin, and wanton with it; nay, wing with it arrows of spite and slander aimed against herself. The same arrows from the sons of the world she feels not, as I said.

"Therein is the real crucifixion, that in the pupils her own Light is debased, her own essence poured along foul gutterways of sensuality, its great power made servant of ambition.

"Wheresoever her pupils and spiritual children may go, they take with them a portion of herself, the spiritual blood of her heart, the highest and most sensitive essence of her being.

"This they can prostitute, darken; befoul, but never lose. *In the end*, it will of necessity (because it is heavenly) purify itself, regain in them its whiteness, redeem them; but till that 'end' come, what of the Teacher?

"And as the essence will make of each of them a God, so, by reason

of its inextinguishable power, each of them can—till the end come and the time is ripe—make it to make of him a fiend, one of the world's scourges.

"The whole evil and separate evils done through the essence by all the children is felt by the Mother, gnawing, tearing, age after age; pangs of growth, wayward thought, casual sin, up to the consecration of infamy. And every one of their pains of remorse and failure is felt in her.

"At last the accumulated structure of evil is cut to pieces by the axe of God and burned in the hells. And the pains of the cutting and burning are reflected from the soul of the pupil and re-echo as the yet prolonged agony of the Mother.

"Out of the ruins and ashes comes the little naked 'child,' born anew, redeemed; in him the Mother may now have the fulfilment of her labor; there is a new seed sower."

FRIENDS IN COUNSEL

DEAR COMRADES: Deep philosophic truth is not confined to universities nor learned men. Packed in small compass in the proverbs and the fables of familiar speech it passes current everywhere. What can be more suggestive and profound than the advice given by the father to his sons that they should not attempt to break their faggot as a whole but deal with the component sticks one at a time? In life we often foolishly attempt to break our bundle all at once. We calculate the intervening space between the heroes and ourselves and are discouraged at the heights we must ascend before our feet can tread where theirs are planted so securely. We overlook the fact that our admired exemplars reached their eminence by slow successive footsteps one by one. It is by unremitting and continuous effort that the pilgrims from the lowland vales gain the pure regions of the mountain snow.

Sometimes we get swept off our feet by periodic currents of reforming zeal and register a fierce resolve that by supreme heroic effort we will uproot the ugly weeds that cast their shadow on our lives. While the high tide continues at the flow we are elated at the prospect of success, but then the unavoidable reaction comes and we retire dismayed at the immense proportions of our task. In our enthusiasm we have challenged an opponent far beyond our present strength, and tried to concentrate the work of years into a few short days of feverish attempt. Faults that have taken long in growing must be destroyed by slow degrees with daily, hourly, momentarily sustained endeavor. The tide of our emotional reforming zeal cannot continue at the full. The periodic tides of apathy and zeal are part of Nature's life and rise and fall with our great mother's breath.

The only force which never fluctuates is that concealed and inner fountain whence Nature with her varying tides has sprung. He who gives way to unrestrained elation when his tide is high will be depressed in corresponding measure when the flow subsides. We must awake into activity that pauseless, pulseless will that knows no wax nor wane, but is as constant as Divinity itself. Those gushes of emotional desire to help the world recur with every rising tide, but the continuous effort is the outcome of a sense of man's all pressing need lying like a burden on the heart. He who depends on the recurrence of these periodical incentives to a better life is like a cork at sea, that alternates unceasingly between the crests and hollows of the dancing waves. We must unite ourselves with that exhaustless, tideless energy which has its home within the central chamber of the heart, where deepest peace combines with most intense activity, and from the throne of our divinity, impose control upon the shifting currents of the outer life.

STUDENT

"IF a superior man abandon virtue, how can he fulfil the requirements of that name?"

"The superior man does not, even for the space of a single meal, act contrary to virtue. In moments of haste, he cleaves to it."

"Is anyone able for one day to apply his strength to virtue? I have not seen the case in which his strength would be insufficient."

"A scholar, whose mind is set on truth, and who is ashamed of bad clothes and bad food, is not fit to be discoursed with."

"The superior man, in the world, does not set his mind either for anything, or against anything: what is right he will follow."

"The superior man thinks of virtue; the small man thinks of comfort. The superior man thinks of the sanctions of law; the small man thinks of favors which he may receive."—*Confucian Analects*

OUR SHADOW

ISA (CRAIG) KNOX

IT falls before, it follows behind,
 Darkest still when the sun is bright;
 No light without the shadow we find,
 And never shadow without the light.

From our shadow we cannot flee away;
 It walks when we walk, it runs when we run;
 But it tells which way to look for the sun:
 We may turn our backs on it any day.

Ever mingle the light and shade
 That make this human world so dear;
 Sorrow of joy is ever made,
 And what were a hope without a fear?

A morning shadow o'er youth is cast,
 Warning from pleasure's dazzling snare;
 A shadow lengthening across the past,
 Fixes our fondest memories there.

One shadow there is, so dark, so dear,
 So broad we see not the brightness round it;
 Yet 'tis but the dark side of the sphere
 Moving into the light unbounded.—*Selected*

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question I have often heard a distinction made between a Theosophist and a member of the Theosophical Society, but do not understand just why. We speak of those who belong to the Christian Church as Christians, and those who follow the Mohammedan or Buddhist form of religion as Mohammedans or Buddhists; so why not those who belong to the Theosophical Society as Theosophists?

Answer The question arises, it would seem, from a confounding of the outer form with the inner condition; the letter with the spirit. It is true, and unfortunately so I think, that outer conformity to the Christian religion, attendance at church, or even being native of a country where ostensibly the religion is Christian, is generally taken as sufficient reason for calling a man or woman a Christian. And the same is true in degree for all the other religions of the world. According to the religious statistics of the world, we find all the people of the earth parcelled out among the different religions. For instance it is said that there are 417,000,000 Christians and so on.

But how many of these millions would be able to answer to the tests that the Founder of Christianity gave to those who would enroll themselves under his banner? He said, "Not every one that saith unto me Lord, Lord, shall enter into the Kingdom of Heaven, but he that doeth the will of the Father that is in Heaven;" and "Whosoever would be my disciple let him deny himself and take up his cross and follow me." And how many professing Christians can or would be willing to answer to this test, as given in *Luke xiv, 26* (revised version), "If any man come to me and hate not his father, and mother, and wife, and children, and brethren, and sisters, yea, and his own life also, he cannot be my disciple."

Which of the so-called Christian nations is Christian in the sense of following the precepts of Christ? How many professing Christians take him as their guide in their business and social relations? It is evident then that the term "Christian" is used very loosely, or will it still be asserted that it may be taken as a standard of character? For, by their fruits shall ye know them.

Coming now to the use of the term "Theosophist." It is true that the public generally use this term loosely, but as stated in the question, a distinction is usually made by students of Theosophy between the terms "Theosophist" and "member of the Theosophical Society." Theosophy is an ideal towards which we aspire. It is easy to make a profession and to label oneself, but that is not enough; humanity demands more, and rightly so.

It is, unfortunately, only too true that certain so-called Theosophists have proven themselves false to their professions, and failing to exploit the Organization for their self-interest have tried to besmirch the names and the characters of the very ones through whom the light of Theosophy has again been brought to the world in these latter days, our Teachers and Helpers, H. P. Blavatsky, William Q. Judge and Katherine

Tingley. And, too, there are certain societies which call themselves Theosophical and even talk of Universal Brotherhood, and if one should attend their meetings, one might hear the word Theosophy used a great deal and a lot of other things with long and strange names, and not profitable to hear or to refer to now.

The Universal Brotherhood and Theosophical Society, which is under the Leadership of Katherine Tingley, and whose headquarters are at Point Loma, does not endorse such so-called Theosophists or such self-styled Theosophical Societies. Why? perhaps you ask. Because we hold to H. P. Blavatsky's definition of a Theosophist, that "Theosophist is, who Theosophy does." She further says, "No Theosophist has a right to the name, unless he is thoroughly imbued with the correctness of Carlyle's truism: 'The end of man is an action and not a thought, though it were the noblest'—and unless he sets and models his daily life upon this truth. No man who has not got it in him will ever become a Theosophist; but he may remain attached for a time to our Society." It may be said here, however, that unless a member of our Society is earnest in his endeavor to live up to the Theosophical ideals, it is not an easy thing for him to remain a member; he does not feel at home.

The year 1895 was a great sifting time; 1898 was another, and there have been others when those who outwardly were members had an opportunity to decide whether Theosophy was a vital living thing or a mere profession.

It will be seen then that to us Theosophy is something very sacred. To be in very truth "Theosophists" is our ideal. We realize that as members of this Organization we have a great responsibility "to make Theosophy a living power in our lives," and not a mere dead letter, but being a member does not necessarily imply being a Theosophist, and therefore it is right to make the distinction referred to. STUDENT

Question What is the difference between Karma and Fate?

Answer Briefly there is much difference, for *fate* is the term given by modern Western peoples to that *apparently* blind, unjust and unknown power in world affairs, over which *human* beings are supposed to have no control.

This idea of their insignificance and powerlessness has been so long in the minds of men that they have almost forgotten that it is *they* who have been the cause of all the suffering in the world and in themselves; and that it is *also* they (ourselves) who must change these unhappy conditions into those of joy and harmony.

How can it be done?

The Law of Karma offers the only real solution of this problem. Its message is that *we are divine in essence, controllers of our own destiny and capable of attaining perfection.*

The word Karma means action, the action of the law of *cause and effect*. According to its decrees, whatever cause we set in motion in thought, word or deed, brings a corresponding result back to us.

If our thoughts, words and deeds are kind and unselfish, and for others' happiness, we create for ourselves conditions in which kindness and generosity come to us to be again used for larger work and higher growth.

If our thoughts, words and deeds are harsh, cruel and unkind, *they* also come back to us in harsh, cruel and unjust treatment of us by others, placing us in conditions of suffering, till from the suffering and the pain we see our error. Then, lo! the same law which appeared as threatening to crush us, is seen to be our true friend which will change our harvest if *we* change the seed.

This is Karma, and it *always* works to bring "order out of chaos, good out of evil, and joy out of pain."

Some have called this law harsh and cruel. Is it not rather the law of divine compassion?

Knowing this shall we not henceforth say that there is *no fate* over which we have not control. We must reap the harvest of past sowing; but today we may sow new seed.

In the new interpretation, then, it is our Fate, Karma, Privilege, whatever you wish to call it, to take our true place once more as *creators* in the highest sense, whose divine destiny it is to make this earth a *happy* dwelling place for *all* creatures. H. A. L.

Mysteries & Study of Language

THE study of language reveals many truths about antiquity and human evolution which do not accord with some of the orthodox scientific ideas, but which bear out the Theosophical teachings. Words are no mere counters or arbitrary signs to express thoughts. Language is a most mysterious and deep-seated thing, and grows up like a living thing from its roots far down in the depths of human consciousness.

One of the chief things which a study of language shows is the immense antiquity of the human race. The theory of evolution from savagery is not supported by it. To quote a recent writer:

As far back as we can trace, there were abstract words, there was a highly organized and developed language. . . . The Indo-European parent language was already highly developed and expressed a vast number of abstract relations.

Trench, in his "Lectures on the Study of Words," makes the following remarks, in which we have italicized the salient points:

Were the savage the primitive man, we should then find savage tribes, furnished, scantily enough, it might be, with the elements of speech, yet at the same time with its fruitful beginnings, its vigorous and healthful germs. But what does their language on close inspection prove? In every case, what they are themselves, *the remnant and ruin of a better and a nobler past.* Fearful indeed is the impress of degradation which is stamped on the language of the savage, more fearful perhaps even than that which is stamped upon his form.

Peoples Who Have Gone Downward

When wholly letting go the truth, when long and greatly sinning against light and conscience, a people has thus gone the downward way, *has been scattered off by some violent catastrophe* from those regions of the world which are the seats of advance and progress, and driven to its remote isles and further corners, then as one nobler thought, one spiritual idea after another has perished from it, the words also that expressed these have perished too.

Renan, in his *Histoire des Langues Sémétiques*, says:

Depuis l'acte générateur qui le fit être, le langage ne s'est enrichi d'aucune fonction vraiment nouvelle. Un germe est posé, renfermant en puissance tout ce que l'être sera un jour; le germe se développe, les formes se constituent dans leurs proportions régulières, ce qui était en puissance devient en acte; mais rien ne se crée, rien ne s'ajoute: tel est la loi commune des êtres soumis aux conditions de la vie. Telle fut aussi la loi du langage.

A spoken language is something that is far above all laws of grammar and syntax. Its form and growth depend upon mysterious laws connecting sound with thought, and there enter into it the elements of intonation, accent and rhythm, which override questions of spelling. One nation borrows a word from another, and then proceeds to use it in an

English Lan- guage a Rob- ber-Chief

entirely different sense, because the *sound* of the word happens to suit the required purpose. The English language is a perfect robber-chief. Instead of making words to fit our thoughts, words adapted to our own particular genius of vocal expression, we have gathered in a most motley assortment of words of foreign make, and simply hacked them down to fit; jamming them into the language with a tail of silent letters adhering.

STUDENT

National Genii

THERE are several ways of studying history and of writing it. One of them, the highest, has never yet been attempted. To do it fully would require a mind that could as it were *think in nations* as we ordinary people think in individuals. Each nation must be thought of as a great individual consciousness, with ideals, with a place in the Divine Order, with a religion and a philosophy, with potentialities. Behind each unit of the nation stands this great being, touching his consciousness more than he knows. So to each a great field of purpose and power is thus open, if he chooses to enter, if he is great-souled enough to step beyond the gateway of his little paddock of personality.

A philosophic writer in a contemporary comments on the unruffled calm of the Japanese after the victories of their armies. He attributes it to "Asiatic pessimism," the pessimism which says: This life is but a sham, an illusion. That we know, and we know nothing else. Why then condescend to be excited or interested in its play? While the play inscrutably lasts we will do our part. When death stops it we may or may not know anything real. Nothing matters.

We think that we can see a little further into the Japanese character than that. In no nation on earth are the units more conscious—though unconscious that they are conscious—of the great Being behind them. Speaking generally of the masses, they are content with whatever is, they are content not to know of the things hidden, because of the profound feeling or intuition that their destiny is with *it*, that with *it* is knowledge. They are content with *its* unspoken *All is well.* Yet it is no overruling and inaccessible power; it is part of themselves, unconsciously recognised as such; with it they are at home. In a deeper sense they feel that in it *they* know. Perhaps the leaders among them have a closer relationship with it, with this product of the nation's whole past and guide of its future, with this collective Soul, and Thinker, and Warrior.

Other nations have *their* Genius. That of France manifests as an ideal in the heart of every Frenchman. It may get distorted and limited there, even debased. But the Frenchman in whom it is purest and least

soiled will be an incarnation of chivalry and courtesy and courage and helpfulness. And he will be touched with poetry and love of all that is pure and beautiful.

What of America? We can picture her genius as a youth new come to a grave and glorious manhood, something stern perhaps, every fibre strung taut. He is Freedom; he is Compassion; and his sword is drawn in readiness for both services. By no shadow of greed or of vanity can he be touched. He was born on July 4, 1776. But since then we have let his place amongst us, in our hearts, be replaced by another genius of very different tendencies.

And so too the English have let that royal old Warrior that once dwelt among them be ousted. May both come soon by their own! And may Russia too come out soon from her deep shadow, for her genius is calling, though but few of her poets and patriots have recognized him. This Slavic Genius is like none of the others. Nor indeed are any of them alike, and therefore all are necessary in the unfolding of the glorious possibilities latent in human life.

STUDENT

Undesirable Immigration

UNDESIRABLE immigration is becoming an urgent question attracting more and more attention. A department of it is known by the extremely recent term *Underground Immigration*. Of this there are innocent and guilty varieties. In the innocent variety, poor foreigners who have already established themselves in this country, send home for a still poorer relative or set of relatives, getting over the port-barrier difficulties by asserting their readiness and ability to provide for the newcomers. As a rule they have of course no such ability and in a short time the imported relatives, who are often old or crippled, lapse on to the charity of their adopted land.

As for the guilty variety it appears that there is no doubt that several agencies exist in some of the countries of Europe for the single purpose of shipping here the disabled, diseased, and criminal. Great skill is displayed in evading our extremely lax regulations, and it is asserted with some amount of good evidence that one or two European governments do more than connive at the work of these agencies.

The evil, whether of the innocent or guilty variety, is quickly increasing. Says a well-informed observer: "During the past eight months I have watched with concerned interest the visible day by day increase in the foreign quarters to which I am accustomed to going in Eastern cities, of the crippled, club-footed, cross-eyed, one-eyed, anæmic, scrofulous, decrepit, hollow-chested and variously diseased recruits to the colony. Where I see eight on Wednesday I see ten on Saturday."

One wonders whether there may not be, back of the agencies, a distinct purpose of lowering the standard of American physical life?

STUDENT

Mad Orgies of Wealth

NOTHING like the extravagance and luxury indulged in by the wealthy of New York City was surely ever seen on earth. At all events never was money squandered to less advantage, or more utter vulgarity and poverty of resource shown in the means of indulging in pleasure. We are told, on the authority of a noted New York restaurateur, that the city is spending a million dollars a day on dinners, which equals half the British national revenue. 350,000 New Yorkers dine in public every evening, and there are 60,000 cooks and waiters. Domesticity is quite unknown to these unfortunate rich idlers, who spend all their time in rushing from "business" to "pleasure," and in eating in public. Descriptions are given of the opulence of the great hotels, where often the most expensive decorations are heaped together regardless of all fitness. Madness is the only word for such a condition, and its pace is too rapid to last long. "For ten years New York has been notorious for its loud worship of the Table god. It is only this season, however, that the worship has become an orgy." E.

Coal-Mining in Spitzbergen

THE march of industrialism has invaded even the chill Arctic Circle, if report tells truly that a company has been formed to work coal-seams in Spitzbergen. A Norwegian, connected with the Sheffield coal-mining industry, has explored the island in search of the coal known to exist there; and has found a seam which crops out on a hill and continues inland horizontally, so that it can be worked by tunneling. The intense frost has rendered the coal friable for fifty feet inwards, but beyond that it is of excellent quality. H.

The Hunger for Reality and Truth

THE following words, quoted from the report of an address recently made by a State Chief Justice to a Bar Association, show the world's hunger for a faith that shall be real and effectual:

Why should we not trust the Power that produced us? The Power that brought us into the world will save us from destruction, if we do right. A man to be religious should be loyal to the truth. I am for the truth, whatever it is. I am for a personal God, if there is a personal God, or whatever power it may be, I am for it.

I am not considered a religious man. I am a member of the church, the Church Universal. I have been misunderstood. So far as Christianity is concerned, I have been a sort of suspect. I can put you on a line of thought broad enough to give hope. To me, there is no credible religion, no religion but that has incredible dogma. I am speaking with the candor of a man that's honest. I am coming to the point where I must soon face religious questions at the grave. I think I now have definite religious beliefs, a religion to die by.

It is not true that the failure of any particular religious system leaves us without hope.

Religion, true religion, I define to be the essential relation between man and the source of his origin, between man and his Creator, without considering whether his Creator is a God, a person, or whatever it may be.

I don't say that any religion is wrong, although some probably are—some must be.

Suppose that any or all religious systems are wrong—are we wrecked?

These thoughts are of great importance and are a great consolation to those who are bewildered, as I have been and am. Why should we not trust that Power that produced us? Why should we despair because these great mysteries exist? Maybe you can solve the mystery of the universe; I can't. Science can't. I have pondered it for years. If we can't find the solution of the mystery by study, then it can't be necessary for us to know it.

Let us live humbly, devoutly, sincerely. The fear of the Lord is the beginning of wisdom.

What a strenuous and pathetic effort to find the real self, to penetrate beneath the changing phantasmagoria of the mind and moods down to some bed-rock of certainty and fixity and peace. And what an inability to express himself in the available jargon of the times.

What a pity it is that honest and truth-seeking minds such as this should be so lamentably fettered by the unconscious adherence to mediæval theology and its puerile conceptions of "Deity" and human destiny! Would that they might understand Theosophy, in all its beauty and soul-satisfying character. Such minds are unconsciously Theosophical, and knowing scarcely what they reach out for and towards, go seeking until their destiny throws them into a *milieu* where Theosophy is at last recognized as their panacea and their natural heritage.

STUDENT

The Recent Intellectual History of Japan

HERE, from the official "White Book," is the intellectual history of Japan, crammed into a nutshell:

In 1873, 29 per cent of school-age children went to the public schools; ten years later, 51 per cent went; ten years later, 59 per cent. Now, it is 93 per cent. In 1873 the number of girls attending was to the number of boys as 15 to 40; now it is as 47 to 54.

So one not only gets the intellectual history in general, but that of women in particular. Statistics may lie if they get time and space enough. But these haven't.

STUDENT

The Falling Birthrate of France

FRENCH statesmen are getting more and more alarmed at the steady decline in the birthrate of their country. In 1899 the excess of births over deaths was only 31,000. In 1900 it was but 20,000. By way of comparison one may note that for Germany the corresponding figures were nearly 800,000; for England 425,000, and so on. Sixteen out of every hundred married couples in France have no children; twenty-four of the hundred have only one, and twenty-two have but two.

Whilst the statesmen are worrying over what to do to increase the birthrate of their country, they will probably not neglect the problem of how to keep those alive who are born. For instance, 170,000 infants under one year of age die yearly. It appears also that more than half the persons treated yearly at the hospitals are alcoholics; and of every ten consumptives nine are alcoholics. A very large percentage of this is preventable death. And by the time it was prevented the rest of the problem might have done a good deal to solve itself. STUDENT

Some Views on XXth Century Problems

"Death" for East & West

TO differ from a Japanese scholar, thinker, and historian, in his estimate of the forces at work in his own country, may seem impertinent. But it is impossible for a reader of Baron Suyematsu's recent paper published by the Central Asian Society—*Chinese Expansion Historically Reviewed*—to help doing so.

After pointing out that there are now in the world three civilizations, Chinese, Indian, and European, he says that Japan has now left, or is leaving, the Chinese type, and "aspires to elevate herself to the same plane, and to press onwards in the same path of civilization, as the countries of the West."

"Aspires to elevate herself"—is that the right phrase? Should it not rather be: Intends to add to herself whatever is of value in Western civilization?

The emendation has already been made. An English critic remarks: "Japan has given much already, and will, no doubt, give much more of essential value to Europe; it is doubtful if she will ever take from us anything more than trains, telegraphs, and guns." He points out that the keynote of their civilization is different and higher, and instances the case of that storming party at Port Arthur who threw their bodies on the bayonets of the Russians in order that the second rank might walk over body and bayonet into the fort. It was "an act which no modern European soldiery would do. The brave European will take any risk there is; if there is only one chance in a million he will take it and take it cheerfully. But there must be just that one chance."

What does that contrast mean? More than that the Japanese knows that his surviving dependents will be perfectly looked after; more than that he puts the interests of his country before any interests of his own, "even life itself" as we should say. "Even life itself" is an improper phrase here; for the Japanese mind does not under any circumstances connect the idea of cessation of his life with that of the death of his body. He has cheerfully given his *body* to his country; his life he knows *cannot* be cut through. The life of his body, and of himself, are to him two different currents, and the latter is the more vividly present to him. The Westerner, brave as he may be, takes the extremest risk of death because, though identifying *his* life with that of his body, he thinks of that one chance in a million and conceives of it as falling to himself.

The Japanese feels himself a part of his people, sharing all his people's life and interest; and he does *not* feel that his death will cut him away from that life or isolate him.

The feeling of true brotherhood, of companionship with all humanity, allowed to develop steadily, carried out in act and thought, will destroy the fear of death because it will unveil that part of the mind which *knows that there is no death*. In using the word *soul*, the current religion has so obscured and glossed its meaning that we have forgotten that *soul is* this now veiled portion of the mind. But however veiled, it is there, and the developed feeling of unity with humanity, of essential family relationship with humanity, will unveil it and redeem life from every fear. STUDENT

Vanity & Facts

DURING the many centuries which have elapsed since the disappearance of the ancient Mysteries mankind has built up various egotistic conceptions of the universe, always putting himself and his abode in the center. Not long after the time of Pythagoras real knowledge of the nature of the solar system and man's standing therein, disappeared from the public mind in most civilized countries. Guesswork took its place, until at last the plausible Ptolemaic system was invented (Second century) which flattered human egotism by placing the earth in the center of all things. This lingered on until Galileo, Copernicus and Kepler demonstrated that the sun had a right to the supreme position. Man's colossal vanity was grievously shocked, and the humiliating fact had to fight hard for acceptance.

Again, even when the larger facts of astronomy were everywhere accepted, the same egotism reappeared, persuading men that space must be peopled with innumerable solar systems of similar pattern to our own.

But with the increasing number of facts collected and the less materialistic outlook of the Twentieth century a more modest position is being

compelled. The discovery of myriads of stellar systems consisting of two, three, four and even more blazing suns, connected by invisible bonds and many of them of gorgeous colors, wheeling about each other; of bright stars associated with enormous companions perhaps as large as or larger than themselves, yet not visible to us owing to their dimness, proves to us that the solar system is *not* the general type. From the strange shapes of some of the spiral nebulae it has been suggested that the law of gravity itself may be greatly modified by unknown forces in the extreme confines of the visible universe. The possibility of there being very many systems *like ours* grows less as continual new discoveries are made of the multiple nature of stars hitherto thought single. We are, in brief, a *portion* of the great design; many other parts resemble ours; but the whole pattern has infinite variety, and only vanity could be satisfied with any other concept.

There is one form in which the idea of man being the center of things may be accepted. The Divine Soul in him, the immortal, is indissolubly united to that Self which *is* the center of life, the spiritual center of the universe. STUDENT

Dollar Worship

MR. JAMES BECK, late Assistant Attorney General, in a recent paper before the New York Bankers' Association, dwelt upon the "searching inquiry now in progress in the great court of public opinion as to the ethical significance of money and money-making."

Along with the enquiry "demagogues are making frenzied appeals to popular passion to proclaim a new crusade against property."

The enquiry would not have been needed, and the demagogues would not exist, if one of Mr. Beck's sentences were true: "No error is more common than that which imputes to the American people . . . an inordinate love of money-making." How then arise the people who make money in inordinate amounts? When in any nation a group of men arises who exhibit some characteristic in very marked degree, whether it be artistic, military, commercial, or what not, they stand as representatives of a tendency common to the whole nation. They are but highly colored points of the same tint which is suffused throughout their people. And no measures will effect their extinction till the disappearance of the general tint. When we cease to have the least respect for a man of great wealth for the mere reason that he has that wealth, when we cease in our deepest hearts to have anything of the same worship for the aristocracy of wealth as the peoples of Europe have for that of rank, when the newspapers cease to chronicle as matters of public interest the doings and wearings of the wealthy Mrs. This and the whereabouts of the summer vacation of the wealthy Mr. That—then we shall know that the tint is vanishing. And then only, not till then, will the demagogues find no more reason for their frenzies. STUDENT

Threefold Education

PRESIDENT JAMES of Harvard has been "saying things" about education. He reminded us that fifty years ago public-school education was expected to be the general cure for vice and crime.

The expectation has been disappointed. "Schools and colleges increase crime by developing intellects which in many cases have criminal tendencies." Why should there be any other result? Our education is of the mind, and consequently the mind only has been improved. Even if there has been a little *moral* improvement, it is only comparable to that little *mental* improvement which follows athletics for the body. Neither the criminal nor the saint in a man are his mind; but either may use it; and the finish of their work will have some relation to the finish of the instrument. That education alone is complete in which the threefold character of human nature is fully admitted and in which all three elements are together brought to their highest point, the physical, mental, and spiritual. This is the Raja Yoga training that has been in operation at the Theosophical Center, Point Loma, California, for nearly seven years, where the sense of beauty, the love of all that is living, and the recognition of the indwelling soul as the sustainer of the dignity of true manhood and womanhood, are awakened and added to mental and physical health. The result is perfect balance. STUDENT

More Testimony to Lemuria—Fiji, Once Part of Australia

A REPORT from Sydney, Australia, as to the results of a recent scientific exploration of Fiji, states that the explorers discovered on Viti Leon, the main island, large areas of granite, diorite, and schist.

This proves the continental character of Fiji; it is no mere island of upheaval or accumulation, but part of an ancient formation. These rocks, it is considered, "were probably formerly part of a large land surface extending from Fiji to New Caledonia and thence to Australia. This geological evidence is supported by the nature of the animals and plants found in Viti Leon."

It is always interesting to hear of these confirmations of the ancient teachings. Nevertheless Alfred Russel Wallace is quoted by H. P. Blavatsky (1888) as extending "the Australia of Tertiary periods to New Guinea and the Solomon Islands, and perhaps to Fiji." Jacolliot, Haeckel, and many other authorities are quoted by her to similar effect, and in support of the remarkable fact that despite the distance between the various Polynesian island peoples—of Lemuro-Atlantean descent—and their consequent utter isolation from each other, yet—

They one and all maintain that their respective countries extended far toward the West, on the Asian side. Moreover, with very small differences, they all speak dialects evidently of the same language; and understand each other with little difficulty; have the same religious beliefs and superstitions; and pretty much the same customs. STUDENT

Easter Island and Its Atlantean Statues

EASTER Island, according to Dr. Alexander Agassiz, who has recently visited it on an exploring expedition, is barren and entirely devoid of native trees and shrubs. Clearly great terrestrial forces have desolated it since that civilization lived which built the marvelous stone images found there. These images are of stone from the quarries of Rana Roraka, a volcano in the interior; they were placed on platforms which are found all over the island and along the shore. The largest of these platforms is 450 ft. long and behind it lie fifteen huge images which once stood thereon. There are also ruined stone houses in the island. The statues have symbols carved on their backs, in which one recognizes that mystery language, with its animals and geometrical signs, that was once diffused among the peoples of earth.

The Easter Island relics are the most astounding and eloquent memorials of the primeval giants. They are as grand as they are mysterious, and one has but to examine the heads of the colossal statues that have remained unbroken on that island, to recognize in them at a glance the features of a type and character attributed to the Fourth Race giants. They seem of one cast, though different in features—that of a *distinctly sensual type*, such as the Atlanteans (the Daityas and "Atalantians") are represented to have been in the esoteric Hindu books.—H. P. Blavatsky

One of the most ancient legends of India, preserved in the temples by oral and written tradition, relates that several hundred thousand years ago there existed in the Pacific Ocean an immense continent which was destroyed by geological up-

heaval, and the fragments of which must be sought in Madagascar, Ceylon, Sumatra, Java, Borneo, and the principal isles of Polynesia,—

says the author of *Histoire des Vierges: les Peuples et les Continents Disparus*. He adds that Easter Island is one of the summits of this continent, and that the aborigines of the various Pacific islands, though widely separated from each other, each—

Maintained that their island had at one time formed part of an immense stretch of land which extended towards the West on the side of Asia.

One should, however, add in this connection that the speculations of learned men, however enlightened these speculations may be, too often fall short of the truth through failure to grasp the *vastness* of the subject. The tendency to make one's theory too compact and circumscribed is almost unavoidable. But there were races and sub-races, and times within times; and the traces that are left us are a motley assortment. It would take the brain of a finally perfected man to piece together the

true story *inductively*. But with H. P. Blavatsky's hints, drawn from indelible tradition, we may fit the pieces where they belong. Jacolliot, speaking of the disappearance of the great Pacific continent, "several hundred thousand years ago," has confused two unrelated details. The Pacific Lemurian continent disappeared several *million* years ago. But its surviving island summits were afterward occupied by those degenerate *Atlanteans* who built the unholy images; and these Atlanteans in their turn disappeared several hundred thousand years ago. STUDENT

Our Rediscoveries

IT sometimes looks as though all discovery was really rediscovery. Nearly half a century ago the sources of the

Nile were "discovered." And for that we pay due honor to Speke, Grant, and Sir Samuel Baker. Yet the lakes that constitute the Nile origin were mentioned by Herodotus; and Aristotle, speaking of the cranes of lower Egypt, says that they "migrate from the Scythian regions to the lakes lying above Egypt from whence the Nile arises."

For centuries the Nile sources were forgotten—to be ascertained a second time. Professor Fischer, rummaging in the library of the old castle of Wolfegg in Würtemberg, has found a map of the year 1507 which pictures with great accuracy the two lakes in question.

So the Nile sources were known in the fifteenth or sixteenth centuries and were forgotten a second time, to be a third time "discovered!"

How many times was America discovered? Icelanders, Vikings, Welsh, Basques, Italians, Chinese—all seem to have preceded Columbus. And there is no small reason for thinking that America was mentioned under the name of Patala in ancient Indian literature.

About 150 years ago we "discovered" platinum. But three or four years ago M. Berthelot was examining a metal box, the property of an Egyptian queen of the seventh century B. C. In it was a small plate made of an alloy of gold and platinum. So it was well enough known at that far period to be extracted and blended into an alloy. Indeed, how could a metal which occurs native to the country remain unknown? STUDENT

Different Views of Nature: The
Poet's, the Scientist's and
the Theosophist's

IT is the privilege of a student of Theosophy to be able to give words to many of the poet's half-expressed musings. For, though the poet may be prescient of Nature's Soul, he has no language for his thoughts, and must resort to "as though," "as it were," and such like cautious phrases, or else use figures borrowed from ancient mythologies not now credited. So his poems come to be regarded as beautiful but unreal, the uninquiring spirit of the age apparently being satisfied to leave unsolved the dilemma which is really implied by such an attitude of mind.

But if we accept, as an article of belief, that the whole universe, and every smallest part thereof, is alive with conscious thought and feeling; then the revelations which we get from contemplating nature come as confirmation of our belief, not as contradiction; and they are hailed with joy instead of being hinted at apologetically.

The poet who has a narrow intellectual outlook continually checking his intuitions, has to have moments of intense inspiration to break down the barriers. But is it not a case of much ado about comparatively nothing? With a proper attitude of mind, might we not live habitually in a state of tranquil consciousness of nature's soul, instead of having occasional moments of ecstasy? It is doubtless a great experience for a materialist to have one of the veils of his soul suddenly lifted, and makes him feel "new created" and "as if the Lord were passing by." But that kind of a Lord is always passing by, and it is possible to stay new created.

States of temporary exaltation are correlative with the prevalent condition of dull insensibility, and both are departures from the mood of tranquil joy and light in which we might live. Simple souls that need no philosophy can do this, but a poet with an intellect must make his intellectual conceptions square with the intuitions of his heart.

In fact we are developed in a lopsided way, and have no people in whom the soul and the mind are both developed and evenly proportioned; and so, in one, the emotions run away with the judgment, and, in the other, the "intellect" obscures the higher perceptions. Raja Yoga alone—the harmonious development of the whole nature—can give us the true balance and enable us to make rational and permanent those states of rapture which at present come only in a spasmodic and abnormal

NATURE'S TRANQUIL LABORS

MATTHEW ARNOLD

ONE lesson, Nature, let me learn of thee,
One lesson which in every wind is blown,
One lesson of two duties kept at one,
Though the loud world proclaim their enmity,—
Of toil unsevered from tranquillity;
Of labor that in lasting fruit outgrows
Far noisier schemes, accomplished in repose.

Too great for haste, too high for rivalry,
Yes, while on earth a thousand discords ring,
Man's fitful uproar mingling with his toil,
Still do thy sleepless ministers move on,
Their glorious tasks in silence perfecting;
Still working, blaming still our vain turmoil;
Laborers that shall not fail, when man is gone.

"THE EAGLE ARCH," CATALINA ISLAND, OFF POINT LOMA, SOUTHERN CALIFORNIA

"Instinct" in Birds

THE familiar bird-book legend that the young birds are taught by their parents how to build nests, will not stand the test of actual observation. Birds whose parents have been shot build nests; so do young birds captured and placed in parks. Besides one never sees the process of instruction going on. Finally it would scarcely be possible for a process transmitted from father to son, and not helped in any other way, to remain so invariable. The readiest explanation is that the bird has a mind. There are many grades of mind. Even a human being can be in the three different states of waking, dreaming, and sleeping; and, of waking states, there are varieties, ranging from the dull intellect of the clown to

the enlightened vision of the seer. Thus one can readily surmise that an animal may have a mind entirely different from ours, yet adequate to its purposes. Indeed, analogy would preclude us from inferring either that the bird has no mind, or that it has a mind like ours; for, while it resembles our intelligent selves in its life and motion, it differs in its form. All this is very elementary reasoning, and it seems curious how any more far-fetched theory should be deemed necessary. One would think that, if a bird knows how to digest a worm, it might know how to build a nest. Instinctual consciousness is present in every moment of our own life.

Where the philosophers go wrong is in trying to derive mind from below, instead of from above. Postulate mind as the primal essence, and it is easy to derive from it all manifestations of life and thought. And one *must* postulate it. We have the most elementary ideas as to what mind is, and are apt to consider it as limited by that particular self-analyzing kind of mind which we have in our own heads. But the things we postulate to take the place of mind in nature and in matter are more fearful and wonderful than the conclusions we seek to evade.

Of course intelligence, and that of a high order, must be needed to accomplish all those marvelous and beautiful results which we witness in the mineral kingdom. But then this is usually attributed, directly and without intermediary, to God. Why these distinctions? STUDENT

"Purity is the best good: a blessing it is—a blessing to him who practises purity for the sake of the Highest Purity."—From the *Ashem-Vohu*

THIS photograph of a Parsee family in **A Parsee Family Group**

They were conquered by the Moslems however, and it was at this time, about the end of the seventh and the

beginning of the eighth centuries, that the Parsees, seeing the hopelessness of their efforts to stem the tide of the religious persecution instituted by the Saracens, fled from Persia to India. They found an asylum in the province of Gujarat, and there they live to this day, still retaining their ancient religion.

Itself tells the story of a better condition for Parsee women, than generally exists among the women in Eastern countries. Fact bears out the evidence of the picture, for in their treatment of daughters, wives, and mothers, the Parsees are known to be more noble and liberal-minded than most other Asiatic races, whose customs are known to us. Parsee women are not subjected to the restrictions placed upon many Oriental women; they appear freely in public, and their position in their own households is one of authority and trust. The Parsees have been quick to avail themselves of opportunities for education, and the women are not excluded from these privileges, but share the training which has opened to them a means of knowing what has been done in the Western world along the lines of science and literature.

In retreating thus before the Mahomedan influence, the Parsees escaped the institution of polygamy, which has so degraded the life of women in the countries conquered by the Moslems. It is a notable fact that one law of the Parsee community is that no man having one wife shall marry another, except in the case of the wife's barrenness or immoral conduct. It is quite clear that in the relations of life Parsee women are on a different footing from most women in the East. The sincere love of truth which is said to have been a virtue of the ancient Persians would seem to have survived in this faithful remnant, and to have preserved them from at least some of the errors to which many Eastern peoples have lived in subjection.

The Parsees have many curious and interesting customs. The love of nature instilled into the race by their ancient religion, and by the nomad life of their ancestors, seems, in them, to exist side by side with a feeling of responsibility about the air and water, the fire and earth. They do not choose to pollute these so, like some of the Indian tribes of America, they hold to the custom of exposing the bodies of the dead as food for the wild birds. This is done with great ceremony at the Towers of Silence, near Bombay, the last resting place of the departed Parsees.

There is in this custom no disregard of the respect due to the dead; the Parsees, like so many Oriental nations, preserve the memory of souls who have departed, and honor them by festivals and ceremonies conducted at stated times throughout the year.

Another of their customs is to hold an annual festival "in honor of truth and friendship." Surely a festival such as this must bring a gleam of the higher aspect of human relations.

When we study the history and the lives of the women of the East, the thought often arises, that in their restricted environment there has still been an opportunity to develop selflessness. Their long, devoted service to time-honored customs, the full bearing of which upon man's many lives on earth is not always grasped by Western peoples, on account of their limited theology, has, doubtless, kept some fire alight in the heart. When devoted service to the cause of humanity has finally broken down

The history of the Parsees is an interesting one. They are the direct descendants of the ancient Iranians, a race who, in physical alertness and grace were almost equal to the ancient Greeks. The Iranian women were especially admired by the critical Greeks, for the dignity of their bearing, which was compared to that of the barbaric queens of the heroic age. In the early life of this race the nomadic impulse was strong; no people have lived more freely in the open than the ancient Iranians. They were fireworshippers, and their altars crowned the hilltops, from which they could look out over a wide stretch of country. The austere and simple teachings of Zoroaster, their great Teacher, inculcated practical morality. Truth and purity were looked upon as the very foundation of right living; and in the practise of the common virtues these people were excelled by none of the primitive races.

History tells us that on the night of Mahomet's birth, the sacred fires that had been kept burning for ages on the altars of the Zoroastrians were suddenly extinguished, as if by some miraculous intervention. This was held to be an omen of the coming conquest of Persia by the Moslems. Be this as it may, the Persians offered a stubborn resistance to the invaders, who accomplished the downfall of their nation. They had a glorious past, these Iranians of Persia; their patriotism was strong, and they fought to the death for their country and their faith.

the barriers between the races of the East and West, it may be that there will be found in the women of the East an unwavering, steadfast devotion to principle, a deep flowing current of true feeling for all that lives, which will be a precious supplement to the grand characteristics of womanhood that have been developed in western countries. M. T.

The Eastern Woman

THE domestic life of the Indian woman is not at all so unhappy as we fancy it. The Eastern woman is consulted in almost every matter by her husband. She has complete management of the home, and the husband advises openly in business matters with the wife, and is not ashamed of doing so publicly, as is, generally, his more progressive brother in the West. As to motherhood, it is a sacrament with them, not an accident; the Indian woman is absolutely mistress of her own person at all times. During pregnancy there is an interesting ceremony held once every month, for the future good of the coming child.

In India, it is perfectly delightful to grow old, for great respect is given to old age. The elders are supported, and waited upon by the younger, who deem the service a privilege. Such a thing as a jest upon "old age" is unheard of in India: the people simply would not understand what was meant, nor would they consider that such could be uttered. S.

ELEANORA DUSE said recently: "Do you know one thing which vexes me so much? It is when people bring their children to my plays. I love and adore all these little ones, and it hurts me when I see them come into the theatre. I have no plays for them, and I never have a child to play a part in one of my plays." To think that Eleanora Duse—who, in the first years of her dramatic life was looked upon as a pioneer of a new school, a high-priestess in her chosen art, could have voiced such sentiments as above, or found it necessary. Where shall we look for the chosen ones who will be the real founders of this much to be desired new school? Will they not come from a body of people who are working in harmony with the actor and actress—and giving them the support which is necessary to hold them to their high standards? E.

COL. GEORGE HARVEY, Editor of *Harper's Weekly*, in a recent address before the Vassar Alumnae Association, declared that women ought to take more interest in politics, but that it should be a higher interest. He said: "Ignorance of causes was never more prevalent than it is today in all departments of our government. The flag of idealism which fluttered in the early days of the Republic, has been supplanted by the rag of material achievement, a condition which should certainly furnish thinking women with inspiration to work for better ideals."

THE passage of a bill recently introduced into the Albany Senate providing that laborers employed by the City of New York shall not work on Sunday without extra pay, is said to be due mainly to the tact and efforts of a woman.

ENCOURAGEMENT has been given to women students of science by the Woman's Institute of Science at Naples, which has offered a prize of £200 for the best work on any subject of scientific research, based on independent laboratory experiments.

ACCORDING to researches recently made by an American woman, Miss Herron, B. L., nearly all trades' unions have been forced to accept the policy of bringing women into their organizations. They are at last giving up the old theory that women were merely temporary interlopers and "they are now recognizing the inevitableness of women's becoming a part of the present system of industry."

The Moth and the Flame

ACCORDING to the Chief of the Detective Bureau in New York, there is no diminution in the number of young girls who run away from home to go on the stage. In fact he acknowledges that the Bureau is beset with inquiries from anxious parents, whose desire for privacy is respected however, and who are assisted in the recovery of their daughters without having public notice directed to them.

Young girls who take this means of reaching the foot-lights are, in the majority of cases, influenced by something other than the determination to excel in the dramatic profession. It is the fancied excitement and thrill of stage life, the purely personal and sensational aspect of it, that has attracted them. Even the most obdurate of parents have been known to yield to a steadfast wish on the part of their daughter for dramatic training. A girl of high principle will trust her vocation, will have confidence that her own aspirations and capabilities will open the way for her, to her chosen career.

The girls who run away from home to go on the stage are not, as a rule, girls of high principle or balanced character. They are girls who have needed much wiser training than they have had; they do not possess the

A PARSEE FAMILY GROUP

poise that would make it possible for them to nobly succeed in any career. If parents and teachers were more vigilant, they would recognize and correct these tendencies in young girls, which, when stimulated by excitement or by some false ideal, tempt them to such escapades.

The difficulty is two-fold, for the wise training that directs all the energies into useful and healthful channels, and nourishes the imagination with lofty ideals and pure aspirations, must begin at a very early age; it can not be given by those who have no philosophy of life and no understanding of human nature. Only the most resolute and strong-hearted moral discipline in early years, coupled with thorough mental and physical training, can develop in young girls the balance of character that is their protection against infatuations of any sort.

Where are the wise who will give this training? What is the solution of this problem? We look to Raja Yoga. STUDENT

DR. MINOT J. SAVAGE, a prominent Unitarian minister of Boston, recently said in a sermon on divorce: "Law doesn't make marriages; all the law can do is to make a clumsy attempt to protect; all the Church can do is to recognize and try to consecrate a fact that already exists. Men and women themselves make the true marriage, if there is one. If there is not, then it is a desecration to keep up the sham."

OUR YOUNG FOLK

The Raja Yoga Question Box

THIS patriot statesman and his talented wife were devoted to the service of America in the days when the great American nation was young.

1 Who was James Madison?

ANSWER—James Madison was the fourth President of the United States. Even as a boy he showed the dignity and self-control which later helped him to be a great statesman. It is said that he was never known to speak nor to act carelessly. James Madison was a lawyer and he loved the study of history. He helped to build a strong government for the States, on the foundation of the Declaration of Independence. The colonists had gained independence, but they were not formed into a nation. James Madison did much to unite them by giving them the Constitution of the United States and teaching them to respect it. He was a clear thinker

and kept calm and steady through all the disputes and difficulties of that time.

2 Who was Dolly Madison?

ANSWER—Dolly Madison was President Madison's wife. Her father and mother were Quakers. She grew up to be a beautiful, gracious woman; she was always kind and unselfish, and had the true courtesy that springs from the heart. She was very young when she became the mistress of the White House. Every one loved her for her sweetness and natural dignity. People of different parties forgot their quarrels in her sunny presence. Dolly Madison was very brave and patriotic. During the war of 1812 she received a message that the White House was to be burned, but she would not leave until she had secured the valuable state papers, and a portrait of George Washington which are still preserved by the government.

THE BAREFOOT BOY

JOHN GREENLEAF WHITTIER

BLESSINGS on thee, little man,
Barefoot boy, with cheek of tan!
With thy upturned pantaloon,
And thy merry whistled tunc;
With thy red lip, redder still
Kissed by strawberries on the hill;
With the sunshine on thy face,
Through thy torn brim's jaunty grace;
From my heart I give thee joy,—
I was once a barefoot boy!
Prince thou art,—the grown-up man
Only is republican.
Let the million-dollar'd ride!
Barefoot, trudging at his side,
Thou hast more than he can buy
In the reach of ear and eye,—
Outward sunshine, inward joy:
Blessings on thee, barefoot boy!

A Young Astronomer

ACROSS the sea, in bonny Scotland, there is a lad who has accomplished so much in his short life, that we think the boys and girls who read the NEW CENTURY PATH would like to know about him.

His name is Hector Macpherson, and he lives in a beautiful old country house, surrounded by great trees and green fields, not far from Edinburgh. Here he has lived a quiet simple life near to nature. His father, a well-known journalist, had different ideas about training from what most parents have, and the result shows there must have been some Raja Yoga wisdom in his method. He believed a child's mind should be allowed to develop freely and naturally, by awakening the imagination and then directing it into helpful channels. Hector has never gone to a public school, but he always loved to study and find out about things, and with his father's help has acquired a general education far beyond most boys of his age. And, best of all, he has already learned how to use it for the benefit of the world. For this boy of seventeen is the author of a book about astronomers which is attracting much attention, especially among scientists, many of whom have pronounced it a valuable addition to scientific literature. This is how he came to write it:

When quite a small boy Hector developed a fondness for astronomy and would read the elementary books which his father got for him with the greatest interest and wonder. He persevered with his reading and went through more difficult books until he had a good idea of the subject. Then he went to work and fitted up a corner of the house as an observatory, with a telescope, maps and the other things necessary for studying the heavens.

After awhile he began to write some articles for a newspaper about the great astronomers of the past; then the desire came to him to write

CUBAN GIRLS IN AN ART NEEDLEWORK CLASS IN THE RAJA YOGA SCHOOL

about the work of the great astronomers who are still living, of whom less is known, perhaps. He could not find any book which would give him the information necessary about these men, so he wrote to them, sending some of the articles he had written, and begged them to tell him about themselves and their work. And they did, and out of that effort grew a delightful correspondence with several eminent astronomers, who commended Hector for his work and gave him the valuable information which he was seeking. Many sent him their portraits as well. Some of his correspondents wrote in a foreign language, but Hector had learned enough French, German and Italian to read their letters and review the books they sent.

He is still studying the stars, but is also working on other subjects,

and plans to enter the University soon. Do you not think this is a good example of what perseverance and pluck will accomplish? And it also shows that we don't have to wait to grow up before beginning to think seriously, or to do helpful work for the world.

COUSIN ALICE

Facts Worth Knowing

AN effort is now being made to have the President use his influence in having amateur publications admitted to the mails as second-class matter. This would make it possible for many boys to have most valuable experience and training and would awaken their interest in journalism.

JAMES MADISON'S favorite quotation was:

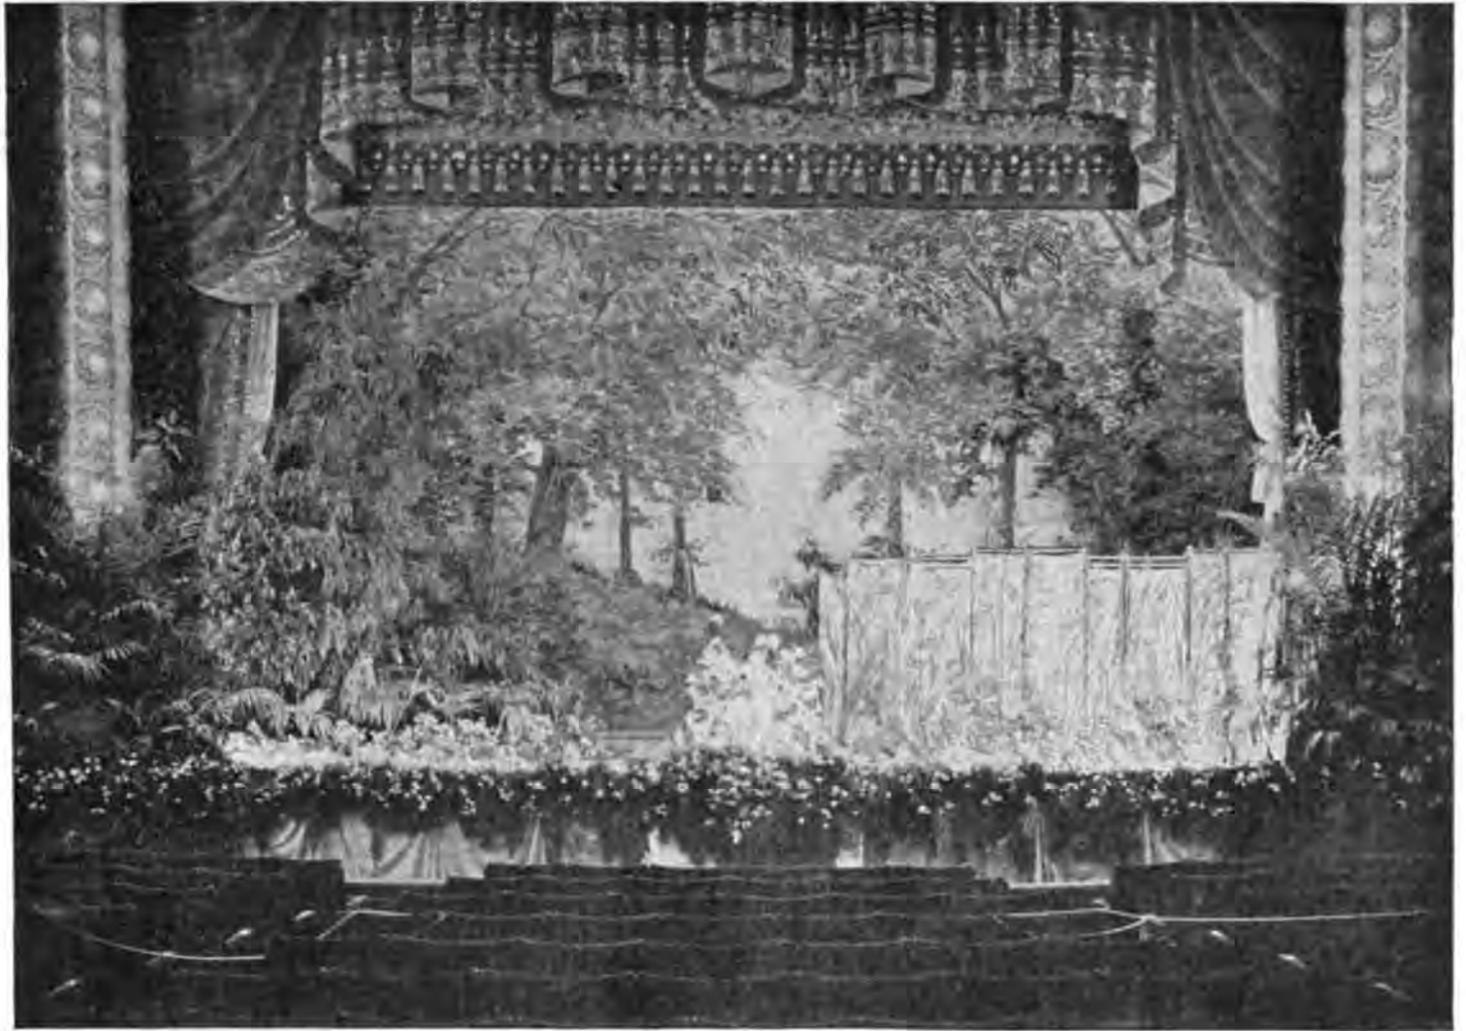

Errors like straw upon the surface flow,
Those who would seek for pearls must dive below.

HAVE you ever seen a rainbow at night? Last June this curious phenomenon was observed in Georgia, U. S. Just before the moon rose there was a heavy thunderstorm, and as the clouds cleared, the rainbow became visible, and grew brighter and brighter for twenty minutes. After the clouds were almost gone, and the stars were shining through the haze, the rainbow could still be seen. Of course you know that the moon furnished the light for this rainbow instead of the sun, as in daytime.

IN Madagascar there is a giant spider which spins a remarkable web. The lines of this web are so strong that they will hold a bamboo cane, and they stretch all the way across walks and shady avenues. Every morning you may see the native girls of Madagascar reeling the silk from the live spiders, which, after a rest of ten days, yield another harvest. Each spider, at a reeling yields about four thousand yards. The rearing of these giant spiders is now an established industry in Madagascar. The silk is manufactured in France and was exhibited in Paris in 1900.

THE THEOSOPHICAL FORUM, IN ISIS THEATRE

LAST Sunday evening the Universal Brotherhood and Theosophical Society held its regular meeting at Isis Theatre, the program including, beside the usual musical numbers, three entertaining papers by Point Loma students.

The first paper, entitled "Small Beginnings," was read by Mrs. W. T. Hanson. In part she said: "Has not all human experience taught us that the season of spring is the most propitious one for planting? Spring is fittingly represented by youth, and it is in youth, in earliest infancy, that the important seeds for future life are sown. To parents is given the privilege of preparing the ground, and to them is entrusted the task of planting the seeds of courage, honor, unselfishness and all the other noble qualities that go to make up the highest standard of womanhood and manhood. Make the small beginnings in a child's life to flow in the right channel and in afteryears there can be no deviating from the same course. If all parents and guardians could realize the enormous importance of the first few years! It is the seed time when the germ of all that is high and noble, unselfish and true, is first taking root, and if wisely tended and guarded, will spread and grow until there is no room in the heart for greed and self.

"The great hope of Theosophy held aloft to the discouraged, the tired, the helpless, is: they can always have a new beginning. It is not necessary to wait for a hereafter to have another life. We can begin from this moment to change the current of our lives. From tomorrow morning there may come the 'dawn of a new day,' and we can rise with it, as one born anew. We can have a rebirth of our best aspirations and resolutions, and start them off with a clearer understanding of our responsibility in carving out our life and happiness, as a sculptor hews and carves the image after the picture he has in his heart."

R. W. Machell spoke of "The World's Ways." "The faith of the world," he said, "is tangled amid the ruins of wrecked faiths. Greed has stepped in to take the place of faith, wealth has dethroned honor, and the way of the world wends back. Each tribe has its totem set up as the god of a sect and seeks to propitiate him by denouncing those who worship other totems. One is called Success, another is called Respect-

ability, another Fame, and so on. Some are high class, some are low, and behind each totem is the great undying and unwritten law that gives to each one harvest of the grain that he has sowed. One of the strange ways of the world is to sow one kind of grain and hope to reap another kind of harvest, and in this the totem is appealed to with devout prayers and suitable offerings. And one sows thistle-down and prays for a crop of roses, and one sows seeds of selfishness and prays for a harvest of love, another sows greed and asks his totem to give him a fine crop of celestial joy; another plants seeds of extortion and trusts to his totem to give him a harvest of eternal salvation.

"As is the seed, so is the harvest."

S. G. Bonn read a paper entitled; "The Day of Small Things." "Has it ever occurred to us," he said, "that if we are fond of adventure and heroic deeds; if we desire to carry forward our boyhood's ideals of fights with wild animals, tigers, wolves and dragons of the deep; if we wish to take a hero's part in tragedy or comedy; or visit a house filled with ghosts and hobgoblins; we need go no further than the experiences of each day of our lives, and we shall find them, everyone of them, full of such. The little universe within, is the place where these battles must first be fought and won, before we are fitted for posts of fuller trust; and until this campaign is in some measure entered on, we are unfitted for a larger warfare.

"Not a day passes but we stand in danger of the tiger of anger, the bear of ill-humor, the snarling wolf of criticism, the fox of cunning self-deceit, the parrot of empty chatter, the peacock of self-admiration. Ghosts of the past rise up before us, which only need careful scrutiny to disappear for ever. Disappointments and disillusion come with tragical effect and give us the tempered strength of trial. Comedy throws away her mask, and shows us her laughing face when the happy dénouement unravels the dread and tangled mystery. And so the warrior of brave heart will go through each day with that 'eternal vigilance' which is the price of liberty; with the star ahead which leads him ever onward. It is doing the small thing, the performance of small duties, that prepares the way for the greater responsibilities of life."—*San Diego News*.

Art Music Literature and the Drama

The Study of Classical Music

WHAT is justly known as "classical music" is a revelation, in terms of sound, of some of the higher laws of Nature. Music is composed of the fixed ratios or vibrating affinities in the world of living sound, which is a universal quality, interpenetrating all kingdoms and all planes. Musical tones are vibrating atoms made up of innumerable smaller tones. Chords are molecular combinations of these atom-sounds, so to speak, all measurable by numerical ratio, and a musical composition might be defined as a piece of molecular architecture fashioned from tones and chords, as its pulsating, vibrating stones.

True music is a revelation of God's truth, adequate in proportion to the laws revealed to and obeyed by the composer; for music may elevate or it may debase. Some music invokes the purest spirit of universal compassion, another kind fires the heart and stimulates the warrior quality of the nature, another kind awakens and feeds the passions.

Let those who speak lightly of classical music take heed. Let them examine their own minds and motives. Classical music must embody some aspect of truth or it could not have withstood the sifting process of time and so become one of the square-hewn stones in the musical temple of humanity. Let us be profoundly thankful that all that is true in music cannot, by its very nature, be made a subject for the dissensions of warring schools.

Music that does not appeal to the highest in human life must pass with the passing of time. The thousands of so-called "musical compositions" that live but for a day are merely floating straws upon the current of a vast life stream. Classical music, on the contrary, is a part of the vast stream itself, and whoso finds its law and abides therein, moves unerringly toward the great ocean of life and truth.

Into that ocean countless rivers flow, be they perceived or unperceived by human minds, for the true son of God releases by every act of his life a stream of music whose keynote is the heart-life, resounding and vibrating as it flows outward toward the Deep.

Let us study "classical music," that which has baffled the assaults of time and the fire of criticism and has taken its place as a structural part of Life's musical temple. Though at first its deeper meaning may escape us, patient whole-hearted attention will bear rich fruit. To reject it at first hearing is folly. Let us permit the Power that fashioned its harmonies to permeate and cleanse our own minds, preparing fit soil for God's truth to take root in. True music not only purifies, but rebuilds.

Modern music has been chiefly of negative value, awakening beautiful ideals. But its real force, as a positive evolutionary power, is yet to manifest. The music of the future will sweep away shams and delusions, both in the inner and the outer life, by the force of its own spiritual current. It will invoke and call forth true spiritual knowledge. It will refine and elevate and illumine.

In the day that is to come, music will re-affirm its heaven-sent message, and within the hearts of an awakened humanity will its echoes reverberate. As Katherine Tingley has said, "Music is not merely one of the refinements of life. It is a part of Life itself." STUDENT

RECENT discoveries in Crete show that it was from this island that many of the architects and sculptors of ancient Greece gained their inspiration. There are remains of architecture strangely similar to the Gothic, and frescoes have been found in which, like those of old Egypt, the colors are almost as brilliant as when painted many thousand years ago. Yet Crete is modern when we think of the explorations made in Persepolis. There, carved on stones, has been found the code of Hammurabi, a King who was contemporary with Abraham. It is the oldest code of laws yet discovered, fifteen hundred years older than the famous twelve tables of Rome.

I WELL know that God is nearer to me in my art. I commune with him without fear; evermore have I acknowledged and understood him.—*Beethoven*

The Author of To-day—Is His Motive Always the Highest?

THIS is preeminently an age of fiction. The demand and supply for this class of literature seems limitless. Three fourths of the books taken from public libraries to-day are novels, for there is nothing the public so demands and enjoys as a good story, and it is eager to be taught in this way what it would reject if presented in any other form; so the ever widening province of the novel embraces history, archeology, society, politics, religion, science, everything, in fact, in which the human mind finds an interest. A certain well-known novelist recently complained: "There are so many people writing, so many poor books on the market that even the best authors must go begging!" The publishers, however, declare that never have authors received such good royalties as they do now, and that literary wares do not go begging for a market if they are deserving. And it is true that a number of our young American and English writers are living proofs that fortunes are to be made today in the realm of literature as readily as in the realm of finance.

But is literature an art, or a trade? Is the success of an author wholly determined by his income? A literary career pursued only for the profit it yields is a sordid affair. The writer who has originality, sincerity and a right conception of life; who has a desire to help as well as to entertain his fellows, without thought of the "profits," accomplishes his literary purpose far more thoroughly than does he whose books are expected, when written, to coin a fortune. The true author feels that in revealing the heart and character of humanity, and its struggle in the world, he has set forth truth and purity with a charm that lifts us to a higher plane, and has portrayed the evils of our civilization in such a way as to strengthen the moral fibre of his readers. Such authors find their career profitable in the higher sense of the word, which may or may not include the financial sense, and their work is of inestimable value to the public. STUDENT

THE following, from the pen of "Carmen Sylva," Roumania's gifted Queen, is of especial interest to students of music in Lomaland, for here indeed is the genius of the great Bach revered, and here are its meaning and message revealed in a new light.

But now, with the approach of age, I have learnt to love Bach so well, I play hardly any other music than his, for his sublime and serene perfection alone can satisfy me. He stands high above all earthly passion in matchless purity and consummate finish. His inexhaustible wealth of inspiration is as a well at which succeeding generations have drunk freely, and will forever drink, without so much as a suspicion that they are taking what is not their own. And who, indeed, should forbid them to taste the crystal-clear waters of an uncontaminated source that flows perpetually for the whole world alike?

It is among the treasures, then, of Bach's great heritage that my thoughts and fingers rove daily at will, threading their way now throughout the mazes of the glorious Fugues for the organ, so finely arranged for the piano by Lizst, now wandering from D'Albert's admirable adaptation of that masterpiece, the *Passacaglia*, to the ineffable harmonies of the great *Concerto in D Minor*, but ever and anon returning with renewed zest to the pages of the marvelous collection of studies, *Das Wohltemperirte Klavier*, a very ocean of infinite and varied melody, in which again and again I set forth on some fresh voyage of discovery, and each time seem to discover new worlds therein. This has become my book of daily meditations.—(*Nineteenth Century*)

THE musicians of old Greece, those who contested at the Olympian games, were not alone musicians, but poets as well. According to Pausanias, the most noted of these were probably also priests of Apollo. The prizes were, of course, as in other contests, simple wreaths of laurel or wild olive. The ancients found no distinction between poetry and music. Even in ancient Rome the word *carmen* meant both a poem and a song.

FRAGMENT

ELIZABETH BARRETT BROWNING

Mark, there. We get no good
By being ungenerous, even to a book,
And calculating profits . . . so much help
By so much reading. It is rather when
We gloriously forget ourselves, and plunge
Soul-forward, headlong, into a book's profound,
Impassion'd for its beauty and salt of truth—
'Tis then we get the right good from a book.

Universal Brotherhood Organization

Central Office Point Loma California

Major-General Abner Doubleday

EVERY member of the Universal Brotherhood and Theosophical Society knows of and honors the memory of Major-General Abner Doubleday, whose face is reproduced on this page.

General Doubleday was one of the staunchest supporters of H. P. Blavatsky and the Theosophical Society and Universal Brotherhood, and remained so up to the day of his passing away on January 26, 1893. He was William Q. Judge's warm friend and follower.

In THE PATH of March 1893, Vol. VII, No. 12, pp 372 *et seq.*, will be found under the title "Faces of Friends," a short sketch of the life of this warm-hearted and honored Theosophist, which is reprinted here for the benefit of many, who, knowing and honoring Major-General Doubleday for what he did in the Theosophical cause, are yet ignorant of many details of his life.

"Major-General Abner Doubleday, died at his home in Mendham, New Jersey, on January 26, 1893, of heart failure. He was born on June 26, 1819, at Ballston Spa, N. Y. His father served in Congress during Jackson's Presidency, and his grandfather fought at Bunker Hill and Stony Point. Abner Doubleday was graduated from West Point in 1842, and afterwards served through the Mexican war and later in the Seminole campaign. He was second in command under Major Anderson at Fort Sumter when the last war began, and sighted the first gun fired for its defence on the 12th of April, 1861. During the war he was in continuous active service, and took part in the bloody battle of Gettysburg, and in that military event he was a prominent figure. After the war a series of promotions followed until he was made Brevet Major-General on the 13th of March, 1865. Thereafter he was stationed in the South for three years. On the 11th of December, 1873, he was retired from the active list of the U. S. Army at his own request. During succeeding years he wrote many articles relating to the war, as well as two books, *Reminiscences of Forts Moultrie and Sumter* and *Chancellorsville and Gettysburg*.

His body was carried to New York, where it lay in state, and then was taken to Washington and buried in the National Cemetery, escorted by a guard of honor and receiving military salute. This is the rough record of a noble and gentle life. The picture shows General Doubleday as a young man. [The illustration is from an old photograph of General Doubleday, as no later ones were obtainable. Although young looking it is very like him.]

"Almost immediately after the Theosophical Society was formed he joined its ranks, attended its meetings, and met Mme. Blavatsky very often, and on her arrival in India was made the President *pro tem.* here with William Q. Judge as Secretary, January 17, 1879. He was often at our meetings, and his beautiful voice was heard many and many a time at the Aryan Branch to which he belonged. His name is the second on the roll-book of this Section. A varied experience furnished him with a fund of anecdote of many strange experiences of his own, and these, told with such gentleness and sweetness, could not be forgotten. . . . A gift from him of over seventy books to the Aryan Branch was the nucleus for its present large library. . . .

"An official letter from the Indian office signed by H. P. Blavatsky and dated the 17th of April, 1880, notified General Doubleday of his election to the office of Vice-President of the Theosophical Society, and is now on file in the office of the General Secretary. After the organization of the Aryan T. S. in New York he was made Vice-President of that Branch, and continued a member of it to the day of his

death. It will be difficult to find another such gentle and sincere character as that of Abner Doubleday."

General Doubleday left a very large number of valuable and rare books and MSS. to the Theosophical Movement, which are now in the general library of the School of Antiquity at Point Loma. This was practically the nucleus of that library.

It is of interest to note the fact that it is to this staunch Theosophist, well-known army officer and author, that the national game of Base Ball owes not only its *name*, but also in large degree its development from a simpler sport; or, indeed, according to some writers, its *very invention*. Mr. Abner Graves, a mining Engineer of Denver, Colorado, has the following to say on the subject:

"The American game of Base Ball was invented by Abner Doubleday of Cooperstown, N. Y., either the spring prior or following the 'Log Cabin and Hard Cider' campaign of General William H. Harrison for the presidency. Doubleday was then a boy pupil of Green's Select School in Cooperstown, and the same who as General Doubleday, won honor at the battle of Gettysburg in the Civil War. . . . Doubleday improved 'Town Ball,' to limit the number of players, as many were hurt in collisions. . . . He also designed the game to be played by definite teams or sides. Doubleday called the game 'Base Ball,' for there were four bases in it, etc., etc."

It is also of interest to note that another well-known member of the Universal Brotherhood and Theosophical Society, Mr. A. G. Spalding, of Point Loma, California, is universally known as the patron of the development of Base Ball and athletic sports generally; and it is certainly due to Mr. Spalding that so large a proportion of our American youth have a love for the health-giving and manly games.

Die Bhagavad-Gita---Das Buch der Ergebenheit

FOLLOWING on the issue of the booklet "Studien ueber die Bhagavad-Gita," by members of the Universal Brotherhood Organiza-

tion in Nürnberg and Stuttgart, Germany, notice of which was given on this page, Vol. viii, No. 31, it is a pleasure to announce the receipt of the first fruits of another effort in the same line from the same source, of an identically gotten up little book bearing the title as above.

It is in all respects, as to printing, binding etc., the equal of the "Studien." The two booklets form a set of two classics which should be in the hands of every German reader and lover of the World's sacred Scriptures.

The edition of the *Gita* just issued is a complete translation of that by William Q. Judge, now in the hands of every English and American Theosophist.

One wishes all success to work of this sort, as one of the greatest aids to Theosophical propaganda and the dissemination of the truths of the ancient Wisdom-Religion, is by spreading our literature.

For the Benefit of Enquirers

REGULAR weekly meetings of the Aryan Theosophical Society, established in New York City by William Q. Judge, the second Leader of the World's Theosophical Movement, are held every Thursday evening at 8 o'clock in Isis Hall, 1120 Fifth Street, San Diego, California. These meetings are intended to meet that large and growing body of earnest enquirers who desire to know more of the different tenets of the Theosophical philosophy. Students from the Universal Brotherhood Headquarters at Point Loma, California, conduct these interesting gatherings, to which every truthseeker is cordially invited.

GENERAL ABNER DOUBLEDAY

Students'

Path

SIMPLICITY OF LANGUAGE

POPE

WORDS are like leaves; and where they most abound,
Much fruit of sense beneath is rarely found.
False eloquence, like the prismatic glass,

Its gaudy colors spreads on every place;
The face of Nature we no more survey,
All glares alike, without distinction gay:
But true expression, like the unchanging sun,
Clears and improves what'er it shines upon;
It gilds all objects, but it alters none.
Expression is the dress of thought, and still
Appears more decent, as more suitable:
A vile conceit, in pompous words expressed,
Is like a clown in regal purple dressed.

Hypnotism

MY attention was drawn to a whole-page advertisement, in a newspaper, of a new book on hypnotism. This book, it was said, would be sent free to all who applied before a certain date, and was said to contain infallible instructions that would enable a man to succeed in business, to gain complete control over the minds of others without their knowledge, to succeed in love, to win money and power and place by means that were safe and beyond discovery. There was much more on the same lines, the whole constituting an appeal to the lower nature of the reader, that amounted to a veritable invocation of the evil that lies dormant in human nature waiting to be called out.

And what of the power that was thus offered to the readers of that paper? The power to influence and control the minds of others without their knowledge, or against their will, by means of thought suggestion, is a power that would be most eagerly sought by the class of people least fitted to use it.

It is well that all *should* know of the existence of such powers, but it is not at all necessary that all should seek to develop the force in themselves. For this hypnotism is not the same force that marks the character of the self conquered, self-liberated man, in whom the Spiritual Will is active. In such a man the lower nature is controlled by a higher Will, so impersonal in character as to seem but the evidence of the universal law of the fitness of things. In him this sense of the fitness of things is so continuous that there is no opening by which another's will can enter into his mind to influence him; nor is there any moment when a personal desire can get such control as to make the man the victim of his own passions or ambitions.

Such a man will be anxious to help others to gain their freedom and become self-mastered, and will have no desire for the vulgar triumph of a treacherous victory over an unguarded mind. But the hypnotist is not such as this. In him the purely personal will and desire have control, and all his aims are of a personal nature, even when endeavoring to cure a patient. You will find him invariably full of vanity, and craving admiration, applause, respect, or even fear; any of these will feed his vanity and insatiable desire to have power over some one or something.

Hypnotism is simply the cultivation of the personality, and the most successful hypnotist is the one who has raised in himself the greatest barrier to his own spiritual evolution and happiness. Self-mastery, or the subjection of the personal will to the impersonal Spiritual Will, is the best protection against the treacherous attacks of the hypnotist, for this enemy can only triumph by finding a weakness or an unguarded spot in his victim's character and aggravating the fault or encouraging the uncontrolled tendency.

Another way in which the hypnotist seeks to feed his vanity is by plundering his victim's mind like a vampire and absorbing his ideas. Being simply a *personality* and having no creative imagination, which is a function of the Spiritual man, he can only accumulate a store of men-

tal plunder and in his turn give it out again in its crude form, precisely as he would do if compiling extracts from the published works of other men, but without the honesty to admit his indebtedness. He becomes a mental vampire and develops the habit of thus depending on others for his intellectual material, and ends by becoming a mere mental "shell," a soulless *personality*, an insane egotist. This is the downward path that leads to eventual disaster.

The path of the hypnotist is marked by ruin all along its course, and the end of such a career is the ruin of the one who has made himself a curse to the community. These are the teachings of H. P. Blavatsky, William Q. Judge and Katherine Tingley. STUDENT

Lifting the Veil

A SUDDEN stillness breaks upon the air, and Nature's multitudinous throng—for one brief moment shocked into silence—suspends the never-ending babble of its wordless voice; and the soul within me stirs, spreading its soundless wings, as if to fly towards the light that bathes the world in momentary blessedness.

Some one has raised the veil and let the glory of the great *Beyond* stream for a moment through the little rift, scarce large enough for one soul to pass through upon the blessed journey we call death.

O restless yearning soul within me, Peace! Have patience for awhile, and be content to live.

What? would you claim the wages e'er the work be done?

O selfish, pleasure-loving soul, yearning to drink the waters of forgetfulness, or bathe in the soft light of dreamland, awake! and shake the deadly spell of that enticing vision from the mind.

Awake and summon to your aid the dormant will to live. Your task awaits you, nor can another take your place. Vast is the field of work, and few the workers; would you make them fewer? R. M.

FRIENDS IN COUNSEL

DEAR COMRADES: Deep-seated fundamental truths have this unique peculiarity, that no familiar use or oft-repeated contemplation has the power to dim the pristine splendor of their dawning on the mind. The doctrine of the universal sway of cause and sequence is a truth of this description. It will endure the closest scrutiny, yet never fails to justify itself to reason and to common-sense. Once we admit it to the mind, it never can thereafter be expelled; it reasserts its power and presence every time a problem rises up for our solution. It is an ever-burning light whose brilliancy will not be hid. Its bearing is profound and all-important on that great but nameless enterprise to which we all are pledged, whatever be our creed, who try to follow up the leading of the light within. A firm conviction of the law that as we sow we reap, gives us the certainty that final triumph is assured to him whose high resolve no failure can destroy, whose perseverance never flags, and who, when beaten to his knees in sore conflict, fights on, and though faint and wounded, rises to renew the fray. He may have failed—but at least *he has succeeded in trying*; and to persist in trying is to set in motion causes that must ultimately issue forth in victory.

The pathway of the conqueror is strewn with many a gallant failure, but to desist from our endeavor is to desert the ranks of those who fight for the regeneration of the race. No effort that we make can vanish from the world of causes. The faintest aspiration for a better life, the lightest effort of restraint upon the lower self, can never be effaced from the all-knowing record of the Book of Life. The faithful Law stores up the energy put forth and marshals it against the day of battle. We will not therefore waste our time in vain regret, although a mountain load of ancient sin, piled by our foolish hands, towers up upon the path and threatens to overwhelm us with its weight. The varied and conflicting forces in a universe of change combine to wear away and dissipate the legacy of misspent lives, and if we discontinue adding to its bulk, and make another start in life, old things will pass away and everything be made all over new again.

What though like ruined temples be our lives, blasted and overthrown! Ours were the hands that wrecked the noble structure, ours the force that hurled the stately pillars to the ground, but with the scattered blocks and fallen columns, we may build a fairer, grander temple yet, to rear its glittering dome into the heavens of blue, and flash the sunlight back from gilded roof and marble walls. STUDENT

FORTH! PILGRIME! FORTH!

CHAUCER

FLEE from the press, and dwell with soothfastness;
 Suffice thee thy good, though it be small;
 For hoard hath hate, and climbing tickleness:
 Press hath cavy, and wealth is blinded all.
 Savour no more than thee behove shall;
 Do well thyself that other folk canst rede;
 And truth thee shall deliver, it is no dread.

That thee is sent receive in buxomness;
 The wrestling of this world asketh a fall.
 Here is no home, here is but wildercess.
 Forth, pilgrime! forth, best, out of thy stall!
 Look up on high, and thanke God of all.
 Wave thy lust, and let thy ghost thee lead,
 And truth shall thee deliver, it is no dread.

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question Does reincarnation admit of our going into animal forms after death?

Answer Replying to this question we would say most emphatically, that according to the Theosophical teaching,

reincarnation does *not* admit of the possibility of the souls of men entering into the bodies of animals, after they are released from human bodies.

Today scientists recognize evolution as the method by which Nature operates. Consulting the dictionary for a proper understanding of this word "evolution," which came into common use in the last century, we find that it means, primarily, "to unroll; the act of unrolling or unfolding, hence development;" also, "it is the doctrine that all organized beings have been developed by continuous upward progress from simpler forms and lower types to higher and more complex structures." A writer upon this subject tells us that "Evolution admits, in the presence of the apparent persistence of forms, types, and species, an element of progress, and recognizes some element that tends to push all life to higher planes, toward higher ideals."

Before there can be evolution there must have been an *involution* or *unfolding* of that "element of progress . . . that tends to push all life to higher planes," and that element we are taught is the Life Principle, which, to a greater or less degree, is involved in every particle of material composing this universe. The effort of each life centre to manifest more and more fully, and to attain to conscious union with the Divine Life whence it came, is the cause of development "by continuous upward progress from simpler forms and lower types to higher and more complex structures." We are also taught in Theosophy that in this process, so much of this life principle as is enfolded within the substance of which the outer universe is composed, re-embodies itself again and again in new forms as the old ones die, its object ever being to attain to perfection on each plane by experiencing all possible conditions on that plane.

When a *life* centre has obtained all possible experience from lower forms, and has attained to perfection on each plane of existence below the human; when, through this unfolding process of evolution, it has raised itself in the scale of being to a point where it has a body capable of standing erect on two feet, with its face toward the skies; when this body includes a sensitive brain which is a responsive instrument for the use of the mind with which the occupant of that body *has been endowed*, so that the occupant is now a conscious thinker; is it not contrary to reason and to the manner in which Nature works through her unchanging, unerring laws, that she should permit this thinking being to return to baser forms? Has evolution brought him thus far on his upward journey only to send him back to the brute, which is separated by a moral gulf from the conscious thinker? Reason, justice, our knowledge of natural law, all protest against the thought. Only in a hap-hazard world ruled by chance could such confusion and such useless conditions exist. "As the blood in the body is prevented by valves from rushing back and engorging the heart, so in this greater system of universal circulation the door is shut upon the Man, the Thinker," and prevents such a backward step.

In the words of William Q. Judge, Theosophy teaches that "the ob-

ject of the universe and the final purpose for which man, the immortal thinker, is here in evolution, is for the experience and emancipation of the soul, for the purpose of raising the entire mass of manifesting matter up to the stature, nature and dignity of conscious godhood. The aim of present man is his entrance into complete knowledge; and it is for him to help the kingdoms below him that they also may be raised up gradually and reach the same goal."

There has been a corruption of the truth regarding reincarnation current among the ignorant, which has led them to state that transmigration, or the passing of souls from body to body, works in the lawless fashion indicated in the question asked, in sometimes going forward and sometimes backward in evolution; but such belief is a wholly false interpretation of the old Theosophical doctrine of Reincarnation.

Nature's watchword is Progress in all forms in all its ways; a higher plane in evolution once gained can never be lost. After the life energy has passed from the mineral into the vegetable, from the vegetable into the animal, from the animal into the human, where it is conjoined to the Immortal Thinker waiting for it, there is no possibility of its now *self-conscious* nature ever sinking back into the forms below, at present useless. Hence the saying of the ancient Teachers, "Once a man, always a man."
 H. F. M.

Question Why are Theosophists so optimistic? I cannot find in the common experience and facts of life any warrant for such an attitude of mind; and for that reason Theosophy seems to put an altogether too roseate hue on existence, and to forget the old adage, which almost every life proves only too true, that "man was born to trouble as the sparks fly upward." Will the Forum kindly throw some light on this?

Answer If common experience and the facts of every-day life do not warrant optimism, it might be well to ask if the average life of today is a normal one. And because an adage is old it does not necessarily follow that it is therefore true; on the contrary it may be foolish and one we had better get rid of as soon as possible. We cannot imagine such a statement to have originated in the Golden Age, nor among people who had knowledge of their divine nature. For many years Western peoples have been taught, and have called themselves, "miserable sinners;" and, possibly, as they know themselves, or rather as they *think* they know themselves, they may be miserable sinners. For all that, however, they may be mistaken, and did they know themselves as they really are, they might repudiate such an aspersion on their real nature.

Why are Theosophists so optimistic? Because it is natural to be so, that is, it is natural to man's true nature, to his real self, which is divine. To be otherwise, to be a pessimist, is unnatural; but if man does not live in his real nature, or as near thereto as he can, it is to be expected that he should be more or less of a pessimist. How different would the lives of thousands be today if they had been taught what Christ taught:—"Be ye perfect!" "Ye are gods;" or what Paul taught:—"Ye are the temple of God;" "Ye are the children of the highest;" instead of "miserable sinners."

Jesus taught the perfectibility and the divinity of man; just as all the great teachers of humanity have. And Theosophy again reiterates the same truths.

One writer on Theosophy sums up its teachings as follows:—

"There are three truths which are absolute, and which cannot be lost, but yet remain silent for lack of speech.

"The soul of man is immortal, and its future is the future of a thing whose growth and splendor have no limit.

"The principle which gives life dwells in us, and without us; is undying and eternally beneficent; is not seen or heard or smelt; but is perceived by the man who desires perfection.

"Every man is his own absolute lawgiver, the dispenser of glory or gloom to himself; the decreer of his life, his reward, his punishment."

Raja Yoga teaches the children that "Life is Joy," and if only we would begin to live the larger life of Brotherhood and mutual helpfulness, pessimism would soon give place to optimism, and we should find that the Theosophist's position was right.
 STUDENT

LET not your goodness be professional; let it be the simple, natural outcome of your character. Therefore cultivate character. When in doubt how to act, ask yourself, What does nobility command? Be on good terms with yourself.—*Thomas Davidson*

Origin of the Name America

As early as 1875 M. Jules Marcon, an eminent American geologist, published an article in the *Atlantic Monthly* and in the *Bulletin of the Paris Geographical Society*, on the origin of the name America, in which he makes this statement:

"There exists, between Juigalpa and Libertad in the province of Chontales in Nicaragua, a chain of mountains known as Amerique. This chain stretches on one side into the country of the Caica Indians, and on the other into the Rama tribe."

His whole article is an effort to prove that the name America came originally from Amerigo Vesputi, and many articles

you that there really does exist in this Republic and in the Department named (Chontales) a chain of mountains known by the name of Amerique, and it is very probable that Mr. Belt visited these mountains, which are in close proximity to the mine where he resided for a length of time. There lives in this chain a tribe of Indians called the Amerique, feeble in number at the present day, but apparently of some importance in former times, to judge by the indications found in these regions. These Indians have always been in communication, more or less frequent, with Cape á Dios and New Gratia, on our Atlantic coast.

(Signed)

AD. CARDENAS."

The Mr. Belt referred to in this letter had said this: "About two leagues from Libertad there are many old Indian graves, covered with mounds of earth and stones. Like most of the sites of the ancient Indian towns, the place is a very picturesque one. At a short distance to the west rise the precipitous rocks of the Amerique range, with great perpendicular cliffs, and huge isolated rocks and pinnacles. The name of this range gives us a clue to the race of the ancient inhabitants. In the highlands of Honduras, as has been noted by Squiers, the termination of tique or rique is of frequent occurrence in the names of places, as Chaparristique, Lepaterique, Llotique, Ajuterique, and others. The race that inhabited this region were the Lenca Indians.

I think that the Lenca Indians were the ancient inhabitants of Chontales; that they were the 'Chontals' of the Nahuatl, or Aztecs of the Pacific side of the country, and that they were partly conquered, and their territories encroached upon by the latter before the arrival of the Spaniards, as some of the Aztec names of places in Nicaragua do not appear to be such as could be given originally by the first inhabitants."

He further stated that the crosses found carved on old images and pottery are similar to the Egyptian and Indian.

It is pretty conclusive that at the time of Columbus' arrival these Ameriques were enormously wealthy. Columbus was in daily communication with the Amerique Indians, for ten days, it is said, in October, 1497. He related many interesting things about them in his incidents of the fourth voyage; he was deeply impressed by their appearance and manners, and also by the fact that each of the Ameriques wore a "mirror of gold" on his breast. They were covered with numerous heavy ornaments of gold. It was doubtless owing to all this that Columbus ascended the Bluefields river in search of gold. These Americ Indians were utterly unlike the Mexican or other Indians and are now rapidly dying out. The Spaniards on their return to Spain told such wonderful stories concerning the marvelous wealth and glory of these people, that the name Americ, Amerrique, and Amerrisque became widely known.

STUDENT

[It is worth while to recall here what was written on this subject some years ago in the *NEW CENTURY PATH*, namely that Vespucci's name was *Albericus*. This piece of information was gleaned, incredible as it may seem, from a writer who was laboring to prove that the continent took its name from Vespucci. The candor of that writer seems to have been greater than his sense of logic. Of course the man took his nickname from the continent. — Ed.]

New Century Path Point San Diego

T. Lambert wrote in Central and very common name,

Date

Enclosed find _____ Dollars for _____ year's subscription to *New Century Path*, beginning with No. _____, of current Vol. To be sent to

Name

Address

Yucatan, Peru, and Mexico.

In Trinidad, Raleigh was told of the great wonders and treasures of Cundinamarca and the valley Amarco copana. Amarca the sacred city was burned in 1524.

Lambert's article was very elaborate, showed thorough study, and gave many new facts about the ancient American civilization which were confirmed by H. P. Blavatsky in *Iris Unveiled*.

In a later number of the same magazine, Mr. George Hurlburt essayed to refute all that had been said by Lambert and Marcon regarding the origin of the name America, claiming that it was named from Americus Vesputius. He laughed at the statement of Marcon that it was named from the Amerique mountains in Central America, for the reason "that no such mountains are shown on any map—hence do not exist." Could human ignorance go further?

The Minister Envoy of Costa Rica at Washington, Manuel de Peralto, became interested in the discussion and wrote to President Cardenas of Nicaragua for information regarding the existence of the Amerique mountains in Central America. His reply was as follows:

Managua May 22d, 1866

haustible markets for the products of Europe and America. The Hindus were "niggers," Japan was a "caricature," and the teeming "heathen" millions of the Middle Kingdom were a profitable source of income for Missionary societies. We forced open the ports of China to the entrance of our opium trade, knowing well the ghastly consequences, in spite of the frantic appeals of the Chinese Government for mercy to its people and justice to itself. The Sino-Japanese war showed the weakness of the Middle Kingdom, and was an invitation to the cupidity of Europe to come and grab, and all Europe did so, blinded to their best interests by mutual jealousies and utterly unconscious of the slightest feeling of chivalry or justice for a defenceless people. Missionaries, opium and death-dealing engines of war were our letters of introduction to the Farthest Orient.

Missionaries, Opium & En- gines of War

But the very things we brought to these "heathen,"—the worst we could possibly bring, truly—were the very means of destroying our influence over them. The superb ethics of Christianity were found by the Orient to be a simple deadletter to Europe, and from that discovery were born scorn and dislike for us. They found that it mattered little, indeed naught, to the European, that thousands upon thousands of men, women and children became soulless wrecks through the opium habit, provided that the revenue derived from the sale of the drug increased yearly; and from that discovery grew hate and fear, and we have become unto the Chinese especially, an unruly horde of white devils, heartless, cruel, and relentless. Is there *nothing* just in that conclusion? Reverse the conditions, and make the Chinaman force open *our* ports to his millions, force us to admit opium and rice-spirits to public consumption, and allow him to impose his will upon us by means of new and irresistible engines of war unknown to us—what would we call him?

Gave Way Before the Irresistible

Until at last, with true Oriental philosophy, they gave way before the irresistible. Admiring our beautiful cannon and the whirlwind of our Gatlings and our Maxims; seeing in the bottling up of steam the power of the magician manifest over Nature; finding something really acceptable in our scientific discoveries and applications thereof, they, like Bret Harte's heathen Chinese, "so child-like and bland," asked to be instructed in all these wonders so that they might sight a gun, or navigate a ship, or wrench Nature's secrets from her! And Europe did so! Japan was foremost among the peoples of the Orient in this movement of self-protection. She received everybody, learnt everything, sent her sons to the far corners of the Earth for instruction and knowledge. Meantime all Europe and America was watching complacently the "monkey-like tricks" of their heathen protégés, and seeing comparatively nothing.

Then a strange day came. It was when Europe first began to learn that the Islands of the Rising Sun (prophetic words!) could get along without her. Gloomy forebodings were indulged in as to the possibility of civilizing Japan; there was talk more than once of coercing the situation, but the chancelleries of Europe, as usual, came to no agreement and the matter dropped.

Japanese Strength & Revelation

The Sino-Japanese war was a revelation to more than Europe, to more than Japan (of her own strength). It was one for China. And ever since, in the face of nearly insuperable obstacles, the progressive "Young China" party has been pulling strings all over the Empire. With the success attending upon the arms of a Mongoloid race over the white Colossus of the North, feared and dreaded by Europe itself, China's awakening is now assured. She is beginning to feel her individuality and her latent gigantic strength. Even one twelvemonth ago, the thought of a concerted boycott of American manufactures by Chinese would have seemed very remote, indeed, an almost unthinkable absurdity. Yet it has taken place.

One is apt to lose oneself in imagining what is going to happen in the Orient in the next quarter of a century. It needs no prophetic spirit to get some pretty clear views, at any rate, for he who runs today can read if he will. Gordon proved to our satisfaction what kind of soldiers the Chinese can make under proper training.

And now Siam is hastening up to the front rank of imported civilization! The American Minister to that country, now on home-leave, has made some very remarkable statements concerning Siam's progressive tendencies and the foresight of its King. An instance—one only—is the following: His Siamese Majesty wishing to abolish gambling, a perfect curse in the Golden Land, issued orders that in one-third of his kingdom gambling should cease to exist; and it did! Some time afterwards, a second royal decree was promulgated forbidding gambling in a

After the War Is Over

1905 will prove to be a climacteric in the course of human evolution and in the destinies of the nations. Is it possible to foretell the ultimate outcome of the peace negotiations at Portsmouth? And, taken altogether, has a more singular gathering ever taken place in history? We must answer in the negative.

The West—a term fast losing its familiar meaning—has made several egregious mistakes in its estimation and treatment of the Orient, and, from all appearances, will reap the harvest of its own arrogant self-sufficiency. It has been the old, old mistake of undervaluation of what is foreign and unknown. One of these mistakes was to regard all between Suez and San Francisco as lands waiting by the will of Providence, *First*: for the White Man's dominion; and, *Secondly*: as inex-

The Orientals Are Not An Inferior Race

second third part of the country; while the present year has witnessed the abolition of the evil in the last third. Truly, legislation appears to be attended with peculiar persuasiveness in the Orient.

Another great error committed by the West, in its judgment of the majority of Oriental peoples, was that the said peoples belonged to a race naturally inferior to ourselves, which could not possibly adopt and perpetuate certain intrinsic and infallible marks of progressive civilization; and by that was meant the Western conception of a progressive civilization. (One wonders if this can mean cannon, cant and rum?) But, *mirabile dictu*, one of these peoples so "inferior by Nature," has proved its right to hold her own with the best of us, and that by qualities of humanitarian instinct and mental grasp of situations, by devotion and energy, by quick-wittedness and initiative—in short, by those very qualities which are the very foundation of a progressive civilization, if the word means anything at all.

Theosophy, in its teachings, does not admit that there are any "inferior" races to the white—in the sense the word is used generally—except certain semi-human tribes like the Bushmen and Hottentots in Africa, the Ved-dahs of Ceylon, *et plura ejusdem generis*. The difference between White and Yellow is one of relative development, not of absolute superiority.

Races May Be Obscured for Centuries

Races and nations according to its doctrines, may be in obscurity for long centuries, sleeping, as it were, until the touch of the cyclic wave of progress reaches them, when they re-awaken to initiative and active effort to again assume their place in the world.

Nobody really knows whence the Japanese came, nor their rightful niche in the temple of Anthropology, though theories in plenty *et ad nauseam* are abroad. The Chinese, on the other hand, are shown immigrating into China some 4000 or 5000 years ago from a country beyond the Hindu Kush, where they lived "under the neighboring influence of the civilization of Susiana, an offshoot of that of Babylon," says Professor Dr. Terrien de la Couperie, the well-known Sinologist; and he enumerates over sixty remarkable identities of belief, science and custom, connecting the Chinese invaders—the original dozen or so of Bak tribes—with the civilizations of the Euphrates and Tigris valleys.

He speaks of the invaders as driving before them the "original" owners of the soil, and as possessing a higher civilization than those whom they dispossessed. Yet this dispossession is very relative, for the same scholar shows the invaders gradually amalgamating with the "originals" during the passing of centuries.

Descendants from a Com- mon Stock

The Japanese and Koreans look upon each other as co-uterine descendants from a common stock with the Chinese, their "cousins," yet the three speak different tongues, and while bearing general strong fundamental resemblances to each other, are sufficiently set apart to make the fact noticeable. These are questions, however, for ethnologists to settle among themselves—which they will never do satisfactorily outside of Theosophical teachings. Suffice it to say here, that the entire Mongolian Race, including all its offshoots, is descended from the last ripple of the great human Life-Wave which preceded our own: from the so-called "Atlantean," in short, a succession of human families having had their habitat on lands ages ago extending from the north to the south Atlantic, and comprising island possessions both in what is now America and the Pacific Ocean. The Atlanteans, as ourselves, knew of races of different colors: white, yellow, red, brown, and black. ALL races now known on earth are Atlantean in descent, save a few semi-human relics, as said before, of a race preceding even Atlantis by ages, the "Lemuria" of Theosophical books. The Mongols, with ourselves, are heirs of all the ages; like ourselves, they have seen the rise and decay of mighty empires, and, like ourselves,—only some 2000 years later—they are now coming out of an obscurity period into another cyclic era of growth and prosperity, to be as inevitably followed by decay and the birth of succeeding races. Still, while it is perfectly correct to speak of the races now having dominion over the earth as "Atlantean in descent," it is none the less true that Man is today (and has been for ages) radically different from his Atlantean ancestors—a new Race, in short, a new *Mankind*. Theosophy divides the human races, following each other in succession across the ages, into the expiring or moribund stocks, the dominant or efflorescent, and the germ or seed stocks of the future. Hence, in this light, any family stock whatever, irrespective of color or anthropological peculiarities, which contains in itself the mental and moral stamina for further evolution, is ranked by it as belonging to the ruling *Man*.

Two of the surest signs that a race has run its course, and is about to

Savage Cannot Cope With a High- er Pressure

vanish forever, after having lapsed into barbarism and savagery, are the phenomenon of sterility of its women on intermarriage with foreigners, and its inability to cope with a higher pressure of civilization than its own. Many Pacific Islanders and the American Indians are in this case, but it is so neither in Japan nor China. Japan's population has been increasing steadily at the average rate of 1.24 per cent. per annum of its total population, since it embraced western ideas, and that in the face of heavy emigration. Japanese Eurasians, springing from an admixture with the Portuguese and Dutch of the XVIth century, are still perfectly fruitful, while the intermarriage of Japanese with the mysterious Ainos, proves itself invariably sterile in the fourth or fifth generation. The Ainos have now dwindled to a mere remnant of a once powerful and widely scattered tribe.

As to the Chinese, the strange mixture of peoples they have become is answer enough to the query, quite apart from the proverbial fruitfulness of Chinese wedlock.

Opium and Religion Undesired

A recent writer on the question of the war, holding, by the way, a responsible and lucrative position in the government of the country he inveighs against, exclaims bitterly against seeing the "renaissance of paganism, full-armed and militant throughout Asia." He says: "The two most important things which we have taken to China were equally undesired, opium and religion, poison in one hand and religion in the other. And so the reckoning is coming and must come." The Japanese are "naturally at enmity to ourselves, a semi-civilized, heathen and savage people, whose ideals clash with our own in every particular, who are heterogeneous to us in every humane and moral aspect." (!) Therefore, he sees no hope for us, and dramatically warns Germany, France, Holland and America that their turn is coming, and closes as follows: "Let those enterprising students who have wondered what will be the ultimate destiny of our civilization watch the plains of Manchuria, for there lies the answer it will be a Chinaman and not a New Zealander who is the more likely to sit on London bridge to study the ruins of St. Paul's."

Well, friend, what should be done? Shall we lock ourselves up in our lands as poor old China tried to do, and as Japan tried to do? In that case, were the need so desperate, we might, probably would, be made to eat a cake of our own making. *Whose hands forced opium and religion on China? Who taught these "semi-civilized, heathen and savage" peoples the diabolic art and craft of scientific war, the selfish emulation of trade and the love of conquest?*

Great Law Shapes Hu- man Actions

If we face a Frankenstein monster, it is one of our own sorcery, and we shall have to reckon with it inevitably. But, thanks to the Great Law which shapes human actions, the probabilities are other than as above supposed. This "heathen and savage" folk have shown a truer spirit of humanity, a nobler sense of human solidarity, and a grander ethic in this war, than an European people probably might under identical circumstances. It is religious intolerance and bigotry, the two-fanged demons of European cultivation, which fear the future, not a trust in the Divine Intention manifest in the awakening of the East.

Let a sorrow fall upon a Japanese, and if he be a man of gentle birth, he will express his ache in a poem. A Chinaman of similar condition would sit for hours, as Nichols so beautifully puts it in his *In Hidden Shensi*, trying to express his soul in a sweeping curve of one of his native ideographic characters. It is hard to imagine a white man doing that; yet it is beautiful and soothing to remember. The Asiatic is as intensely introspective as the European is not. Let that once be thoroughly understood, and half the mistrust between White and Yellow will fall away.

True, a lot of vapid balderdash—for and against—has been written about the Japanese. But it can do little harm, probably, except to prove to ourselves our own instability and vacuity of judgment. Certainly, at one time, there was an apparent danger that Japan would become a "caricature" of western civilization, but that danger is now nearly past. The avowed intention of her ablest men and of the national will to combine the best in both East and West, shows a spirit that might be copied with advantage by others. One wishes, nevertheless, that the Japanese might never abandon certain things, such as their incomparable art, their comfortable and dainty and hygienic dress, and their sterling qualities of patriotism; and their women their modesty, and devotion to home and children.

The wave of awakening has been sweeping around the world for several centuries past. In 1849 it had definitely reached the waters of the Pacific, after crossing the Atlantic and the American prairies; a year or so later, it broke on the rugged coast of Japan with Perry's vessels; it has given individuality to the new Australian Commonwealth; China is moving, and Siam, in a negligible period, promises to repeat the actions of Japan; Younghusband's expedition broke the first barrier down in Thibet. It now remains for the *Aryan races of India to be stirring*. When will that be?

The Globe has entered on a new cycle. The Newly Born is still young, as time is counted, still in its wrappings; but it is a lusty youngster and has already learnt to kick a bit. Human affairs feel it already, and in this whole connection, one cannot too often emphasize the words of a Teacher of Theosophy, written years ago: "The Twentieth century will see many accounts squared between the races of the Earth."

G. DE P.

Some Views on XXth Century Problems

Astralism & Vegetarianism

THE recent International Vegetarian Congress in England seems not to have been without its touch of comedy. One speaker criticised the fads of vegetarians, and blamed them for some of the slow popularity of the cult. Advocating common sense and science in the matter, he said that he had lately had a letter from a woman asking him whether he thought that a diet of spring water and popcorn would be conducive to getting on to the astral plane quickly. He suggested that dried apples and heart-sighs would be even better. His correspondent doubtless thought that the popping nature of the corn would communicate itself to her soul, and that she might as it were suddenly and explosively diffuse herself through the astral realms. And the spring of the spring-water would help the pop of the popcorn.

Which leads one to meditate on the nature of the astral aspirant in general. What sort of a person is he?

Taking him (or her) at large, one might say that he is a person who has lost hold of whatever sense of duty and moral fibre he may once have had. He lives in dreams of his own importance; thinks his aimless chance ideas to be "teachings" handed to him for delivery to the world, and his floating mental pictures to be scenes from his own or his admirers' previous incarnations or from past human history; thinks the flashes of color due to his congested retina to be glimpses of the "auras" of bystanders. The forms and faces that people his wandering imagination he takes to be the great dead with whom he is in converse; and he tells you that in his sleep he is occupied in rescuing souls from limbo. And he attributes to his sexual impulses a transcendental and spiritual import.

In all the above, *she* may of course be read for *he*. In fact the *she's* are perhaps a little more numerous.

The worst injury these people do, so far as the world is concerned, is to mix up the sacred name Theosophy with their maunderings, C.

A Chair of Philanthropy

AT last we shall have philanthropists. For Otterbein University has established a chair of philanthropy where the subject will be taught in all its branches. The studies include sociology, psychology, hygiene, and the modern agencies for health improvement. Obviously no one who studies those subjects could possibly fail to evolve into a philanthropist—that is, unless you pedantically insist upon it that philanthropist means a lover of humanity. In that case you could only admit that the studies *might* make the already philanthropist a little more efficient. Though even then, sociology—which mechanicalizes our conceptions of human evolution—and psychology—which mechanicalizes our conceptions of the mind, and neglects the soul altogether—might seem more than suspicious assistants.

Surely philanthropy is no affair of learning at all, but an attunement of feeling to human needs, a power of entering into and imagining human suffering and joy, and making them one's own; or, better, of losing one's consciousness of separate-interestedness, in the pains and joys of others. It is a conception of what human life might be, as exemplified in one's own highest moments; and a perception of what it is as compared with that. In a word, it is a sense of unity with all men and a yearning to lift the common life one shares with all the rest. The attempt to teach it in a university is an almost pathetic symptom of the blindness of the age.

STUDENT

The New Womanhood

A SERIES of eloquent lectures on the *women* of Italian novels has just been completed at the Sorbonne in Paris. The summing up of the argument is in these words: "The depth of the thought, with all these romances, is that woman, being made for love, and for nothing but love, it is useless to study her from another point of view, it is superfluous to reclaim her for other rights."

The lecturer pointed out that Italian women are no longer willing to answer to the description "made for love," and are pressing forward to their proper place in the new world currents.

Which may mean anything. It often means the entry into politics,

into the various worlds of activity of all kinds; and the refusal of maternity. Will these attempts on the part of women, whether in Italy or America, to gain their proper place, ever bring them to it? It may conceivably be an *individual* woman's proper work to enter politics, or conduct a paper, or lecture on embryology, or command an army, or think out a system of philosophy. But not *as woman*. The path for woman to gain her true womanhood is the same as that for man to gain his true manhood. It may take its way through *any* sort of duties, and it may be lost if it is followed or sought through any devised plan of conduct. For both sexes the path is surely a sustained attempt to realize their highest *being*, and then *any* doing, in that spirit, will be the highest doing. True womanhood and manhood are the expressions, for the life in hand, of the soul, and are evolved by seeking the soul. Exactly what their essence consists in, the reasoning apparatus cannot comprehend. Such attributes as courage and tenderness belong alike to both sexes. The essence cannot be put into words. But it can be felt radiating from the true men and women ahead of their age who, living their highest, have learned to carry their consciousness of the divinity of human life into all duties that presented. The sexes help and redeem each other in redeeming themselves, and in that way only can the true relationship—which is almost never pictured in the romances—come about.

STUDENT

The East- ern Christ

A contemporary discusses—whilst discussing foreign missions—not what effect Christianity will have upon the East, but what modifications the East will make of Christianity. The writer points out that as Christianity successively reached the Greek and Roman mind, the Teutonic mind, the Celtic mind, it became in each new vehicle modified. What will the East make of it?

One may predict that the East will throw all the dogmas and specialties of the sects into one solution, and, from the complex, precipitate one common truth already known to it. The Eastern nations have always believed in, or known of, the periodical and frequent incarnations of the World-Spirit, the Logos, in selected men; or, to put it in the other way, the self-elevation of certain men at all times in history to such a point that their consciousness touched the supreme inspiring and motor consciousness of the world, and that they were thus able to speak as it, to give it intelligible voice to the minds of men.

So the East will say: We accept your Christianity; we recognize your Christ as a man whose love for humanity, increasing for many births, at last destroyed all the limitations of passion and selfishness, so that he could know God and God speak through him. And we can fully believe that he has taken among men not only the birth you know of, but many others, that he might lighten human suffering. We can also accept with you that his conscious mind broods over humanity, feels all suffering everywhere, and tries to touch the hearts of all sufferers with hope and comfort and understanding. We add two other beliefs to yours: that it is a possibility for all men to become Christs, and a duty to try; and that both East and West have actually produced Christs who have worked, and work yet for humanity.

In a word, to the East, Christianity will be accepted as a particular case of a general principle already known there. It will never be seriously accepted in any other way, and the chief delay to this acceptance will be the presence of contending sects and of sects whose missionaries meddle with politics and conduct themselves otherwise than as compassionate comrades struggling Christward.

Neither can the progress of Christianity be anything but delayed by the attempt to induce the Asiatic to believe that true religion was only introduced into the world in its fullness two thousand years ago. He regards the human race as having been in existence on earth for untold ages, thinking and civilized. To him two thousand years is a mere moment. And so he can but be outraged by the idea that in all that vast past there was no real light of truth on earth, no true religion for men to live by. His legends speak of bygone civilizations higher and purer than any that our history records or even knows of.

STUDENT

* The Trend of Twentieth Century Science *

A Curious Diet

CAN there be an insect that feeds on lead? We must be careful of saying no, strong as may be the temptation. No one would have supposed that anything living could support its life on india-rubber till the little insect that destroys the rubber sheathing of the Atlantic cable evolved itself from—what? But it is more probable that the black mischief-maker—known as *Bostrychus Jesuitica*—which eats through the lead covering of the Australian cables, does so in order to get at the more nutritious tarred linen wrapping of the contained wires. We do not know whether it is the tar or the linen, and of course it may be the lead after all. The insect is very minute and for a long time escaped detection. But at last it was found at the bottom of its hole, which is sometimes as much as a quarter of an inch deep. When it was not found, there were the traces of its work in the shape of two minute parallel scratches. How many millions of strokes it must make to get through that thickness of metal!

There are other larvæ that bore through lead, either to get at food beneath—how do they know it is there?—or to get out from confinement.

STUDENT

A Mysterious Visitor Returning from Afar

HALLEY'S great comet of 1682, which was observed by the immortal Newton, has re-entered the farthest confines of the solar system, and for a few years will approach the sun at terrific and ever increasing speed, probably blazing with lustre as it gets close; but on reaching a point about fifty millions of miles from our sun it will swing round it and return with ever-diminishing velocity to the remote abysses of space not to return till our earth has journeyed seventy-five times around its orbit.

Halley, (British Astronomer Royal appointed in 1720) was the first to be inspired by the idea that some comets returned on their tracks at regular intervals, and daring to prophecy, from historical records, he announced that the comet of 1682 would return in 1757, for the appearance of a notable comet had been recorded by the annalists during the six previous centuries at intervals of seventy-five years (with one or two gaps). The first record dates from 1006, the time just preceding the Danish invasion of England. The next appearance is not mentioned, but historians again speak of it in 1155 and 1230. An extraordinary chill throughout Europe accompanied its return in 1305, when the harvest was nearly destroyed in England by frost at midsummer; and in 1456 its appearance was so tremendous as to fill all classes of men with consternation; the Turks had just become masters of Constantinople and were threatening to overrun all Europe. In 1531 the comet had taken on a golden hue.

Galileo and Kepler watched its ninth visit in 1607 and the tenth was the celebrated one of 1682 which gave Halley his great opportunity of prophesying and gave the comet the name by which we know it. It did not return in 1757 as he calculated, but that was only because the powerful attraction of Jupiter and Saturn delayed it. Halley had overlooked this, but it duly arrived a little later. The next return, in 1910—11, will be the thirteenth, and although it has diminished in brilliancy it will still be a highly interesting object. Comets are yet profound mysteries; the spectroscope does not give us perfectly satisfactory information as to their constitution. Their curious behavior under certain circumstances puzzles astronomers. For instance, we may recall the fact that the tails are turned away from the sun whether the comets be approaching or receding. Some comets almost touch the sun as they swing round it: the great comet of 1843 nearly scraped its surface, for it approached within one-seventh of the sun's diameter! How could such an apparently fragile body as a comet escape being vaporized out of all existence by the intolerable heat, more than equal to that of 47,000 suns blazing in the midsummer sky of the earth's tropics? It has been suggested that the total materials constituting a comet could be compressed into a nutshell, but this is probably too extreme a view. Certainly when Lexell's comet in 1767 passed among Jupiter's satellites it did not disturb them a particle, but itself was twisted round and sent off in an

entirely new direction by the powerful attraction of the Jovian system.

Strange coincidences have been noted between the apparition of great comets and subsequent striking events on earth. Tycho Brahe, the Danish astronomer, teacher of Kepler, announced, as he declared, from observations of a large comet, that a great hero would soon arise in Northern Scandinavia, do mighty deeds and die in 1632. Curiously enough this was literally fulfilled by the birth of Gustavus Adolphus in Finland and his triumph and death in battle in 1632! Napoleon's disastrous march to Moscow, the beginning of his downfall, was just preceded by the sight of the marvelous comet of 1811 (Donati's). But nowadays the awe and terror that seized upon the European world at the coming of a comet has passed away, and to the majority of people they are only objects of beauty and interest. In time we may expect to penetrate more deeply into the mysteries of their nature and origin and effects.

R.

The Life Essence

THE rapidly famous experiments of Professor Burke of Cambridge in causing organisms to develop in sterile broth by exposing it to radium, have inevitably suggested comparison with the results reached by Dr. Littlefield of Indiana. The latter uses no radium and no broth, only salt, water, nitrogen (in ammonia) and hydrogen (evolved from alcohol). In both cases, organisms were developed, and in the latter case, by the repeated additions of water, the organisms reached a higher and higher type, achieving, though on a minute scale, the forms of plants and even protozoan animals.

Full details of the latter's work are yet to come. But both sets of experiment are in corroboration of Sir Oliver Lodge's recently published speculations about life—that it is an omnipresent immaterial essence constantly seeking material vehicles for its manifestation, and acting as a force constantly raising the vehicles it finds, to an ever higher level of evolution. When the vehicle wears out it seeks another; itself, as life itself, being indestructible.

It is a new phenomenon to find science and metaphysics—and even religion—gradually converging to make a new fabric of human knowledge, a phenomenon full of hope.

STUDENT

Asbestos Bodies

HOW Asbestos came by its silky fibrous structure no one knows. But an interesting suggestion is offered by an English chemist. He suggests that life was always on the planet even when all things were in primeval white heat. The then physical basis of life, the then protoplasm, must have had a composition that could live under those conditions. He pictures a general vast sea of molten silica in which swam and floated organisms whose essential basis was silica instead of—as now—carbon. Asbestos in its varieties is, according to this theory, the surviving framework of these creatures, still remaining after countless ages as the mute evidence of life at a time when we have hitherto thought life impossible. The characteristics of this substance are certainly suspicious, whether we consider the delicate amianthus, the rougher common specimens, the varieties known as "mountain leather" and "mountain cork," or even the still denser "mountain wood." None of these will resist blow-pipe heat, but they might have been—as the bodies of animal or vegetable life—slightly more coherent than the sea in which they floated, just as the almost fluid jelly-fish holds itself together in water.

Other elements may then have existed which are now extinct. And these may have been followed, in the make-up of protoplasm, by elements which though not extinct, though still existing in protoplasm, have mainly been replaced by others more suitable to present conditions, and only play subordinate roles. Sulphur may have done what oxygen now does, antimony or arsenic what nitrogen does; and so on.

According to this view, the answer to the question: When did life begin on the planet? would be: When the planet itself began. And the planet began when its center formed in the primal—but still existing—ether. Whether there are forms of life in *that*, standing to it as fish to water and birds to air, science has not yet begun to speculate.

The
**Natural Steps at
Quebec**

ALITTLE above the Montmorency Falls the solid rock has been worn away in the form of these natural steps, through which the river passes in a deep gorge to the falls (100 feet higher than Niagara), by which the river connects with the River St. Lawrence.

Quebec is supplied with electric light and power by these falls.

Civilization Dies With the Destruction of Forests

BERNARD PALLISSY, the famous Potter of the Tuileries, one of the most profound men ever produced in Europe, pleaded for the wood of France as follows:

Having expressed his indignation at the folly of men in destroying the woods, his interlocutor defends the policy of felling them by citing the examples of divers bishops, cardinals, priors, abbots, monkeries and chapters, which by cutting their woods have made three profits; the sale of the timber, the rent of the ground, and the good portion of the grain grown by the peasants upon it. To this argument Pallissy replies:

I cannot enough *detest* this thing, and I call it not an error but a curse and calamity to all France; for when the forests shall be cut all arts shall cease, and they who practice them shall be driven out to eat grass with Nebuchadnezzar and the beasts of the field. I have divers times thought to set down in writing the arts that shall perish when there shall be no more wood, but when I had written down a great number, I did perceive that there could be no end of my writing, and having diligently considered, I found there *was not any* which could be followed without wood. . . . And truly I could well allege to thee a thousand reasons, but 'tis so cheap a philosophy that the very chamber wenches, if they do but think, may see that without wood it is not possible to exercise any manner of human art or cunning. — (*From the Proceedings of the American Forestry Congress; italics in the original*)

Every one must admit the foolishness of destroying forests. But what we need is, not to show people what is wrong, but to prevent them from doing it. Under the rule of selfishness, I shall destroy your forest and you will destroy mine; and, though we shall enrich ourselves, each at the expense of the other by selling the other's timber, the net result will be no forests. Like Niagara, it is a question of preventing individual appropriation.

SHOWER AND SHINE

WM. WATSON

LET us home and take shelter,
While romps on the plain
Like a herd helter-skelter
The galloping rain;
For the thunderclouds blacken,
And drench as they pass
The deer in the bracken,
The kine in the grass.

It is gone—let us follow;
The heavens breathe free;
The shafts of Apollo
Are loosed on the sea;
And pure from the thunder
In sheen and in hue,
The world and its wonder
Are fashioned anew.

— Selected

An International Chamber of Agriculture

A PLAN for an international unification of farmers' work is being energetically promoted by Mr. David Lubin, a former Californian, who has succeeded in interesting in the project the King of Italy. The promoter is said to be a business man who has no financial interest in agriculture but works for it as a "hobby."

Farmers suffer perhaps more than any other class from disunion. They live far apart and scattered; there is no coöperation in their work. Crops are grown without sufficient regard to the suitability of the location, and without regard to the crops of other farmers or to the requirements of the market. There is no system of collecting and sharing valuable information, of taking combined precautions against pests, or of resisting the extortion of transit companies and other organized bodies which make their profit out of the farmer's helplessness and ignorance.

The plan is to have an international chamber of agriculture. This would form international exchanges and labor bureaus, to improve the methods of distribution of produce and of labor, and to regulate transports, emigration, and immigration; to study legislative questions, such as laws relating to pests and diseases; to federate agrarian coöperative societies; and to combine against the tyranny of transports and trusts.

The fact that the movement is international is of no little importance, as tending to unite farmers on a basis other than national. And it will be a decided advantage if the preponderating influence of trade and manufacture can be counterbalanced by thus increasing the power of the agricultural interest. The two powers of coöperation and intellect have been brought to bear with wonderful effect in manufactures, engineering, and other concerns. It is a pity the farmer should continue to suffer from a lack of their application.

STUDENT

Great Men and Their Mothers

A NOTE of joy, of tender awe, is struck in all hearts by the thought of the coming to earth of a man of genius. Whence this soul that endows the voice or hand with the power to body forth the ideal so clearly that men see, where before they could not see, glimpses of the true and beautiful? Whence this strong soul who can lead men on toward heights, upon which, before the genius of the great man has revealed it, few perceived the signal? And what hand holds back for the awakening genius the veils which so soon obscure the realms of light to ordinary mortals?

The light of the genius does not fade, as does that of other men. It shines in his heart, and there gives birth to art or poetry or music. This light must be felt by those who are in sympathy. It should call forth the fostering care that is needed to give the soul a firm foothold in the dawning physical life. The great must needs create a sturdy companionship for themselves. Their light shall not be clouded by superficialities and mere hearsays before it can shine forth clear and strong. How often, in the lives of great men, has the strong comrade, with firm though gentle hand, and heart-light aflame, been the great man's mother!

There is a brotherhood of souls, though human relations in comparatively few instances seem to exemplify it. In every day life the power and beauty of the soul often find feeble expression. The diversity and conflict on every hand are seldom illumined in human minds by any intuitive perception of the underlying purpose of life. We have to remind ourselves that we are souls, and that the great underlying purpose must be *our* purpose. The deeper aspects of the relations of human beings to one another *as souls*, working together, life after life, for the accomplishment of this great purpose, are also lost sight of in the conflict of personal desires and aims.

But in the march of human progress through various races and civilizations, many true and lasting comradeships have been formed. These were based on the desire to serve, to stand side by side and serve nobly. This deeper tie of warrior-comradeship has always been known to those great of soul. The evanescent relations based on merely personal feelings, fade into insignificance beside the lasting friendships of those who have recognized the true meaning of life, and have set their feet firmly on the path that leads to human enlightenment. What could be more reasonable than that these ties are renewed from life to life, the bond ever becoming closer, the united service more far-reaching and effective?

The relation of mother and child offers a peculiar opportunity for

THE bravest battle that ever was fought!
 Shall I tell you where and when?
 On the maps of the world you will find it not,
 'Twas fought by the mothers of men.
 —Joaquin Miller

one soul to serve another, and with it the race. It exists at the very dawn of the life of a human being. It is, in almost every case, the tie of ties, during the most susceptible years of the child's development. The welcome in the mother-heart

is the first greeting to the incarnating soul. How much could be done by a mother who realized fully her opportunity and her duties!

History does not record the deepest side of the relations of human beings. We can read between the lines, however, and we find that many women, in doing their simple duty, bravely and unselfishly, have created the home atmosphere in which great men thrived, and builded strong the characters that have left their mark on the times. The history of the United States offers two notable instances of this. Mary Washington was the guide and counsellor of her great son, his honored friend throughout her life; and although Nancy Hanks Lincoln died when Abraham Lincoln was very young, the memory of her unselfish effort to make their humble home count for all that was helpful and true, never faded from Lincoln's mind. He knew the service that a true mother had rendered him.

It has often been the case that the line of heredity has passed from mother to son in transmitting a tendency towards the very pursuits or characteristics which have brought fame to a man of genius. Goethe's youthful mother, sympathetic and joyous of nature, brought up her son in an atmosphere of legend and fairy tale, which early fostered his love for beauty and universal truths; Schiller's mother was a woman of sweet, poetic temperament; Sir Walter Scott's mother had great imaginative power; it was from gently reared Mary Arden, his mother, that Shakespeare inherited the rare qualities that enabled him to preserve so successfully his integrity and independence, and to look out over men and things from the stronghold of a balanced nature. The greatest of English kings, Alfred, owed much to his early training by a gifted mother, and the colossal energy of Napoleon is said to have been fostered by the Corsican heredity that came to him through his mother.

The art in which the mother has been proficient is often the means of expression for the genius of the son. Gounod's noble musical talent came in direct line of heredity from his mother, who was an accomplished musician, and she it was who gave him his early training in music. It is interesting to note that Mendelssohn and Rubinstein also received their first musical instruction from their own mothers. We read of Spohr singing duets at four years of age, with his mother, who was herself a fine singer. Who can tell what deep memories were stirred

OUR YOUNG FOLK

ONE OF THE LIFE CLASSES, ART DEPARTMENT, RAJA YOGA ACADEMY, POINT LOMA, CALIFORNIA

Raja Yoga Art Study

KATHERINE TINGLEY says: "Only that art is true art which leads the student daily nearer the golden portals of the Life Beautiful."

Raja Yoga students know how true this is. Do they study just for their own benefit? Raja Yogas would find it impossible to do anything with so selfish a motive as that. Do they dream of the days when they will make a great deal of money, or when they will be honored for having painted some picture that the world calls "great?" By no means.

Of course Raja Yogas study art for sheer love of it. That goes without saying, for training in Raja Yoga brings out in every heart a deep love for the genuine and the beautiful—which must be of course, the true. But there is a *selfish* liking of beautiful things, as well, and a *selfish* way of striving for even beautiful results. It is this kind of selfishness which has given the world so much art that is useless and even degrading. It is this kind of selfishness that has kept our greatest artists away from their higher possibilities. Raja Yogas show the folly of the selfish kind of devotion by the simplest means in the world. They just study and work *unselfishly*. With what eagerness do they look forward to the time when they shall be teachers—teachers of that true art which is something more than just clever brush-strokes, or even the best of what the world calls "technique."

Raja Yoga art study is a seed-planting time and the boys and girls of the Academy in Lomaland realize how, in the silence—yes, even should daily work be discontinued for a time—the seeds sown live and grow until lo! they spring up and blossom and bear fruit. The fruit is not, however, merely a great picture or a great work of sculpture or a great song, no—it is all these, as just the expressions of a great and noble life. That is what art study means in Lomaland. ONE OF THE TEACHERS

Art

ART is the expression of harmony. Expression is giving an outer form to some idea; and this may be done in all sorts of ways.

A picture is an idea put into a visible form; so is a person's life. When an idea is well expressed, it can be understood by others, and when it is artistically expressed it should stir up similar ideas in others; it should be a call to action, an invocation. So I think art is magic, that is, it is a call to the soul to awake, it gives us an impulse to live a better life.

To be artists of this kind we must be living the better life ourselves; we must have ideas that are able to stir our own hearts, if we hope to stir the hearts of others. And having these high and true ideas, we must learn to express them so that they may do what we mean them to do. If we cannot express our high ideals in our own lives, we shall never create a true work of art, but that kind only which makes people say, "Yes, it's very beautiful but only an ideal." But the real Art would make people feel something stir in their hearts, that would not let them rest till they had tried to give expression to it. Those who are living the true life are making living pictures all the time, and some of this kind of people are more worthy to be called artists than many who can draw and paint very skilfully. But of course this does not mean that an artist need not trouble to study; on the contrary, he must master every detail of his art, as he must master every part of his own nature, for if he does not, he will fail to give a true expression to his high ideal. Art is long, and so is the life of the true man, the soul; and each lifetime is a day in the training of the soul, the true artist that never dies but finds, life after life a nobler art to express this ideal. R. M.

THE CHILDREN'S HOUR

CHILD AND MOTHER

EUGENE FIELD

O MOTHER-My-Love, if you'll give me your hand,

And go where I ask you to wander,
I will lead you away to a beautiful land---
The Dreamland that's waiting out yonder.
We'll walk in a sweet-possie garden out there
Where moonlight and starlight are streaming,
And the flowers and the birds are filling the air
With the fragrance and music of dreaming.

There'll be no little tired-out boy to address,
No questions or cares to perplex you;
There'll be no little bruises or bumps to caress,
Nor patching of stockings to vex you.
For I'll rock you away on a silver-dew stream,
And sing you asleep when you're weary,
And no one shall know of our beautiful dream
But you and your own little dearie.

And when I am tired I'll nestle my head
In the bosom that soothed me so often,
And the wide-awake stars shall sing in my stead
A song which our dreaming shall soften.
So, Mother-My-Love, let me take your dear hand,
And away through the starlight we'll wander---
Away through the mist to the beautiful land---
The Dreamland that's waiting out yonder!

"And why did she say it?" asked Molly again.

"Because I first fell over the mat, and then I stepped on her dress. She didn't look a bit pretty when she was cross," he added.

"Perhaps somebody else doesn't look pretty, either, when they don't feel kind," said Molly softly, "and eyes might as well not be there if we don't use them."

She went to the window and pulled down the blinds.

"Isn't the Sun shining brightly? And how beautifully green the trees look!"

Ernie glanced at the windows, but of course could see nothing.

"Why did you pull down the the blinds?" he cried, "I can't see out."

"Why did you pull down your eyes' blinds," asked his sister in return, "and so never see the mat and tread on Violet's dress? She is upstairs mending it now, and she never told me that you tore it. Poor Violet, she must stay indoors this lovely day, all because some little person I know didn't use his little windows as they should be used."

Ernie was quite good-tempered again now, and wanted to know all about it.

"How did I pull down the blinds?" he asked.

"Well, you tell me," said his sister. "You did it, so you must know."

"I was thinking of my rabbits," said the child, "and trying how quickly I could get to them, and never thought of the old mat, and I never saw Miss Hamilton until her dress tore; I was thinking the little one might be hungry."

"That was better than thinking of yourself," replied his sister, "but it pulled the blinds down, just the same; suppose next time you try another way. The little windows are there for you to look through while you are walking or running about. Now, what you did was this: you kept looking into an inside window—your mind's eye—which looks into the Thought Country, and then you saw your rabbits, and all the while your poor legs had no one to guide them, because no one was looking through the outside windows, and so they went astray."

Ernie looked very thoughtful.

"I like to look through the inside window," he said at last.

"And do you like tumbling down and tearing people's dresses?" asked Molly, kindly smiling.

"No," said the little boy.

"Well, I'll tell you how you can look through both windows safely: look first through your mind's eye and see what you want to do, then

The Eyes That Did Not See

LITTLE ERNIE was discovered by his sister gazing earnestly at his face in the glass.

"I have got eyes," he said to himself, "blue eyes," and he turned away and saw his sister, and she was smiling.

Molly was the great confidante of the children. They always came to her alike with their troubles, their puzzles or joys.

"She said I had no eyes," the little boy cried indignantly. "And I have."

"Who is she?" And Molly drew her little brother towards her, smoothing back his curls.

"Miss Hamilton," he answered.

look through your outside eye to see that your fingers and toes do what you want them to do, properly, and then things will go splendidly. Try it, dear, and see!" E. I. W.

A Wasp's Nest

A WASP'S nest may be made of mud and hung for shelter under leaves, rocks or eaves of buildings, or it may consist of a little tunnel hollowed out in the ground or in trees or in the stems of plants. When the nest is made in the ground, the wasp, after having dug the tunnel—a long and laborious task, as you can well imagine, for a wasp's tiny mouth and little thread-like legs—fills it up again with loose earth which she crumbles down from the sides. Then she collects, from outside, more fine earth with which she completely fills up the hole. I think her reason for doing this must be to keep the tunnel intact and to prevent the sides from caving in, and creatures getting into it before she is ready to lay her egg in it, don't you?

Before, however, the wasp lays her egg, she has to do some hunting, for wasp grubs live on animal food—spiders, caterpillars, grasshoppers, flies, beetles and such things. (Full grown wasps, as you know, live on fruit.) Then when the food has been found, the wasp drags it to the mouth of the nest. Sometimes she hangs it up on a weed out of the reach of ants, while she removes the loose earth from the nest, into which she then shoves the food.

The wasp now lays her egg upon the food and again fills up the hole with earth, pounding down the outside layer with a tiny pebble which she holds in her mandibles, until the ground is firm and hard, with no trace of a nest to be seen.

The egg hatches in two or three days, and the mother-wasp's forethought, as you see, has provided a dinner for the larva or grub for from six to fourteen days or until it is ready to spin its cocoon. M. V. H.

DEAR CHILDREN: There is a very lovely garden all around the Raja Yoga Academy in Lomaland, where we play nearly every day. There are many large palms and there are some other trees just like the one you see in the picture, and there are ever so many flowers.

Do you know I can remember when this very tree was just a little bit of a bush? I know when the man planted it near the big Academy entrance; but everything grows so quickly in Lomaland, and the gardeners love to care for the trees and flowers. I think the tree knew that and so it grew just as fast as it could to show how pleased it was for a chance to help make the world beautiful.

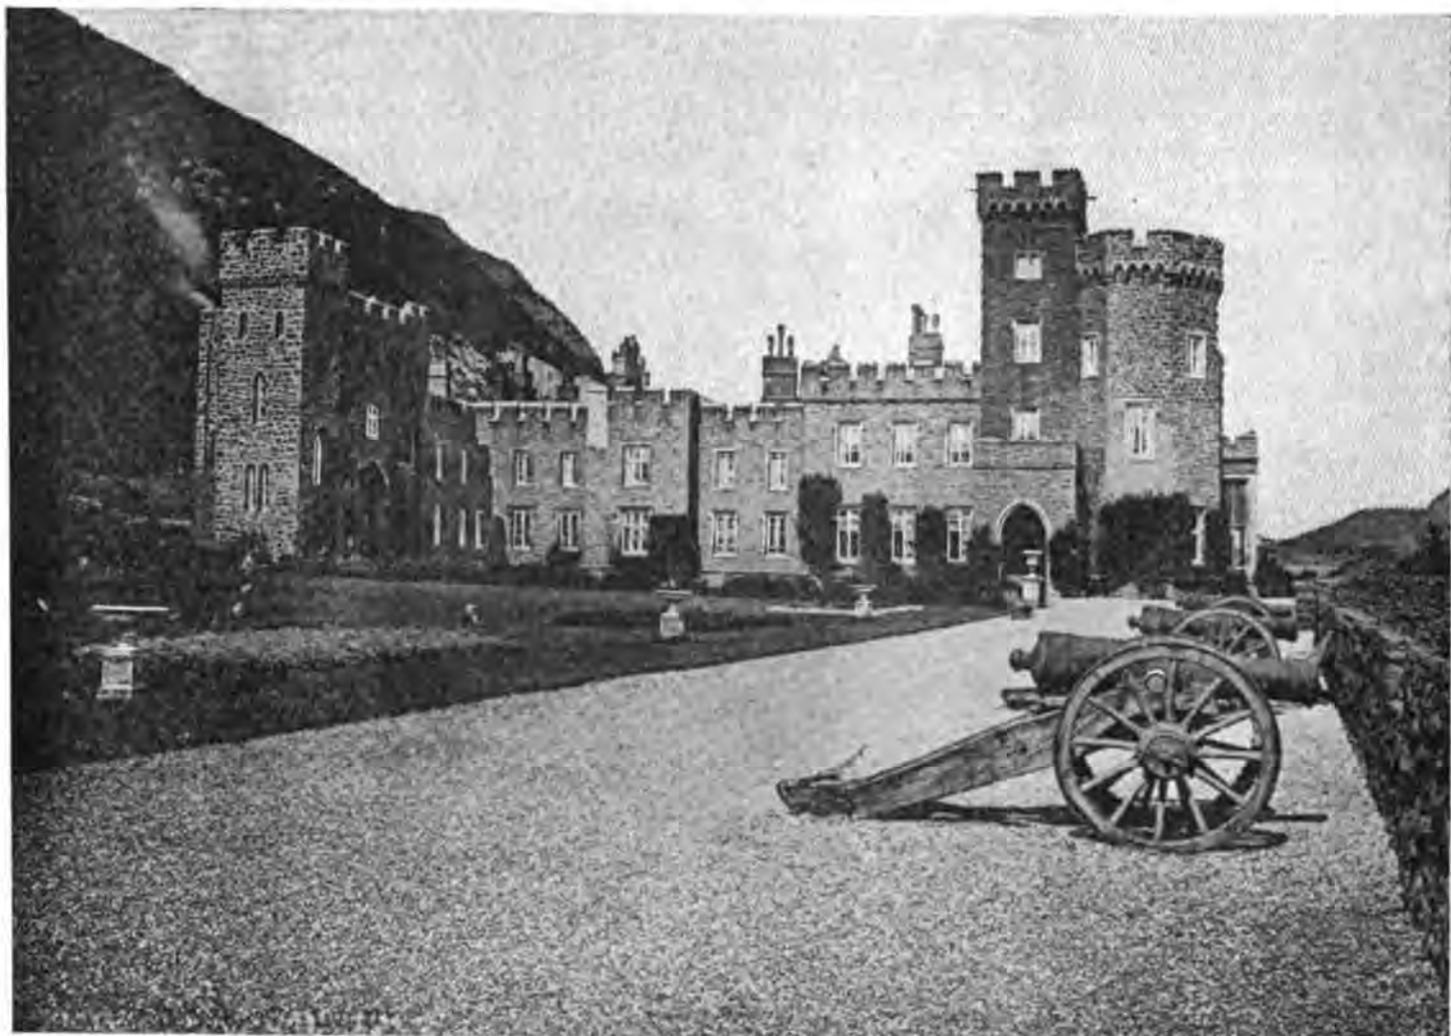

We often go out and play near it. It is an acacia tree and is full of small, sweet smelling, yellow blooms. I know that many of the Raja Yoga children can remember when one of the Cuban girls had her picture taken sitting under this tree. She had her big doll sitting in a chair beside her and it looked like a real little girl. A RAJA YOGA SCHOLAR

DEAR CHILDREN: How would you like to visit the aquarium at Naples and see the curious fish there?

You would be much interested in the little electric fish, because you would be allowed to touch it and feel the sharp little electric shock it gives when disturbed. This little fish isn't much of a swimmer and cannot swim from danger as many others can, so he has this way of defending himself. Here is another flat fish called a ray, lying at the bottom of the glass tank. This fellow has a sharp little sword in his tail, which he can use as a weapon in time of danger. Nature has provided many ways of escape and defense which are well worth studying. E.

IN THE ACADEMY GARDEN

A CASTLE IN COUNTY GALWAY—IRELAND

Verbal Echoes of the Past

OUR language bears evidence that music—and especially song—was once credited with more power than now. Indeed the old myths often make all nature sing, the dawn, the trees, the moon, and even the unruly gods of storm. They not only make nature herself vocal, but show her as moved by the songs and music of men. Orpheus has many counterparts in the field of myth.

Evidences in language are such words as *charm* and *enchanting*, both from the Latin *carmen*, a song or poem. As lately as Milton the word *charm* was used in the actual sense of song:

“Sweet is the breath of morn, her rising sweet
“With *charms* of earliest birds.”

The word changed its meaning slowly. The singer away of pain and evil could also get rid of them by touch. All other things that relieved them became charms, and the idea of song departed. Good and beautiful women, because of their goodness and beauty, were charmers, in the older sense—and then charming, in the modern where almost all the original meaning has gone.

Must not music have been something more once than now; must not something, some magic of it, in its practise, have been lost that it should have been credited with such power over human ills and pains and even over nature? And yet we are told that the same peoples who gave music so much credit, who esteemed it as *the* magic power, produced it from instruments that we would hardly give to a child in a nursery and whose rude scales made real melody impossible! All antiquity made a scarce distinction between *song* and *poem*. In many ancient languages the word used for one signified the other. Poetry and music combined had for the ancients the significance that the Hindus attach to their man-trams, or rhythmic, chanted strophes, and they were supposed to have the power of moving inanimate objects and of closely affecting the inner man.

Perhaps there was more than a little method in their “madness,” and wisdom in their belief, as we are beginning to find out ourselves by our scientific researches in the field of sound. STUDENT

Buddhism and Art

IT seems to have remained for the Japanese to develop, or perhaps to show, the essential connection of Buddhism with Art. The subject is worked out in a recent little book on *The Japanese Spirit* by Professor Okakura-Yoshisaburo.

He shows that under the influence of Buddhism the art of his people developed its most characteristic qualities. So intimate became the connection of religion and art, including poetry, that a certain Zen priest was accustomed to rebuke a pupil who had lapsed from the ideal life in any particular, by saying “This is not poetry.”

The highest ethical life was to be treated like any other work of art, made flawless in the spirit of pure love for it, not to be soiled or daubed by any imperfect or ignoble act. The same inner spirit demanded beauty of conduct as of form and color. The best of the nation came to understand the deep identity of all beauties.

The Professor says that the nation was never attracted by the Buddhist ideal of a “cold Nirvana.”

It was the development of the inner life in its perfection, (as if that very aim were not the “Path” of the Nirvani to be—among other aims) “enabling man to meet after a moment’s thought, or almost instinctively, any hardship that human life might impose,” that brought about the popularity of the Buddhist creed. And so it harmonised perfectly with pre-existing Confucianism. The attitude of the whole nation in the first flush of repeated victories is an example of one of its collective “works of art.” STUDENT

Notice

FOR a number of weeks the meetings held every Sunday evening at Isis Theatre, and every Thursday evening at the Isis Hall, San Diego, will be discontinued. The faithful work done at these meetings by the Lomaland Students appointed to it, entitles them to a needed vacation.

The meetings will be resumed early in the autumn, and will be duly announced in the NEW CENTURY PATH and San Diego press.

Art Music Literature and the Drama

The Future of Art in California—What is the Outlook?

THE spirit of Art has been a roving spirit. Though sometimes it became so firmly rooted in the hearts of a people that its stay seemed as if for ever; yet, as ancient Egypt's history and Japan's long current of civilization teach us, there are ups and downs, cyclic periods of advance and decline even in the most innately art endowed nations. Turning to less enduring nations, the glory of Greek and Roman art was brief, the Moorish, the Gothic and the Renaissance styles played their part and vanished, in spite of all efforts to revitalize them; luxury and ostentation set their fatal mark upon them just at the moment of highest success. And what have we now? Almost a dead level, with a few partial exceptions—Japan, perhaps China, possibly France. Almost everywhere we see commercial art, commercial architecture, commercial painting, commercial designing of ornament and handicrafts, all betraying greed and ostentation. We have sold our birthright, the feeling for simple beauty, for the mess of pottage—luxury and desire to make a show.

But history teaches us that things cannot last thus forever, fortunately, and as everything returns in the cyclic flow of life there must be a land which is being prepared for the artistic breath of life. Shall not the western world be able to call the Angel and hold him till he remains and blesses us?

The secretary of the University of California Extension course said lately: "It is worth while to be a resident of the State of California. This state, I feel assured, has a great future in art, for already, north and south, there has been started a great art movement. . . .

. . . California and the great art center of the world, Italy, are in many respects similar. The climate and valleys and mountains of the latter bear great points of resemblance to those here."

His words are strikingly true, for many things point to California as the future art center of the western continents, if not of the world. Among them are the rapid mingling of interesting and high types of mankind from many countries, the growing prosperity, the perfect climate, the impressive scenery in this "land of wondrous distances"—the far-reaching views of mountain, plain and ocean being a never-ceasing spur to the imagination—and, not the least, the art work of the International center of the Universal Brotherhood Organization. All great art has been inspired by great causes: the Greek, by the passion for liberty; the Roman—such as it was—by the grandeur of imperialism; the Egyptian, by a profound knowledge of the divine government and inner nature of things; the Gothic by a genuine, although narrow and dogmatic faith in the unseen; and the Renaissance, even, by a very real enthusiasm for the antique learning just brought to light.

And now the leading spiritual effort of this age has established its center in California by a sort of natural gravitation. Here is being learned the joyous lesson of the *really* "simple life," the life of unselfish work and effort for the race. Can it be doubted that a higher art, a higher music and a higher polity will be evolved here, to radiate through the state and then afar, inspiring, not destroying the seeds of genuine artistic movements arising in the nations? Already the discriminating eyes of many visitors who have spent even a short time in Lomaland, have found something altogether new in the design and grouping of the buildings here, although but the merest beginning has been made, compared with the plans that have been outlined for the not far distant future.

The effects of the Raja Yoga system of education upon the minds of the children are of as much interest to the art lover as to the educationalist, for, by the self-control and acute habit of observation thus evolved, a power which penetrates into the meaning of things is aroused, which is not common in the world. It is the power the real artist wields. True civilization does not need the forcing of a few professional artists—an exclusive coterie—while the masses remain wandering outsiders, gaping in wonderment at the mysterious productions of the initiated few. The need is for a lifting of the general level, and the making of an artistic nation, a whole nation that will love the arts as it now loves power and money. This has been begun in the Raja Yoga schools, now quickly spreading out from this center.

The Californian climate is supposed to be favorable to leisure and therefore to the cultivation of art. While that is largely true, by itself a good climate alone would do little, and good art has been produced in most inhospitable climes. More is needed than climate, scenery, leisure or prosperity to lead this state into the front rank. A higher, more dignified and more impersonal life is needed. That, inevitably resulting from the spread of the Raja Yoga system of education will free the imagination, raise the general level of aspiration and provide a harmonious environment for the incarnation of the Spirit of the Arts. Without noisy discussion or artificial forcing this leaven will work, till an even higher appreciation, and a fuller and freer expression of "the Good, the Beautiful and the True" will prevail than in the noblest days of ancient Greece.

A GLIMPSE OF THE LOMALAND CLIFFS

The Study of the Antique

THE study of the history of the evolution of the arts throughout the Christian era reveals a constant effort to emancipate these various forms of soul-expression from some paralyzing influence.

Each age produced men who sought for a new means of expression by a return either to nature, or to the "antique," or to both. But nowhere do we find any indication of a return to that which produced the "antique." I am convinced that what made the Greeks so great in all the arts was their almost unconscious knowledge of their own divine origin and *superhuman* possibilities, if one may use such an expression. The influence that had blotted out of men's consciousness this knowledge of their essential divinity, killed in them that sublime confidence that dares to be original. Men studied the antique, but how? They studied the method of expression, and not the life that gave birth to the method. So that the knowledge gained was a restraining influence, instead of being an inspiration; study of that kind spells slavery not freedom. In the same way, nature was copied slavishly, because man had learned to think himself separate from nature, and studied her analytically and intellectually as an outsider. This was the fruit of the triumph of ecclesiasticism which has ever sought to stifle "the spirit" by the deadening influence of "the letter."

In our day commercialism and the worship of wealth are doing for the arts what ecclesiasticism did in the earlier age. Great men arise, but their genius is throttled in the cradle, and their souls are drugged before they have time to show their divine nature, and though they give great works of beauty to the world, these are all dwarfed and crippled by the paralyzing doctrines that they have almost unconsciously absorbed from the influence of parents and teachers. R. MACHELL

Universal Brotherhood Organization

Central Office Point Loma California

1899---1905

IT was my good fortune during a recent visit to San Diego, to be present at the closing exercises of the Raja Yoga Day School, and see the wonderful results of the Raja Yoga methods.

One hundred and fifty (more or less) of the little ones, without a word from the teachers, went through their exercises with a precision and accuracy that (as said by a Lieutenant in the U. S. Army who was present) would have done credit to a West Point military training.

Later, during a drive to Point Loma, where the five teachers who have the little ones of the Day School in charge receive their training, my mind went back to the time of the Universal Brotherhood Congress, six years ago. Then there were only three temporary buildings on the hill, one of them a barn. There are now over two score.

Then, the face of all the land in sight was covered with sage brush, cactus, scrub-oak and the like, with one dusty driveway from the main road to the one building of moment, since rebuilt and beautified, until it is hardly recognizable, into the Raja Yoga Academy.

Now the charming buildings have beautiful grounds about them. Miles of broad graded roads and walks have been built, some of them oiled and all of them rolled as smooth as garden walks, with masses of ivy geranium or other plants all in delicate purple bloom, backed up by magnificent date palms ten to twenty feet high; the whole laid out after the irregular fashion of a Japanese village.

Here and there, at drill or at play, were groups of bright-faced, healthy, well-dressed children, laughing as they danced and sang; while from some of the artistic buildings came sounds of the various orchestras at practice.

Where wild slopes had been there was now the yellow stubble of grain fields fresh from the harvest. In response to a question, one of the attendants said they had from seventy-five to one hundred acres of oats and wheat this year. The oats were cut when in the milk for fodder, the yield of it being something over a ton to the acre.

Out at "South Ranch," lately acquired by Katherine Tingley, are the buildings for Industries, including Photography and Half-toning works, Laboratories, Carpentry workshops, etc., all located just at the edge of a thrifty lemon grove.

Across the newly-made, fifty-foot boulevard, running from the government reservation to the dyke and U. S. Government road, and connecting with India St., into San Diego, lies a slope covered with mulberry trees for the feeding of the silk-worms; and above and beyond this, are scattered a number of Bungalows, green-roofed, beautiful to look at and delightful to live in. To the north lies the comfortable "Tent Village," built for tourists and for the friends of the Students.

The gentle woman who presides over all this beauty—who plans and directs personally all the details of this wonderful work, gave me a few moments time, looking as serene and sweet as if a small wagon-load of correspondence, papers, plans, and proofs, were not at her side waiting her attention. I listened to the enthusiastic love with which she told of her work with the children, outlining the joy and peace that might be the lot of the world if they were educated aright, as "in a few years they will be the men and women of the world." And I marvelled at the extraordinary results attained by many older students here. In response to the question as to where she found time to attend to all this work, and where the money came from, she replied: "Oh, there is time enough for all things"—and with a far-away look coming in her eyes said: "And the money? Well, the money comes from friends here and all over the world, who are interested in or devoted to Universal Brotherhood, and from my little gold mine of Trust."

She told of plans for a new building for a larger Raja Yoga Day School in San Diego in the near future; of a new Public Raja Yoga Day School at Lomaland, as soon as the proposed trolley line was completed; of the "City Beautiful," and of the great College Temple, the cornerstone of which has been laid to overlook it all.

In six years all this and a hundred times more has been accomplished by the untiring effort, the enthusiasm, and the Masterly genius of Katherine Tingley.

Wonderful ideas! wonderful plans! wonderful work! wonderful achievements! and yet more wonderful woman! W. A. STEVENS

[Mr. W. A. Stevens, for many years the untiring and devoted President of the Buffalo Center U. B. O., has just recently made his permanent residence at Point Loma, where, with his family, he occupies one of the "beautiful and delightful family bungalows" he writes of.]

Work and Joy

A NEWSPAPER paragraph, girding at food-faddism, which makes life a burden, says: "All of which is founded on the wholly foolish idea, which is more and more obsessing civilization, that man is on earth to work. He is on earth to be glad; if he doesn't believe that, he is mad."

Here we have two things, which should be at one, regarded as separate and mutually opposed. Work is put against gladness, as though the two were irreconcilable. But one of the great lessons of life consists in learning that these two are not separate, and in finding out how to reconcile them in our conduct. A few may have learnt the lesson; but the great majority have not, and still go on looking upon work as opposed to gladness.

Food-faddism, and other forms of anxious precaution, are due to the morbid excess of a quality which, in due moderation, is excellent and necessary. It is right and needful that we should be wise and prudent. But it is also right and needful that we should be joyous and unanxious; and it is owing to our incompetence that we fail to balance these two faculties and that we fall into extremes.

The problem is a very old one and familiar; yet Theosophy can, in this case as in others, shed a light that shall be effectual; for the wisdom of Theosophy is *practical* wisdom.

To balance two such forces, we must take up a firm position on neutral ground, and rise to a plane that is elevated above the conflicting moods, like one holding a balance by the center. To an ordinary person, with no clearer ideas as to human nature than conventional philosophy (such as it is) affords, such a higher plane would be vague and abstract. But Theosophy reduces the vagueness to a practical reality; for one of its cardinal teachings is that *there is* in man a soul or mind which is steady and unwavering, and that, when we have learnt to recognize this as the true Self, we can look down upon the changing moods as from a vantage ground.

This is in fact the very thing that practical students of Theosophy at Lomaland and elsewhere are learning to do. The keynote of the training, as applied in the case of children in the Raja Yoga Schools, and in the case of adults in the course of their daily experience, consists in the constant endeavor to become independent of all those pulls and pushes of the lower mind and its moods which make life such a slavery. And this is to be accomplished by so living as to render the Soul ever more and more of a reality. The voice of the Soul is one of wide sympathy and love of human nature; and it can readily be understood that such an atmosphere precludes alike carelessness and sordid care.

Anxiety and heedlessness are among the many conflicting moods that harass us when the tide of life and spirits is at a low ebb. Both vanish in the light of vital energy and high purpose. Life is not for toil nor for wantonness; let us be glad and vigorous like Nature. STUDENT

Notice

Attention is called to the importance of having all remittances to or for any of the different Departments of the International Theosophical Headquarters at Point Loma, California, sent either by postoffice money order or by draft. Otherwise responsibility for any losses must fall upon the sender.

AMBITION

N. P. WILLIS

HOW like a mounting devil in the heart
 Rules the unreined ambition! Let it once
 But play the monarch, and its haughty brow
 Glows with a beauty that bewilders thought
 And usethrones peace forever. Putting on
 The very pomp of Lucifer, it turns
 The heart to ashes, and with not a spring
 Left in the bosom for the spirit's lip.
 We look upon our splendor and forget
 The thirst of which we perish.

Press Ingenuity About H. P. Blavatsky and Thibet

MADAME BLAVATSKY has truly shared the fate of all great reformers in arousing the undying spite of the worst enemies of reform. In her personal character she was as utterly devoid of all interest in certain tabooed questions as a healthy child. There was no vestige of sentimentalism in her frank robust disposition, and the very suggestion of grossness and sensuality nauseated her. She was refined not only in character, but in physique, and she toiled courageously against bodily weakness brought on by her life of self-sacrificing labor—her iron will keeping the body alive long after its decease was due.

In a certain newspaper, after a vile attack upon H. P. Blavatsky's personal character, the following paragraph occurs:

Col. Younghusband's expedition has thrown some light upon the mysterious land. It has been discovered that the people of Thibet are, without any question, the most filthy people on the face of the globe. Since these discoveries, we may expect that some of the glamor will be rubbed off Theosophy.

The same mail brings us a glowing description of the wonderful palace of Lhasa, opened to the world by Col. Younghusband and described in a book written by a member of his expedition. The author says: "All that romantic phrase suggested beforehand was realized to the full;" and that the Golden Roofs of Potala will recall "to those who saw them the image of that ancient and mysterious faith which has found its fullest expression beneath the golden canopies of Lhasa."

At the same time Thibet is no more connected with the philosophy and truths of Theosophy—as such—than is the Eiffel Tower in Paris, or the Moscow Kremlin. Just as logically might one suggest the *glamor being rubbed off Christianity* because the Holy Land (?) has been found by travellers to be no more than it is. Theosophy is universal, depends no more on Thibet than on the North Pole, and it seems safe to say that the true Theosophist would welcome the sight of that great portion of the Celestial Empire called Thibet entering into comity with other nations. Thibet has her mysteries, many of them; and those which vitally affect the spiritual well-being of mankind will never be touched by armies nor commerce, by railways nor "spheres of influence." STUDENT

The Buddha Brand

PASSING down the street of an English city one day the notice of the writer was attracted by a box of cigars in a shop window. On the lid was printed the well known figure of one of the greatest men who ever dignified the human form, and underneath ran the legend "The Buddha Brand." Alas for the gross barbarity of the western world! It aptly illustrates the prevalent contempt for alien faiths, that we can find no better use for the title of one of the Helpers of the world than to make it serve as a tag or label to an article of common indulgence.

One may excuse the manufacturer in his busy, strenuous life for knowing but little of Buddha's teachings; but he surely might have had the grace to respect the feelings of the millions of his fellow-men in Burmah and Ceylon who reverence their Elder Brother as a divine being, and as the

loftiest ideal of manhood of which they can conceive. Imagine the outcry that would be raised if a Christian tourist should discover the head of him whom the Occident regards as the incarnation of Divinity, stamped upon a cake of toilet soap in the shop of a Rangoon barber! But the supposition is preposterous, for the so-called heathen have too much consideration for the religious beliefs of others. It is said that one of the war-cries of the present conflict in the Far East is "Asia for the Asiatics," and with this incident fresh in our minds the sentiment is not surprising.

STUDENT

Darius Slays His Temper

IN a history book, under the head of Persia, occurs a picture of an ancient bas-relief, representing a man vanquishing an animal which is a compound of lion, bull and eagle. It is headed, "The King Slaying a Monster;" and very likely it was the figure of Darius, or was honorably so entitled; for another picture represents Cyrus with symbolic wings and head-piece. But, while admitting that the Persians honored their kings by including the royal likeness in such symbols, we cannot fail to see the meaning of this figure. The bull, eagle, lion, and man, are the well-known quaternary of symbols that make up the Sphinx and represent the cardinal forces in human nature. The man is slaying his temper, represented by the monster. He has it by the horn on its head, and with his other hand is stabbing it in the belly, as it rears up against him.

We are all kings, though most of us are still, like Nebuchadnezzar, eating grass and going on all fours. But some day, and that the sooner the better, we shall confront in mortal combat that monster that balks our majesty. We shall seize him *by the head*, wherein lurks the *pride* that is his strength, and thus we shall be enabled to conquer him in the body also.

STUDENT

FRIENDS IN COUNSEL

DEAR COMRADES: From certain points of view, the situation in the world to-day may appear to justify the gloomiest forebodings for the future of the race. But we should bear in mind that though abuses are so much in evidence just now, it does not follow they are springing into life for the first time. Society is in a critical transition stage, and as a boiling cauldron mantles over with a seething scum, so we may imagine purifying processes at work searching and bringing to the open daylight that which has long been lurking unsuspected in our midst.

Is it not often thus in personal experience? A vigorous awakening of the spiritual life frequently causes whatever faults we may have to come to the surface, and, by contrast, to appear greater than we may have hitherto thought them. But it is just this that gives the opportunity for complete conquest over them, and for a deeper knowledge of our complex natures. A very little self-examination is enough to show that there may be tendencies in our natures, both good and bad, which have not revealed themselves for lack of favoring circumstances, but which we must some day face. And yet there is no need of discouragement, and, however dark the prospect may appear, we can at least console ourselves with the reflection that as we come to know our weak and strong points, we may be on our guard against the former and can strengthen the latter. It may be, too, that in strict proportion to the depth of our sincerity, our inward foes rise in their strong battalions; but the most elementary tactician is aware that a declared opponent, openly confronting us upon the field, is better far than a lurking enemy concealed in ambush.

Those who are cowards often make complaint about their difficulties and regret the need of conflict; but a soldier's business is to fight, and but for opposition he would lack the opportunity for exercise of all his varied powers. Many a worker for humanity has persevered in a life-long struggle against the greatest obstacles; but in his daily combat, energy was freed which reinforced and made invincible his efforts for the public good. The man without the will to put his high ideals into action, might be as pure and beautiful and blameless as a white-winged angel in a stained glass window—and as ineffective too.

The world is calling out for men of balance.

Such men preserve their equipoise by never-wavering control, and vigilance that never sleeps, and thus they pour the whole of their superb subjected powers into the channel of man's ceaseless need. STUDENT

A Minister as Water Diviner

NO less a person than the head of the Congregational Union in England, a scholarly and eminent clergyman, has been trying his hand at water-divining, and might now perhaps call himself "Doctor of Divination." He gives his experience and opinion as follows:

At a certain point the water-finder held the forked stick over the road, and the stick immediately bent downwards. He said that there was water underneath. I was a little sceptical, and when we came to a place where there was open running water, I asked him to try again. He did so, with the same result. I then suggested that the same thing would occur if any one of us held the stick. All

Act of Charles II Still in Force in England

AN English tobacconist has been fined 156 times, being once a week for three years, for Sunday trading in contravention of the Act of Charles II. The fine amounted to 7s. 6d. each time, including costs. Thus there are ways of satisfying both the progressive spirit of the times and the demands of antiquated literalism in religion; while the law reigns on in undisturbed and relentless majesty, and the officials and the trader divide the profits between them!

The Depth of Wells

THE following are some figures representing the depths of the deepest wells known. At Passy, France, 2000 feet; at Neusalwerk, near Minden, 2288 feet; Columbus, Ohio, 2775 feet; La Chapelle, Paris, 2950 feet; Pesth, 3182 feet; St. Louis, 3843 feet; Sperenberg, near Berlin, 4190 feet, or about four-fifths of a mile deep.

Curious Legal Problem

THE following legal conundrum recently caused much learned discussion among judges. Who was the "next eldest brother," referred to in a will? The testator had both elder and younger brothers. The counsel being divided, three judges took the problem in hand. Of these, one thought the expression meant a younger, another an older, brother; and the third could not make up his mind. The case was referred to an appeal court. Clearly only an estimate of the testator's probable intentions, based on a knowledge of the family, could settle such a point.

Overwork and Drugs

AN ENGLISH neurologist has been combating the idea that overwork and the swift life of cities are directly responsible for the ever increasing number of cases of nerve collapse, nerve disease, and insanity. It is not the work, but the stimulants and drugs used to combat the warning signs of exhaustion. If it were not for the drugs, nature would compel sleep and rest, even if she had to bring on an acute illness to effect her purpose. But, drug-aided, against the warnings, men push on; and when at last they do collapse, they find that they have bankrupted themselves of the whole of their reserves, and the breakdown is final.

Filipino Bands and American Tunes

AN exchange describes how the Filipinos are a musical people and every district has its native band. When the Americans came, these bands quickly learned American tunes, but without having any idea of the different shades of sentiment attached to the melodies. So, one Sunday at a cathedral, the elevation of the host was celebrated by the band striking up, "A Hot Time in the Old Town To-night." Upon being remonstrated with, after the service, the conductor agreed not to use that tune again; but the remonstrance proved of little use, for on the next celebration the tune was "Johnny Get Your Gun."

"A MAN should say, I am not concerned that I have no place, I am concerned how I may fit myself for one. I am not concerned that I am not known, I seek to be worthy to be known."

The Master said, "I have talked with Hwuy for a whole day, and he has not made any objections to anything I said;—as if he were stupid. He has retired, and I have examined his conduct when away from me, and found him able to illustrate my teachings. Hwuy! He is not stupid."

The Master said, "See what a man does. Mark his motives. Examine in what things he rests. How can a man conceal his character!"—Chinese Classics

AUGUST 27, 1905

No. 42

from which as time went on it gradually grew.

And so, in one way and another, Homer as a personality was gently made to disappear. But a very erudite German, Friedrich von Blass, has now re-established him. He brushes, as it were, the dissectors and critics aside, with the obvious but needed remark that a great poem is evidence for a great poet. Why, he asks, should so many poets have conspired together to write about two periods of six or seven weeks each? And why should their work in this particular have survived whilst all the rest has disappeared? If they wrote nothing else, why not? Why did they leave all other epic subjects to lesser men?

In general, if the lack of unity and the chronological inconsistencies existing in the Homeric poems, be evidence against their unity of authorship, then on the same grounds we must call in question the unity of authorship of some of the greatest Greek masterpieces, as well as many of the masterpieces of more modern times.

Perhaps the tendency to sentence the great figures of the past to non-existence, if they should presume to exceed a certain stature, to overlength the critic's yard measure, may soon come to an end. STUDENT

Mercury Poisoning and Its Prevention

AS is well known, the workers in mercury mines, and at all occupations that involve the use of that metal, come to suffer from a peculiar form of nerve poisoning often finally ruinous to health, and, if the occupation is not changed, ultimately fatal. In the mercury mines of Spain, Austria, and America, it is usual to wait till the workers show some signs of the disease, and then move them to a part of the works where the presence of the metallic vapor is at a minimum. Even then it is doubtful if health is ever again quite recoverable. A contemporary reminds us that during the sixteenth century thousands of Indians, compelled by the Spaniards to work in the celebrated Santa Barbara mine at Juancavelica in Peru, must have died of this cause. So large is this mine that it contains a subterranean village with a church cut out of the cinnabar. So the dying Indians perhaps did not lack religious ministrations. Spain has always looked after the *souls* of her victims.

But a preventive remedy has at last been found. Aluminium in a finely divided state, it appears, will absorb mercury even when only present in minute proportion in the air, and declines to give it up even at a temperature twice as high as that of boiling water. Respirators have therefore been made of fine aluminium gauze which will absorb every particle of mercury vapor. Government should see to it that mining companies are compelled under the severest penalties to supply them to their men, and the men to wear them. Selfishness will doubtless be in the way in one case, and stupidity in the other. But we ought to have learned something from such examples as the difficulty of inducing railway companies to adopt safety couplers, and coal miners to adopt the Davy safety lamp. STUDENT

Enriching Europe

A NEW and curious comment on our national revenue returns is made by *The Financier*. It appears that the excess of our exports over the imports for the closed year was \$400,000,000. Which means that for work done in this country that much pay, in some form, has come in from abroad. This looks very well; but there is another factor. Wealthy Americans go abroad every year in great numbers, live luxuriously, buy pictures, freely spend money in all ways, spend it—it is estimated, to the tune of \$600,000,000. So a balance of \$200,000,000 is on the other side after all, and we are a source of steady wealth to the countries of Europe. Of course there is no remedy; and if one person in ten in the country—according to recent estimates—were not on or over the starvation line, we need not wish for any. STUDENT

The Bluffs of Newspaper Politics

READING a paragraph about the European powers, their armies, their mutual approaches and estrangements, and so on, one is struck with the idea that all this newspaper talk is "up in the air" and bears very little relation to truth. The keeping of huge armies and navies is a game of bluff; the jealousies, threats, policies and all the familiar appurtenances of the game of politics as played in print, are mostly imaginary. When anything does happen, it is seen that events move calmly on in their own way, which is *always unexpected*, and take but small account of our imaginings. We are still talking

with bated breath about a sovereign who is supposed to be very masterly and to have a first-class army and navy at his disposal and all sorts of sinister plans; but we might have learned from recent events not to be overawed by a mere reputation, however long maintained, until it has stood the test of actuality.

The nations seem like a band of secret sinners, each afraid of what the others may do, and each ignorant of the others' real weakness. No nation with a good conscience would need to fear all these warlike preparations. The deadly cankers of inefficiency, disunion, disloyalty and corruption outweigh all the seeming power, and will turn the sword against its wielder. STUDENT

The Inexhaustibility of Coal

THE report of the recent English Royal Commission on coal supplies points out the unexpected fact that if the working of English coal mines continues at the present rate, it will nevertheless be 500 years before the supply begins to fail. In 1820 Great Britain raised but 20 million tons of coal; now she is annually raising 230 million. The Commissioners remark that long before the 500-year period is ended, there will be other ways of getting energy than from coal.

A scientific contemporary, commenting on the finding of the Commission, tells us that the *world's* supply is too vast to be exhausted by any demand that humanity will make upon it in any calculable period. In China, for instance, there are enormous coal measures as yet untouched. Seams from 30 feet thick and upward have been traced in a horizontal plane for 200 miles towards the Mongolian frontier. And every addition to the engineering technique of mining means the opening of immense coal deposits in many places over the earth. STUDENT

The Recapture of Saghalien

WHEN the Japanese took Saghalien they merely took what was their own. It is now thirty years since Russia took it from them, giving them in return what was not hers to give, namely the Kuriles. Moreover, whilst the Kurile Islands measure but 3000 square miles, Saghalien measures 30,000. Russia has since used it as a penal colony.

The real name of the Island is Karafuto, and it is of some considerable archeological interest since it is known to have been inhabited since the neolithic age. Flint instruments, sharp stones and hatchets, and pottery are found dating from this period—whenever it may have been. Then came a people who could work in bronze; and then the present mixed population of Ainos, Mongolians and others. Who the Ainos are, nobody knows; they are not Mongolians. They are also found in Yezo, and seem to be the earliest inhabitants of that country. STUDENT

The Progress of Italy

NOTWITHSTANDING the Italian population's tendency to emigrate, we are assured by a well-informed writer in *L'Italia Moderna* that the condition of the country is increasingly prosperous. He points out that the public debt pays an interest of four per cent and is quoted at 107; that the quantity and value of agricultural products is three times what it was thirty-five years ago—the famous 1870; and that exports are three times what they were as recently as fourteen years ago.

Of course this makes pleasant reading, but after all what about those emigrants? If certain districts are congested, why do not the emigrants go to less congested places in their native country? The answer is of course that they know they can earn more here. Italy must not be content till she is prosperous enough to be able to keep her own people. C.

An Irish Gold-Mine

GOLD has again been discovered in Ireland, this time in the mountains of Donegal, and the average quantity of the metal in the assaying is two ounces to the ton. The ore, which also contains silver and lead, is thought to be very promising, and regular mining is being commenced. R.

The Health of Cuba

Reports received from Cuba indicate that on account of the great attention that is being paid to sanitary conditions in the Island, there are no cases of yellow fever; and under the strict régime that is being carried out by the officials in charge, there probably will be none, notwithstanding the prevalence of the disease in the southern part of the United States.

Some Views on XXth Century Problems

Schoolroom Psychology

AN editorial writer in *American Medicine* argues for the treatment of certain cases of sudden laziness in children as physical disease. "A child, for example, enjoying heretofore good health, all at once undergoes a radical change; he becomes slow in his actions, takes more time than usual in eating, dressing, studying; his intellectual faculties become less vivid, memory fails, he lacks attention." This condition we are told to regard as physical ill-health, and treat accordingly.

In certain cases, such conditions might of course mean the oncoming of typhoid or other considerable disease; but it is not to these that the writer is referring. Putting them aside, and confining ourselves to the vast majority, we may say at once that it will be well enough to give medical treatment for any definite physical symptoms that may be present, but that to treat the condition as primarily physical will be a deadly mistake. What is really going on will be made evident by the fact that sympathetic (or rather sentimental) treatment *will infallibly cause the complaint to become infectious*. In other words the real focus of the evil is deep in the child's *mental* nature, and though physical symptoms may follow, they are effects. The *wisely* sympathetic teacher who will look straight into the child's eye and tell him that, will see a sullen little flash come up for a moment out of the depths. It will be gone in a moment, but the teacher will now understand that a little hiding mental imp knows that it has been detected. The rest of the child's mind as it were at once knows, and does not know, what is present in it. But if it is made quite clear to him that he is expected to use his own will in arousing himself and that no quarter will be given till there are evidences that he *is* using his will, the situation will soon clear. We are not arguing for corporal or any other kind of punishment; only that the child shall be made to understand that he is understood, that he cannot hide from the teacher what he is very likely trying to hide even from himself; and that cordial praise shall be freely and at once given to him for the least evidence of right effort to use his will. Then each such attack will become for him a lesson in real psychology, in the duality of his own nature, and in the power of his will over the lower elements. This method has been successfully pursued for years in Katherine Tingley's Raja Yoga schools at Point Loma and elsewhere, and no punishment has ever been necessary. STUDENT

Testing a Nation

IT came out at the recent meeting of the British Union for the Abolition of Vivisection that in 1904 there were 32,562 vivisection experiments as against 19,084 in the previous year—a notable increase. But the number of licensed experimenters was almost the same—366 against 347. Considering that nearly all these are physicians, why does not the Union try a little experiment of its own to test British feeling on the point? If the names of this small crowd of malefactors were repeatedly published, British abhorrence of, or indifference to, their vivisectional work would be indexed by the falling off, or by the unaffected maintenance, of their professional practises. If a fair proportion of them were ruined, it would mean that the English nation objected to have vivisectioners at its bedside. It might also turn out that the nation objected to meet vivisectioners in its drawing-room. It seems only fair to these men, who assure us that they are working in the interests of suffering humanity, that their noble efforts should be known and their modest blushes disregarded. C.

Waiting Faculties

A German student of myths, who possesses a well-developed sense of humor, remarks that no record of the mythical Golden Age mentions the occurrence of natural accidents in that happy period. Were there no earthquakes, no avalanches, no tidal waves? If there were such calamities with their attendant deaths and mutilations and bloodsheds and bereavements, could the Age really have been Golden? And then, looking ahead, he questions whether for the same reasons a Golden Age can be in store for us in the bosom of the future. Machinery

may simplify; new and easily managed forces may take the place of the brutal monsters we now harness; in a word all preventible accidents may then be prevented accidents. But what of the great forces of nature?

Our philosopher is joking, but one may nevertheless suggest an answer to his question. Suppose another faculty should develop, a faculty isolated instances of whose action are scattered everywhere, even in the newspapers of to-day. Animals often know long in advance of men of the coming of an earthquake or a storm, we know not how. Why is it impossible that men living purely, in touch with nature, with intuitions unsoiled and unsilenced by impurity of conduct and desire, should regain what belongs to them as the highest of the animals? Perhaps even now these intuitions speak if we knew how to interpret them.

And besides these subtle animal intuitions, arising from delicate sensory touch with nature, warnings might also come from the soul itself.

We cannot dogmatise. We can only be sure that man's consciousness has faculties in germ of whose full flower we can form no conception, faculties which will place him in quite other relations to space and time. The blossom will begin to show itself the moment he permits. STUDENT

Sentimental Illumination

THE letter of which the subjoined is a part was recently read in an English Police Court. It was found in the pocket of a young man who had committed suicide:

Mother—I have carefully considered the different ways of life, and as things are I have chosen no way at all. This should be a man's life—Love. It will be seen soon that of all the mighty forces of nature, Love is the mightiest, the mightiest, the mightiest—silent love. No man loves perfectly, as the state of the world proves. When a man loves perfectly, he will be as a god. The suffering that may be in the world is all the result of self-love. Well, it seems reasonable that a man's first thought and affections should be for himself. People say "Look after No. 1." Now I have proved to myself that man has but one enemy, but one—and that is himself. I believe that the most paying thing in the world is self-sacrifice, strange though it may seem. . . . Man comes into the world in most cases with a pure mind, a sound mind, a happy mind, a right mind. As he grows he follows the old, old custom, that is, he looks after No. one (No. 1), himself. In 18 years he is insane, miserable, suicidal, may be. All the result of self-love. Now, if a man can sink to such a state from his birth by self-love, can't he rise to a corresponding height by the right love, the true love? Certainly.

As the remainder of the letter showed, the writer was not strong enough to take his own medicine. In a fit of morbid and emotional self-depreciation, he proved false to his principles and took his own life. That sort of illumination which stands in no relation to the will necessary to practice it is very common, and usually the result of morphinism or the early stages of private vice. Its almost invariable sentimentalism marks it off from the real thing. PHYSICIAN

Tested Patriotism

IN the interests of the health of women, the German Society for Social Reform is pressing a bill to limit the working time for adults of that sex. The provisions are very modest: That the day of eleven hours come down to ten; that overtime, when permitted, should never mean more than twelve hours; that there be a dinner pause of an hour and a half; that there shall be no factory work for eight weeks after motherhood—though, by special medical certificate, the eight may become six.

This bill meets with almost unanimous opposition from the employers. Boiled down, their objections are that their trades would be injured. Collective selfishness does not usually care to take quite so open a form. As a matter of fact, of course, the small loss would fall nearly entirely upon the consumers, and only upon the employers as such.

Questioned individually, these men would probably profess much anxiety for the future stamina of their country's working classes. In a general sense they are really anxious for the perfection of the German physique. But when it comes to sacrificing something to secure that physique, their minds throw up a thousand reasons against doing anything.

What an illumination of the reality, or unreality, of vociferous "patriotism" one gets occasionally! It is limited to no one country. STUDENT

NAG-KON WAT, CAMBODIA. PERISTYLE OF THE GALLERY OF BAS-RELIEFS

Cambodia: A Stupendous Monument of the Past

CAMBODIA, in the extreme south-eastern corner of Asia, between Cochinchina and Siam, is one of the most interesting archeological places in the world. It is the relic of a very ancient and splendid kingdom, to the fame and glory of which there is abundant historical testimony, while its numerous and stupendous ruins bear out the records.

The people speak of their own race as the *Kbmer*, and say that they immigrated from the North. Local records mention two early immigrations from India, and the annals of Ceylon record that a Buddhist mission was sent to the "Golden Realm" about 200 B. C. The Chinese annals mention, under the name of Fu-nan, 12th century B. C., a kingdom which embraced Cambodia; and about 125 B. C., a Chinese emperor made the country tributary. Ptolemy speaks of it, as also do Arab narratives. M. Abel Rémusat has translated an account of Cambodia by a Chinese envoy sent about 1300 A. D., and the writer's accuracy as to topography and the ruins proves his reliability. He describes the magnificence of the court and capital, and the many fortified cities.

The ancient architecture is scattered all over the country. It includes large walled cities; palaces and temples, vast and richly sculptured, and with long galleries of bas-reliefs; artificial lakes within stone walls; stone bridges of wonderful engineering skill; embanked roads; etc.

The ancient capital Nag-Kon Thom, which was called Inthapataburi, after the capital of the Pandus in the Mahabharata, has walls $8\frac{1}{2}$ miles around and 30 feet high, and five richly embellished gates. Five miles south of the city is the Nag-Kon Wat, a great temple described as one of the most extraordinary architectural relics in the world.

It is enclosed by a quadrangular wall 3860 yards around, outside which is a wide ditch. The architecture and sculpture defies all description. The towers rise to 180 feet and upwards. The design is partly Indian, partly allied to other remains in Java, and partly of a kind not known elsewhere. A striking feature is the *Roman-Doric* character of the pilasters (see illustration).

Frank Vincent, a traveler, says:

"We whose good fortune it is to live in the nineteenth century, are accustomed to boast of the perfection and preëminence of our modern civilization; of the grandeur of our attainments in science, art, literature, and what not, as compared with those whom we call ancients; but still we are compelled to admit that they have far excelled our recent endeavors in many things, and notably in the fine arts of painting, architecture and sculpture. . . . In style and beauty of architecture, solidity of construction, and magnificent and elaborate carving and

sculpture, the Great Nagkon-Wat has no superior, certainly no rival standing at the present day. The first view of the ruins is overwhelming. . . .

"We entered upon an immense causeway, the stairs of which were fixed with six huge griffins, each carved from a single block of stone. The causeway is . . . 725 feet in length, and is paved with stones each of which measures four feet in length by two in breadth. . . . The outer wall of Nagkon-Wat is half a mile square.

. . . The entire edifice, including the roof, is of stone, but without cement, and so closely fitting are the joints as even now to be scarcely discernible. . . . The shape of the building is oblong, being 796 feet in height and 588 in width, while the highest central pagoda rises some 250 odd feet. . . .

"We enter the temple itself through a columned portico, the façade of which is beautifully carved in basso-relievo with ancient mythological subjects. From this doorway, on either side, runs a corridor with a double row of columns, cut—base and capital—from single blocks, with a double oval-shaped roof, covered with carving and consecutive sculptures upon the outer

wall. This gallery of sculptures, which forms the exterior of the temple, consists of over half a mile of continuous pictures. . . . There is no keystone used in the arch of this corridor. On the walls are sculptured 100,000 separate figures. One picture occupies 240 feet of the wall. As many as 1532 solid columns have been counted."

In some notes on the very numerous and gigantic ancient architecture of Java and neighboring islands, which must be held over to another number of the *NEW CENTURY PATH*, the connection is shown between these remains and those of America and other parts of the world; all of them being the work of those mighty races of the past of which H. P. Blavatsky speaks. STUDENT

Mysteries of Chinese Turkestan

THERE has recently started from Berlin an expedition to explore Chinese Turkestan, a region mostly desert where ancient civilizations have been buried. The last expedition, under Grunwede, brought back a collection of statues, paintings and manuscripts, said to be from ancient monasteries known to have flourished in the Fifth century.

Chinese Turkestan, or Eastern Turkestan, is a vast depression in the great plateau of Eastern Asia, bordered by the Pamirs on the west, the Kuen-Lun mountains on the south, the desert of Gobi on the east, the Tian Shan mountains on the north. It is really an elevated plateau, but is depressed in comparison with its surroundings. It is mostly unknown desert, and the only river, the Tarim, is now lost in the marshes of Lob-Nor. Kashgar, the chief town in the west, has a floating population of about 50,000. It is in the midst of desert, but mountain streams render cultivation possible. To the east the desert stretches 2000 miles; the whole region being composed of that peculiar friable dusty drift known as *loess*. There are other similar towns, situated on oases, and occupied by mixed Aryan and Turanian populations. Little is known of the history of the country. It has been by turns under the sway of Chinese, "Huns," Turks, and other races; and most religions, including Zoroastrianism and Nestorian Christianity, have flourished there.

In view of the finds now being made, one may quote the following from H. P. Blavatsky (1888):

"According to the traditions of pilgrims the now desolate regions of the waterless land of Tarim . . . were in the days of old, covered with flourishing and wealthy cities. . . . The same tradition speaks of immense subterranean abodes, of large corridors filled with tiles and cylinders. It may be an idle rumor, and it may be an actual fact."

She also speaks of secure hiding-places, known to certain guardians, where are preserved treatises on those sacred mysteries whose keys were withdrawn from public access when times of degeneracy set in for the world. STUDENT

✧ The Trend of Twentieth Century Science ✧

A Dietetic Impostor

THE writer of an article in the *London Academy* on the action of alcohol is grieved that he has been allowed to publish his article!

He recites, he says, a series of facts well known to the medical profession and to be found in every physiological or other scientific primer that deals with alcohol.

"Recently some fifteen thousand doctors presented a petition to the Government, praying that the truth about alcohol be taught in our schools . . . and last week there was held in London a medical conference, presided over by the King's physician, at which it was resolved that the profession must set its shoulder to the almost superhuman task of educating the Board of Education in this matter."

In other words, in respect of knowledge of the true action of alcohol, the public is still where the medical profession was sixty years ago. So, the writer says, "It is possible for me, without a spark of originality, to recite commonplace facts which are to be found in every primer, which illustrate principles the neglect of which blights millions of human lives and personally affects every inhabitant of these islands; and yet to insult nobody."

In the public mind, alcohol still ranks as a "stimulant," even a "tonic." The public knows that Paul was paid, but does not know that Peter was robbed to do it; knows that stimulation is gained in one place, but does not know that it was at the expense of paralysis in another; knows that one organ is toned, but not that several others have had to be weakened; knows that it feels better after a dose, but does not know that a later lassitude is the inevitable reaction from that same dose. And not knowing these, goes on admitting alcohol, the physiological forger, thief, and liar, into its family. PHYSICIAN

The Flat Earth Fantastics Again

FRENZIED Astronomy is about to precipitate itself upon the devoted shores of practical America, in the guise of a small, but highly enthusiastic and self-satisfied band of "Zetetics," as these eccentric survivors of unenlightened times call themselves. That high-sounding name strikes the vulgar imagination more impressively than any term suggesting the flatness of something besides the earth! This heroic band of apostles of flatness, who desire to set us all right, are apparently educated people, and afford a curious example of "reversion to ancestral types" in certain ideas which had, one might have thought, received their death-blow from Galileo's telescope, despite the frantic efforts of bigotry to stem the rising tide of intelligence. For over a thousand years, the ancient true knowledge of the stars and the earth's shape and movements had been lost in the West, obscured by monkish ignorance and prejudice, but with Galileo, Copernicus, Kepler and Newton, the veil was rent, and the clear light of Truth grudgingly allowed to be seen when it could no longer be hidden. And yet now we are asked by a few self-hypnotised medievalists to return to the ignorant foolishness of the dark ages! The writer of these lines once had the curiosity to enter into a newspaper controversy with the then high priest of the cult and during the course of the correspondence it became evident to the readers that his arguments were not straightforward, but were based upon false premises and supported by quibbles with words. He also trusted in emotional appeals to theological prejudice.

The main facts of astronomy are absolutely proved. *Anyone* who takes the necessary trouble can conclusively demonstrate the motion of the earth for himself and it is almost insulting to our readers to speak of such a preposterous idea of a flat, motionless earth in civil terms. R.

Our Various Memories

HOW many modes of memory have we? Where there is a choice possible, most people use some one of the various modes in preference to another. Some cannot learn poetry unless they see it in print, and in all subsequent recitations of what they have learned they have to call up the picture of the page. Another will learn it best by having it read to him, and if he learns from a book only does so by repeating it aloud. Those who have little development of the additional memory are of course those who find great difficulty in recalling music. Then there is the motor memory, which is very likely to go below the

threshold of consciousness altogether. It is often strikingly developed in pianists, so much so that they may continue to play as they would to walk whilst consciousness is largely occupied with a conversation or a train of thought. The various memories stand in very various relations to the will. To hold a picture in the visual memory and go over its details usually requires a sustained effort of will. Phrases of music and other contents of the additional memory much more often come up of themselves, and when they come they often haunt the consciousness. Music will sometimes go on reproducing itself for hours.

More exercise of will than for any of these is demanded by the intellectual memory, the memory that recalls the steps of an argument or of a demonstration in geometry.

And there is probably another memory, requiring the exercise of will more than any other, a memory of which we know almost nothing, the spiritual memory. This is the memory which holds past states of spiritual feeling, the memory of states of spiritual consciousness, evidently in much higher development in the East than among us. Most of us can only call it to action by calling up the surroundings in which such feelings arose. Yet our spiritual progress must sometime come to depend upon the acquirement of the power to call upon this memory independently of any aid. STUDENT

Cameras as Witnesses

THE number of persons killed by overdriven motor-cars is becoming so great in England that the police are calling in the aid of science to detect the offenders. An instrument has been patented which places the unlying camera in the witness-box. In its use a stretch of much frequented road is accurately measured and a police officer is stationed at each end of this tract. Both are provided with cameras the plates of which are arranged for an exposure of one-thousandth of a second. The car and the occupants are thus photographed twice. But both cameras contain watches synchronized with each other and so arranged that they are photographed with the cars. Comparison of the two pictures thus gives the exact fraction of a second at which the car passed the two officers respectively. This, with the length of road intervening, gives the exact speed. And the portraits of the people make their identification easy. The only precaution necessary is to continually vary the test piece of road, and to put the detectives in plain clothes. Has officialism intelligence and flexibility enough to see to these points? STUDENT

Survival of the Fittest

PROFESSOR Ray Lankester seems to think that Natural Selection has come to the end of its work with man, and Darwin had somewhat the same idea, expressing himself very gloomily about the future of humanity. Modern man, by his care of the sick and unfit, prevents nature's purpose to destroy them. So they go on producing offspring and diffusing their unfitness.

But we are beginning to learn—and the world will learn it more and more the more it learns the results obtained at Point Loma—that an infant, of almost any badness of heredity, physical or moral, taken early enough and placed under ideally right conditions, may be carried nearly or quite out of reach of the moral and physical taints of its make-up. In this case, the crude way of "nature" is replaced by a far better.

And really, that too is reliance on the eternally regenerative power of the same nature. If she has handed over some of her responsibility to man, on her part the urge towards the perfect type has not ceased, and will not. STUDENT

A New Sense

IN a New York paper a gentleman whom an accident deprived of sight describes the substitutes that gradually developed. Hearing and smell became of course much more delicate and did a good deal to fill the gap. But an entirely new sense developed. "I discovered," he says, "that the delicate nerves in the face could in some indescribable manner discern objects four or five feet away, or, under favorable conditions, even ten feet distant." This sense became as important to him as his ears, and enabled him to walk about safely. STUDENT

COCONUT PICKER ASCENDING THE PALM

The Coconut Palm: Its Home and Its Uses

WHEN Columbus on his third voyage of discovery in 1498, came upon the island which in obedience to a vow he afterwards named Trinidad, he anchored in the Gulf of Paria, off the most southerly point, now called Icacos.

In his letters to Ferdinand and Isabella the great discoverer speaks of the stately groves of palm-trees and the luxuriant forest which swept down to the sea-side, with fountains and running streams beneath the shade; and he "dwells upon the softness and purity of the climate and the verdure, freshness and sweetness of the country."

Today, more than 500 years later, as one stands on a hill from which the whole of the southerly point is visible, one feels the same charm, and the eye and imagination are fascinated by the scene. Around, beneath, beyond, extends a forest of waving coconut palms (*cocos nucifera*) their trunks bending and curtsying to each other in all directions. In the middle distance the waters of the gulf lie sparkling in the sun, and beyond stretches the great South American continent, the muddy water from the mouths of the Orinoco lying far out on the surface of the sea.

Immediately around are coconut palms of varying height, on which hang in profusion flower-sheath, flower and fruit in all stages of development. The flowers, unlike those of other palms, are fructified before the sheath opens; and when the sheath opens it reveals diminutive but perfect nuts surrounded by flowers. It is these nuts alone which come to maturity, all the other flowers quickly falling off.

A few hundred yards below, in a barren circle, can be seen a mud-

cordage and *lianes* (the unbreakable stems of certain vines), he climbs the tree with his cutlass in his mouth, placing his feet against the trunk and hitching up the rope in front of him as he goes. Arrived at the top, he braces himself out from the tree with his feet and casts off the ripe nuts before him, quickly swinging round to do the same on the other sides. He also cuts off dead branches and old flower stems, and clears away ants' nests, all of which are detrimental to the tree.

Nuts for export are deprived of their outside husk, and on arrival are converted into desiccated nut, coconut chips, and various sweetmeats, besides playing a prominent part in the popular game of bowling at coconuts. The brown shell can be made into a variety of useful articles, such as hanging flower-pots, ash-pots, and twine boxes.

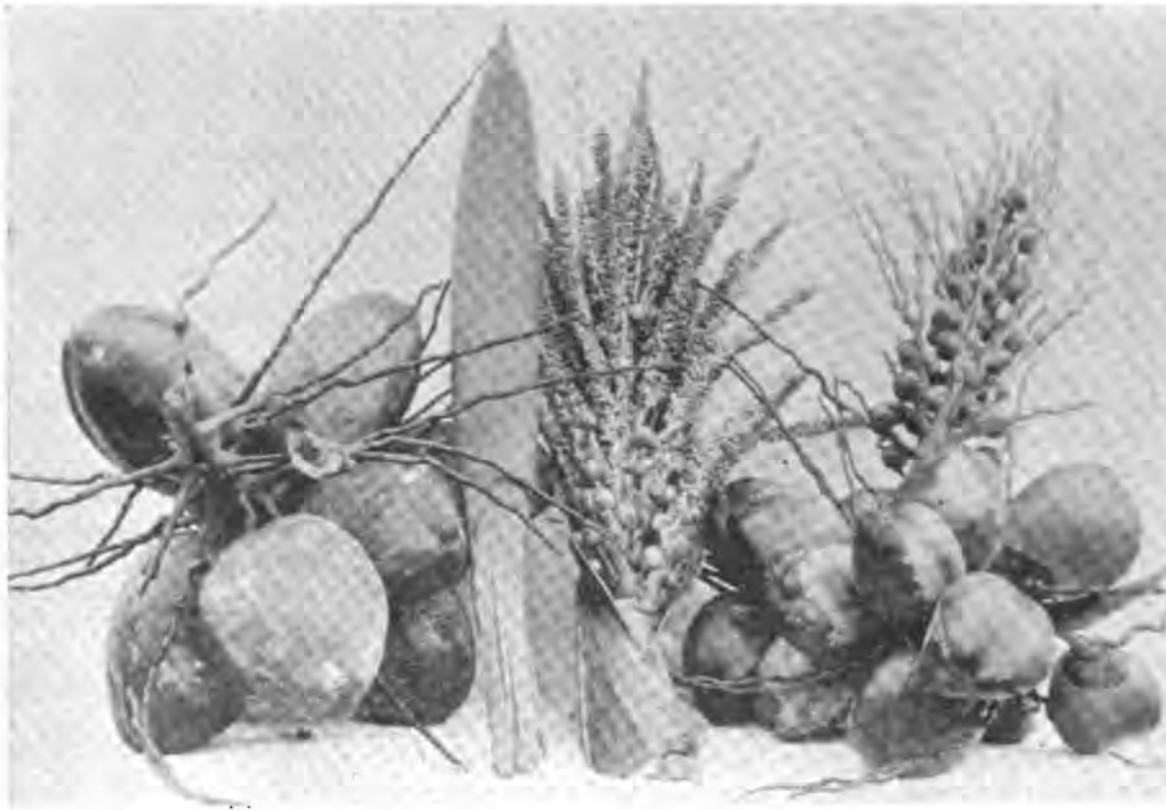

If the nuts are to be manufactured into oil locally, the husk is removed by three deft strokes of the cutlass, and the *copra*, or kernel, dug out. This is dried in the sun or artificially, and the oil extracted under heavy pressure, the meal left form-

ing an excellent food for stock. The fibre of the outside husk, besides being a good fuel, can be manufactured into mats, rope, brooms, etc. The green nut contains a large quantity of water or milk which proves a refreshing drink on a hot day. B. G.

[The word Coco, or Co-coa, comes originally from the Egyptian word *Kuku*. Mr. C. W. Goodwin first deciphered an Egyptian text speaking of a palm 60 cubits in height bearing nuts holding water.]

Do Flowers Adapt Their Colors?

IT is said that if flowers whose colors clash with each other, are planted near together, one or both will slightly change its tint, so as to produce a more harmonious effect. Certainly the colors one observes in nature never seem to clash, though the hues are so many.

THE COCONUT IN TRINIDAD: CLOSED FLOWER-SHEATH, OPENED FLOWERS AND FRUIT

How sweet is goodness of disposition when tempered with
Wisdom!—*Menander*

WHAT is the meaning of life?
Each one of us has asked
herself the question—no

one has ever passed through the gates of life and death without asking it—it is the riddle of the ages that each must solve according to his or her development, that perplexing, vexing question, that, unanswered, leaves us drifting like rudderless barks upon the sea of chance, and the true answer to which steers us straight into the harbor. The meaning of life is its purpose, and with each one of us the purpose of our life is the key-note of our existence.

But how do we ask ourselves this question? Do we ask it carelessly or lightly, sadly or despairingly? Or do we ask it solemnly and reverently, yet with deep hope and confidence that we will find the answer and fulfil our destiny?

Yet with this question woman's education or the lack of it, for centuries past, has inclined her to have naught to do. She was told that it was a mystery that she could not fathom, and that she would better leave it to others to solve for her, and occupy herself with the things of life that lay within her sphere. Think of it in this Twentieth century, the mother of children having no fixed knowledge and purpose as to the meaning of her existence! What are sufferings, trials, struggles, endurance, to lead to—what is all experience and all education to lead to, if not to a truer understanding of the meaning of life? Think what it would be if every woman in the world had this clearly defined, noble knowledge, that life is not a play time, and the best to be gotten from it is not admiration and gratification and ease and luxury and pleasure. And that, again, life is not a tragedy; it is not a weary and hopeless struggle with tired hands and aching hearts. If we will only look up, we will see that it is a golden possession, a glorious opportunity for the manifold powers of the soul to unfold themselves and to make life mean what it should mean—joy and light and love and power! For power is of the soul, like other gifts that in our blindness and ignorance we have often turned into curses. This is a part of the knowledge that women should have—to know all these blessings of life, to recognize them under all their disguises, to rescue and use them and to give them to others.

Let me quote to you from one of the writers who has striven to awaken women to seek this knowledge: "As within the human heart there is always set an instinct for all its real duties—an instinct which you cannot quench, but only warp and corrupt, if you withdraw it from its true purpose; as there is the intense instinct of love, which, rightly disciplined, maintains all the sanctities of life and, misdirected, under-

Woman's Place

mines them; and *must* do either the one or the other; so there is in the human heart an inextinguishable in-

stinct, the love of power, which rightly directed, maintains all the majesty of law and life, and misdirected, wrecks them. Deep rooted in the innermost life of the heart of man, and of the heart of woman, God set it there and God keeps it there. Vainly, or falsely, you blame or rebuke the desire of power! For Heaven's sake, and for Man's sake, desire it all you can. But *what* power? That is all the question. Power to destroy? The lion's limb or the dragon's breath? Not so. Power to heal, to redeem, to guide and to guard. Power of the scepter and the shield; the power of the royal hand that heals in touching—that binds the fiend and looses the captive; the throne that is founded on the rock of Justice and descended from only by steps of mercy. Will you not covet such a power as this and seek such a throne as this?"

If woman had this knowledge of the meaning of life, there would be no more doubt as to what her duties are to herself and to others. Those who are selfish and evil could not psychologize and bind and fetter her with mistaken notions of the word "duty," and make of her, indeed, a beast of burden; for she would see clearly that in the highest sense duties never conflict, and that when doing her duty to herself in becoming as good and as great, as strong and as pure, and as beautiful as she may be—and as wise, not for self-development, but for self-renunciation—she is sharing goodness, purity, wisdom and love with those around her. She would know that she owes a duty to all other women on earth, to uphold the dignity of their station, to be a light unto them, and if they fall, to lift them, as no man can, with strong and wise and tender hands. She would know that she owes a duty to all men on earth, to be a queen to them, and an inspiration to them and to make a constant appeal to what is highest in them. It is not a woman's duty to bear with a drunken husband, for instance, to degrade herself by living with him, nor to let vice or selfishness in any form fasten upon her life and cripple her powers, and ruin her children's lives. And if she took a different stand, if instead of meekly thinking that this is her burden that she has to carry through life, she had the self-respect and the self-control and the courage to declare that she would not tolerate it, and to act upon it—always with the right motive—which of you do not believe that, as there *are* contagious germs of good as well as of evil, she would plant in the man's heart the corresponding germs of self-respect and self-control and courage?

Such a woman would know that it is her duty to make the world better

OUR YOUNG FOLK

The Raja Yoga Question Box

POET and patriot, these two still live in the hearts of the Scottish people.

1 Who was Robert Burns?

ANSWER—Robert Burns is the Scotch national poet. He was born in Ayrshire and died while still a young man. His father was very poor, so that Robert worked on a farm and had very little education. He was very studious and loved to read. When very young he wrote beautiful verses and at last was welcomed by great noblemen because of his genius. He was tender and lovable and kind-hearted, but he did not know how to control himself. That was why he sometimes brought sorrow to others without meaning to do so and why his life was often very sad and filled with regrets. His poems are like beautiful wild flowers.

BANNOCKBURN

Robert Bruce's Address to his Army

SCOTS, wha hae wi' Wallace bled,
Scots, wham Bruce has often led,
Welcome, to your gory bed
Or to victorie!

Now's the day, and now's the hour;
See the front o' battle lower;
See approach proud Edward's power—
Chains and slaverie!

Wha will be a traitor knave?
Wha can fill a coward's grave?
Wha sae base as be a slave?
Let him turn and see!

Wha for Scotland's king and law
Freedom's sword will strongly draw,
Freeman stand, or freeman fa'
Let him follow me!

By oppression's woes and pains!
By your sons in servile chains!
We will drain our dearest veins,
But they shall be free!

Lay the proud usurpers low!
Tyran's fall in every foe!
Liberty's in every blow!
Let us do or die!

—Robert Burns

contest for his kingdom. It was no easy task. Bruce had to gather his followers secretly, and hide them in the mountain fastnesses, till they were strong and numerous enough to face the enemy. It was well for Bruce then, that, besides being able to deal mighty blows with a sword while mounted on a war-horse, he could endure cold and hunger, and take long journeys on foot over the rocks and mountains.

Many were the narrow escapes he had; his pursuers at one time got possession of a bloodhound, which had once been his, thinking thus to track him successfully. But Bruce was too quick for them; he heard the baying of the hound, and guessed their plan. He waded into a stream, then swung himself from tree to tree along the bank so that no trace of his stepping out of the water could be found, and thus put the hound off the scent.

No adventure was too bold for this brave knight, but he was always thoughtful of others even then, and he used to cheer those of his followers who were less strong and brave, by reciting to them tales of chivalry.

By the battle of Bannockburn, Bruce and his army won the independence of Scotland. After this battle, Bruce showed how humane and chivalrous was his character. Many and bitter were the wrongs which had been done by the English army to the people of Scotland; but Bruce treated this conquered army with kindness and mercy. They were his old companions-in-arms, and he did not forget this. He would not permit his soldiers to demand greedy ransoms for the prisoners they had taken; if any of the soldiers were dissatisfied, Bruce gave up to them a portion of a sum belonging to himself.

Soon after the battle of Bannockburn, Robert Bruce was chosen by the

Robert Bruce

WHEN Robert Bruce, the hero-king of Scotland was a youth, he spent several years at the court of England. He was so brave and high-spirited that King Edward I. had him thoroughly trained as a warrior, little thinking that Bruce, instead of winning glory for England, would re-establish the independence of Scotland, and himself reign over the kingdom.

The young Bruce had royal blood in his veins; his grandfather had been a claimant for the Scottish crown; this warranted his ambition to wear a crown, and one day, in the year 1306, Robert Bruce was missing from the court of England. He had hastened to Scotland, where his first act was to have himself crowned at Scone, though the sacred stone of destiny, the royal robes, and even the crown itself were in the hands of the English.

Then, undaunted, Bruce began the

2 Who was Sir William Wallace?

ANSWER—Sir William Wallace is the national hero of Scotland. The Scots had lost their ancient liberty; they had been forced to do homage to the King of England. Sir William Wallace stirred to life their patriotic hopes, and led a daring band of them to win back the Scottish strongholds, and defeat the English. Sir William Wallace was recognized by the Scots as the guardian of his country. He lost the famous battle of Falkirk, and after that he had to carry on a guerilla warfare. A price was set on his head, and, after seven years, Wallace was captured and put to death. Wallace was a man of great strength and stature. He began the work which Bruce finished when he won the independence of Scotland.

Scots, with one voice, to be their sovereign. Then Bruce proved that he could rule a kingdom as well as win one. He reformed the laws and saw that justice was given to the poor as well as the rich. His reign was a long series of successes. He forced the other countries of Europe to recognize Scotland as an independent power, and he proved himself a match even for the Pope, proudly refusing to receive the papal bulls until they were addressed to him as King of Scotland.

Robert Bruce was a champion of liberty, first of all for Scotland, and then for his subjects. Seldom, if ever, has there been a sovereign so illustrious. He found his country enslaved and helpless; he left it free, united, prosperous and honored. Well might the faithful Douglas, who by Bruce's request bore the great king's heart in a casket to the wars against the Moslems, fling it before him when he fell in battle, crying, "Onward, as thou wert wont, thou noble heart." STUDENT

Facts Worth Knowing

A SWEDISH professor has made the discovery that whales inhabit the sea near Norway and Finland only during the winter months. They migrate to the tropical waters in the spring, and are seen no more until the autumn when they return, many bringing harpoons, which bear the names of ships. They are able to swim these long distances in a very short space of time.

ONE hundred years more will be needed to complete the topographical map of the United States, begun in 1882. The States are cooperating in the work by contributing money and by supplying the details concerning the different localities. Heretofore only rough sketches of parts of the country have been published. This map will show plainly the physical features of every part of the United States.

How many boys and girls have heard of migrations of butterflies? They have been seen in Switzerland, and in Brazil, in the valley of the River Amazon, where, in July and August, a tree called arapary is covered with bloom. This blossom has a strong perfume and a honey-tube to which the insects go to get juice. When the migrating butterflies are in the neighborhood of these trees, a detachment of them leaves the main body, in order to visit the flowers, returning later, after describing a sort of circle in their flight.

A SHIP master has recently stated that Chinamen make the best of sailors. They are not inclined to grumble nor to quarrel nor get intoxicated when on shore leave. English ship owners found some years ago that for voyages in the tropics they must have sailors less affected by the intense heat than Scotch or English sailors are, so they employed East Indians. Now it is predicted that American ship owners will select Chinese sailors for similar voyages. Already the maritime business of the Philippines is in the hands of Chinese merchants, and many of their sailors come from Hong Kong.

THE explorers of the Lewis and Clark expedition often heard a strange noise in the mountains of the west. The Indians told them that the mountains made this thunder, which sounded like the discharge of a six pound piece of ordnance. It was caused by the bursting of the rich mines of silver confined in the bosom of the mountain. The miners of Idaho and Montana became familiar with the sound of these subterranean reports.

THE CHILDREN'S HOUR

ORKNEY LULLABY

EUGENE FIELD

A MOONBEAM floateth from the skies,
Whispering, "Heigho, my dearie!
I would spin a web before your eyes---
A beautiful web of silver light,
Wherein is many a wondrous sight
Of a radiant garden leagues away,
Where the softly tinkling lilies sway,
And the snow-white lambkins are at play---
Heigho, my dearie!"

A browaic stealeth from the vine
Singing, "Heigho, my dearie!
And will you hear this song of mine---
A song of the land of murk and mist,
Where bideth the bud the dew hath kissed?
Then let the moonbeam's web of light
Be spun before thee silvery white,
And I shall sing the livesong aight---
Heigho, my dearie!"

The night wind speedeth from the sea,
Murmuring, "Heigho, my dearie!
I bring a mariner's prayer for thee;
So let the moonbeam veil thine eyes,
And the browaic sing thee lullabies;
But I shall rock thee to and fro,
Kissing the brow he loveth so,
And the prayer shall guard thy bed, I trow---
Heigho, my dearie!"

We like to have these pictures put into the NEW CENTURY PATH again because it gives us, and our friends, something by which to measure the growth we have made.

Some of us had just come to Point Loma when this was taken and we have learned many things about Raja Yoga that we did not know then, and have changed in other ways besides growing bigger.

If a boy or girl, no matter how little, really tries to live in the sunshine of the heart, which is the Raja Yoga life, every day is a step ahead of yesterday. In beautiful Lomaland we have so much done to help us in every way that we just cannot help improving fast.

We very little ones who have been here almost since we were born should be especially grateful I think—and we are. You see we have had the advantage of the right training almost from the first—something very, very few children anywhere can have. Not that parents and teachers do not do their very best and are often unselfish and true, but they have not the knowledge of what to do to bring out the real soul life and help a little child to overcome the evil tendencies of its nature.

Some of the grown-ups may think we are too little to know about these things, but we understand a great deal better than they know.

We are trying to become living examples of Raja Yoga so that we can be little teachers. We have so much joy and sunshine in our lives, that we can hardly wait to grow up, to go and tell all the little children in the world about Raja Yoga, and help them to become Brotherhood workers as we are. For we know that the only way to find real happiness, is to be always working for others.

ALICE

ROUND and round went the merry little folks in a game of ring a rosy. A new note in their voices made me stop and listen. What do you think? They had taken Dolly into their game. Her brown knitted arms were firmly grasped by two of the tots and Dolly was dancing around too. This was the secret of their great joy—a new comrade.

M. M.

WHEN Dick, a big black fire-horse of New York, lost his life while on duty, the poor little street boys, who had many times saved their pennies to get cake for him, contributed fifty cents to buy some flowers for their friend. They said he was only a black horse but they loved him and wanted to give him something beautiful for he was their friend.

A CLASS OF TINY TOTS IN THE RAJA YOGA SCHOOL

DEAR FRIENDS: In this picture you see us as we looked two years or more ago, when we were scarcely more than babies, but now we are ever so much bigger and look quite different in school.

vation desired. "Perhaps there will be other ships," he continued. "There can't be the really, truly *last* of anything! Things grow into something else. There can't be the *last* of a thing, of course. I tried last night to imagine the end of the universe, where there would be no stars and no sky or anything—but it was no good; you just can't do it."

"But ships are different, there could be the last ship."

"Not so long as people want to go to places," persisted Alfred. "Of course there might be the last *steamer*, but then there would be other kinds of ships."

"What kind?"

"What they used to have long ago, when there were mighty kings on the earth."

"But what kind?" repeated Tommy with interest.

"Air-ships."

"Ships that float through the air?" said Tommy excitedly.

"Yes."

"Wouldn't that be fine! but I say, Alfred, do you really think that? Honor bright?"

"Honor bright," answered Alfred, nodding his head.

"But how could they go?" asked Tommy.

"I don't know just how," replied Alfred dreamily, "but I know they could go if we did know how. I expect," he continued meditatively, "we would have to *be* a little different."

"How different?" asked Tommy in a tone of disappointment, "I don't believe we could have air-ships, anyway."

"I do," said Alfred with emphasis, "and we could be different if we tried—we could be greater, we could *feel* great and mighty—and then we would know all about air-ships, and how to guide them. And we will some day," said he positively.

Tommy laughed. "I say, Alfred, won't it be jolly fine!"

Alfred's bright eyes flashed brighter still.

"Just think," continued Tommy, "perhaps by the time we grow up everybody will be greater and we will all go sailing in air-ships! and there won't be any more shipwrecks!"

"There will be air currents," remarked Alfred, "but," he continued philosophically, "we—why not be great ourselves? If there will be air-ships when we grow up, the man who finds out about them, most likely, is a boy now. Any boy might be that man, if he is great enough."

"But how?"

"Well, people long ago were mighty because they were true and honest, and they scorned to be selfish. That gave them the power—it made them feel noble and then they couldn't help being great."

"We've anchored long enough," he added. "And just think, Tommy!" he continued, as they dropped to the ground, "just think of floating through the air, like kings! feeling mighty and grand!" A. P. D.

Air-ships

THE two yachts were sailing peacefully down the stream, much to the satisfaction of their owners.

"I wonder who first thought of a boat," remarked Alfred, as he leisurely unwound his ball of twine.

"Don't know," ejaculated Tommy, "I expect it was someone who wanted to go somewhere."

"I suppose it was," agreed Alfred, "but I expect the first boat was a raft."

"And the last a big ocean steamer," said Tommy. "Let's anchor and climb that tree, and sit on the branch hanging over the water!"

"But why the last?" inquired Alfred, after they had reached the elevation desired.

"Perhaps there will be other ships," he continued. "There can't be the really, truly *last* of anything! Things grow into something else. There can't be the *last* of a thing, of course. I tried last night to imagine the end of the universe, where there would be no stars and no sky or anything—but it was no good; you just can't do it."

"But ships are different, there could be the last ship."

"Not so long as people want to go to places," persisted Alfred. "Of course there might be the last *steamer*, but then there would be other kinds of ships."

"What kind?"

"What they used to have long ago, when there were mighty kings on the earth."

"But what kind?" repeated Tommy with interest.

"Air-ships."

"Ships that float through the air?" said Tommy excitedly.

"Yes."

"Wouldn't that be fine! but I say, Alfred, do you really think that? Honor bright?"

"Honor bright," answered Alfred, nodding his head.

"But how could they go?" asked Tommy.

"I don't know just how," replied Alfred dreamily, "but I know they could go if we did know how. I expect," he continued meditatively, "we would have to *be* a little different."

"How different?" asked Tommy in a tone of disappointment, "I don't believe we could have air-ships, anyway."

"I do," said Alfred with emphasis, "and we could be different if we tried—we could be greater, we could *feel* great and mighty—and then we would know all about air-ships, and how to guide them. And we will some day," said he positively.

Tommy laughed. "I say, Alfred, won't it be jolly fine!"

Alfred's bright eyes flashed brighter still.

"Just think," continued Tommy, "perhaps by the time we grow up everybody will be greater and we will all go sailing in air-ships! and there won't be any more shipwrecks!"

"There will be air currents," remarked Alfred, "but," he continued philosophically, "we—why not be great ourselves? If there will be air-ships when we grow up, the man who finds out about them, most likely, is a boy now. Any boy might be that man, if he is great enough."

"But how?"

"Well, people long ago were mighty because they were true and honest, and they scorned to be selfish. That gave them the power—it made them feel noble and then they couldn't help being great."

"We've anchored long enough," he added. "And just think, Tommy!" he continued, as they dropped to the ground, "just think of floating through the air, like kings! feeling mighty and grand!" A. P. D.

SOME WRITE THEIR WRONGS IN MARBLE

S. MADDEN

SOME write their wrongs in marble: he, more just,
 Stooped down serene and wrote them in the dust;
 Trod under foot, the sport of every wind,
 Swept from the earth and blotted from his mind—
 There, secret in the grave, he bade them lie,
 And grieved they could not 'scape the Almighty eye.—Selected

The Philosophy of Environment

Recently read at Isis Theatre by a Student of Lomaland

THE study of life reveals how on every hand the influence of environment has made or has marred. Opportunity, first of all to live, to get a foothold in a human body, is largely dependent on the environment into which a child is born. And the foothold gained, at any moment conditions of disease and neglect may arise that may hamper the young life, if they do not cut it off altogether. This is true of the life of the physical body; and how true it is of the life that strives to unfold from the inner being, the soul, is known to close students of human nature, and lovers of humanity. For, given healthful and pleasant physical surroundings, that, one would think, could tend only to establish beauty and harmony in the life, it does not always follow that these are the predominant characteristics of people who have had such advantages.

Though it is not so well recognized, it is clear that the mental environment is

very important, and that here, too, the purest and most uplifting influences must be active if the young mind is to have the atmosphere in which the highest growth is possible. It must be acknowledged that, given even the best opportunity for building a healthy body, and the advantage of good mental training, added to a strong bias of a religious order and considerable moral training as far as *precept* is concerned, the result is not often a well-rounded, well-balanced character, or a man or woman well equipped for life with qualities of mind and heart that make possible superb human endeavor.

On the other hand, when we study the lives of the great, we see how, under most adverse conditions of physical privation and almost total absence of mental training, some great talent shone forth and enriched human life.

One truth is to be read between the lines of the written lives of the great. Only when some window was open to the light of the soul-life, was man able to master his environment, and to get into the harmony of a conscious use of it. The history of great thinkers and men of genius shows us that *ever* there was present in the dawn of their development this opening to the light. It may have been the pure thoughts and hopes of an unselfish though perhaps ignorant mother, or the skilled handwork of a conscientious father, or the moral strength of a long line of plain folks that suddenly blossomed into a fruitful art life. Perhaps a great national crisis revealed the forces of life; but ever there was a window open for the soul to shine through. It is within "the power of the individual to rise to the plane of the soul and wield external conditions to the extent that they may mirror the ideal world." The great have done this.

So the truth about environment is that a strong soul can shine through surroundings of privation and suffering, and great qualities may appear like bright gems in the dark recesses of human life, while often an envi-

ronment, which, to the casual glance, would seem to foster only strength and purity and power to achieve, is a hot-bed where selfishness and mental dissipation and general mediocrity flourish.

What is the secret of the harmonious relation of the soul to the outer conditions of life? In the light of the teachings of Theosophy, what is the philosophy of environment?

Emerson says: "The soul contains the event that shall befall it." And from the soul that is *free*, that is not obscured and held in bonds by narrow personal conceptions of life, by wrong education, nor selfish living, the light could radiate that would teach mankind to recognize and know the utmost use and lesson to be gained from any and all conditions of earth-life. It is because, in earliest childhood, the light of the soul is divine, and soon forgotten, that human beings are out of harmony with their environment, and are limited and warped by *some* of its aspects, instead of mastering and using the whole of it for the soul's experience.

Who can foresee the light of wisdom that will be kept burning bright and clear in those who, from their birth, are recognized as souls? This soul to soul recognition, which should be the very atmosphere enveloping a young child, is the seed of a relation between the child and its parents of a higher order than now exists. Those who believe, and dare, and do, and trust this larger life, shall have their hearts filled with a purified joy.

To the teachers of the Raja Yoga School has been revealed the magic of thus recognizing and appealing to the soul of the child. They see a little of the life that is

being fostered by not shutting away this soul-light. They see that the province of the educator is, gently and firmly, to establish in earth-life, in the expanding physical being, this light of the soul. They see that as children grow in an environment which makes no compromise with selfish impulses, and harbors only the noblest and purest influences, there is gradually established in the *youngest* children self-reliance and stability and unselfishness of character, that argue well for the use to which any environment will be put by them. It is evident that when *this* right environment is the fostering life for the young child, a moral fibre, a strength of heart, an unclouded alert condition of mind will be secured to the human race, and that the soul will be free to mirror in these minds the knowledge of how to turn all the conditions of life to highest uses.

The Raja Yoga teacher in Lomaland has the privilege of seeing daily how the highest aspirations, the unselfish efforts, the determined self-mastery of the teacher are absorbed like a life-essence by the children. Life is lifted to a plane of helpfulness that causes a glow in the heart, a feeling of thankfulness that the problems of Heredity and Environment are solved. All that remains is to give to the world's children *Raja Yoga*.

Notice

FOR a number of weeks the meetings held every Sunday evening at Isis Theatre, and every Thursday evening at the Isis Hall, San Diego, will be discontinued. The faithful work done at these meetings by the Lomaland Students appointed to it, entitles them to a needed vacation.

The meetings will be resumed early in the autumn, and will be duly announced in the NEW CENTURY PATH and San Diego press.

ADMIRAL ADIGARD AND HIS STAFF OFFICERS LEAVING THE HOMESTEAD AFTER THEIR RECENT VISIT TO U. B. HEADQUARTERS, LOMALAND

[Admiral Adigard, of the French cruiser Protet, was for long Chief of the Pacific Division of the French Navy.]

Art Music Literature and the Drama

CORONATION AT EDFU
(EGYPT)

Have We Any Standard of Literary Criticism?
If not, Wherefore and Why?

THE old saying, "When you have no case, abuse the plaintiff's attorney" might be paraphrased thus, *apropos* of certain recent literary criticism: "When you have no hope for fame along legitimate lines of work, turn iconoclast."

Is a new cult to be inaugurated by the "critic" who is just now abusing Browning, and by his fellow critic who declares that Shakespeare's plays are inane and sensational, and that his (the critic's) own dramas are vastly better? It is too much to hope that all of humanity has passed the sheep stage—even the small part which is

supposed to do its own thinking—and other, though certainly no less erratic iconoclasts, are bound to follow. For very humor's sake the remarks of the Browning critic are worth quoting. He states that "in the most primitive and unequivocal manner it is to a certain extent true that Browning has written great poetry." But that, of course, was because he understood "the little trick of alliteration," (just as Beethoven, by the way, understood the little trick of harmony and so, just by this little knack, succeeded in producing the *Ninth Symphony*, while his contemporaries produced only discords or nothing at all!)

Then, Browning had such a dreadful "elliptical style" and he was "so supercilious of the reader's needs"! He is very "nimble" however, because he had another little trick which this critic calls his "suspended psychology, requiring a peculiar flexibility of the reader's mind." According to this iconoclast, Browning's poems have appealed to certain readers because they "hold out the flattering promise of an initiation into mysteries not open to all the world." But he assures us that "our wits have become pretty well sharpened by the complexities of modern life, and we are ready enough to prove our analytical powers on any riddle of poetry or economics"! To cap the climax, let us quote one last sentence: "Browning's emotional content is of a sort that requires no further adjustment; it demands none of that poetical displacement of the person, which is so uncomfortable to the keen but prosaic intelligence."

It is barely possible that the writer of these lines knew what he meant—we do not. Our wits may have become "pretty well sharpened" but, on the other hand, the probabilities are that the complexities of modern life have whetted our appetites, and encouraged our desires and passions, and fed our prejudices and egotisms to such an extent that very few can tell philosophy from something quite otherwise, these days. It is the few who have not been blinded by the whirl without them who understand Browning to be what he is, a marvelous teacher, in his own way, of a true philosophy of life. "Paracelsus," "Saul," or if only one of his shorter and less significant poems remained—say "Andrea del Sarto," that marvelous study of the dual forces of human life—it would proclaim Browning to stand, as long as human nature is human nature, as one of the few who in some degree understood it, one of the few revealers and interpreters of the heart's law.

And about Shakespeare—listen to the other critic, who assures us:

That the idolatry of Shakespeare which prevails now, existed in his own time, and got on the nerves of Ben Jonson.

That Shakespeare found that the only thing that paid in the theatre was romantic nonsense, and that when he was forced by this to produce one of the most effective samples of romantic nonsense in existence—a feat which he performed easily and well—he publicly disclaimed any responsibility for its pleasant and cheap falsehood by borrowing the story and throwing it in the face of the public with the phrase, *As You Like It*.

That Shakespeare tried to make the public accept real studies of life and character, such as, for instance, *Measure for Measure* and *All's Well That Ends Well* and that the public would not have them, and remains of the same mind still, preferring a fantastic sugar doll like *Rosalind* to such serious and dignified studies of women as *Isabella* and *Helena*.

Not, as has been erroneously stated, that I could write a better play than *As You Like It*, but that I have actually written much better ones, and, in fact never wrote anything, and never intend to write anything, half so bad in matter.

That Shakespeare's weakness lies in his complete deficiency in that highest sphere of thought, in which poetry embraces religion, philosophy, morality, and the bearing of these on communities, which is sociology. That his characters have no religion, no politics, no conscience, no hope, no convictions of any sort.

Shakespeare comes out of his reflective period a vulgar pessimist, oppressed with a logical demonstration that life is not worth living, and only surpassing Thackeray in respect of being fertile enough, instead of repeating *Vanitas Vanitatum* at second hand, to word the futile doctrine differently and better in such passages as "Out, out, brief candle." Finally, that this does not mean that Shakespeare lacked the enormous fund of joyousness which is the secret of genius, but simply that, like most middle-class Englishmen bred in private houses, he was a very incompetent thinker and took it for granted that all inquiry into life began and ended with the question, "Does it pay?" Which as I could have told him, and as Mr. Gilbert Chesterton could have told him, is not the point.

Such statements wear a label quite easily deciphered by those who can look below the surface; those who have some conception of the work Shakespeare was trying to do in revealing to men the mysteries of their own natures and of human life. Speaking, as he did, often symbolically, he as well as Browning, as often deceives us by his very simplicity as by glyph or figure. Both, in their own way and in their own places, are teachers, revealers and prophets. To those who have some insight into a true philosophy of life, these are facts too self-evident for argument. To those who have not—well, let them turn iconoclasts if they choose—and pass serenely into the future, distinguished mainly by the marks of the mud flung from their hands upon the garments of the world's Great Ones, whose work, however, it is impossible for them to mar. STUDENT

YEAR after year the curators of our picture galleries and museums are compelled to take down this or that valuable picture because it has become ruined, decrepit, cracked and wrinkled, for with

all the improvements that have been made in regulating the temperature and humidity of galleries, still the fatal decay of modern works goes on. While it is true that posterity will be far richer because of the loss of a certain few of these paintings, others have qualities which should

give them the right to endure, for a time at least. And these conditions are the more exasperating because they have not always existed. They appear to be quite modern. Certainly the old masters labored under no such disadvantages. Look at the Van Eycks, as glorious and rich as ever; the Sistine Madonna; all the marvelous paintings of Rubens, of Murillo, of even Rembrandt, which last go to disprove the theory that thinly painted canvases outlast the ones on which paint is placed thickly. It is true, of course, that oil will turn yellow with age, yet the old masters used oil, and we must seek some other reason for the permanency of their work and the impermanency of so much that is modern. The secrets of their craft—for most of them ground and mixed their own pigments—have been long lost. Until they are rediscovered, it is probable that this decay, indicative of modern inefficiency, will go on. STUDENT

THE higher musical consciousness does not permit the mind to dissipate by following a meandering stream of detached ideas flowing in meaningless succession. By its divine power it holds all thoughts and feelings close to the center of things and molds them into that Temple of Music through which the Soul may diffuse its light for the uplifting of humanity. Such musical consciousness knows no past or future, but liveth simply in the full-orbed present, in which all events, time and space, are, as it were, welded into one living reality—the Doctrine of the Soul. H. M.

O POET! the world is full of renaunciations and apprenticeships, and this is thine; thou must pass for a fool and a churl for a long season. This is the screen and sheath in which Pan has protected his well-beloved fower, and thou shalt be known only to thine own, and they shall console thee with tenderest love. And thou shalt not be able to rehearse the names of thy friends in thy verse, for an old shame before the holy ideal. And this is the reward: that the ideal shall be real to thee.—EMERSON

Universal Brotherhood Organization

Central Office Point Loma California

PROBABLY one of the first ideas grasped by a student of the Wisdom Religion is that of univer-

sal law. He comes to comprehend more and more the reality of law, inherent in every atom of the universe. By actual living, he comes to realize that working with the law brings harmony and peace, and that working against it means defeat of all high ideals. He comes to know as a fact that in doing his appointed duty to the best of his ability, he realizes a strength and concentration of purpose which he does not feel when he slights his task.

Through experience he learns that when he turns his thoughts away from himself in conscious effort to give the best he has, he is more content, and able to accomplish more than would be possible otherwise.

A life in harmony with the law of truth may not, then, be an impossible ideal, and the prayer of every earnest student may well be for understanding. But the fact that we do not understand the law does not free us from responsibility, nor is our unbelief a sufficient proof of its non-existence.

THE FIRST STEP

Does it not appear, then, that the first step which a true student of this philosophy must take, is to consciously endeavor to understand the laws which govern his life, and which, since they govern *his* life, must govern all lives?

Most of our lives consist of so-called daily living, by which we usually mean the commonplace, uneventful work and daily routine which make up the greater part of existence. How are we to lift this out of the commonplace, and make each day a stepping stone toward a fuller, truer life?

Our circumstances may be so humble that in a material way it may seem impossible to alter or beautify our surroundings; and while it is commendable that we desire to have about us things that harmonize with our sense of beauty, we must not lose sight of the fact that it is not possessions which make a beautiful life, but rather the thought and the love which prompt the living of it aright. A little thing may lift a day above the common level. We may, at least, concentrate our mind on one strong, helpful thought for ever so short a time; it may be no more than scattering a few crumbs on the window ledge or placing a flower upon the tea table; but if love lie back of the deed, do not these little things make life more beautiful and helpful to those about us?

The children in the Lotus groups are taught that "to live to benefit mankind is the first step" in the building of a true and helpful character. How can we live to benefit mankind? How better than in the daily duties and opportunities that come to us? We can benefit mankind by helping those nearest to us. It is by doing little things well that we become able to do greater things. We have seen children eager to help in the humble duties of the mother. When the dishes have been washed and are ready to be set away, what child is not eager to carry them in? It is given one small dish to carry. To its eager request for more, the wise mother explains that, as it grows, it can take more and more, but at first it must take only one; it is not able yet to carry more.

A master has told us that if we would enter the kingdom of heaven we must become as little children.

THE FORCE OF CONTRASTS

In each life there are many obstacles and disappointments to be disposed of. It is not the obstacle or deprivation which of itself can sadden or weaken us, but that in our own nature which responds to the hindering influence. Our obstacles and disappointments are often our greatest opportunities. "If all our plans succeeded, then no contrast would appear," and by contrast we may often see the truth more clearly.

Theosophy and Daily Living

All of us cannot be engaged in the sort of work that society deems worthy of its recognition. Some must do the lowly work. The lowly work is necessary. Is it not a source of strength to know that it is not the act which glorifies, but the thought and purpose which lie back of the act? Mr. Judge in *Letters That Have Helped Me*, advises us that it is our own duty which should occupy our attention; the duty of another is full of danger.

A true student of Theosophy can wait. The forcing of a bud means the blighting of a flower.

If there is any good thing which we lack, we know that there exists a reason for it. Instead of rushing madly about, trying to discover the reason, and thus gain the prize, we might better quietly set ourselves to the performance of duty and to make our lives *more worthy* of that which is good.

HARVESTING THE SEED

It is an uphill road—all will admit that—and the most earnest student

Lomaland Photo and Eng. Dept.

EUROPEAN HEADQUARTERS OF THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, 91 AVENUE ROAD, LONDON, N. W., ENGLAND
A SUMMER VIEW

makes mistakes, fails, perhaps, in the accomplishment of certain results, but he does not suffer defeat until he gives up trying. He does not believe that life is a matter of three score years and ten, and he knows that he must harvest the seed which he sows.

A student of Theosophy need not look to works on metaphysics for his inspiration, but into his own heart and into the life of the world of nature about him. Through the light of Theosophy he may come to know that nothing is separate; that all are united in the common brotherhood of life, and that brotherhood is a fact in nature. If I harm my brother, do I not bruise myself? If I take advantage of my friend, is it not I, myself, who am cheated? If I give comfort and help to the stranger in distress, do I lose that which I give?

We are not asked to accept this blindly, but even a little study, a little of the practice of Theosophy will demonstrate it as the key to the understanding of the problems of everyday life. STUDENT

THE world is shadowed or brightened by our own heart rather than by anything in itself. Our joy makes the cloudiest day glad, and our grief finds night in the sunniest sky.—*Joseph Parker*

THE CROSS AND THE CROWN

GERALD MASSEY

'TIS weary watching wave by wave,
And yet the tide heaves onward;
We climb, like corals, grave by grave,
That pave a pathway seaward.
We're driven back, for our next fray
A newer strength to borrow;
And where the vanguard camps today,
The rear shall rest tomorrow.

Though hearts brood o'er the past, our eyes
With smiling features glisten;
For, lo! our day bursts up the skies!
Lean on your souls, and listen!
The world is following freedom's way,
And ripening with her sorrow.
Take heart! Who bears the cross today
Shall wear the crown tomorrow.

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question How much of the knowledge of one life do we carry over to the next? For instance, if we gain a knowledge of Theosophy in this life, will it be ours in the next life on earth?

Answer So far as the average person is concerned, we can answer the question from our own observation. It is evident to anyone who will observe that every child that comes into the world brings with it a heritage from the past. Some call this heredity, but those who have studied Theosophy, know that it is its own inheritance of its own making in past lives.

Every child has certain aptitudes which do not result from the training which it receives in this life, some of which show themselves in the earliest years, and others as it grows older and as the events and circumstances of life may call them out. No child is born without its distinctive character; some are born with talent and some with genius; and some display to a marked degree a sense of justice and a perception of human character, that often surpasses the judgment of their elders.

On the other hand, we do not find children born with what usually and unfortunately passes for knowledge, namely, detailed information of facts, etc. of history, science, or any other branch of learning. But the child brings with it, more or less developed, the power of judgment and intuition and, as said, character, aptitudes, talent, and these are the results of knowledge as well the basis for the acquisition of deeper knowledge. No doubt we are all familiar with instances, either known to us directly, or of which we have heard, of children born with the very soul of music, or with a marvelous aptitude for learning languages, or great mathematical, or mechanical ability. Where did this power or ability come from? The question remains unanswered except from the standpoint of Theosophy.

But it may be asked, why do we not bring back more? And the majority of people, if this question were presented to them, would no doubt look back over their present lives and wonder at the difficulties they have met all along the way, and the bitter experiences they have had in the acquirement of knowledge, and they, too, might ask, why should this be so?

Do we not find the answer in our own lives, and in the lives of most of the people around us? How many lives are lived in the pursuit of a great purpose, or to some great end? On the contrary, how many are dominated by selfishness, or tossed hither and thither by a multitude of desires? Thus in the one case, if a fixed end is followed, it is a purely selfish end, for the gratification of one dominant passion; or in the other case, because of the multitude of desires, there is no fixed purpose, or dominant note in life. And the majority of people belong to the latter category. They have nothing therefore of a permanent nature to carry over with them from one life to another.

Once we can realize that behind and above all our life is the soul, and that, in the words of Shakespeare, "There is a Divinity that shapes our ends, rough hew them how we may," we shall gain a solution to the problem. For the link between successive lives is the soul, and it is in it that all that is permanent and of true value is stored; and so it is that, as we seek to live in accordance with the soul's purposes, do we receive

ever fresh accessions of power and knowledge from the vast storage of the past, and one life thus lived makes possible a larger outpouring of the soul's knowledge in the next.

There is still another point to be considered in answer to the question, Why do we not bring back more of the knowledge of the past?

Who can say how much we ourselves have lost and how much we have caused and are causing the children of today to lose, because of the failure in the past and today to provide the best conditions for the return of the soul to earth life. And while the responsibility is chiefly on parents, it does not rest only on them, but on all. And further, how much of the knowledge that the children do bring back do we stifle through our ignorance, and through the soul-deadening systems of education?

Who can paint the picture of what would be, and what indeed shall be, when children are born under the best conditions, and are educated under the Raja Yoga system? Then the knowledge of the soul will again be ours and will not be lost or forgotten from life to life.

If we gain a knowledge of Theosophy, will it be ours in the next life on earth? If it be truly a *knowledge*, which means also the *practice* of Theosophy, and a purification of the whole life, this knowledge will be ours in the future—not, as above referred to, in detail, but in power and character.

STUDENT

Question How is the doctrine of Karma different from the old Mosaic law of "an eye for an eye, and a tooth for a tooth?" How can you expect Christians to accept this teaching in place of Christ's law of love?

Answer Perhaps it is not known to the writer of the question that Jesus himself taught the doctrine of Karma. Did he not say, "With whatsoever measure ye mete, it shall be measured to you again?" And "Do men gather grapes of thorns, or figs of thistles?" And the same doctrine was taught by Paul in the words, "Be not deceived, God is not mocked; for whatsoever a man soweth, that shall he also reap." And yet both Jesus and Paul taught the law of love.

Is it not possible then that the law of Karma is the law of love? Consider for a moment, can there be true love where at the same time there is not justice; or to put it in other words, is true love unjust? Which is the truly kind, loving parent, the one who guides and corrects, pointing out the little faults and failings, helping the child to recognize the relation between cause and effect, both good and bad; or the one who pets and coddles and condones the little faults and weaknesses? Many mistaken people would call this latter the law of love, and yet it works incalculable harm.

The Mosaic law of "an eye for an eye and a tooth for a tooth," is indeed one aspect of the law of Karma, but by no means a complete expression of it. Taken literally, it is no more than another way of saying what Jesus said—"With whatsoever measure ye mete, it shall be measured to you again." But it is usually taken to infer that *man should exact the penalty*; whereas the law of Karma, and the words of Jesus are impersonal, and the Theosophist knows that it is Nature, or "God" or the Supreme that brings to every man his due.

Only through the lessons of Karma can we learn the meaning of life and gain that experience which will enable us to climb to higher levels. So may it not be that instead of opposing one another, these two laws help and support one another? Can we understand one without the other? Take justice out of life, where would love be; life would be a chaos; but life without justice is unthinkable.

The difficulty in the questioner's mind arises perhaps from taking the Mosaic law, as quoted, as being a complete expression of Karma, whereas it gives but a crude and mechanical idea of it.

For a definition of Karma, let us turn instead to the words of William Q. Judge:

Karma is a beneficent law wholly merciful, relentlessly just, for true mercy is not favor but impartial justice.

And in the words of H. P. Blavatsky:

We describe Karma as that law of readjustment which ever tends to restore disturbed equilibrium in the physical, and broken harmony in the moral world. We say that Karma does not act in this or that particular way always; but that it always *does* act so as to restore Harmony and preserve the balance of equilibrium, in virtue of which the Universe exists.

Can there be love without harmony, or harmony without love? and the law of Karma is harmony. It is the Great Equilibrator. STUDENT

Empire Slow But Sure

THE story of the discovery, exploration and settlement of the Oregon Country, to which the Lewis and Clark Centennial Exposition at Portland is drawing the attention of the world, presents some very interesting aspects. Perhaps the fact that arouses the greatest degree of astonishment in the up-to-date citizen of today, is that such a long period of time was required for taking possession of this vast territory after its discovery and exploration.

The coast line of Oregon and Washington was known to mariners generations before the interior was explored, and maps more or less accurate were made from time to time. Spanish, Dutch, British and Russian navigators vied with each other in exploring the coast, but practically no attempt was made to explore the interior of the country until

named and known—remained wildernesses, with but a straggling settlement here and there, and those settlements harassed by hostile Indians and exposed to the natural perils of remote outposts.

The history of the actual development of Oregon and her sister states in the territory acquired by treaty with Great Britain in 1846, is the history of less than sixty years of heroic effort and high achievement. America was discovered 413 years ago. Jamestown was colonized by the English 298 years ago. Plymouth Rock was touched by the tread of the Mayflower pilgrims 285 years ago. American independence was declared 129 years ago. Lewis and Clark crossed the continent to the Pacific Northwest 100 years ago. The United States finally acquired the Oregon Country by right of discovery and exploration, after forty years of pourparlers, 59 years ago. "Westward the

course of empire takes its way," but until three-score years ago it took its way most deliberately and with dignified slowness.

But after the treaty with Great Britain the work of development was pursued with gratifying rapidity. With the extension of the railroad and the invention of the telegraph, distance was annihilated—and distance was the main factor in keeping this great region undeveloped for so many generations after the eastern part of America was settled. The Pacific coast was so remote from civilization that one felt, as Joaquin Miller has expressed it, that it was a land that even God had forgotten. Now it is but a few days' trip by rail from New York, and but a few seconds' time by wire from any point east or west.

Great as has been the development of the past sixty years, Oregon and her sister states of the Pacific West are as yet, comparatively, infants. There is room still for many millions of people, and the Lewis and Clark Exposition no doubt will be the means of drawing a large increase of population.

CORRESPONDENT

Barbarous Superstition in Christian Lands

THERE are thousands of people in insane asylums today because they were taught to have faith in the doctrine of an everlasting hell, where millions suffer roasting. The ministers are responsible for this error. They know that that doctrine is false, but it suits their purpose and they do not care to tell the truth.

These words are quoted from the report of a recent sermon by a clergyman. Thereby he seems to assert that a representative number of his brethren deliberately lie to the people and make some of them insane by the awful mental anguish inflicted by the lies. If this is true, it is a dreadful commentary on the state of that sacred calling which has the people's spiritual health in charge. The only alternative is that the ministers are sincere; that is, that they themselves believe the doctrine of eternal hell-fire to be true. But this alternative, while acquitting them morally, condemns them mentally to an equal extent; and in either case, such are unfit spiritual guides.

Birmingham-Made Antiques

BIRMINGHAM, England, has long been noted as a place where you can get anything manufactured, and that supplies Zulus with assegais and Polynesians with idols and bibles. We hear now that it is turning out weekly about 1200 flint-lock muskets for the natives in Central and East Africa, to whom the possession of modern firearms is denied by their European protective governments. But the funny thing is that these weapons fall into the hands of the guileless traveler, who regards them as antiques. This circumstance too has actually led to the intentional manufacture of the flint-locks for that very purpose.

The Higher Ideal & the Lower

AN essential element of all progress is that men should have high ideals, and follow them. If we are always looking downward it will be impossible for us to rise above the low level on which we dwell. And yet, on the other hand, if we are always star-gazing we shall soon fall into the ditch. We are creatures of two worlds, the seen and the unseen, and we must keep an eye on each. We must fix our Soul's gaze on the distant heights, and we must at the same time give due heed to the path at our feet.

I think it was Lord Rosebery who lately spoke of Oliver Cromwell as being a "practical mystic," or idealist—a man before all others the most dangerous to oppose. The practical idealist is one who, in the true sense, "makes the best of both worlds;" or in other words, he gives

good heed to the path before him, and at the same time is upheld and inspired by lofty ideals.

It has too often been the fashion with worldly people to mock at the idealist, to sneer at the theorist, and to regard as worthless all that is not tangible. This is a grave error, for in very many cases, if not in all, the idealist is the salt of the earth which prevents the decay of the general mass.

The Idealist a Type of the Divine Spirit

He is a type of the Divine Spirit brooding over Chaos and darkness, and producing Light and Kosmos. But if the idealism be not joined to the best method of action then the results for good will be disappointing; they will fall far short of what they might have been. In a sense we must have *two ideals*—one resting evermore in "the Light which no man can approach unto:"—for as said by a mystic, "You will enter the Light, but you will never touch the Flame"—and we must have another ideal, the best practical plan for translating into action the Perfect, the Sublime, which we know to exist. It is in the relation and subordination of this lower ideal to the higher that many have found very great difficulty, and not a few have taken the "left-hand path." It is so easy to assume that a person's methods are right because he has a high ideal, that the next step, "the end justifies the means," follows as a matter of course.

The difficulty in dealing with this second, or practical ideal, is all the greater because Nature, or the Divine Spirit moving in things, seems to teach that deception, or illusion rather, is part of the great plan in our development from ignorance to Truth, or to Reality. From birth to death, and from the earliest ages of humanity till the present time, we

Educated to Approach Reality or Truth

are continually finding out that "things are not what they seem;" we are being educated through illusion after illusion so that we may approach Reality or Truth itself. If this be Nature's plan to lead us on by the illusions of childhood, the illusions of early religions, the illusions of seers, and many others, should not the teacher of men follow the same plan in his "practical ideal," and so adapt the Perfect Ideal to those whom he wishes to uplift that it will be suitable to them? Here is the point of danger. Here is the temptation to bow down to the ways of the world in the wish to save the world. This was one of the forms of temptation met by Jesus. "You have come to save the world, it is a very difficult, dangerous, and lengthy task, but if you will fall down and worship me all the kingdoms of the world shall be thine in a moment." He met it by saying, "Get thee hence Satan; for it is written thou shalt worship the Lord thy God, and *him only shalt thou serve.*" Or in other words, "no man can serve two masters." We cannot go into partnership with Satan to save the world!

It is well known that in many public bodies a man, in order to get what he believes to be perfectly right and just, must obtain the votes of his fellows by assisting them to get things of which his conscience does not approve. In this case the practical ideal, or the political ideal, becomes so low that it is really separated from the Supreme Ideal.

Conscience Strained by Political Ideals

It is the belief of some that Christianity as taught by Jesus was too high, or too pure and advanced for the world. They say "truth had to come down through the ages on the wings of error," which is erroneous. The well-known author, Greg, says that "the most suitable teacher is one who is just a step in advance of the pupil," which I prefer to understand as meaning that the Teacher leads on but a step at a time—Nature's law. And certain it is that "Paulinism," the teaching of the Epistles, rather than the "Sermon on the Mount," has been the form in which, for nearly 2000 years, the vast majority of the world have accepted Christianity. There is also the fact that a low type of religion has in all lands and in every age claimed a wider hearing and a larger following than a lofty form of religion. And it is *not* the truth, as I know well, that a clergyman has only to teach more advanced truths and the people will gladly accept them. The vast majority have ever demanded and still demand the lower form of teaching; and the crown of thorns has ever awaited the Reformer. Is the Reformer, then, to make concession to the majority? How much, or in what way, is he to veil the highest truth in order that he may lead men to the Highest Ideal? Will the "end justify the means"? To have high and pure motives: to have the Truth itself, or Supreme Perfection as the ideal is not enough. Very much depends on the Sec-

Various Methods of Teaching

ondary ideal, the "working pattern." Are we to bow down to the world to gain the world for the Highest Ideal? In other words should our type be that of John the Baptist, or Eusebius? H. P. Blavatsky, or the Archbishop of Canterbury?

Great teachers *do adapt themselves* to the needs of men: teaching by parables is one method. But there is the teaching of Paul, "I am become all things to all men that I may by all means save some." And Jesus gives the parable of the unjust steward to show that "the children of this world are wiser in their generation than the children of light." We are to be "wise as serpents, and harmless as doves." Does this mean that we are to be "wily," "crafty," able to dissemble, flatter, and deceive? Is the Supreme Ideal not compromised by this Secondary Ideal?

A fundamental principle for our guide through life must be that the lower, or practical ideal should not contain elements opposed to the Supreme ideal. We must "not do evil that good may come." It does not show our trust, but our lack of trust in the Supreme Good as All-powerful and All-wise, if we think we can help the purpose of the Universe by doing what is wrong. Nor must we forget that the final law, the "standard measure" by which actions, or ideals should be measured or judged, is the Divine Voice within man.

Judged by the Nature of Our Ideals

A nation or an individual may be judged by the nature of the ideal which is held up, and by the methods—the Secondary ideal—used in attaining that goal. Perfection, or Godlikeness; Unity, or Brotherhood; Truth Absolute, and Love for all; these things, it will be confessed, should constitute the ideal of humanity; but in practice (the true test of belief) we know it is far otherwise. And our secondary ideal, or the *way* we strive toward perfection, should be in harmony with Perfect Truth and Compassion Absolute; justice and judgment, the pillars of the Universe, and the only sure and lasting foundation for the life of an individual or a people.

(REV.) S. J. NEILL

The Olympic Games

THE festival of the ancient Olympic games, the expression not only of Greek physical ideals but of spiritual as well, had not been celebrated for a millennium and a half when in 1895 two noblemen, (of Greece and France), decided to attempt a revival. A year later their plans were realised and the first celebration after that long rest was held at Athens. The international idea was in everybody's mind, and under its sway it was decided that future celebrations should rotate among the countries, Greece being favored no more than the rest. So Paris and St. Louis had the honor of the next two occasions, and the third was booked for Rome, in 1908.

But somehow it did not seem to be right to hold Olympic games in any other country than that in which they were born. It was as if one should try to hold a Bayreuth festival in New York. So at last it was decided that the affairs at Paris and St. Louis, whatever they were, were not Olympic games. And the real second set, and all future sets, will be in Greece. They will, however, remain international.

Surely this represents a stir of ancient Greek life, long sleeping but now renewing its vigor, a stir to which there are many other witnesses. Greece had not finished her career; she only needed a few centuries of painful discipline, and we may hope that they are well-nigh over.

If the reincarnated Olympic festivals are to take up their own past, the promoters have some hard moral work before them. The modern prize-ringing element must somehow be kept away and every form of betting guarded against. The old games were a part of the religion of the people, a people which in its best days did not make a religion of athletics, but physical perfection a part at once of art and of religion. They knew that if the soul was to have perfect expression it needed a perfect body as well as mind.

The Humor of a Treaty

NOT without a touch of humor—doubtless perceptible to the Japanese, but less so to the Koreans—is a recent treaty between those two countries. Be it remembered that the "government" of Korea is a deplorable chaos, in which every official gets all he can out of his post. Fortunately Japan now has her order-making hand upon it,

but in all her interventions is very careful to keep up appearances and save the feelings of the Korean Emperor. This becomes manifest in the first clause of the document in question. It reads thus:

The Imperial Governments of Japan and Korea, finding it expedient from the standpoint of the administration and finances of Korea to rearrange the system of communications in that country, and by amalgamating it with that of Japan to unite the two systems into one common to the two countries, and, having seen the necessity, with that object in view, of transferring the post, telegraph and telephone services of Korea to the control of the Japanese Government, Hayashi Gonsuke, envoy extraordinary and minister plenipotentiary of Japan, and I-hayeng, minister of state for foreign affairs of Korea, each invested with proper authority, have agreed upon and concluded the following articles:

which are then enumerated. The last clause contains a touch of the same humor:

ART. X. When in the future an ample surplus exists in the finance of the Korean Government, the control of their communication services may be returned, as the result of the consultation of the two Governments, to the Government of Korea.

So the Korean feelings are carefully spared, and there is a polite suggestion that in the "future"—probable time not stated—"an ample surplus" may exist in the funds of their Government. But on the other hand the fuller the Japanese control the more possible the surplus.

A Way to Wealth for Ireland

IT appears that a great source of wealth has suddenly opened for Ireland. This consists in an application of electricity for releasing the water from the peat of her bogs. Recent estimates have it that these bogs are capable of turning out 50,000,000 tons of fuel a year for no less a period than a thousand years, and that in a century an exhausted bog will reproduce itself. This quantity has a selling value of about \$62,000,000—a clear addition to the country's income, and, further, a saving of the \$5,000,000 which she now pays for coal.

Peat is smokeless in burning, makes no cinder, does not crumble, has a high calorific value, and occupies about a fifth less space than coal. Powdered, it is a valuable disinfectant and preservative, and can be made to yield a food for cattle.

The invention will free several other industries. There are immense stores of iron, now unworked for want of coal. There is also some gold, silver, lead, and a good deal of copper.

Irish peat-bogs occupy a belt reaching right across the island. They are from 25 to 40 feet in depth. The deepest layers come from ancient oak forests which were gradually killed by the immense growth of mosses. Later, from the remains of the mosses and the rotten oak timber arose a set of fir forests, these also perishing. Their excavation on a large scale will be of considerable interest to the archeologist. They contain animal and human skeletons, cameos, gold and silver ornaments, some of great beauty and perfect finish, canoes, log dwellings and sunken roadways—all, owing to the qualities of the peat, in good preservation.

STUDENT

Making Use of the Enemy

THE enthusiasm of the Viceroy of Canton for modern education has been taking a strong practical form. Desiring to establish a school in a certain part of his province, he found himself confronted with the opposition of the monks of a neighboring monastery. He not only squelched the opposition but made it effectively serve his purpose. After expelling the interfering monks he sold the monastery and found his benevolent pocket the fuller by \$300,000. This he is now spending in the creation of a Normal School on foreign lines for the children of two provinces.

C.

The Scourge of Portugal

IN the tremendous fight with Tuberculosis which Portugal is making, the Queen (Amelie) takes a very prominent part. Founding the Tuberculosis League, she has caused it to erect sanatoria on many suitably lofty situations throughout the country, and from time to time she visits them all. The prevalence of the disease—it is said that three out of four of the population are touched with it—is due to the poverty of the people. Hardly any agriculture or manufacturing is done, the chief industry being wine culture. And of late years the vine disease has reduced immense numbers almost to starvation. Moreover out of a population less than that of London, Portugal thinks it necessary to maintain a standing army of more than 30,000 men!

C.

Some Views on XXth Century Problems

Hypnotised Senility

ACCORDING to Sir James Crichton Browne—in his presidential address to the Preventive Medicine section of the recent Public Health Congress in London—the natural life of man is 100 years, and that of women a little longer. And though during the later part of this there may be a good deal of physical decay, yet “in the higher nerve centers evolution goes on till late in life; even in what is called old age the freshness of youth may sometimes survive.” His text was that it is our duty so to live, and to teach our children so to live, that the evolution to which he refers may never cease even when the lower nerve centers and the rest of the body are decaying; and that the freshness may persist. “Every child should be brought up impressed with the obligation of living to 100 and taught to avoid the irregularities of living which tend to prevent the attainment of this laudable ambition.”

He produced some figures showing that centenarians were by no means so rare as is supposed. Among the deaths for 1903 in Great Britain alone were more than 12,000 above the age of 80, and of these many were approaching the 100. In 1901 and 1902 the register showed that 61 and 56 persons had died over the 100.

The speaker may have touched a profound truth in his suggestion that the evolution of the higher nerve centres may go on side by side with some amount of decay of lower ones. The brain is—or should be and may be—the vehicle through which some of the purely spiritual ideations of the soul are shaped for the reception of the normal thinking consciousness. And this function should become more and more perfect up to the very last. Even in the very hour of death it may be doing this work more perfectly than ever before. It is even now no uncommon thing, and should be the usual thing, for consciousness to go on enriching itself, getting clearer and fuller and serener, up to the very moment of death, to the very moment when the apparatus of speech cannot any longer convey to the bystanders the utterances with which the soul would fain teach and encourage them. The very last word, summing up what it now sees of the life opening before it, is often “Light.”

Our age has hypnotised itself into the belief that old age must mean senility, and death extinction. These beliefs are in the air, dwell with us all the years of our lives, and at last acquire a force that almost ensures its own fulfilment.

STUDENT

Work as Alchemy

WHEN the physician recommends his patient to take up a hobby, he means more than to do a certain amount of work. He wants him to do it with an object, knowing that the object is an important element in the prescription. The force expended builds something in the patient as it passes into the work done. And in recommending a daily walk, he will similarly say: do not take it as a mere “constitutional,” but have an object, go somewhere for some purpose. The mind is here called upon to become a builder. The same thing makes the difference between athletics done by a rubber cord attached to the bedroom wall, and the same amount of work done in raising flowers in a garden.

A higher example of the same principle lies in work done as devotion to duty, or as devotion to the interests of humanity, and the same work done for self-interest, or for amusement, or for exercise—in descending scale. It serves as a building force in the web of character of the man who does it, building a fabric on a plane corresponding to the motive, and on the planes below, down to the merely physical. The rubber cords simply build the physical; the flower-raising work that and something higher; and so up to the highest. In a perfect life, all is according to duty, and the duty is coextensive with pleasure, and exercises all the parts of the nature, from the spiritual downward, so that all are benefited and built up.

The principle was long ago taught as a part of Theosophy. A Teacher wrote: “We see a vast difference between the two qualities of two men, of whom one, let us suppose, is on his way to denounce his fellow-creatures at the police station, and the other on his way to his quiet daily work, while the men of science see none; still less does exact science perceive that while the building ant, the busy bee, the nidificient bird, accumulates each in its own humble way as much cosmic energy in its

potential form as a Haydn, a Plato, or a ploughman turning his furrow, in theirs; the hunter who kills game for his pleasure or profit . . . (is) wasting and scattering energy. . . .”

Nature, says the same Teacher, works incessantly and consciously towards the evolution of conscious life out of inert material. And so man, in selecting his work, may help; for the higher the work, the more does it transform inert “matter” in his constitution into more complex and conscious forms, in which forms corresponding energy is stored. STUDENT

Carnage in Peace Time

IT appears that the crime list of this country contains the astonishing total of 10,000 homicides a year. This is less than our death list for the Spanish-American war, including those who died subsequently of fevers.

There are several causes for this. The first is the respect paid in the law courts to technical quibbles by which men obviously and almost admittedly guilty go free. Often there is no question at all about the guilt, and the quibbles stand between the verdict and the sentence. The second is the right of every man to bear arms. In England there is the same right, but the bearer must register the fact that he does so. As there is no written English Constitution, the permission to bear arms is not written. That in this country it is written and universally known to be so, seems to exercise a hypnotic permissive effect, outweighing, and causing to be freely set at naught, the one restriction—that the weapon shall not be concealed. A man carrying a pistol in his hip-pocket would be an extraordinary phenomenon in England, a very rare case indeed. In parts of this country it is rare not to do so. But the radical reason is that in those parts of this country the average pressure of opinion against murder by firearms, the average of horror at the crime of murder, the average of respect for human life, is not as high as in the older countries—which, to that extent, must be called more civilised.

The remedies are of course to make it a little more difficult to procure arms; to make the punishment of murder come more swiftly and certainly; and to allow of fewer “extenuating circumstances” in the courts and in our minds. In view of certain European statistics in countries where capital punishment has been abolished, probably hard labor for life would be a greater deterrent to murder than the legal savagery of capital punishment! That is soon over, the other is perpetual.

STUDENT

Life and Lives

SPENCER'S definition of Life as the continuous readjustment of internal to external relations, which was for a while received as a real contribution to our mental stores, is less and less quoted as years go by. It is of course only a summary of a *process* and is hardly more respectable than would be a definition of a clock as a continuous pointing of two hands to a set of figures.

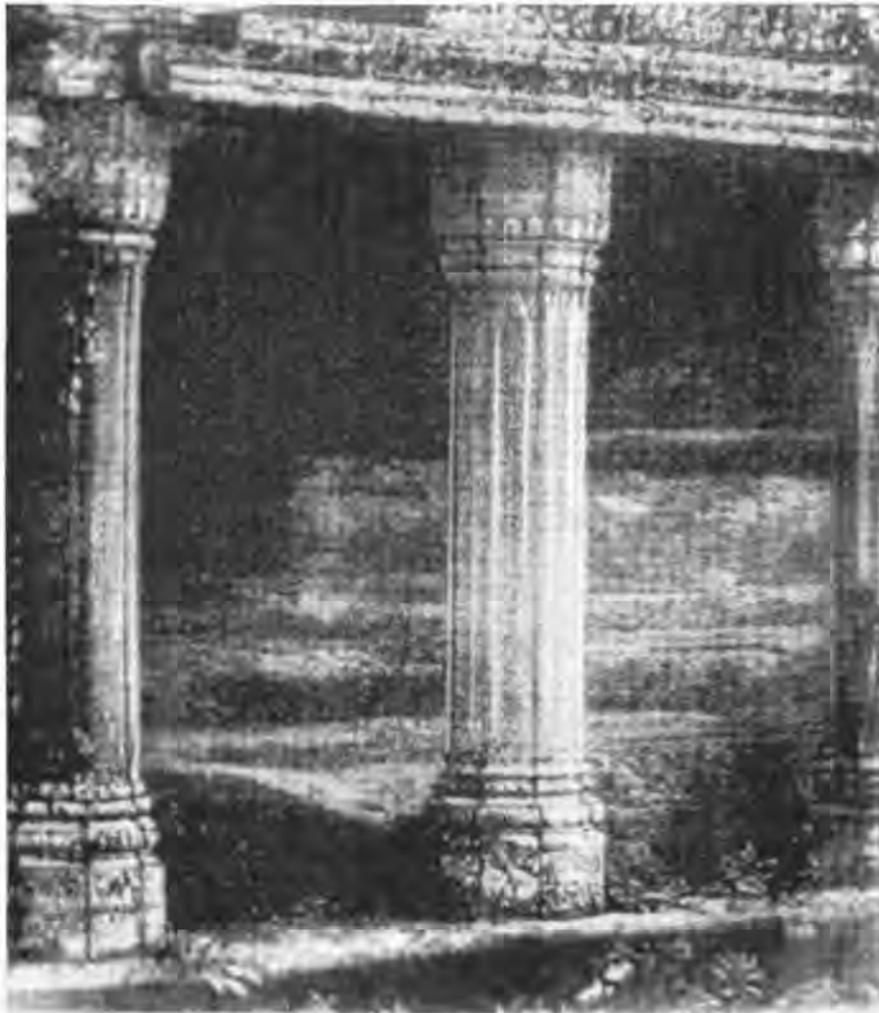

The difficulty in defining Life is surely an artificial one, arising from an attempt to evade the very point. It is an abstract term derived from our perception of living *beings*. The life of an organism is that living being, *in* the organism, which “continuously readjusts its internal to the external conditions.” Apart from it, the organism is a machine. The being is the *employer* of the forces in its organism. There may be several living beings, grades of them from the highest downward, handing down instructions to each other. And the lowest may be capable of a good deal of initiation on its own account. But the very lowest is an *employer* of the electric, chemical, luminous, and other forces of the frame. They are all *lives*, and the abstract term Life becomes so difficult to define because it is artificial. It cannot exist apart from lives any more than clockishness can exist apart from clocks. The materialists are right in denying it an absolute abstract existence. But from that they went on and confused the always present living director—however humble—with the forces it directs. An *amoeba* will contract when touched with a needle, and the reaction may be called mechanical. But it will also contract because it chooses to do so, chooses to work the mechanism for itself. No experiment with machinery and scalpels will find the operator, the conscious being; but that it exists is a common sense statement which clears a thousand difficulties from the path of philosophic science. Childish Speculations in Chronology

WITH regard to the gigantic human skeletons discovered in Maryland (see NEW CENTURY PATH, Vol. viii, No. 36), the date assigned, "at least 1000 years old," is childish. Are we to understand that the race here mentioned was still living only 600 years before the discovery of America by Columbus? Did they suddenly disappear at about that time, or did these *men, women, and children* merely represent teratological curiosities, "chance" favoring their discovery just now? Skeletons of so-called giants have been disinterred at different places during the last 100 years or so in the United States from Georgia to California. Evidence would go to show that a big race of men *did* inhabit this continent long ago, and that nearer 150,000 years than the supremely ridiculous 10 centuries mentioned above. Did the *red men* shrink two feet in size in 10 centuries?—if indeed these skeletons be those of "red men." STUDENT

Where Was Paradise?

THAT the region of the North Pole was the seat of Paradise and that primeval man dwelt there, is one of the oldest traditions in the world. Not only is it not dead, but it is regaining its youth.

A full and remarkable re-presentation of it is given in *Paradise Found*, a book by Professor Warren, late President of Boston University. It is there argued very carefully and learnedly, and the writer even maintains that the Four Rivers and the Tree of Life find their explanation in conditions about the Pole.

It is now orthodox geological history that the Pole was once the centre of a great continent, and that this was the first spot on our globe to possess a temperature fitted for animal life. And both animal and vegetable life may have existed in great abundance. There are but 61 days of darkness in the whole year, and even then the Aurora and the brilliant night sky make the word darkness almost out of place. Professor Heer, one of the first authorities on fossil flora, points out "that there must have existed a warm climate and a rich tropical vegetation in the highest Arctic circles, and that the mother region of all the floral types of the more Southern latitudes was originally in a great continuous continent within the Arctic circle."

Why should it not also have been the mother region of all the *human* types of the more Southern latitude? Professor Warren points out that both in the Scandinavian and Hindu mythologies, the godlike ancestors of man are represented as dwelling in a land where there was but one day and night. There is only one such place, the land about the Pole. The same tradition is found in several other mythologies, and the traditions of every nation speak of a far off Golden Age when men were as gods and as yet knew no strife.

Science begins its study of man in his savagery. Carrying a line backwards from the highest to the lowest types, it assumes that the same line

may be extended confidently till it reaches the brutes.

According to Theosophy, and according to the myths of all peoples, we find that our line, going backwards and "downwards," reached at last a point at which it turned and began to *ascend*, and finally culminated in an actually "godlike" race; and that all our progress is recovery of a lost status.

It has been the teaching of Theosophy—for the last thirty years, for Europeans—that the region of the North Pole *was* the home of this race, and that all the later-arising continents were peopled by its descendants. These always degenerated after attaining heights of civilization and culture, though each one preserved and developed some special type and characteristic, the key-note of which had been struck by the parent race. This race was spiritual because it held the animal in perfect domination. The degeneration was the gradual advance of the animal to the ruling place. The higher faculties were clouded over; the animal senses took the place of subtler ones, and the swift and sure cognitions of the early time became correspondingly dulled

and slowed. The Golden Age was over—only to be regained by millenniums of suffering and struggle.

STUDENT

[This is yet another instance in which the teachings of the ancient Wisdom-Religion, today called Theosophy, are beginning to receive *learned* support. H. P. Blavatsky, writing seventeen years ago, said that the doctrines of Theosophy bearing on man and our planet, and their origin, growth and destiny, would begin to receive recognition in the *Twentieth century*. Her words are already proving true, and the century is but five years old! What may not Theosophists expect, therefore, in 25 years from 1905? So much has already come to pass, as outlined years ago by H. P. Blavatsky and W. Q. Judge, that it is well within the limits of the probable, that in years to come, learned men may find it quite *convenient and wise* to come to the School of Theosophy at Point Loma, California, to find a solution of some of the problems that will confront them. Ed.]

Egypto-Israelite Discoveries and Conjectures

THE admitted antiquity of history has been set back some thousands of years, and more gaps in historical knowledge filled, by recent excavations in the Sinaitic Peninsula. A temple has been unearthed at Sarabit-el-Khadem, which is supposed to date from between 2500 and 1500 B. C., or according to another account, is 7000 years old. This temple is described as entirely Semitic, not Egyptian. It is crowded with pilgrims' resting-places, and there are traces of burnt offerings on the hill in front. There were also courts with tanks in the middle, prototypes of the modern mosque, but dating 2000 years before Muhammed. Sarabit-el-Khadem is five days' journey across the desert from Suez, and sixty miles from the monastery of Mount Sinai. The Egyptian turquoise mines have been discovered, but there are not enough turquoises now to compete with those from other places. One account says that a collection of flints used by the Bedouins in working turquoise out of sandstone has been discovered, and that it dates to 10,000 B. C.; also that the temple of Sarabit-el-Khadem was originally a sacred cave of Hathor and "must have existed in the Third Dynasty nearly 7000 years ago." Thus archeologists seem to be fairly vague and inclined to set back the dates of the dynasties beyond even those limits which till recently have been considered as too bold.

STUDENT

The Trend of Twentieth Century Science

The Blood as a Warrior

IF man's blood—fortunately out of his control—knew its business no better than his mind, we should assuredly all be dead by now.

For whereas the former is roused to instant resistance by the presence of enemies, the latter not only tolerates many of *its*, but allies itself with them and rejoices in them. *We* have control of the latter; *nature* of the former!

The study of this warrior tendency of the blood in the defence of the body has made some progress of late years. In unimaginative parlance it is known as the study of immunity. And quite recently it has been dragged in as buttress to the Darwinian theory. The method is this:

Extracts from the blood or tissues of one animal injected into the blood of another not related to it cause the latter to fabricate various forms of shot and shell for the destruction of the foreigner. But if the two animals are nearly related, no such ammunition results. The ammunition will work abroad as well as at home. For if it is extracted and carried into the enemy's camp—that is, if it is injected into the animal from which the invading extract was taken, it will carry on the war there and do much damage. And it will do equal damage to any related animal.

Thus extracts from the blood of the anthropoid apes do not excite the hostility of human blood; extracts from the blood of a goat do. And ammunition thus produced in human blood will not only injure the blood of a goat but equally of a sheep. So the relation of man and ape is shown; and the relation of goat and sheep; and the non-relation of man and sheep.

The ammunition is of three kinds. One kind—"lysins"—dissolves the enemy's ranks, that is, his blood corpuscles. Another—"agglutins"—makes his blood corpuscles stick together and makes them useless to him. Another—"precipitins"—clots the fluids in which the corpuscles float.

Science goes on thoroughly proving the relation of man and ape, and assuming that the former came from the latter. It does not yet consider the possibility of the reverse being the truth, which Theosophy teaches.

STUDENT

The Building of the Firmament

THERE must be order and law in the spacing of the stars. Bode's Law of planetary distances proves that there is cause for the position of the planets; can we trace any relationship between the fixed stars?

If a person stood, without moving, in the midst of a plantation of trees it would be almost impossible for him to determine if they were arranged in regular order or not; but if he could see distinct rows of trees in some directions and clear spaces in others he would have reason to suspect there was some plan. This resembles our position on earth, for although the earth, sun, and planets, are speeding onward towards the constellation Hercules, in consequence of the enormous distance of the stars we are practically stationary in respect to them. Thousands of years will elapse before there will be the slightest apparent change visible to the naked eye in the positions of the stars, resulting from our movement onward. We are, therefore reduced to deductions from the arrangement of the stars, their distances and their own movements. There really appears to be some trace of systematic spacing. No one can fail to remark certain long curved lines of bright stars in many portions of the sky. The Constellation of the Northern Crown contains a perfect semicircle, the Scorpion has a long line of stars down its back and tail, and in Eridanus, Perseus, Canis, Argo and the Dolphin, among others, distinct curves are traceable. With an opera glass or low power telescope hundreds more appear. If the stars composing the rows are at about the same distance from us it is clear that the curves are real and not merely fortuitous, but if the components are at greatly varying distances from us there can be no doubt that the apparent connection is merely optical. In time this will be settled by the measurement of the distances of all the stars, an intellectual triumph that is bound to arrive some day, but in some of the instances the suggestion of a real connection seems irresist-

ibly forced upon one, because of the equality of the distances between the components and their similarity. It is easy to imagine a stream of primitive ethereal matter concentrating and "crystallizing" into nebulae and suns at regular intervals along the line, even if they wandered off afterwards by the action of unknown laws of repulsion and attraction. In this, as in most of the modern problems of astronomy the mind is almost dazed by the immensity of the subject, but it is well worth some attention.

STUDENT

The Primeval Frenchman

WAS France primevally peopled from Egypt? Legend says that Isis, sister of Osiris, came in a ship to Lutetia, now Paris. She was well received and made patroness of navigation. The name of her ship was Baris, and it would seem probable that the B became a P, and that the Parisians and their town took the name of the vessel. So it may be *this* vessel that is to this day in the arms of the modern City of Paris.

When the Romans vanquished the Parisians and took the city they found the worship of the Egyptian triad, Isis, Osiris, and Horus, in full swing. In excavations under the site of the Bastille a statue has been discovered which Sellier has identified as that of Osiris.

Greek writers call the earliest inhabitants of Gaul Ligurians, and these people are generally regarded as having once spread themselves over southern Europe and Northern Africa. They were conquered by the ancestors of those who are now the Basques. Later still came the great Celtic wave from the East. The Gaulic peoples whom Cæsar conquered must have been blends in various proportions of these. And the Egyptian cult of the Parisians, along with the legend, makes one wonder whether the Ligurians were not of identical stock with the Egyptians.

The population of France is changing, and it may be that that "Egyptian" element is reasserting itself. It seems that the blue-eyed, fair-haired Celtic type has for many generations been giving place to "a more ancient, dark-eyed, black-haired, round-headed man."

But it may be that the "Isis" of the legend was but a symbolic name for wisdom, for wise men, "giants," "heroes," from Egypt, who according to other legends once came into Europe founding religion and marking their work by the stone ruins of Carnac, Stonehenge and elsewhere.

STUDENT

Sap-Rising

LA REVUE SCIENTIFIQUE points out that the phenomenon of the rise of sap is still unexplained. The text-books generally illustrate it by telling the pupil to dip a lamp-wick into a narrow-mouthed bottle of water. The bottle soon empties, since the water continually ascends along the wick to replace that which is lost by evaporation from the part projecting beyond the neck. This, of course, is the usual attempt to make a natural phenomenon look as mechanical as possible. But it turns out that it will not do. Says *La Revue*: "In the highest trees the total pressure required would be nearly 100 atmospheres, according to what we know of the vessels through which the sap passes in the trunk. We cannot suppose that the leaves exercise so intense an osmotic suction, and the sole hypothesis that has any probability is that some sort of pumping action is exercised in the wood by the living cells."

No one has yet observed the cells of a tree contracting like a slowly acting heart, the wave of contraction creeping from below upward; but that is what must happen. Plants may not have definitely differentiated hearts, but the cells must perform heart functions, just as, though they have not definite muscles, parts of the cells do slowly the same thing as a full fledged muscle will do quickly. In other words, function precedes structure. That principle is true from top to bottom. "The law of nature is that they who do the thing shall have the power; they who do not the thing have not the power." And we might add that they who use the power shall presently have the apparatus to make the power do its best work. That *those who can see shall have eyes*—is a standing promise good for every plane of nature.

The Wild Sage

THE Sage Brush is an object very familiar to Californians and forms one of the endearing home attachments to the students in Lomaland. While resembling the culinary sage grown in gardens in other parts of the world, it here attains the dignity of a shrub or small tree, and covers large areas of the country side. Its fragrance makes the air balmy, and is especially strong just before a fog in the night. E.

Thoughts from a Lomaland Bee-Farm

WHILE watching the labors of the ants or the bees many ideas come to the observer. That their senses are acute, their intelligence quick and responsive to new conditions, and their whole communal organizations much better managed than our human societies is clear. Yet their individual lives last such a brief time, seldom exceeding a few months, except in the case of the queens, that the suspicion is almost forced upon one that there is some deep secret in connection with their modes of thought or feeling.

In ancient Egypt bees were kept in the sacred precincts of the Temples, being associated with Hathor, the "Virgin Mother of God, in the West," Isis. Virgil, in the fourth Georgic, speaks of the heavenly origin of honey, and after sound, practical advice on beekeeping, gives some mysterious counsel about the way to produce a swarm by spontaneous generation from the entrails of cattle that have been killed with certain ceremonies. This obviously has a concealed meaning, probably connected with the dedication of the cow to Hathor in Egypt. Also is it not Homer who calls Juno, the wife of Father Jupiter, the ox-eyed goddess? H. P. Blavatsky in the *Secret Doctrine* refers significantly to bees, saying they were perfected ages before the present condition of things on earth, and have a special place in nature's scheme.

The following idea, based upon a suggestion thrown out by Dr. Russell Wallace, in another connection, may throw a little light upon the subject of the mental action of these fascinating creatures.

We know the average rate at which we perceive objects, reflect upon them, and observe the passage of events in time. We know that if a movement goes beyond a certain speed it becomes impossible to follow the details of its course with our perceptions; our rate of consecutive thought is slow; our nerve currents sluggish. So in a given period the number of events

J. G. PERCIVAL

CENTRE of Light and Energy! thy way
Is through the unknown void; thou hast thy throne,
Morning and evening, and at noon of day,
Far in the blue, untraced and alone:
Ere the first wakened airs of earth had blown,
On didst thou march, triumphant in thy light;
Then didst thou send thy glance, which still hath shewn
Wide through the never-ending worlds of night,
And yet thy full orb burns with flash unquenched and bright.

Thy path is high in heaven: we cannot gaze
On the intense of light that girds thy car;
There is a crown of glory in thy rays,
Which bears thy pure divinity afar
To mingle with the equal light of star;
For thou, so vast to us, art, in the whole,
One of the sparks of night, that fire the air;
And as around thy centre planets roll,
So thou too hast thy path around the Central Soul.—Selected

we can grasp is very limited. But suppose for a moment that our speed—capacity of perceiving consecutive happenings—vibrations, or what you will—was intensified enormously, then we should comfortably watch the actual movement say, of the spokes of a wheel revolving a thousand times a minute; a flying bullet pushing the air before it would seem to move deliberately across the landscape; and the march of the sun across the sky would appear interminably slow. A day would be almost as a thousand years! The effect of such a quickening of perceptions would be something like the impression produced by a series of moving photographs on a screen when the machine was reduced to a fraction of its ordinary speed.

Sounds would be entirely changed; the low notes would be quite inaudible, only the highest would affect us, the others would be no more than the wagging of a finger; but a multitude of infinitely higher vibrations than we can now perceive would suddenly burst upon our astonished senses; we should live in a new world. Such rapid vibrations are pulsating throughout nature; why should not the consciousness of the ants and bees be largely centered in them? Their short—to our way of thinking—lives would thus be crowded with events, and be equal in experiences to those of beings whose perceptions were far slower. Does not this fanciful suggestion

offer a reasonable explanation of much of the conduct of these intelligent creatures which has puzzled investigators? APIS

Inoculating Seeds

BACTERIA can be made very useful if a suitable field is provided for the exercise of their virtues. And this is the case when seeds are inoculated with them, as is now being done experimentally with excellent results. The bacteria act as nitrogen gatherers, and their activity in this respect turns an unproductive soil into material for raising fine crops of legumes or clover. Clover has been produced 18 to 20 inches high and blooming, on a soil where non-inoculated seed was yielding a crop only 6 to 8 inches and not blooming. The dry culture bacteria can be exported without deterioration, and in New Zealand the trials on experiment farms are reported successful, while in

Natal good results were obtained in cow-peas. The germ does not act well in an acid soil, but an admixture of lime corrects this defect; moisture also is needed as a carrier of the bacteria and their products. This is a good instance of the way Science helps Nature. STUDENT

unable for the time being to receive the Ministers, he caused them to be summoned to the presence of Queen Alexandra for consultation with, it is stated, most satisfactory results.

An enlightened sovereign wields a mighty force in the world today; but only at that time in the future, when the deeper currents of human endeavor have been sounded by many more women, only when many

A Womanly Queen

“I ALWAYS think,” says Mr. Harold Begbie, in *The London Magazine*, “that Queen Alexandra’s first public greeting in London was prophetic of the days to be—prophetic of this life so largely devoted to the relief of sorrow and distress. She came to us on a fair morning in spring, with a light breeze blowing foam from the historic

KING EDWARD VII

more women have been true to every lawful demand, spoken or unspoken, will it be known how the rule of King Edward VII has been sanctified by the pure unselfish life of his noble-minded helpmeet.

M. M. T.

THE Marchioness Oyama spiritedly remarks—in defense of the Japanese women:—“They do not play with fans and walk in the streets carrying oranges and paper napkins in their long sleeves as they do in so many Japanese plays and stories—in America. They are wonderful workers. From the Empress down to the women of the lowest class they are working, as hard as possible.

“Our model and our inspiration, especially at this time, is our beloved Empress. She appears to us a symbol of wisdom, benevolence, gentleness, and chastity. She is perfection. We are happy to have her and live under her shadow and become ennobled. Yes, we Japanese women all look upon her, our great Empress, with devotion and love, as of a thousand Japanese mountains turning toward Holy Fiji with the divine white cap so far above us.”

M.

AN Englishman has just published a pamphlet entitled *Women and the Legal Profession*. In his opinion it is unfair that “a woman should be allowed to minister to the cure of souls and to assist in the cure of bodies, while any attempt to interfere in the cure of quarrels is met with vigorous opposition.” He quotes women lawyers as being far from a novelty in many lands, as for instance Holland, Sweden, Norway, Germany, Finland, Switzerland, France, Canada, India, and of course in progressive Japan, as well as in the United States.

AN American woman has invented a very unique nursery chair with every facility for dressing infants. The necessary articles, brushes, combs, powder puff, etc, are kept in drawers which slide under the chair seat.

waters of the Thames, and the sun shining hopefully on the grey stones of the City. The river was decorated from shore to shore; a swarm of little craft, from which flags and handkerchiefs were waved incessantly, surrounded the yacht, and every yard of the wharves was packed with a holiday humanity shouting its great welcome to the beautiful Princess.

“Then she left the Thames, and proceeded through the dark and narrow streets of London. Almost immediately she was surrounded by a mob of the humblest and roughest citizens. They broke through the police, swept the military out of the way, and, surging to the carriage with grimy faces and hurraing lips, thrust their blackened hands into the hand of the Danish Princess, and shook it with a will. At one moment the carriage was in danger of overturning, and, pale and startled, uttering a little cry of alarm from time to time as the carriage rocked and swayed, the Princess gazed, as one spell-bound, upon the grim faces of London’s hoarse-lipped millions.

“She was fresh from a charming little kingdom where labour is beautiful and even the cities are gentle; and the hands stretched out to her in this new kingdom—this grey city of Father Thames—were the hard black hands of our London mob. Thackeray exclaimed: ‘Since woman-kind existed, has any woman ever had such a greeting?’ Well, the Queen has been faithful to that greeting—the first to greet her, the first to make her feel London. She has never forgotten the people.”

MRS. PETRIE, wife of Professor Flinders Petrie, has been an active assistant to him in his Egyptian work. Mrs. Petrie has labored gallantly in the arduous work of excavation, directing and superintending no less than 17 workmen, and has fully established the right of her sex to be ranked among Egyptologists. Mr. Petrie has been appointed one of the honorary secretaries of the newly formed Committee of the British School of Archeology in Cairo, which includes several English women as well.

OUR YOUNG FOLK

The Raja Yoga Question Box

GREAT writers help the world by planting in the minds of those who read, thoughts which have power to awaken effort.

1 Who was Thomas Carlyle?

ANSWER—Thomas Carlyle was a Scotchman who became a great author. His parents were poor, but they saw that he loved to learn and they tried to have him educated. When he was fourteen he walked eighty miles to Edinburgh, and entered the University there. He studied very deeply, and soon began to write books. Thomas Carlyle was a philosopher; he teaches us how foolish are shams and pretence of every kind. He was like the prophets of olden times, warning the people to turn from selfish ways and be pure and true. Carlyle has told us

much about the heroes of history, the warriors, the poets and great teachers.

2 Who was Ralph Waldo Emerson?

ANSWER—Ralph Waldo Emerson is called "the Sage of Concord." His home was in this New England town. Emerson was a philosopher and wrote noble essays and poems. People in many countries have been helped by his writings. His pure life was also an influence for good in the world. Emerson was one of the first great public lecturers of America. He believed in the divinity of man and all he said and wrote tended to make people honorable and true. Many young people had their better selves awakened by this kind counsellor. These two great philosophers, Emerson and Carlyle, were warm friends for many years.

TO-DAY

THOMAS CARLYLE

SO here hath been dawning
Another blue day:
Think, wilt thou let it
Slip useless away.

Out of eternity
This new day was born;
Into Eternity,
At night, will return.

Behold it aforeside
No eye ever did;
So soon it forever
From all eyes is hid.

Here hath been dawning

DUTY

RALPH WALDO EMERSON

SO high is grandeur to our dust,
So near is God to man;
When Duty whispers low "Thou must,"
The youth replies, "I can."

The Easy or the Noble Way

I AM young, I have a life to give." So said Paracelsus in the great poem of that name by Robert Browning—a poem which you boys and girls will read for yourselves some day. By that time you will have learned something about fighting for the right, and you will have had many a hard battle with foes you little dream of now.

If you have fought your battles with courage and patience, even though many times defeated, you will be glad to read of the great men who have fought the same battles.

But this life that each of you has to give, this splendid responsibility that is yours! Will you give it to the right or to the wrong? It must be one or the other. You may think that so big a rule does not apply to little every-day temptations, but you will see if you look for it, that in everything in life, even in your own mind and heart, these two sides are forever waging war.

There is a strong tendency for boys and girls to think constantly of what they want for themselves and of the easiest way of getting it. Instead of wishing for beauty and nobility of life and character that they can attain and teach to others, they let selfish wishes fill their minds.

Money is usually the thing most wanted. So many people talk and think about wanting money, and so much is said about it in the newspapers, that those who are not watching from within soon believe that it is the natural and the only thing to strive for, and get in the easiest way.

But you know that this is not noble. Not for this does a real warrior

Lomaland Photo and Eng. Dept.
BASKETS AND BEADWORK MADE BY CHILDREN OF THE RAJA YOGA ACADEMY AND RAJA YOGA FREE SCHOOL, SANTIAGO DE CUBA

fight. This easy way leads to selfishness and often beyond that into crime. Through wanting to get things in the easiest and quickest way, one comes to try unbrotherly and unlawful ways.

Each one who chooses the wrong and selfish way makes it harder for others to see the difference; while he who chooses the right makes his life a shining weapon to fight evil.

This is what Brotherhood and Raja Yoga are doing for boys and girls all over the world. They give a glorious opportunity to work for humanity, a definite purpose in life, a high ideal to strive for. They teach all that Paracelsus meant when he said—"I am young. I have a life to give." A RAJA YOGA STUDENT

Facts Worth Knowing

THOMAS CARLYLE once said: Never till now did young men and almost children, take such a command in human affairs.

A FRENCH scientist has discovered that the eggs of insects contain the same poison venom that is found in their sting. So also the eggs of serpents.

EVERY year, on the shore of Lake Huron, a play based on the story of Longfellow's poem "Hiawatha" is acted by the Ojibway Indians. In the last scene the chief stands in his bark canoe which, guided by an unseen cable, moves slowly from the shore, and Hiawatha disappears into the setting sun, just as the last notes of the death-song die away. Longfellow's family were present at the first performance of this drama six years ago.

NEAR Calcutta there is a hospital for animals where there are usually one thousand animals under treatment. A staff of eighty nurses, directed by a British veterinary surgeon, looks after the patients, which are elephants, horses, mules, oxen, dogs and sheep. The world will be a happier place when there are more institutions of this merciful nature.

IN THE state of Arkansas there is a unique farm. It consists of a number of small, shallow lakes in a valley, and here are raised every year about one thousand alligators, to supply the circuses and zoological gardens throughout the world. Alligators do not reach maturity until they are thirty-five years old, but they often live four hundred years. The alligators at this farm were brought from the swamps of Florida. For three months every winter they become torpid, and are placed in wooden boxes, where they remain till they awaken in the spring.

THE CHILDREN'S HOUR

LULLABY

J. G. HOLLAND

ROCKABY, lullaby, bees in the clover!

Crooning so drowsily, crying so low.

Rockaby, lullaby, dear little rover!

Down into wonderland,

Down to the under-land,

Go, now go!

Down into wonderland go.

Rockaby, lullaby, rain on the clover,

(Tears on the eyelids that waver and weep!)

Rockaby, lullaby—beading it over!

Down on the mother-world,

Down on the other world,

Sleep, oh sleep!

Down on the mother-world sleep.

Rockaby, lullaby, dew on the clover,

Dew on the eyes that will sparkle at dawn!

Rockaby, lullaby, dear little rover!

Into the stilly world,

Into the lily world,

Go! now go!

Into the lily world go.

AT A DUTCH FARMHOUSE—THE SHEEP AND THEIR SHEPHERD

The Children and the Queen

I HAVE just been reading an account of the children's festival in Santiago on Cuban Liberty day and I thought that perhaps the Lotus Buds might like to

hear of a great children's festival held in Dublin, Ireland, on April 7th. Of course the children there were not all Lotus Buds as we have not as yet very many in Dublin, but there were some members of our Lotus Circle present and a great time of it they had that Saturday afternoon. The occasion was the meeting between the Irish Children and the English Queen in our beautiful Phoenix Park. The children came streaming into the city from all parts of Ireland to the number of fifty-two thousand and were marshalled into position along both sides of the main road through the park. About one o'clock the Queen drove slowly down between their lines and was saluted with cheers and waving of flags till she reached about half way down, when she was presented with a lovely bouquet of flowers by the Lord Mayor's little son. She then drove slowly to the end and back again along the entire route, greeted everywhere with cheers, waving of bright colors and singing, which touched her deeply. I do not know whether it was the thought of seeing a real Queen that made the children all seem so happy, but I do know it was the great-grandmotherly heart of the Queen that was stirred at the sight of all those bright young faces giving her an Irish welcome, and I thought of a day that may not be so far off when a great number of children will assemble here bearing lotus banners with inscriptions, such as Love, Trust, Harmony, and when with songs of brotherhood and mutual help they will unite in giving a Caed Mile Failta (hundred thousand welcomes) to one whom they will look upon not so much as a queen as their own dear mother.

R. C.

A True Story

DEAR CHILDREN: When I was a little girl I was fond of having all sorts of queer pets. It did not much matter what they were, for if I could not find anything better, I made pets of grasshoppers, beetles or butterflies.

Once I caught a most beautiful butterfly. It was light green in color with delicate black markings on the wings. I found it in the woods about five miles from home. When I reached home with my butterfly, I opened the box in which I had carried it, and let it fly about the room.

I forgot about it when I went to bed that night, but when I went to look for my pet the next morning, what do you think I found? On the

outside of the window screen on which my butterfly had lighted was another one, just like mine. It was the little mate and it must have come all the way from the woods to find its little companion. How do you suppose it knew where its mate was imprisoned? Is it not possible that insects have ways unknown to us of communicating with one another?

I opened the window screen and let the two butterflies fly away together. After that I did not care to make pets of that kind for fear that their little companions might be searching for them and not be able to find them. AUNT EDYTHE

What Can be Done With Flowers

WHERE do the new flowers come from? Every year new varieties of plants are shown in green-houses and florists windows. How many know how these new wonders are created?

If we study plants and flowers we find that nature invites us to work with her in many ways. Often when we sow seeds we find one plant, coming up, will be different from the rest. Perhaps the stem is shorter, the color different, or the petals fringed instead of round. Now the florist takes the seed from this flower and sows it quite apart, by itself. Then when the little plants come up he destroys all that are not like the parent flower. Thus, with careful guarding, a new type may be formed.

Then there is another way: The pollen from one flower may be carried to the pistil of another which differs in form or color. This can be done with a camel's hair brush, or even the finger.

And what wonderful changes sometimes take place! Plants that hung down their heads hold them up straight. New colors, stripes, spots and strange markings often appear. Suppose, for instance, the pollen from a red dahlia is carried to the pistil of a white one. The result may be a white dahlia with red spots or stripes. But this can only be done among plants belonging to the same family. Nature makes her distinctions and draws lines which we must observe.

Here in California is a garden where all these wonderful things are done by a woman. In this beautiful spot we find many old friends with new faces, and some are so changed we cannot recognize them.

Is this not "helping Nature and working on with her?" L.

DEAR CHILDREN: In front of the Academy is a big field. Some months ago we watched the horses plowing there. Soon we saw tiny green leaves everywhere. They grew taller and taller. Then we saw little feathery tips waving in the wind. Our teacher told us the oats were growing. The oats turned yellow. The mower came and now in little heaps all over the field the oats are ready to be taken to the barn.

There is such a nice little hill near the garden, where we roll our hoops. You should see us come flying down the hill! We have skipping-ropes, too, and have a great deal of fun running and jumping. Then there is the big lotus pond to visit. We like to watch the goldfish. They are not a bit afraid, but come quite close and let us see their shining coats. Some nights after tea we have fine runs down the long hill to the Roman gate, but coming back we walk very slowly. M.

Drama as Compressed Nature

MARK TWAIN says he once wrote a play or a novel in which he forgot to put an end in the last chapter to the villain. His attention being called to this, he put in a supplementary remark to the effect that the villain fell into a cauldron of boiling lead. Vice thus met its proper punishment after all, even if the punishment had to be lugged in by the scruff of its neck.

With something like this as a text, a New York paper criticises the modern "drama with a lesson." Four acts smelling of the earth earthy, and a final act flung on the stage as a concession to "prudery," an act in which the sinning heroine irrelevantly and causelessly reforms or as causelessly dies. The death in no way constitutes the "wages of sin," nor is the reform any real development of character. "On the portrayal of an unconventional instinct, the author will bring to bear devotion and skill, observation, insight, analysis; he will find you the original spark, nurse it, test it, watch it grow until it has attained the climatic fury he is after; and then he loses interest. Ah, well, let her infant brother come in just in the nick of time, or let her shoot herself, or something: anything that will bring out the necessary commercial fact that virtue triumphs, or that the wages of sin is death."

If the great truth of Reincarnation had not been forgotten in our day, no one would ever have thought that the wages of sin could be a romantic death, or that the bill to the divine Law could be settled by a suicide. Nelson died a splendid death at Trafalgar—the wages, if you wish to think so, of his heroism. He could not thereby escape the wages of his intrigue with Lady H——; they remain for his succeeding incarnation.

The wages of sin must always be disgrace, reaction, nausea, weariness, pain. And the furnace must go on burning till the impurity is all consumed and the pure gold of a new resolve alone remains. In each incarnation men and women pay debts left over from the last; and because they do not remember the last think they are unjustly treated. But if so, they would be equally undeserving of the rewards held over from a previous life. If the drama would be true to its own rôle of teacher, it must imitate nature's ways whilst foreshortening the time she takes over them. The play cannot very well put its characters through two or more incarnations; it must epitomise evolution. Within its five acts it must compress that orderly and natural evolution of vice and sin into disaster and pain which would or might stretch across death and birth into another lifetime.

STUDENT

Beguiling the Tedium

IN many cigar factories in Havana the employés relieve the tedium of their occupation by having a novel read to them. The reader is appointed from a number of competitors and is paid a salary by his hearers. He is mounted in a sort of pulpit and his duty covers three hours daily. The workers select the story by vote, and, provided a translation into Spanish is to be had, the writer may be of any nation. Thus *Quo Vadis*, *Oliver Twist*, *Vanity Fair*, *A Tale of Two Cities*, *Don Quixote*, and the books of Wilkie Collins and Hugh Conway, are all popular. *Uncle Tom's Cabin* was, but is now regarded as out of date. The reader is required to be of the very best. The poet Martinez was once a reader. So was Secretary Morna, of the Cuban Senate; so the Cuban orator, Ambrosio Berges. And so is now Victor Muñoz, the well-known editor of *El Mundo*, one of Havana's chief dailies. H.

Pernicious Extremes in Education

A SPEAKER at a recent conference in Los Angeles is reported as saying:

Nor little better was the realm of education. Here, too, oppression, mutual distrust, envy and the springs of vengeance found fruitful play. What was a child? A child of man was a child of hell, and could only be a child of light by the torture of persecution, the self-inflicted consciousness of depravity and the despair that leaps from hopeless hope when a God offers what man cannot attain.

Hence the old idea of education was suppression, suspicion, espionage, moral torture, personal malignity—any agency that might magnify the humiliation of the victim of perennial doom! To praise a child was a crime—the open door to vanity and the crooked way to sin. Keep the child down, oppress the native instincts, lest the devil devour him with temptation and conquest. For the child to think was a cardinal sin. The priest and the pedagogue stood for creed and precedent; woe be to those who questioned such authority.

But today all is changed, because the voice of science is supreme in modern culture.

This is all very well; but, standing alone it is a direct invitation to fall into the opposite extreme, an extreme whose deplorable results we are witnessing today. To allow a child to grow up unchecked and ungoverned is to hand him over to the dominion of his passions and instincts, and is the greatest cruelty to him and to all who come in contact with him.

Both of these evil extremes are due to a total lack of discrimination between the higher and lower—the essential and non-essential—nature of the child. The old system suppressed the higher nature together with the lower; and the new system, in attempting to free the higher, lets loose the lower.

But where shall we find the parent or guardian wise enough to discern the true from the false, or strong enough to act

upon that knowledge? Just how much of the childish nature is good and healthy, and how much noxious?

What is true freedom? All the wisest men have defined it as freedom from bondage to the self-will and passions; and they have said that freedom can be attained only by discipline. If we would make our child really free, we must aid him to keep in order his unruly impulses, or these will soon grow strong and put fetters on his soul. And we have to learn how to enforce this discipline in some other way than by connecting it with a dogmatic theological bondage of the soul. Theory is not sufficient, nor good intentions; the age demands practical examples and that the teachers shall themselves embody what they profess.

But all this implies, firstly, an understanding of man's real nature, and secondly, self-disciplined teachers to apply the knowledge. These may be had in the Raja Yoga Schools, but elsewhere, alas! where shall we find them?

The truth of these remarks rests upon undeniable evidence, as anyone may know who compares a typical spoilt child of the world with a child brought up under the Raja Yoga system. Which of the two is free, which bound? The one that fidgets and squirms and frowns; or the one that is serene and self-possessed? The one that *can't* and *won't*, or the one that *can* and *does*?

ADMIRAL ADIGARD OF THE FRENCH NAVY, WITH HIS SUITE, AND LOMALAND STUDENTS

Art Music Literature and the Drama

Miss Edith White—A Lomaland Artist

EVERY one having a love for nature and feeling for what is true in art becomes interested, on coming to Point Loma, in the work of Edith White, the well-known and successful California artist and active Student at Lomaland. The visitor takes away a happy memory of her studio at Lomaland—so simple, yet so individualized by her personality—and of her work, which imparts the glow and warmth of summer days. A real lover of flowers, Miss White finds her greatest pleasure in studying and expressing them. Many artists have this high enjoyment and keen appreciation of their beauty but few can give it such expression.

Edith White is preëminently a flower painter though she has done fine landscapes and excellent portraits. She works with sincerity and enthusiasm, with great ease and quickness, making every stroke tell, a power grown from years of patient and constant effort, conscientious work, and a habit of thoroughness acquired in the beginning of her career.

Her childhood was spent near the very heart of nature in the mountain forests of northern California where, with childish wisdom, she made friends of the trees and flowers and delighted to draw and paint them. Her earliest lessons were taken from a clever young Virginia woman whose strange fortune had brought her to the far away settlement of gold miners where this child of artistic temperament became her apt pupil. Once the young girl went with her parents to San Francisco for a year and there, at a "State Fair," got her first glimpse of pictures, doubtful specimens of art probably, yet what a world of fancy they awakened in her childish mind! An artist had a studio in their home there and she used to hurry home from school to spend delightful afternoons watching him deck his canvas with clouds of impossible cherubs, and wondering why he didn't fix upon it, instead, a bit of the actual world or of human nature.

As the years went by every opportunity for good instruction was eagerly seized and made the most of, not only in San Francisco but later at the Art Students' League in New York. All help from every source that could be of value in work Miss White has used to good effect and this faculty has gone far in making her the artist she is today.

In 1901 Miss White moved her studio from Pasadena to Point Loma,

MISS WHITE IN HER STUDIO

where her work has been even more successful because of the ideal conditions under which it is accomplished and the inspiration drawn from daily contact with the students, among whom exists a spirit of real comradeship and harmony, a unity of thought, feeling and purpose.

Her pictures of wild flowers are delicate and expressive of feeling; her studies of roses are full of character and grace, so skilful are they in their ar-

range— in earthen jars, in picturesque baskets, or in crystal bowls on whose shining curved surfaces the reflections vibrate and glance. Her intense love of nature is the dominant feature of her art and has made her canvas bloom like flowers of nature perfected, touched with the ideal. All the treasures she has gathered she endeavors through her art to give to others.

Her pictures have been exhibited not only in the Academy in New York and elsewhere, everywhere recognized as works of extraordinary

"ROSES"—FROM A PAINTING BY EDITH WHITE

merit, but have scattered their freshness and beauty afar into many homes and private galleries throughout the land. LAURA BONN

The Conscience of Ancient Days

TO the glory of Christ, I, Johannes Bosscaert, honestly bound this book." Thus runs the quaint legend on a certain old book-binding.

What a true understanding of craftsmanship we glimpse here! May we not find in this spirit of devotion, the source of that inspiration which makes the tomes and bibelots of the middle ages, in so many respects, still unrivalled gems of craftsmanship?

The old guild-workers wrought lovingly with their hands, therefore the royal insignia of soul was impressed upon their creations. That is why certain old books seem almost human in their individuality, arousing in us genuine respect for the characters of their makers by their excellent construction, just proportion and harmonious decoration.

Book-making today, in all but isolated instances, is without dignity; it is no longer an ennobling art; it is but a means of earning a livelihood. Our books come to us from the machines, poorly printed, flimsy and tawdry. We have more books and cheaper ones than of old, and good literature is easily obtained; but so much that is indifferent and evil has been flung to us from the rapid presses, that our culture is rather lessened than increased.

A revival of the beautiful old crafts, however, for esthetic enjoyment only, would be but another evanescent fad. The source of the change must be deeper in human life. Our industrial and social life must become less complex and we must return to simpler ideals of living, before we can be sufficiently liberated from machines to labor lovingly by hand. The old spirit of devotion will return when we recognize that worthy work, well done, is "divine service" in its deepest sense, for it does glorify "the Christ," and its reward is beyond price. BERTHA BUNDSMAN

CORRESPONDENCE from Japan states that Schiller's *Wilhelm Tell* is being presented in one of the theatres of that country, Tell himself being represented as a Japanese huntsman and Gesler as a redoubtable daimyo.

Universal Brotherhood Organization

Central Office Point Loma California

The Memorial Services for the Victims of the Disaster to the U. S. S. "Bennington."

AS soon as the date of the United States Naval and Military Memorial Services for the sixty-seven victims of the terrible boiler explosion on board the U. S. S. "Bennington" was decided upon, the chief of the Pacific Squadron, Rear Admiral C. F. Goodrich, extended a most courteous invitation to Katherine Tingley, her cabinet officers, and other representatives of the Universal Brotherhood and Theosophical Society, to be present and take part in the ceremonies at the Isis Theatre and at the graveside. The Leader although unable to personally respond to the Admiral's cordial request, sent her representatives to the theatre, and was glad to be able to accept on behalf of a number of the members of the Universal Brotherhood Organization residing at the Point Loma International Theosophical Headquarters. A delegation of members were soon busy preparing wreaths, floral and other decorations and appropriate texts for the solemn event, and finally, on August 14th, brilliant sunshine and a gentle breeze—Point Loma weather in short—gave the opportunity for an impressive ceremony. Early in the afternoon a strong and representative detachment from the Raja Yoga Academy, dressed in the comfortable and tasteful Point Loma uniform and bearing wreaths of evergreen on their left arms, and flags of all nations on their right, which were made by some of the younger lady-students, set out upon the long march to the graveyard. A little later several of the Cabinet Officers, a number of the older men students, and the members of the Young Men's Club carrying wreaths and mottoes, after a memorial assembly in the Aryan Memorial Temple, started in a long double column, marching through the Homestead grounds and those of the School of Antiquity, then through the Egyptian gate into the main road. The long march was conducted in silence, the firm soldierly tread of the students showing plainly the good results of their regular military drill.

Upon reaching the cemetery, which had been beautifully decorated by the students from the Homestead with evergreens and immense palm leaves, the column passed through the assembled crowd into the enclosure and formed in lines at "attention" in the southwestern portion of the ground, next to the soldiers from Fort Rosecrans, a position selected by the Admiral. Near them were the long ranks of Raja Yoga boys with their wreaths and the American flag with international flags. The whole appearance of these representatives of the Universal Brotherhood was worthy of the cause they stood for, and aroused much admiring comment on the part of the spectators.

After a short wait, the sailors from the U. S. Flagship "Chicago," and the survivors from the "Bennington" arrived, and then came Admiral C. F. Goodrich, commanding the Pacific Squadron, Capt. C. E. K. Moore, of the "Chicago," Commander Young, of the "Bennington," Col. Mc-

Clelland, Major Kneeder from the Fort, and a large group of officers, both naval and military. The mayor and members of the city council were also present and the scene was now very animated and impressive. The intensely blue waters of the Harbor with the white warships lying in the entrance just below, the glittering white houses of the city far across the bay, with a background of blue peaks and deep valleys, on either side the pretty little bays and sandy beaches and villages of Point Loma—all provided a feast for the eye and the imagination. At this moment the pathetic human element took its place in the rows of sailors paying a last tribute of respect to their dead friends, while the members of the Universal Brotherhood, representing so many nations, offered their silent sympathy with the relatives and with the country whose hospitality they are enjoying. The whole scene and the deeper meaning of it were profoundly moving and impressive.

A short service was conducted by the Chaplain of the "Chicago" and a brief address was given by another clergyman, and then the touching event of the strewing of the grave with flowers by the survivors took place. Following this, the long column of Katherine Tingley's students and her Raja Yoga pupils, the International representatives from Point Loma, marched in perfect cadence to the grave, forming in double lines along its sides. Their wreaths were then laid reverently upon the mound, each with its beautiful and appropriate quotation uppermost, and in bright, musical tones, several of the older Raja Yoga boys read the texts attached to their tributes. The clear young voices rang out powerfully over the whole assembly with their words of hope and encouragement. This portion of the ceremony produced a strong impression upon the spectators, as there was a sense of conviction and reality in the firm tones of the boys which plainly showed the superior advantages of the Raja Yoga training. There must have been many present to whom an appeal was thus made which they will never forget. To complete the International character of the event, one of the Japanese residents at Point Loma Homestead then stepped out and laid on the mound a bunch of Lotus flowers from one of the little lakes in the Homestead grounds as a tribute from his kindly nation.

At the close of the service the troops fired three volleys and "taps"—the last farewell—were sounded on the bugle, after which the assembly dispersed, all the International representatives from Point Loma returning in one column in quick step to the Aryan Temple. In the morning of the same day the first part of the service had been held at the Isis Theater, San Diego (Port Orient), and in response to the warm invitation of Admiral Goodrich, Katherine Tingley had sent a deputation of International representatives to occupy her private box. The Admiral and other officers expressed their hearty thanks for the active assistance given and sympathy shown by the Leader and her students both at the Memorial and funeral services, and in helping the sufferers in the hospitals. O STAR OF STRENGTH!

LONGFELLOW

O STAR of strength! I see thee stand
And smile upon my pain;
Thou beckonest with thy mailed hand,
And I am strong again.

Within my breast there is no light
But the cold light of stars;
I give the first watch of the night
To the red planet Mars.

The star of the unconquered will,
He rises in my breast,
Serenic and resolute and still,
And calm and self-possessed.

And thou, too, whoso'er thou art,
That chanest this brief psalm,
As one by one thy hopes depart,
Be resolute and calm.

Oh, fear not in a world like this,
And thou shalt know ere long,
Know how sublime a thing it is
To suffer and be strong.

The Greater Teaching

ONE sometimes wonders if the Soul has a fear of its own, a fear lest the human being that it is overshadowing shall not, when the hour of adjustment strikes, have reached the place which in the reckoning of the law, it should have. If at such times we have been living in harmony with the higher nature, we catch some of this urge and the whole moral being becomes awakened. The brain mind, not being able perfectly to interpret the message, begins to stir and question, and to ask and demand, and, if let alone, a healthy circulation would be set up between the soul and the mind, and we would throw off some of those diseased mental and emotional states that infest brain and heart. But we do not let it alone. We permit our desires to step in and complicate what would be such a simple and easy process, this purifying process, if we only permitted it to act naturally.

If the desires of the personal nature do not clog this circulation from soul to heart life and mental life, and back again—the brain mind, in response to the soul impulse, begins to reach out, hungry for a fuller and richer life. Life itself becomes our Teacher, for we find ourselves placed among certain circumstances, and if we used them rightly and strove to understand their meaning, we could fashion from them a key which would open door after door to still larger relations, until at last it included all human life. We know that we are opening some of these doors—for who of us does not view life from higher and higher levels as the days go by? Because of this we know that nothing prevents us from opening all the portals that lead to truth—except ourselves.

When we have learned to see the working of the law in the events of daily life and the lessons which they teach; when we have learned instantly to obey the voice of conscience and intuition—which are eternally sounding, if we will but stop and listen; then will the door of the sacred Temple be opened and we shall stand at the threshold of the Greater Mysteries. "As the lesser mysteries must precede the greater, so must discipline precede philosophy." STUDENT

The Power of Speech

EVERYBODY knows how a phrase of music will haunt the memory, echoing there in monotonous repetition for hours; and how at each repeat it draws upon the feeling which it first awaked.

Somewhat similar is the effect of the spoken word. He who does not wish to have a thought or a feeling must not say aloud or silently the

words that embody it. Said aloud, the effect is stronger, for most of us. The long-lived echo is awaked in the body. After the active consciousness is turned elsewhere, the phrase is repeated and repeated in the passive,—as we say, unconsciously, or in the chambers of "unconsciousness." At every repetition it awakes the thought and feeling that it embodies, though, it may be, below the threshold of active consciousness. But it is not less powerful. At each repetition it gathers force and moulds character, the character from which spring all future acts and thoughts.

Remembering then, that the body—the subjective body—*listens* to, registers, and repeats to itself, the words said on the lips; that its thought and feeling are colored thereby, not only then but for hours and in subsequent dream; and that with most of us, *its* thoughts and feelings are *ours*, or are indistinguishable from ours and regarded so; how dangerous and how valuable will be the instrument of speech! With it we can delay or advance ourselves, mould for good or evil our character, hurt or bless others. For we can use this power, in acquired wisdom, just as we have hitherto let it be used by our moods, whims, and prejudices.

Let us then say things that are kindly and gracious; things that express the soul, our aspirations, our sublimer will. We can speak ourselves forward of our present selves, speak as that ideal self which in our better moments we conceive ourselves to be and thus make that ideal of the future come into the restless *now*. Thus we can make speech the wand of a divine magic, compelling the myriad imps of whirling physical thought and feeling to change their robes, to become sparks of gold and purple, to become builders of a new bodily temple for our habitation. For "Know ye not that ye are Temples of the Living God, and that the spirit of God dwelleth in you?" STUDENT

FRIENDS IN COUNSEL

DEAR COMRADES: Habits of courtesy are often looked upon as merely surface polish, and are valued as an ornamental finish to complete the education of a man. Much of what passes for politeness in the world is just exactly what the word by origin implies, a *polish* that may be applied to any surface irrespective of the qualities it overlies. The inmates of the Raja Yoga Academy are noted for their manners, which are not so much the outcome of specific teaching of the rules of etiquette, as the embodiment in outward act of something of the grace and dignity pertaining to the soul.

True courtesy may be regarded as the harmony and beauty of the unseen world assuming form by the symbology of action in the daily life. Perfect behavior properly includes consideration for another's feelings, ready tact, a sympathetic intuition and the sensibilities refined to such a point that every slightest intimation of another's need is instantly perceived and met.

For perfect manners we require a blending of rare qualities that are seldom found united in a single individual. The presence of the Soul must be continuous, that by its immanence it may suffuse the whole demeanor with the warm radiance of universal love. The mind must be at leisure from the thought of self, and all the harsh discordant tones of egotism put in tune with life's deep undertone of cosmic joy. The consciousness must be untroubled by obtrusive ailments of the body, and a measure of robustness and a genial flow of spirits are invaluable aids. True courtesy may be perhaps defined as the performance of each action with a conscious reference to the welfare of our fellowmen. There is a certain affability which in the main consists in paying court to all the baser elements in those we meet, and by a flattery either open, or, (which is more effective still) subtly implied, wielding a vile persuasive force to bend the minds of others to our will. But courtesy which is sincere and true, while being no whit less agreeable, is concerned in an appeal to what is noblest in our nature. It makes the bold assumption of our willingness to serve. Looking beyond the base, ignoble personality that holds the reins in ordinary life, it enters into close relations with the royal warrior in the inmost place, and issues its insistent challenge to the hidden soul.

Only a man who has attained the royal union which Raja Yoga is designed to bring about, can perfectly discharge in all their fulness those minute, yet so important obligations which devolve upon participants in social life. Rules for good conduct may be sedulously followed out, but if the nature be not sound, sincere and clean, and the mentality to some extent detached from self, all efforts to appear polite will be as hollow mockeries of the supreme transcendent charm, which glorifies the smallest act of one who has attained the "royal union." STUDENT

PRINCE AND BEGGAR

CHARLOTTE FISKE BATES.

BODY, how hast thou fared to-day?
 "I have had the best that the world can give;
 With my costly feasting and rich array,
 Where is the prince who could better live?"
 And how has it been with thee, O soul?
 "I have lived on a crust or two of prayer,
 And had not a vestment that was whole:
 Ah! how much worse could a beggar fare?"—Selected

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question For some months, I have been reading in my spare time all the Theosophical literature I could get. I wanted to find out for myself why you, and the other Theosophists I know, are so sure of your position. I cannot yet understand it and so I made up my mind to put the question to you. What grounds have you for the certainty of your knowledge? Do you not after all accept the Theosophical teachings merely on faith; in other words, how do you know your philosophy is the right one?

(Note.—The above question was sent to a New York member, who has forwarded it here with the request that it be answered in the *Forum* of the NEW CENTURY PATH.)

Answer In one way, it is true that we do have knowledge, as well as a deep conviction, and a profound faith. But the word "knowledge" is so misused, that it would be necessary to know (we can hardly help using the word) what meaning is attached to it in the mind of the questioner.

The same statement that Jesus made has been made in substance by all the great Teachers, "Live the life and you shall know of the doctrine."

Such "knowledge" can be obtained in no other way. One may study Theosophy intellectually, and find much in it that throws light on the problems of life; in fact, if studied impartially, and without bias, it cannot fail to do so. But after all, what Theosophy really is will never be known unless it be lived. And just to the extent that it is lived, does it become known.

I do not know of any other way in which a satisfactory answer can be, not given, but obtained, to the question. If you wish to understand the position of a Theosophist, you must try to become one,—and that means that the endeavor must be whole-hearted and sincere. The reading and study of Theosophical literature is a good thing and helpful if there is the effort to lead the life; but without this latter, Theosophy can never be known. A further answer regarding the value of the literature will be given in a subsequent issue; but I am reminded here of the following stanzas from the *Book of Golden Precepts* which Madame Blavatsky gave to the Western World:—

Be humble, if thou would'st attain to wisdom,
 Be humbler still, when Wisdom thou hast mastered.

And, comparing the followers of the "Eye Doctrine"—the intellectualists—with those of the "Heart Doctrine":—

The first repeat in pride: Behold, I know;
 The last, they who in humbleness have garnered,
 Low confess: Thus have I heard.

STUDENT

Question How can you call yourselves unsectarian when you teach Theosophy? Is not Theosophy as much a form of belief as any other?

Answer If we can really understand what is meant by the term "Theosophy," we shall be able to judge whether or not it is sectarian, but the question cannot be answered on any other basis except such comprehension.

And as it was through Madame H. P. Blavatsky that Theosophy has been again brought to the world, let us turn to what she herself gives as the meaning of the word.

In *The Key to Theosophy*, she says:—

Theosophy is Divine Knowledge, or Science; . . . Divine Wisdom or Wisdom of the gods, . . . Divine Wisdom such as that possessed by the gods.

Continuing, Madame Blavatsky calls Theosophy the "Wisdom Religion," and quoting from another writer, says:—

All the old worships indicate the existence of a single Theosophy anterior to them. The key that is to open one must open all; otherwise it cannot be the right key.

The WISDOM RELIGION was ever one, and being the last word of pos-

sible human knowledge, was, therefore carefully preserved. . . . The Society is a philanthropic and scientific body for the propagation of the idea of Brotherhood on *practical* instead of *theoretical* lines. . . . "A tree is known by its fruit."

William Q. Judge, in defining Theosophy, says:—

Theosophy is that ocean of knowledge which spreads from shore to shore of the evolution of sentient beings; . . . It is wisdom about God for those who believe that he is all things and in all, and wisdom about nature for the man who accepts the statement found in the Christian Bible that God cannot be measured or discovered, and that darkness is around his pavilion. Although it contains by derivation the name God and thus may seem at first sight to embrace religion alone, it does not neglect science, for it is the science of sciences and therefore has been called the Wisdom Religion. . . .

It is not a belief or dogma formulated or invented by man, but is a knowledge of the laws which govern the evolution of nature and of man.

Katherine Tingley says:—

Universal Brotherhood has no creeds or dogmas; it is built on the basis of common sense. It teaches that man is divine, that the soul of man is imperishable, and that Brotherhood is a fact in nature, and consequently takes in all humanity.

Seeing then that Theosophy is the root from which all the great religions of the world have sprung, and that its main teaching is Universal Brotherhood; also that it is, as has been often stated, "the synthesis of Religion, Science and Philosophy," it cannot in any way be said that it is sectarian. On the contrary it is the only ground on which all the different sects may find a common meeting place, and is alone that which can and ultimately will bring harmony and unity out of the strife and discord of warring opinions.

Theosophy has been likened to the One White Light which contains all the colors. These colors forgetful of their origin may think themselves separate, but recognizing their origin they know they are but aspects of that from which they have sprung. So too when Theosophy is recognized the dividing lines of sect and creed will fade away, and, instead, men will recognize their common human Brotherhood and their common Divine origin, and will act accordingly. STUDENT

Question I have often heard a distinction made between a Theosophist and a member of the Theosophical Society, but do not understand just why. (See NEW CENTURY PATH, Vol. viii, No. 39.)

Answer 2 As an additional answer to that given in the issue above referred to, I was recently reading *The Key to Theosophy* by Madame H. P. Blavatsky, and noticed the following, which bears directly upon this question:

The Society is a philanthropic and scientific body for the propagation of the idea of Brotherhood on *practical* instead of *theoretical* lines. . . . (And speaking of the members) These may, or may not become Theosophists *de facto*. Members they are, by virtue of their having joined the Society; but the latter cannot make a Theosophist of one who has no sense for the *divine* fitness of things, or of him who understands Theosophy in his own—if the expression may be used—*sectarian* and egotistic way. "Handsome is as handsome does" could be paraphrased in this case and be made to run: "Theosophist is who Theosophy does."

Its aims are several; but the most important of all are those which are likely to lead to the relief of human suffering under any or every form, moral as well as physical. And we believe the former to be far more important than the latter. Theosophy has to inculcate ethics; it has to purify the soul, if it would relieve the physical body, whose ailments, save cases of accidents, are all hereditary. It is not by studying occultism for selfish ends, for the gratification of one's personal ambition, pride or vanity, that one can ever reach the true goal: that of helping suffering mankind.

I have said already that the true Theosophist must put in practice the loftiest moral ideal, must strive to realize his unity with the whole of humanity, and work ceaselessly for others.

From the above, it is very clear what are the marks of a Theosophist, and of a true student of Theosophy, and we also have given us here the tests by which we can judge of those who call themselves Theosophists. For in Theosophy as in everything else, "By their fruits shall ye know them."

Gradually the world is awakening to the knowledge of what Theosophy is and with the high ideals which it places upon all who accept its teachings, the world rightly demands that the life shall show forth what the lips profess. The message of Point Loma is penetrating to the farthest corners of the earth, and it will not be long before there will go forth those now being trained by Katherine Tingley in the Raja Yoga schools, proclaiming the "Wisdom-Religion" and showing it forth in their lives. STUDENT

East and West

IT seems that the national life of the Arabs is beginning to stir. A national Arab movement is arising in Asia Minor, known in Europe—where are some of its leaders—as the Arab Patriotic League. A short time ago the Supreme Committee of this League addressed a manifesto to their countrymen in Arabia and Asia Minor, and to the foreign powers, declaring that the nation should now throw off the Turkish yoke and found an Empire to include all the Arab countries of Asia, extending from the valley of the Tigris and Euphrates to the Isthmus of Suez, and from the Mediterranean to the Gulf of Oman.

The movement is evidently part of the general emergence and even ebullition of national self-consciousness everywhere. The success of Japan of course had something to do with it; but Japan only foreran the general process; she did not create it. The phenomenon itself is the opening of a new and vast chapter in universal history. The stir is not merely Eastern. Even in Turkey there is a "Young Turkish Party," whose leaders also—wisely—have their manifesto headquarters in Europe.

A marked symptom is the seizing by the re nascent Eastern nations of whatever is worth anything in Western methods. Later must come a tincturing of the West by a wholly beneficial current from the East, a current largely spiritual in its effects.

H. C.

A Prophecy of Rousseau's

ROUSSEAU seems to have been a prophet who saw a good way ahead. He predicted the present war and its results. In the eighth chapter of his "Contrat Social" he says: "L'Empire de Russie voudra subjuguier l'Europe, et sera subjugué lui-même. Les Tartars, ses sujets ou ses voisins, deviendront ses maîtres et les nôtres; cette révolution me paraît infaillible." (The Russian Empire would like to subjugate Europe, but will be itself subjugated. The Tartars, its subjects or its neighbors, will become its and our masters; this reversal seems to me inevitable.)

H.

An Oak Mine

IT is reported from South Russia that a timber dealer has discovered there a mine of oak. It is very valuable, and is situated in a river, where it occurs in layers three or four feet deep, scattered over an area of one hundred and fifty square miles. There is a great variety of colors, supposed to be due to the different kinds of mud in the river bottom. As many as twelve shades have been discovered, pink, blue, yellow, and brown. The logs are forty to two hundred feet long and fifteen to twenty inches in diameter.

Old Glory and the Tri-Color

THE *Army and Navy Journal* has a letter from an indignant American who lives in Paris and saw the John Paul Jones parade. "The courtesy of the French populace will never be excelled," he writes, "for not only did they salute their own colors when carried by French troops, but every man uncovered when Old Glory was carried by. It was in bitter contrast that I noticed the Americans who saluted their own colors, but kept their hats stolidly upon their heads when the tri-color went by. As to those of our fellow countrymen who were so ill-bred as to fail to salute both the French flag and our own, no phrase, name or sentence is strong enough to qualify such behavior."

Americans, as a rule, are far from lacking in the feeling of international courtesy. There may have been another reason for the above. One wonders if the representative (?) Americans in Paris at the time could have been so bigoted and ill-bred as to allow "religious" feelings to affect them. If so, it is a bad outlook for our Home government. G.

A Mammoth Lumber Raft

A NEW era in rafting is inaugurated by the project of towing ten million feet of logs across the Pacific from British Columbia to Shanghai. The distance is 6000 miles, and it will take nine weeks to cover it at an average speed of four miles an hour. A collier accompanies the giant raft with coal and supplies. A raft has been towed recently which was 750 feet long and 50 feet wide, and contained 600,000 feet of lumber. It was built cigar-shaped and bound with chains.

The Earliest Polar Explorer

IT is reported from Vienna that a Norwegian professor, while pursuing his studies of the history of astronomy and astrology, at the Imperial library in Vienna, has discovered a most valuable manuscript of the first North Pole explorer, Claudius Claussen. The manuscript, which dates from the beginning of the Fifteenth century, shows how the explorer penetrated into Greenland and named various places the origin of whose names has so far been mysterious.

STUDENT

Scalp Gardening

A TURKISH physician is said to have successfully tried a method of planting hairs on bald heads and making them grow. The bald pate is scarified and then hairs, taken from another head and clipped at both ends, are planted in the incisions. After a while these hairs actually take root and grow. Thus do the sciences of horticulture and surgery overlap each other!

■ The Cauldron of Human Life

etc. He enumerates a great number of other things he could do.

We could place more than money at his disposal. There is all the intellectual energy that has been expended in making and in disposing in campaigns of the munitions of war. There is all the energy of feeling expended on thousands of battlefields by countless millions of men—enough, these two, if properly directed, to have made humanity by this time a race of gods. But humanity has preferred another way. And though in the end it will reach that goal, at what a cost of agony, agony

never in the program of nature!

There is an old Japanese fable that after the gods had made the earth and placed men thereon in happy consciousness of the Golden Age, they look on a while, sharing the happiness of the race they had called to life. But the happiness waned and at last the gods could bear to look on no longer. They turned away, all save some few. These few said that they would go and live as men among men, foregoing their godhood, till out of all the pain that was to come for earth, a new Golden Age had come. For, said they, unless we do so, the race that we have made and which we cannot but love, must perish utterly in its wickedness and blindness. And the other gods laughed and said they would take a look every thousand years and see how things were getting on. So the world went wild with sin.

And then it was found that because men were of one essence with the gods who had made them, they drew upon the very life of the gods who had laughed, for the force with which they fought and hated and lusted. So the gods grew pale and wan, and their raiment shone no more. Wherefore they called, and called continually, upon those nobler few who had sacrificed themselves, to redouble their exertions for human redemption. "And they were dissolved in the boiling cauldron of human life," which, through them, became self-conscious. But the others toiled on as humanity's ever-crucified teachers and redeemers.

The fable ends with a description of the time and manner of their release from their task, and humanity's redemption. It reads like a description of our own day. And we believe it is. STUDENT

The Burden of Possession

UNDER such names as *The New Thought* goes a mass of literature containing philosophy and advice that seems most excellent. How to avoid worry, and how to relax yourself, and so on—these are the themes discussed.

Yet, in spite of their excellence, there is in them all a morbid element that repels the healthy minded; and their votaries are seldom free from a certain air of "crawliness" and unpleasant affectation. A nasty glare of the eyes, an oiliness and floppiness of the movements, and, in extreme cases, an intolerable presence, are some of the characteristics.

The reason is not far to seek. The teachings are based primarily, when not totally, on *self-interest*. The motives appealed to are personal and private. The inevitable result, therefore, is an *intensification of the self-consciousness*; and this is what is so trying to other people.

So these teachings are nothing better than *stolen goods*—noble principles belonging to the brotherhood-life, perverted to (im)moral individualism. But woe to him who thus tries to harness Pegasus to his mud-wagon!

The true student of life, the *wise* student, knows that this accursed accentuation of the personality is the foe that is strangling human life; and the very last thing he wants to do is to go and increase it. He may have discovered by experience that advantages sought under the instigation of cupidity or vanity turn into burdensome guests, which act as barriers between oneself and the common life, and are hard to eradicate. And he may also have found that the really useful faculties have come to him unsought and unexpected, and in harmonious proportion, as an indirect result of unselfish work. Then he knows what Jesus meant when he said:

Seek ye first the kingdom of God and his righteousness; and all these things shall be added unto you.

The tremendous friction of personal wills in the world makes life difficult for all. Shall I then strive to encase myself in a protective shell like the tortoise? The rhinoceros is the chosen oriental symbol for this kind of selfishness, by reason of his tough hide, solitary habits, and false horn, which is only a wart. Shall I emulate him?

Again, if I am tempted to say that I will first gain the powers and then I shall be ready to use them in the service of humanity, let me know that that too is a fatal delusion. We know that people who have spent half their life in accumulating, acquire such a habit that they go on accumulating; and, even if philanthropically inclined, they make sad bumbles in such unfamiliar work. In fact the powers so acquired are not the ones I shall need in my work for humanity; they will be in my road.

We pity persons who have made unto themselves such a big and com-

plicated personality that they can scarcely walk under it; and we resolve that we will rather strip ourselves of some of our accretions than seek to get more.

There is an entirely false way of regarding faculties and powers—that is, regarding them as *possessions*. In reality they are like the air—common property—and we use them as occasion requires, and then step aside, simple and free. Otherwise, if we are to carry about with us all the tools we have to use, for fear they will get lost or stolen, we shall risk sinking under the burden. All one needs is the ability to act and use nature's exhaustless powers, when called upon. Then one can be free and happy. STUDENT

Roumania's Coming Exposition and Birthday

ROUMANIA proposes to be in the fashion by holding a national Exposition. The date is to be next year, when the Roumanians regard themselves as just 18 centuries old. That much time ago the Roman *Dacia* was conquered by Trajan, and the Roumanians claim to be the progeny of the fusion between conquerors and conquered. The present king will have reigned 40 years, and it will be 25 since the country attained its independence.

The Exposition will be of Roumanian products only, except that foreign farm-machinery will be admitted so as to educate the people to it; and such foreign fruits and vegetables as it may be possible to introduce and grow at home. Three-fourths of the population is agricultural, but the methods are still very primitive, and the exhibition of modern machines may mark a new era. The country also contains large quantities of several metals, so far unmined.

No country can develop its resources without also benefiting all the rest, and for that reason as well as every other we wish the Roumanians many happy returns of their eighteen hundredth—and also twenty-fifth—birthday. C.

The Old Monuments of France

FRANCE is awakening to the necessity of preserving the priceless monuments still witnessing to her romantic past. Besides the Historical Monuments Commission, societies with more local objects are forming everywhere. There are beautiful old-world village churches; remains of ancient abbeys, often now diverted to very modern uses; châteaux and public buildings of great age. Four of these societies have taken for their work the ruins along the basins of the Seine, Loire, Rhône, and Garonne. No country in Europe can be so rich in historic remains as France. Paris alone may hide countless archeological treasures as yet unsuspected. It was not long since that a statue of Isis was found under the Bastille, dating from a past not easily measurable. And such finds will certainly be paralleled and illuminated by others waiting in or under many an old dismantled monastery, church, or château. STUDENT

Finnish Literary Life

A CERTAIN period of national obscurity seems to be sometimes good for a people, forcing them to develop and perfect another kind of life. Indeed, that may be why it comes upon them. German literary journals are noting that the literary and philosophical life of Finland has been rather intensified than stayed by the difficult period through which it is passing. And more thought and investigation has been turned upon the folk-lore and traditional history of the country. The Finnish Literary Society is publishing a series of translations of classics in philosophy, Plato, Descartes, Rousseau, and others. And there is a second instalment of old Finnish melodies and songs. When Finland again gets her freedom she will not find herself to have retrograded for the temporary lack of it. C.

America Feeds Europe

BESIDES the traveling of wealthy Americans in Europe, and their costly purchases there, there is another way in which this soil feeds other populations. During the year 1904, emigrant Austro-Hungarians, resident in this country, sent home to their relatives a sum of money amounting to more than \$40,000,000. To this must be added the amounts sent to Sweden, Ireland, Italy, Russia and Poland by the sons of those nations. These outgoing sums, for which there is no corresponding income, must be a source of considerable confusion to students of the balance of trade. For no account is usually taken of them. STUDENT

The Unreasonable Cretans

“TROUBLE continues smouldering in Crete.” So runs the sentence appearing from time to time in our morning paper. At last we are inclined to objurgate them for a cantankerous nuisance. Then we begin to reflect and remember. They are restless, first because they want to get home—that is, they want to rebecome part of Greece. And second, because the Turk—a foreigner—still has a hand in their affairs. All their ties are with Greece. The leaders of the disquiet are the magnificent race of mountaineers called Sfakiots, representatives of the original mysterious Dorians; and the language is Greek. From the Byzantine Empire they passed into Saracenic hands; then into the possession of the Venetians; then the Turks; then they fell under Egyptian rule; and then under Turkish again. And when Europe finally allotted them a Greek Governor, they thought it was the prelude to their rejoining Greece. It is no wonder they are restless, to use a mild term. Why in the name of Justice should they not have what they want? For the usual reason in such cases—because each of two or three of the Great Powers hopes that when the others happen to have carried their snarlings over the borders of peace, it may be able to put the island into its bag. But the problem is not going to work out in that way. Crete will get what she wants and should have. STUDENT

The War Burden of the Nations

HOW long do the European nations propose to live by putting their expenses out to wash, that is, by increasing their debts? These debts are growing mountains high, and in some cases the interest can only be met by adding to the principal. In every case the addition is necessitated by increasing war material.

The German budget gives the picture very strikingly. In 1874 the Imperial expenses were 841 million francs; in 1904-5, 1673 million francs; in 1904-5, 2549 million francs. The army expenditure for next year is to be 79 millions more than for the current year; the naval expenditure 31 millions—total 110 millions. The Imperial debt was in 1901 nearly 17,000 million francs; now it is 19,000 million francs.

The military burden manifests in some States very curiously; in Portugal for example as tubercle due to poverty; in many countries as falling birth-rate; in some as dynamite bombs; in some, for example Spain, as emigration. And it is one of the causes of the congestion of cities and consequent failing physique. C.

Finger-Impressions as Signatures

A NEW YORK lawyer seriously proposes to bring in a bill legalizing finger-tip impressions as a form of seal to be attached to signatures. After much research he has satisfied himself that no two persons, even in the same family, have exactly similar impressions; and he proposes that a signatory to an important document should always append to his signature his finger-tip impression. Furthermore, since no two of the ten fingers are alike, the signatory could, with the remaining nine fingers, indicate the date of the signature, by using a finger for each digit.

Two points which occur to one are, whether the finger-impression remains characteristic throughout life, and whether a person's impression might not be counterfeited by some photo-plastic process. STUDENT

The Population of China

The latest estimate of the population of China, made by the officials of the imperial maritime customs, places the total at 432,000,000 in the Empire, plus 7,012,000 at the treaty ports. This may be exaggerated, some authorities estimating at a lower figure the population of those provinces little known to Europeans; but others again favor the higher figures. H.

Where Shall the Jews Congregate?

It appears that the seventh Zionist Congress has failed to come to an agreement as to where on the broad earth the Jewish people shall congregate themselves into a nation. The rival locations were Palestine and Uganda, East Africa, offered by Great Britain.

A good many prominent Jews deprecate the movement altogether, holding that “it presents the Jew as a foreigner to every great nation that gives him citizenship.” There are, however, two or three countries where this “gift” of citizenship constitutes a series of bitter penalties. C.

Some Views on XXth Century Problems

Civilizing to Death

A WELL-KNOWN sociological writer has been strongly criticising the view that the less civilised native races must necessarily, by some mysterious law of nature, disappear at the colonising advent of more civilised white races. Where this takes place, he says, the causes are quite obvious and preventable.

One cause is interference with native "superstitions." He instances the case of Fiji. Missionaries found that the Fijian mothers were in the habit of nursing their children for two or three years. There were no milk-yielding animals in the country, and an alternative diet of roast pork and yams somehow did not suit the infants. So for that space of time the mother went back to her own home and the husband to the *mbure*, a sort of clubhouse for this purpose run on bachelor lines. This arrangement savored of heathenism to the missionaries, and they got the natives to make an end of it. Accordingly: "Women who had reared families of four or five healthy children now bore ten or twelve, of which, perhaps, two survived infancy, and the race decreased by several hundreds annually."

Another native custom rested on the belief that if an enemy could procure something that one had worn, or that had formed part of the body, such as hair, he could use it to weave an evil spell. So there was an unwritten, but scrupulously observed, law that all refuse should be carefully burned or buried. The villages were consequently absolutely clean. The result of the vanquishing of this "superstition" was that "the people had scarcely abandoned their old beliefs when weeds sprang up in the village square, kitchen refuse and all kinds of abominations were left lying near the houses. So admirably was the old law framed to secure sanitation through the superstitious fear of a people naturally prone to insanitary habits, that one almost suspected the cunning hand of some prehistoric medical officer of health with a taste for legislation."

These old races had their teachers, who taught them as much as the intelligence of the people permitted them to learn, leaving them to continue in fixed ways of hygiene and social life until their hour for progress should strike again. These customs were perverted, sometimes lost, sometimes mixed with real superstition; but sometimes they stayed unchanged and were the preservation of the people for ages. Then came the trader, the missionary, disease, and the whiskey bottle. The customs were laughed at, taught away as "heathen superstition," and the race began to disappear. The work of the old teachers was undone. If colonisation and trading were done under the laws of brotherhood many or most of the old races would stay and from the day of advent of the white man begin a new chapter of development. STUDENT

The Christi- anity of Constantine

UNDER Constantine, in the fourth century, Christianity became the official religion of the Roman Empire. How much of Christianity had Constantine really embraced? The most recent volume of *The Heroes of the Nations* series attempts to answer this question. The writer, Mr. John B. Firth, does not take the ordinary view that the conversion of the Emperor was a political move by which he reinforced his power with that of a now extensive sect. Mr. Firth argues that had he been indifferent to Christianity "he would never have surrounded himself with episcopal advisers . . . ; never have lavished the resources of his Empire on the building of sumptuous churches; never have listened with such extraordinary forbearance to the wranglings of the Donatists and the subtleties of Arians and Athanasians; never have summoned or presided at the Council of Nicæa . . . ;" and so on.

On the other side are the crimes he committed after his conversion, and his tolerance of paganism. Steering between the arguments, Mr. Firth regards him as a sincere though not a devout Christian. We might suggest a gloss upon that verdict.

By the time of Constantine, and before, Christianity had definitely separated into two streams. The mystical stream no longer bore the name of Christianity. From this stream came such works as the *Pistis*

Sophia and certain other presentations of Gnosticism, and to it, as it came from Christ's lips, belong the recently discovered Logia. It was that which Christ taught to his disciples as "not for the multitude." To us has come down only the other part—for "the multitude." That, embodied in the official Gospels, is alone now "Christianity." But in the separation of the two almost lay the death of the latter. At any rate its relative powerlessness; witness the condition of the world today. And a new full life can only lie in a reblending. Because of the separation it became possible for the exoteric presentation to be over-run with dogma and stifled by mountains of such disputes as were in full blast at the Nicæan Councils. That was what Constantine got as Christianity; and it is no wonder that his respect for it was not enough to make him suppress paganism or abstain from crimes. He respected it enough to use it as a political weapon, however. There must of course have been many devout Christians, ruling their lives according to the highest principles; but they were not among the disputants, any more than they are now; and probably Constantine, if he met them at all, regarded them as fanatics. The true and complete Christianity will be brought back to the world through Theosophy, in which the long submerged stream finds its fountainhead. STUDENT

Man and Animal

A ONCE famous lecturer on Homœopathy had finished a discourse on morbid mental and emotional states, their producibility by drugs, and their curability by the same drugs in other doses. It is recorded that a student in the back of the lecture-room arose and said, "But who am I that states of *me* should be created and removed by tinctures and solutions?"

The teacher replied that he was speaking as a physician and not as a philosopher. And he added briefly that for the ordinary person, drugs had to be invoked to do what the will could not; quoting—whether comprehensibly to the students or not—the remark of Van Helmont that drugs acted by stimulating the physiological imagination.

Biologists used to be much exercised in finding the clear line between human and animal faculties. They were past being satisfied to be told from the pulpits that man had a soul, whilst animals had not. Of late they have cleared away the problem by asserting that there is no line, that human faculties are only animal ones magnified, and that no attribute or power of human consciousness is without its humble representative among the animals.

But did not the lecturer's answer show the line with perfect clearness? The real man, the *soul*, is the perceiver and critic of its mental and emotional states, of the states of its mind. And in asserting its being in that way, in disentangling itself from the states and emotions, it can discharge from the mind those that it finds unworthy and substitute worthy ones. That judging and ruling power is surely specifically *human*. He who does not use it is living on the animal side of the dividing line, however complex or evolved or artistic his feelings, however analytical or subtle his intellect. Evolution, which we can encourage in ourselves every moment, consists in seizing more and more fully our rightful dominance over thought and feeling. If we wake in the morning with consciousness cloudy, and are inclined to snarl at breakfast—and let the clouds stay, and *do* snarl—we are living as animals, consciousness being the mere echo of the temporary bodily state. If we can discharge the clouds, act courteously and speak cheerfully, we are living on the human—which is the divine—side of the line. STUDENT

Japanese Prisons

THE Japanese idea of imprisonment is reform as well as punishment. Useful occupation is provided, and the prisoners get a proportion of their earnings. The younger ones also attend school. The discipline is military but the actuating spirit reformatory. According to conduct, the prisoners are arranged in three grades, these being mainly marked by differences of diet. The only other punishment is solitary confinement not exceeding five days. *No prisoner may be given his freedom unless his family, or friends, or one of the many benevolent Prisoners' Aid Societies, will assume responsibility for him.* C.

Temple of Hathor at Abu-Simbel, Nubia

ABUSIMBEL, or Ipsambul, is situated in Nubia beyond the First Cataract. There is the celebrated rock-temple, whose front is adorned with four gigantic statues of Ramesse II., seventy feet high. Next to it is the temple illustrated here. It was dedicated to the goddess Hathor by Ramesse II. and his queen Nefert-Eri. Hewn from the solid grit-stone, the temple penetrates to a depth of eighty-four feet. The façade is ornamented with statues of the king

and his wife and children. Over the entrance are cartouches bearing the royal names and titles. Inside are six square Hathor-headed columns, and a small chamber at the extreme end.

Abu-Simbel is the classical "Aboccis," or Abshek in Egyptian. A large town once stood around and behind these two temples; but all traces of it have now disappeared, and nothing remains but the temples, covered with gigantic mounds of golden sand, with their colossal figures gazing out eastward in silent majestic expectancy.

Curious Creation Myths of the Ainus

AMONG the degraded remnants of those early Races of whom a part fell away from the light, none perhaps are more degenerate than the "Hairy Ainus" of Japan. This people inhabits out-of-the-way places in some of the Japanese islands, and resists all attempts by the Japanese to civilize it. It is aboriginal and is dying out.

Some of the myths and superstitions of the Ainus are the last possibility in the way of perversion; yet the skilled student of arcane symbolism will be able to trace their original source. Unfortunately we cannot always say that these superstitions differ in degree from some that are found in more civilized religions. Their form is unfamiliar, that is all.

God sends the water-wagtail to separate the water from the land. The deity then carves out the hills with mattocks, and when he has finished, throws away the mattocks, which become demons.

God takes mud and moulds the human form, putting a willow-twig in his back for a spine. (The willow-twig is still used by the Ainus as a kind of fetish or totem.) Then God has to leave his work and go back to heaven. So he calls the Otter and gives the Otter instructions as to how man is to be finished, telling him to give these instructions to a second God who will presently come to give life to the model. But the Otter forgets and so the second God bungles the task and leaves man imperfect.

The Ainus live in a very primitive manner, and are dirty and unhealthy in their habits. They are cannibalistic and eat raw flesh; have an insane craving for drink; degrade the woman; and exhibit other familiar signs of a race that is passing.

The Bible Traced to Egyptian Origin

THAT all religious systems can be traced back to a common source in the Wisdom-Religion which, in remote antiquity, was known among men, is a fact familiar to students of Theosophy. From this fact it follows that all religions will have more or less close resemblances to one another. Therefore to a Theosophist it is neither surprising nor especially significant that the Jewish or Christian systems should

be similar to the ancient Egyptian. Nor, to a Theosophist, would there be much sense in jumping at one bound to the hasty conclusion that the whole of Biblical theology was derived exclusively from Egypt. Biblical theology has also been traced to Chaldea. It might likewise be traced to India and Japan and many other places, though, to be sure, it is more closely related to some than to others.

Scholars, however, with their meagre and specialized equipment of research, pitch upon some one aspect of this great question and exaggerate it at the expense of the whole view. For instance, we have read recently that a German professor has excited the theological world by declaring that "the writers of the earlier books of the Old Testament only reproduced Egyptian myths, slightly altering them," and that "the histories of Abraham, Isaac, Jacob, Esau, Joseph, and Moses are purely Egyptian."

He might have gone further and shown, as others have done, that the mystic story of the Christ and his crucifixion and resurrection are to be found in Egyptian ceremonial records which have now been translated; for, whatever may have been the actual life-history of Jesus the Christ, or of any other Christ, the sacred allegory of the Christos is always the same.

However, this latest utterance of German criticism is very interesting as a sign-post. But it should make for the glorification, rather than the depreciation, of Christianity, by helping to prove what true Christianity was—a presentment of the eternal Wisdom-Religion.

STUDENT

Ancient Subterranean Chambers in Ireland

ON a farm in County Antrim, Ireland, workmen engaged in making excavations have discovered two large subterranean cavities, built of unhewn stones. There were a series of chambers, each about twenty feet long and five feet high, all perfectly formed. The entrances are very narrow, and it is believed that the inhabitants used them as places of refuge, especially as they are found in regions covered with bracken, where a person might mysteriously disappear through an undiscoverable aperture.

But the surmise that this gave rise to the belief in fairies is rather too thin. The cavities date back to pre-Christian times. Much more of deep archeological interest in Ireland waits exhumation.

A Message from Mars—The Reality of the "Canals" Proved at Last

THE interesting planet Mars is passing rapidly into the west and will not be well seen again for more than a year; but during the time he has been shining in our night skies he has left his portrait upon a photographic plate more vividly and perfectly than ever before. On May 11 Mr. Lampland at the Lowell observatory, Flagstaff, Arizona, obtained a negative with the 24 inch Clark refracting telescope, showing clearly and unmistakably the long continuous dark lines called "canals," about which there has been such controversy. This scientific triumph is an event of prime importance.

For centuries the plurality of inhabited worlds has been discussed. Science and common sense have upheld the extreme probability of there being numberless other inhabited globes besides our tiny earth, but medieval theology repudiated the suggestion with horror, and, as in the martyrdom of Bruno by the Church of Rome, with fire and faggot. The objections of the theologians were very absurd; for instance they fancied that such an idea would necessitate the sacrifice of the Atonement of Christ being made upon every planet throughout the universe, and so forth!

As far as we know, the conditions governing the rest of the planets of the solar system are very different from ours. Even on Mars, which appears to resemble the earth in many respects, there are some striking differences. For instance, the year lasts 668 days and the change of seasons must be very gradual. Owing to the small size of Mars the attraction of gravity is far less than with us; a man weighing 140 pounds here would only weigh 52 pounds there. The atmosphere of Mars is nearly always clear and the rapid motion of his inner satellite, Phobos, which passes round him three times a day must be a most extraordinary sight, and necessarily would produce unexpected tidal effects if oceans exist on the planet. But the complicated network of straight lines, discovered by Prof. Schiaparelli of Milan in 1877, the existence of which is now conclusively proved in spite of the denials and ridicule heaped upon the heads of those astronomers who did see them by those who could not—the old story—are the most remarkable features upon the planet, for they almost certainly point to the presence of intelligent life—in short to beings possessing minds something like our own, though perhaps in a more advanced stage. The thousands of miles of "canals" with their double formation, and the enlargements at the crossings irresistibly suggest trade routes or irrigation systems. They are of course too wide (30 to 50 miles) to be simple waterways if they be "waterways" at all, but are possibly "fertile fields" like the Nile valley after the inundation. If intelligent beings exist on Mars, which is now extremely likely, it is clear that the conditions under which we live are not necessary for the display of mental activity, and, as H. P. Blavatsky pointed out, once the existence of thinking beings on other worlds is admitted there is no difficulty in understanding how man existed upon earth in past ages when the conditions were entirely different from those of today. R.

Alcoholic Bodies!

THAT the human body will ultimately contain alcohol instead of water is a suggestion gravely made *in extenso* in an English scientific monthly. The idea is thus developed:

The temperature of the earth was once far greater than now, and living bodies needed then to be composed of chemical ingredients—such as silicon and sulphur—which they now only contain in minute proportion. As time goes on, and the temperature falls lower, water will cease to be fluid and exist only as ice. So if living bodies are to retain their mobility, water (of which at present they contain more than 90 per cent of their weight,) must give place to a fluid that will not freeze at the water-freezing temperature. Such a fluid is alcohol, whose freezing-point is 130° C lower than that of water. The alcohol will be healthily generated in the tissues in large quantity, just as it is now unhealthily in small, and just as it is normally by such organisms as the yeast fungus. And man's tendency to use alcohol and get drunk is really an intuition of what he is coming to need!

Variations of type and habit continually occur among living beings. Those that are useful lengthen the life and enhance the activity of their

possessors, and thus give them an advantage in the struggle. Detrimental variations do the opposite, and *their* possessors tend to vanish from the scene.

Competitors in any sort of athletic or skilled contest have at last learned to discard alcohol. Insurance companies are learning that even the "moderate" use of alcohol tends to shorten life. Ridge, Richardson, Parkes, and many others have shown that it dulls the edge of every sense and impairs the power of doing any sort of continued work. There is no need to speak of its effects upon the moral nature. In other words, the least use of alcohol is a variation in the *wrong* direction, and is promptly met by nature with her penalties.

We must commend to the speculator his own final sentence: "It may be, however, that some other fluid . . . and not alcohol, would be the liquid which will ultimately replace water in living matter." The living body of the far future may consist of elements yet unborn, or of radiant stuff for which we have now no proper name.

One is almost inclined to suggest that framers of hypotheses in science should be compelled to take out a license before publishing them. But of whom could the Licensing Board be composed? STUDENT

Honest and Dishonest Bacteria

IN his book on *Bacteria* Professor Fischer makes three classes of these minute forms of life. The lowest—"Prototrophic Bacteria"—are those that can build themselves up from purely inorganic matter, carbon dioxide, ammonia, salts and so on. They are thus real builders, carrying matter a step forward. The next class—"Metatrophic Bacteria"—have to have organic matter to build themselves from, bouillon, infusions of leaves, and similar stuff. These too are builders, for though their food is organic and has lived, it has been killed or has died; and in their own bodies they raise it to life again. The third class—"Paratrophic Bacteria"—can exist only in the living tissues of other organisms. They are parasites, stealing living matter and translating it *downward* into their own bodies. They are *unbuilders*, destroyers. These are the bacteria and bacilli of disease.

But the lines between the three classes are not fixed. Recent researches show that the members of the third class have acquired their vicious habits and can be made to get rid of them. If men lived ideally, so that disease could not touch them, the disease-making bacteria would have to get their living in another and innocent way; and would do it. And Bastian has recently shown that members of the second class can be made to enter the first. He developed crowds of the second group in infusions of hay and bouillon. Then he transferred some of these to solutions of inorganic salts containing no organic matter. They soon got accustomed to working hard and honestly for their living, picked their nitrogen and carbon from the salts they were supplied with, and from the air, and learned to flourish very well.

The whole set of researches suggests the final futility of the various serums now so constantly manufactured for checkmating this or that particular set of disease germs. Each serum renders the blood immune against *one particular kind* of them. But they only smile, go behind the scenes and change their ways a little, and come back. Then science gravely chronicles a new disease and invents a new serum. It is probable, for example, that vaccination, whilst decreasing the deathrate from smallpox, has done nothing to diminish the deathrate from disease generally. Other diseases have risen to meet the deficiency. Though of course it may be considered convenient to take one's share of disease in some other forms than in that particularly objectionable one. STUDENT

Chemical Silk

CHEMICALLY made silk is seriously threatening the silk industries of Italy. There are now eight or ten factories producing the artificial article. This is made from cellulose variously treated with acids and alkalis and then spun through fine glass tubes. The resulting fibre is then twisted into strands, soaked with rubber or gelatine, and otherwise made suitable for different uses. About ten thousand pounds a day are now turned out at a price of \$3 per pound. C.

The Wonderful Ant

IT is quite surprising how frequently we find in the current magazines, articles which describe recent observations on the habits of animals and insects. The cause, and perhaps also the result, of these observations is, that by general consent, it has become far more interesting to hunt animals with a camera, or with a microscope, than with a gun. For in the latter case, you are killing the goose which lays the golden eggs of knowledge, in addition to committing the folly of hunting for something which you do not want, for the mere pleasure of the hunt.

In the columns of a German contemporary, Professor D. A. Forel gives some further extraordinary details of the instinct and resourceful character of the ant. They are simply wonderful and extraordinary, because we did not know of them before. The knowledge we gain from them is that these insects possess constructive foresight of a very high order. Professor Forel says:—

In one of these, each female which goes forth to found a new colony carries with her, in a hollow of the mouth, the mycelium of a fungus, and bits of blanched leaves. These are laid down in the new abode as the beginning of a fungus garden. After laying her eggs she will break some of them, and use them as soil, or manure, for her mushroom bed. Other species make a garden for shelter and concealment. They nest, that is to say, in the branches of a tree among the aerial roots of an epiphyte, which thus helps to conceal them. They bring the soil and the seeds of the epiphyte to the chosen spot, and presently the roots hang down and hide the nest from view. Another species is shown by Dr. Göldi to use its own larvæ in a curious way in building its nest. It requires fine spider-like threads to draw together the leaves and twigs. The adult ant cannot produce these threads, but the larvæ can. So the ant will take a larva in its jaws and use it as a sort of shuttle. Fastening the silken thread which issues from the mouth of the larva to the required spot, it carries it hither and thither until the required weaving is accomplished. So also does an East Indian ant use its offspring in weaving its nest. Certain green ants in Queensland, which also make their nests of leaves and flowers spun together, are said to keep spiders to spin for them. Whether these latter do it spontaneously, or require to be held as the larvæ of the other species, does not seem to have been determined. In the devices of these ants there is surely one of Nature's hints to human inventors. STUDENT

The Grass Family

THE voice that cried "All flesh is grass" came very close to the truth even in the material sense of the statement; for the family of grasses furnishes the chief products for building up and sustaining the bodies of men and animals, and even the carnivorous eat grass that has become flesh.

The grass family stands third among the great families of plants as regards the number of species, the composite family standing first and the pea family second; but, as regards the number of individuals, it probably stands first. It is surpassed by none in usefulness. It furnishes the cereal grains, wheat, rye, oats, barley, rice, Indian corn and durra, also su-

NATURE, THE CONSOLER

SCHILLER

THE torrent from the mountain's melted snow
Foams over rocks and roots of trees laid bare,
And pours its waters in the dell below;
While o'er the desolate place, in the lone air,
The eagle hangs, with outspread wings, on high,
And knits the savage landscape to the sky.

No winds can hither waft the faintest sound
Of human joys or cares. Alone I seem,
And yet am not alone. Thy arms surround
Thy child, maternal Nature! 'Twas a dream
Of human woes that led me far astray;
But now thy presence drives my fears away;
From thee I drink once more a purer life;
The hopes of youth revive within my breast.

LOMALAND PHOTO AND ENG. DEPT.
ONE OF THE WILD FLOWERS OF LOMALAND, GOLDEN
YELLOW, WITH WHITE TIPS. VARIOUSLY KNOWN
AS TIDY TIPS, BUTTER & EGGS, BREAD & BUTTER

gar cane. Asa Gray says these cereals "are none of them known with certainty in the wild state, even their native countries being in doubt," which indicates a great antiquity not only for these grains, but also for civilized man, if they are due to his cultivation of some wild grain of much less use.

Some of the grass family have valuable medicinal properties, and a number of them furnish perfumes. The stems and leaves are put to many uses. They are braided or woven into material capable of being used for a great variety of purposes both useful and ornamental. The bamboo, which belongs to this family, is of great value for building purposes and for making furniture, as well as many other things. The seeds are edible and the tender shoots are cooked and eaten.

There are at Point Loma more than thirty species of grass growing wild, of which a few are species that have been introduced and have escaped from cultivation.

Many species of grass are cultivated for ornament, and there are few that are not beautiful. From the stately pampas-grass to the most lowly type that carpets the earth for our feet they have a charm of their own. To look over a prairie of tall waving grass swaying with the wind is like looking over the billows of the sea.

The usefulness of grass is matched by its commonness, and well may it say:

Here I come creeping, creeping everywhere;
By the dusty roadside,
On the sunny hillside,
Close by the noisy brook,
In every shady nook,
I come creeping, creeping everywhere.

Here I come creeping, creeping everywhere;
You cannot see me coming,
Nor hear my low sweet humming;
For in the starry night,
And the glad morning light,
I come quietly creeping everywhere. — Sarah Roberts

A Fly's Nemesis

FEW people know what has happened to that fly which you find dead on the window-pane, covered, as you see when you look closely, with a faint whitish fur. The floating spore of a certain fungus, of the last possibility of minuteness, settled on him as he flew about. It immediately began preparations for its life work. This consists in sending a great number of hair-like tubes in all directions into the fly's body. These absorb its

juices and in that and other ways kill it. The threadwork now penetrating in every direction now sends buds out into the air, each ending in a little bulb. The fly, being dead, has no interest in this part of the programme. Within the bulb a number of spores like the one that began the mischief, quickly develop. Then the bulb bursts, and the liberated spores float gaily off in search of other victims. One is sorry for the fly; but on the other hand he had probably been exasperating every human being in the room for hours. Life is an endless cycle of panoramic changes, death giving place to birth, and birth to death. STUDENT

The Women of Korea

THE following extracts from the *Fortnightly Review*, if correct, can scarcely fail to be of interest at this time when things Korean are so much in evidence:

“Very little is known about the women of Korea, not even a medical man being allowed access to their rooms.

“When a child is born a rope is stretched across the entrance to the house. If the child is a boy, a piece of coal and a leaf are fastened to it; if a girl, nothing, for girl children are not counted in the family. Up to the age of seven the latter bear separate names; after that, the father’s surname only, and are henceforth known only as the daughter, sister or wife of some man.

“In education, the separation between boys and girls takes place in the eighth year, that of girls of good family consisting of a knowledge of morals and the ceremonies in connection with the religious culture of ancestors. Girls of the poorer classes are taught dressmaking and all kinds of needlework and are particularly clever in the use of the needle, embroidery on silk undergarments being exquisitely executed.

“Owing to the long period of mourning—three years for each death—and white being the mourning color, the majority of people choose to dress in white all the time to avoid the expense of repeated changes. These garments are made by the women and have to be taken to pieces each time they are washed. In washing they are beaten for hours by a bat in order to obtain the metallic gloss which is considered particularly beautiful. These bats are made of cedar wood and shaped like a large conic bottle, flattened on one side.

“As the girls develop later than boys they are, as a rule, older than their husbands by a few years. . . . The marriage customs are as follows: A written, formal request is sent for the hand of the girl, and her family sends a written reply. Particular attention is paid to the date and hour of birth, as it is believed that thus a date propitious to the marriage can be fixed. The site for the ceremony is arranged at the bride’s house underneath the outside entrance staircase. The bridegroom comes riding or driving, dismounts outside the gate and walks to the spot with his face turned to the north. He puts down his bridal present, which

must be either a live white duck or a carved substitute. He bows twice, retires a short distance and stops with his face turned to the west. The reason for the present of a duck lies in a legend which tells of a hunter having shot the male of a wild goose and of its mate’s faithfulness in always returning to the place where it had been killed. The duck suggests the hope and the expectation that the wife shall be equally faithful to her husband. They then plight their troth in the following words: ‘Now our hair is black as the feathers of the wild goose, but even if it should turn white as the fibre of the bulbous root, we will still hold together as faithfully as we do this day.’

“Dressed for the first time in her life as a Korean woman, the bride puts on an upper garment of variegated colors, with purple shoulder-bands, a lower garment of scarlet, held around her waist by a broad girdle five inches wide, with white cuffs over the hand. She wears white stockings and red, purple, green or blue silk shoes. Her face is powdered, her eyebrows painted black and her lips colored with safflower. Three hairpins, with gold birds of paradise, hold up her hair, on which is placed a light hat. Supported by festively dressed maids of honor, the bride slowly descends the steps and stops at the place prepared, her face turned to the east and covered with a fan. She bows twice to the bridegroom, who returns the compliment. Two vessels are adorned, one with blue ribbons and the other with red, and they are then filled with wine and handed to both, who take a sip simultaneously. This act completes the ceremony. Husband and wife are conducted separately to the house, the bridegroom and his father partaking of the banquet with all the bride’s relatives, but the bride does not go to the husband’s

house until the propitious date. . . . “Once married, the Korean woman leads a life of complete seclusion. She may see no man save her husband, not even the male members of her own family. . . .”

WOMAN'S WORK—WEAVING SILK, ETC.

From the Chinese of Lady Tsao, called “Instructor of Women,” about the year 80, A. D.

ALL girls, everywhere, Should learn woman’s work. In weaving cloth.

Distinguish between the coarse and fine:
When sitting at the loom work carefully;
When boiling the silk cocoons,
Collecting for them the mulberry and chia leaves,
In all be very diligent.
Protect the worms from wind and rain.
If cold, warm them by the fire;
Keep them in a clean place;
As the young ones grow,
Transfer them to baskets, but crowd them not;
Making silk, be careful of the straight and cross threads, so you will make a perfect piece.

—Translated by Mrs. S. L. Baldwin

FLOWER arrangement is the only branch of Japanese art that bears few, if any, traces of foreign origin. It was undoubtedly of religious origin, appearing in Japan simultaneously with Buddhism. The idea at the root of it seems to have been the preservation of plant life, analogous to the Buddhist reverence for animal life. This art has been practiced for centuries by both men and women.—*Ex.*

Extracts from an Ancient Hawaiian Mele

(Translated by Curtis J. Lyons)

Lamentation for Kaabumanu (a Queen)

CEASING from storm, the sea grows calm and glassy. Like a puff of wind flitting over it, so her spirit glides away to the far regions beyond Kahiki. She flies, averting her eyes; she fades away in the wild mists of the Northland—the deep, dark, mysterious North.

She has gone from us to the courts of Kane, treading royally the red, streaked path of the rosy dawn, the misty, broken road to Kanaloa.

An ebbing tide flows out, laden with departing wealth.

The chief is turning away, sinking to sleep, drifting away. She fled at the first gleam of the dawn, at the faint ending of the cut-off night. Then was her departure.

O, our beloved one! Our departed one! Our bemoaned one!

The heart beats tumultuously; it throbs within us; it strains us; it breaks the wall around it.

Oh, the pain, the breaking up, the rushing of tears, the falling of the flowers scattered of grief.

We are borne away; carried away; the very depths of us are torn from us by this passionate grief.

Our true liege lady was she, and I grieve. Love as to a sister is mine, yet not a sister. Yea, a sister, chosen and separate in the Lord, born of the Holy Spirit of the one Father of us all. Thus, thus I feel that she is mine to sorrow for. The precious name, sister, is indeed ours [to use], by dear inheritance. Alas, my sister! my beloved sharer in the sweet labor of the voice [conversation]. O, my beloved! My beloved! O, centre of thought! O, centre of thought!

The spirit of the shadowy presence, the spirit body is gone. The many-shadowed, the glorified, the transfigured body is beyond, new featured, heavenly formed companion of angels. She rests in the rich light of heaven; she moves triumphant. She sings praise-psalms of joy in the paradise of glory; in the everlasting daytime of the Lord. He is our Lord, the everlasting Lord. He indeed, in truth.

Such are the thoughts that burn within me; they burn and go out from me! Thus I pour out my soul, my soul.

IS it true, as some allege, that a sweet voice is rare among American women? Foreigners say that the American voice is nasal in tone and high pitched, and that these disagreeable qualities are more pronounced among women than men.

Have we lost our heritage of a pleasant voice and smoothly flowing speech, through conversing too much in public conveyances, in noisy thoroughfares, and in crowded shops? Surely this would be deplorable, for there is no charm so enduring as that of the voice whose gentle, thrilling tones linger in the memory. It must be that we use our voices carelessly, for with just a little thought and control we could lower the pitch and so modulate them as to produce pleasant, agreeable tones.

MISS HELEN A. KNOWLTON, who enjoys the distinction of being the only woman lawyer in her own state, Maine, said recently, speaking of woman suffrage, in which she does not believe, "If men cannot govern the country properly, *what can they do?*"

The Problem of the Child

THE exclusion of children from apartment houses has long been a problem in our great cities, and those who have personally encountered it need no assurance of its seriousness. It is but one of the many signs proving the existence of that deep-seated social disease called "unbrotherliness." But, on the principle apparently, that things have to get worse before they get better, this problem seems to have turned the corner toward its own solution. A dispatch from New York states that a twenty-story tenement house, designed to cover an entire block and to be the airiest and best equipped residence building in the world, will shortly be erected by a number of wealthy society women, and that it will be known as the *Children's Tenement House*. Children will not only be welcomed, but apartments are to be let to tenants with children only. This is in no sense a charity, but only a cynic would declare it not to be a genuine piece of philanthropy. The plans, so far, have been prepared and carried out entirely by women.

From Chicago comes the reassuring news that the leader of the Board of Aldermen has introduced a resolution which he intends shall result in legislation,

for the purpose of making it illegal for landlords and agents to discriminate against children. The text of the resolution introduced by this Alderman was passed unanimously. It reads as follows:

WHEREAS, It has been brought to the attention of the citizens of this city that the growing discrimination on the part of the landlords and agents of apartment-houses against parents with young children is contrary to the dictates of humanity and justice; and

WHEREAS, Thousands of families have recently been inconvenienced and the health of their children menaced by being temporarily deprived of

the proper shelter by this custom of demanding "families without children" as tenants; and

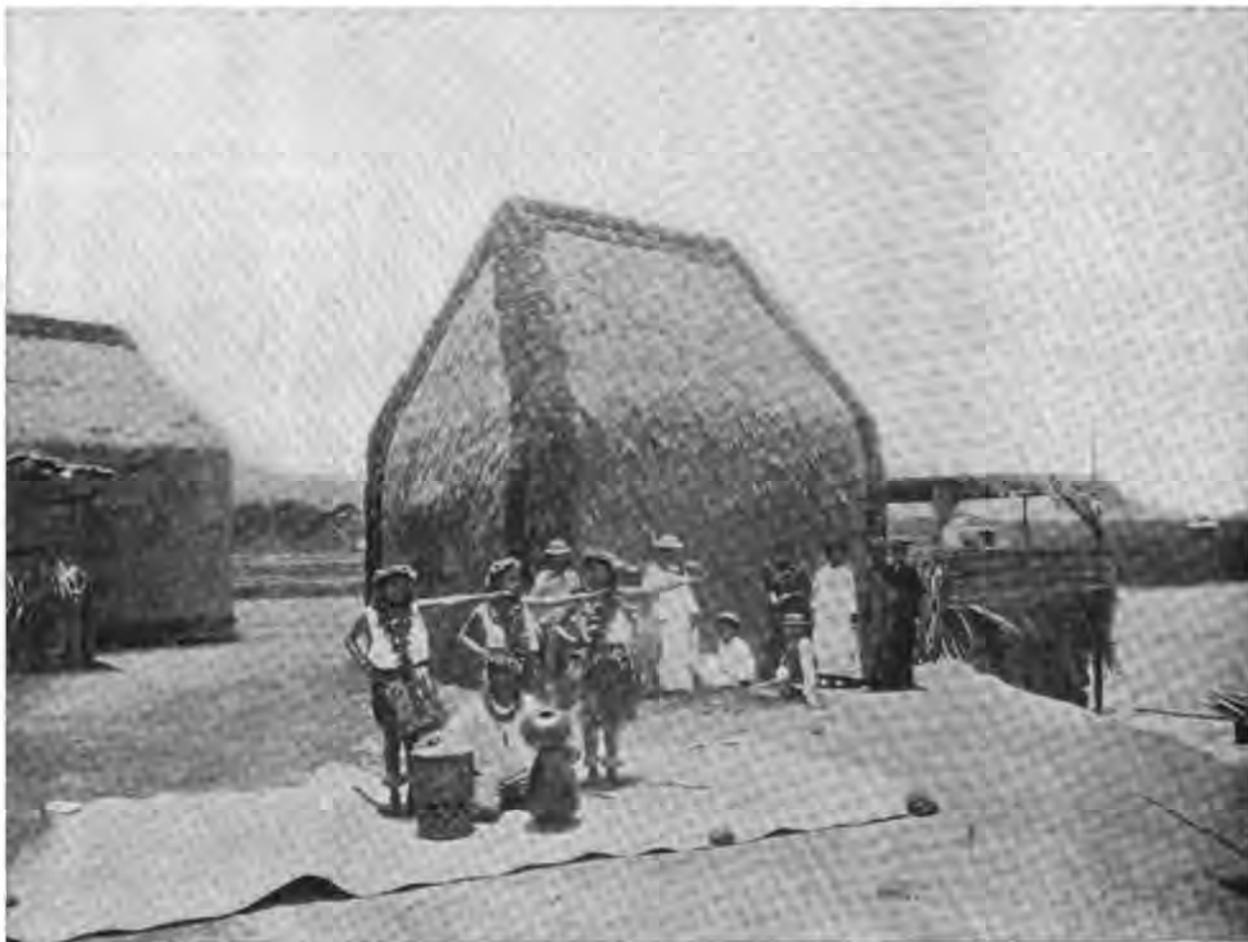

WHEREAS, This action of the landlords and agents tends to discourage and militate against the most cherished tenets of our nation's life; therefore, be it

Resolved, That the Board of Health, Department of Public Charities and the Tenement-House Department be respectfully requested to examine carefully into the subject, report to this body the result of their investigation and request the Corporation Counsel to at once advise what course in law could be adopted to remedy the growing discrimination.

The question has two aspects, however, as all who have seen beautiful apartments ruined by the wanton recklessness of badly brought-up children, will cheerfully admit.

QUEEN WILHELMINA made up her mind in early life to keep a diary, and has admitted freely that she was led to do so by the example of the Queen of England. Like her, too, she has adopted the habit of adorning her pages with tiny sketches, wherever a picture will most readily recall a cherished incident. This, also, has been one of the pre-occupations of Queen Amelie of Portugal, whereas both Queen Margaret and Queen Helena of Italy have chosen rather, for many years, to enshrine some of their choicest experiences in verse. A GLIMPSE OF NATIVE HAWAIIAN FAMILY LIFE

THE CHILDREN'S HOUR

LAUGH A LITTLE BIT

HERE'S a motto just your fit—
 Laugh a little bit!
 When you think you're trouble-bit,
 Laugh a little bit!
 Look misfortune in the face,
 Brave the beldam's rude grimace—
 Ten to one it will yield its place
 If you have the wit and grit
 Just to laugh a little bit!
 Cherish this as sacred writ—
 Laugh a little bit!
 Keep it with you, sample it,
 Laugh a little bit!
 Little ills will sure betide you,
 Fortune may not sit beside you,
 Men may mock and fame deride you
 But you'll mind them not a whit,
 If you laugh a little bit!—Selected

A YOUNG TEACHER IN THE RAJA YOGA SCHOOL

DEAR CHILDREN: I am sure you are never tired of hearing about the little chil-

dren of the Raja Yoga School at Point Loma, for, in some ways, their lives are quite different from most boys and girls you hear about, and so wholesome and happy that perhaps you can get a few hints that would help you to make your lives as true and beautiful.

Looking out of the window just now I saw a group of the very little girls going down to their supper. They marched along two by two very sedately until they came to the big gate which is about a city block from the Refectory, and then the teacher with them said "Now run" I guess for they came frolicing down the broad road as fast as their chubby little legs could carry them, laughing and rosy. Such a merry little flock! But as they came to the steps of their dining-room they immediately got into marching order again, without being told, and went in quietly two by two. From another direction came a group of little boys, and then the big boys and the big girls, until all were assembled at their places. Soon the breezes brought through the window the notes of their song, for always, before sitting down, the Raja Yoga boys and girls sing together.

It is wonderful to feel the rhythm that marks the life of the children in Lomaland; they go through the day doing everything together, and with so much earnestness and joyousness, that they teach the grown-ups many Raja Yoga lessons.

COUSIN ALICE

The Training of a War-Horse

DEAR CHILDREN: Did you know that horses must go to school in order to become good war-horses? In every large country there are army stations where horses intended for cavalry service, go through a regular military training.

First they must become used to a great many different sounds. They must learn to obey the bugle calls and not be frightened at the sound of a great many guns, some, perhaps, fired from behind them. Then they are taught to swim. This is a very hard lesson, for horses are usually afraid of being in the water. Some learn by having their masters swim by their sides, talking, coaxing and patting them to give them confidence. Others never overcome the fear of water and finally have to be used in some other branch of the service.

The men who train these horses are usually patient and kindly. They know that horses are very intelligent animals and, like people, can be ruled by kindness, when perhaps severe treatment would entirely ruin them.

Men who have ridden such horses to battle say that the intelligence they show at such times, is very great. They may be nervous and even fearful before the battle, but when the fight is on, they are as brave and fearless as the men upon their backs.

It is only when horses lose their masters in the battle, and the line of horses in which they are running is broken, that they become afraid. At such times they run about the field, neighing in alarm. The horses

which are riderless are then apt to gather together, but do not leave the battle-field. Often the rally of the bugle will bring them into line again for, in spite of the terror inspired by the battle going on about them, they do not forget to obey the bugle call.

COUSIN EDYTHE

Why Gertie Was Called

DOWN the mossy path of a large old-fashioned garden, dashed nine-year-old Gertie. Under the boughs of trees and over flowers, she flew, occasionally glancing back towards the house, the roof of which could be seen through the trees.

"I know what she is calling me for," she said to herself, "but I'm not going to do it. She'll

never know I heard her calling."

By this time, she had reached a little woody copse, and quickly climbed into a great old oak-tree, which was her favorite haunt.

With a sigh of satisfaction she snuggled down amongst the thick leaves, completely hidden from sight. Taking from her pocket a rosy apple, she opened a book she had brought with her and prepared for a glorious time, with the "Golden Haired Princess." Soon she was lost to everything but the perils of the Princess. She raised her head, presently, and took a delicious bite of her apple.

"I don't see why I should have stayed indoors to dust that room. I know that is what Mother called me for. Mary could do it quite easily," she murmured, turning once more to her story.

"Gertie, Gertie," called a voice from the garden. "Gertie, where are you? Your mother wants you."

It was Nurse, hunting for her. Gertie sat still as a mouse, and almost held her breath till she had disappeared. Two or three times she heard voices calling. Once her big brother came quite close shouting, "Gertie, Gertie, come, Mother wants you."

"Oh yes, I know what Mother wants, and I'm not going."

But the story suddenly seemed less interesting. Gertie remembered that Mother had a headache. "But she need not dust the room, and she often has headaches," thought Gertie.

In vain she tried to forget all about everything but her book. Presently it fell from her lap, and landed in the middle of a blackberry bush. Gertie scrambled down and picked it up, torn and stained. It was a book borrowed from a schoolmate. "Oh," thought Gertie, looking woefully at it, "how can I return it in that condition?" She almost wished she had stayed in the house, but it was too late now.

It was nearly tea-time. Slowly, she began to walk towards the house, not feeling altogether happy. Meeting no one she ran upstairs to get ready for tea. She wished that Mother would help her clean the book, but somehow she did not feel like asking her, so she went to Nurse.

As she entered the nursery, Nurse looked up from her sewing. Gertie thought Nurse's bright face looked strangely sorry.

"Wherever have you been, Miss Gertie?" she asked. "How we have hunted for you. Your Mother would not go till the last minute, hoping you would be found." "Go," said Gertie, "go where?" "Why, my dear," said Nurse, "I'm very sorry for you, but your Uncle Charlie came to take you all with him to the big sugar camp this afternoon. He had arranged a maple-sugar party as a surprise, and had the Bonn and Cummings children come out in the first big load to wait for you."

"Oh—o—oh—oh," said Gertie. Is it too late?"

"Why, of course, dear. They'll soon be starting home."

And Gertie—well, she learned her lesson and the next time she came when called!

COUSIN CHARLOTTE

Waking and Sleeping

THE man who knew how to wake would be in the possession of the finest of all fine arts. It would seem that in a moment the direction could be given to the whole day.

For is not waking the descent of the personal soul, the *I myself*, into the mind? There, in that busy hive of pictures, thoughts, desires, it loses hold of its proper nature and is swept whithersoever the mind would have it go.

Waking is birth, in a sense; the daily coming *into* the rush and whirl of physical life *from* the "place" where there is another kind of life altogether. In *that*, the man's divinity is not veiled, his light—be it small or great—not shrouded. But in *this*, his consciousness is so shot through by the incessant sparks of thought and of wish that it loses itself in the urgency and particularity.

To be asleep is therefore, *for the soul*, to be awake in its proper nature and at its proper work.

As the cells concerned with brain-thought wake up in the light of morning, the pictures and memories they hold start into life, and for a moment there is that swift kaleidoscopic confusion we call dream. Then, when the opening senses touch the real world, order is restored. That moment, the click of the senses into apposition with things, must therefore be one of the key moments of the day. If the soul could hold itself as a soul through that, it would have achieved a great victory for the day, and the effect would last all the waking hours.

What is the proper state and work of the soul? One would say that at night it must—delivered from the senses—enter wholly into the intensely vivid and multiform currents of human *feeling* with all their intense lights and shadows. And among these, it would seek and live in such as are in harmony with its nature. Just as, aboard ship, an artist will presently be found with the artists, an actor with actors.

If it be weak and untrained, it will seek the lights, avoiding the shadows; and get rest and interlude from the troubles and pains of waking life. If it be stronger, able to give compassion, it will seek the shadows made by human pain, and try to lift them, lighten them, pour light and comfort into them.

And for all this, for its power to work by night in helpfulness, to work in and accept the shadows whilst ever they shall be upon earth at all, for its power to wake as a soul—the preparation and the only preparation must be done by day. Practise must be had by day in living the life of the heart, in holding oneself as a soul, as a light.

Thus, getting within personality into the deeper life, one gets beyond the domination of passion, of desire. The voluntary retirement from personal aims and ambitions may at first be painful, may seem to leave a difficult void; but it leads to the great light, the immeasurably great life.

STUDENT

Inability to Converse

One of the chief causes of the dulness of life is the inability to listen which you find in nine people out of ten. The extraordinary selfishness at the root of this defect is a shock to the optimist who is anxious to think well of human nature.—*The Lady*

THE fact noted above is pretty generally recognized, and we often read articles on it. Do we not all know that it is true that even good-hearted, generous people will fire off their ideas on you, but become suddenly absent-minded when you venture to make a remark? And do we not do the same ourselves?

Of course selfishness is at the bottom of it. If one pleads thoughtlessness or impatience, one is only making a sorry subterfuge, as these failings are merely the various weapons or disguises of selfishness. If a man has a dog, he should keep it in order, as other people will not take in excuse for being bitten, the apology, "Never mind, it's only my dog!"

It may be argued that such defects are only superficial and do not in-

dicating a deep-seated fault. But goodness should not be content to remain in seclusion and leave evil in occupation of the field of action. When we are really anxious to make a favorable impression, we do not trust to our concealed goodness, but take mighty good care of our visible manners.

Hence the inability to converse must be taken as a genuine sign of selfishness.

STUDENT

A Striking Proof of the Universality of the Wisdom-Religion

PERHAPS one of the simplest and most striking evidences of the actual existence, in ancient times, of a universally understood mystery-language, is the widespread occurrence of the symbol known as the *Jaina Cross*, or *Thor's Hammer*, or *Svastika*, so well understood by students of Theosophy. The following quotation from Kenneth Mackenzie's *Royal Masonic Cyclopaedia*, gives condensed information on this point:

It was adopted by the sect of the Jains as a specific symbol. It is also known as the Fylfor, among heralds, and it is evidently a very ancient symbol indeed. . . . Dr. Henry Schliemann found it on the remains of the ancient city he takes to be

Troy. . . . Raoul Rochette, Petra, and de Rossi find it in the catacombs of Christian Rome.

. . . . It is found alike in the Old World and the New: on the monuments of Egypt, the wedge-cut bas reliefs of Assyria, the rock caverns of India, and the Cyclopean walls of Peru, as well as in the forest cities of Pre-Columbian America; it is associated with the medieval Rosicrucians, and perpetuated by the operative Guild-Masons on the cathedrals and fortresses of Central Europe. . . . It was the hammer of Thor, celebrated in the mythology of the Norse nations.

What better proof could we have of the identity of the Wisdom-Religion than the finding in all parts of the world of this identical symbol? And, remember, this is but one instance out of a vast multitude of similar evidences.

Sumptuous Tibetan Books

THE temple books seen by the recent military expedition in Tibet are beautiful and rich indeed. The covers are of close-grained wood divided into three panels, each minutely and exquisitely carved. In the centre are Buddhas on the lotus throne and surrounded by the foliage of the bo tree. The whole cover is plated with gold, and the first page of the manuscript is covered with a green or red silk veil. The page itself is of a deep Prussian blue with a panel in the centre having the opening words embossed in

gold. The book is in large letters of gold, or in alternate lines of gold and silver, and the leaves are held together by a thin gold circle. E.

A Pioneer Worker

MRS. ANNIE TENNENT BUSH, one of the pioneer members on the Pacific Coast, was born in London, England, coming in a sailing vessel to San Francisco, in 1852, with her father and mother, two sisters and a brother, the vessel being seven months on the voyage without touching land. In 1854 she was married. She has two sons living, with the elder of whom she resides in San Francisco. In 1888 she joined the Theosophical Society, and has ever been one of the faithful and loyal members. She is now in her seventy-seventh year, and is dearly beloved by all her comrades. As she herself said in a recent letter: "I have been with the Society and our three Leaders through their many trials, and thank the Good Law, I have lived to see the marvellous results brought about by the untiring efforts of W. Q. Judge and Katherine Tingley, from the good seed sown by our dear H. P. B."

Theosophical Meetings for Sunday Nights

Public Theosophical meetings are conducted every Sunday night in San Diego at 8:15, at the Isis Theatre, by the students of Lomaland.

Theosophical subjects pertaining to all departments of thought and bearing on all conditions of life are attractively and thoughtfully presented.

An interesting feature is the excellent music rendered by some of the students of the Isis Conservatory of Music of Lomaland. Theosophical literature may always be purchased at these meetings.

Chinese Music. Its Relation to Our Own

WE may hope that the recently published interview with the Chinese reformer, Kang Wu Wei, may do something to stimulate interest in Chinese music. He pointed out that the music of a nation is in perfect relationship with its character, and quoted Confucius who advised that we should study the music of nations in order to understand the nations themselves.

It appears that Chinese *military* music is based upon the same twelve-semitoned scale as our own, and that the orchestra is sometimes so elaborate as to contain eighty-four distinct instruments. But the music is of a much milder character than our own. Their *vocal* music is, however, built upon five tones only—F, G, A, C, and D.

As to the origin of their full scale, the Chinese tell this legend: The blind musician, Lyng-lun, was ordered by King Hoang-ty to reform and systematize music. He sat down by the river Hoang-Ho and after a while noted that its essential sound was the same as the primary note of his own voice. Then came the magic bird Fong-hoang, with his mate, and perched upon a tree to sing. It turned out in a few minutes that the birds' chief note was the same as that of the river and the musician's voice. This note—the Kung—he concluded to be the grand keynote of nature, our "middle F." Each bird sang six notes. Taking twelve pieces of bamboo the musician cut them of such lengths as to yield those exact notes, thus obtaining the full natural scale.

The Chinese, said the reformer, are fully aware of the relation of music and color; and he also spoke of other relations of which we know nothing. Chinese music, he said, "would be more intelligible to Western peoples if the occult meanings attached to the various sounds were understood." He regards our music as very artificial, whilst that of his own people and of other Oriental nations is nearer to nature. The Chinese unit of *measurement* is curiously connected with their scale. It is derived from a square pipe ten inches long and of the sectional area necessary to give the note F. This sized pipe, it appears, will contain exactly 1200 millet seeds!

Their musical instruments are various. The most remarkable consists of sixteen pieces of stone, hung by strings in a frame. The stones are shaped like a carpenter's square "and are tuned by slicing off a piece from the back to flatten them, or from the end to sharpen them." Another contains sixteen bells hung likewise in a frame. Another consists of twenty-five silk cords pegged upon a board. They are in five groups of five, variously colored; but we are not told what notes they give. They cannot be the five notes of the vocal scale repeated in five octaves, for silk would not stand the strain of the higher notes. Another instrument is made to represent a tiger, life sized. Sticking up from his back are twenty-seven teeth made of wood. The teeth are scraped with a rod on the principle of the violin bow. Presumably the body of the animal is a resonating chamber, and the notes might well be of great power. It might be worth our while to try something similar; and it will certainly be worth our while to study the music of the Chinese. They attach names to the notes with a view of expressing something of their character. Thus F is Emperor, G is Prime Minister, and A is subject. D, the sixth—as we count it—from F, is Majesty or the Mirror of the Universe. One would like to know the names of all the twelve semitones.

STUDENT

IT is said that we owe Bach's work on *Fugue* and the *Well-tempered Clavichord* to the persistence of his friends, who urged him, in his old age, to write a treatise on fugue-making. He began the work but, after writing a few pages, threw it aside, saying: "I cannot teach by precept, only by practice." He recommenced the work on a wholly different plan, taking one simple subject and on it writing sixteen fugues and four canons, in every style of composition.

In ancient Egyptian funeral ceremonies music played a most important part. The best singers and players were engaged, the music itself being chiefly melodic, the songs being sung in unison.

An Interesting Document Recently Discovered

A DOCUMENT recently brought to light in Italy is of peculiar interest in revealing certain characteristics of a man about whose life clusters a wealth of marvelous tales—Leonardo da Vinci. It is in the form of a letter written to his patron, Ludovico, at that time Governor of the city of Milan.

No contemporary, not even excepting Michelangelo himself, surpassed Leonardo in the variety of his gifts and the ease with which he attained the very heights in every one. He was versed in practically all the arts and sciences known to his day, and in optics and allied branches made important discoveries. Perhaps this letter reveals one secret of his successful climb, though let men of lesser gifts beware of following its example. Self-confidence is an incomparable armor to the master in any line, but to the tyro or dilettante it affords but a sorry and ill-fitting cloak.

And this is what he writes:

I have the means of constructing very light bridges, which may be carried about easily, and with which one can pursue enemies as well as escape from them according to need. And I have others which are fire-proof and cannot be injured in battle: they can be removed and set up again easily.

During the siege of a place, I know how to cut off the water in the moats. . . . If during a siege, bombs cannot be used, because of the height of a rampart or the strong fortification of a place, I have means to destroy every tower or any other fortress, unless it be founded on a rock.

I know of another kind of bomb, light, and carried without trouble, and with which a hailstorm of missiles may be projected. The smoke produced thereby causes great terror among the enemy, to his hurt and confusion.

And, then, after mentioning various other inventions in the science of war, Leonardo concludes, quite simply and naturally:

In works of marble, bronze and terra cotta, as well as in painting, I shall do whatever can be done by anyone, whosoever he may be. H. H.

RICHARD WAGNER was a man of pronounced humanitarian instincts and great tenderness of heart, and his love for animals gives one an additional key to his inner life. A contemporary recalls the following incident which occurred when he was in the midst of producing his wonderful festival plays at Bayreuth. In spite of financial stress and many disappointments, in the midst of close attention to the details of building his theatre, the daily rehearsals of many hours, the revision of scores, etc., he still found time in which to promote and help to support "The Society for the Prevention of Cruelties Caused by the Dog Tax." Among his literary works is extant one protesting against vivisection. Himself a vegetarian, the musician attributed human degeneration very largely to meat-eating.

Wagner's life was unselfishly devoted to furthering the regeneration of the human race, and he looked upon art, music, and the drama as means to that end. He has been called an idealist, but the future will realize that idealism, grounded on strong intellect and compassion, has a very solid foundation. The future is destined to witness the fulfilment of his dreams for the betterment of human life and it will make of his ideals living actualities.

STUDENT

A CORRESPONDENT writes from Paris that a number of French artists have recently formed a society known as the Psycho-Zoological Institute, where dogs, horses, wolves, and other animals, wild and domesticated, will be allowed a certain amount of freedom, for the purpose of giving animal painters a better opportunity to study their subjects.

THE ancient Egyptians declared close correspondences to exist between the seven tones of Egyptian music and the seven heavenly planets.

ORMIN, an old English poet, who wrote probably not later than the Twelfth century, says quaintly, in the dedication of his poem, "The Ormulum:"

I haf sett her o this boc
Among Godspellless wordess,
All thurth me selffean manig word
The time swa to fillca.

Which meaneth, modernwise:

I have set here in this book
Among Gospel's words
All through myself, many (a) word
The rhyme so to fill.

Central Office Point Loma California

A Memorial Service

For

Ralph Wythebourne, the Heroic Raja Yoga Teacher

VERY beautiful and impressive was the funeral service held in the Aryan Memorial Temple at Point Loma, August 30, just before sunset, for Ralph Wythebourne, the heroic Raja Yoga teacher, who lost his life in the surf at Ocean Beach on Tuesday afternoon, after having brought to a place of safety seven of the Raja Yoga boys who were in his charge, and who, while bathing, were caught by a strong undertow and swept into danger.

Mr. Wythebourne's body was recovered on Tuesday evening; it lay in the Temple which was decorated with flowers and palms. Here gathered, at the hour named, the students and residents of Point Loma and the children of the Raja Yoga School. All felt the inspiration given by Mr. Wythebourne's heroic death, but they also felt keenly the loss of a comrade so beloved, and a worker so valued, and this was expressed in the tributes that were spoken or read by Mrs. Tingley, the Cabinet Officers of the Universal Brotherhood Organization, the children of the Raja Yoga School, the Young Men's Brotherhood Club of which Mr. Wythebourne was a member, and the Woman's League of Lomaland.

Beautiful songs were sung by a choir of Raja Yoga children, a chorus of the young men, and also by the large choir of the students, and these numbers were interspersed with organ music.

The Raja Yoga children were the first to offer an affectionate and reverent tribute to the teacher who had nobly laid down his life for them. They stood with wreaths and flowers, and recited words that called forth the noble sentiments that had actuated the dead hero.

They were followed by the Young Men's Brotherhood Club, the thirty members of which surrounded Mr. Wythebourne's body, while the president of the club read a glowing tribute which revealed a part of the strong and heartfelt comradeship that exists among these young men, who serve the cause of Brotherhood.

Mr. R. Machell read the following from an illuminated scroll which had been prepared to send to Mr. Wythebourne's family:

"To die performing duty is no ill;
He who seeks other paths shall wander still.

"Our comrade, Ralph H. Wythebourne, has given his life to the cause to which we are all pledged, the service of humanity; he has earned the right to the protection of the flag that now shelters his body. Peace to the soul of a hero!

"His last words to his comrades were: 'Leave this to me; this is my duty,' and nobly was the duty fulfilled. The seven boys who were in danger, were brought safe to shore, but the relentless waves claimed a heroic life as the price of their ransom.

"We have lost a faithful comrade, who especially during the last year had grown into our hearts, and won our esteem by his upright conduct, his devotion to duty, his constant effort to make himself a worthy worker in a noble cause; and by his unfailing loyalty to her who is to all of us a beloved Teacher, Katherine Tingley, who today mourns the loss as of one of her children.

"The Young Men's Brotherhood Club has lost one of its most promising members, and the Raja Yoga School one of its most faithful guardians.

"But he has left us an example that shall be his monument, such an example as 'keeps the heart of man forever up to the level of the old time.'

Peace! Peace! Peace!"

A member of the Woman's League then read a tribute which we give in part:

"The Woman's League of Lomaland bring a nature-tribute of flowers

to the hero-hearted nature-lover, Ralph Wythebourne, who in every twig and leaf, in every shy bud and blossom, saw a friend. So deeply had he listened to the nature voices, that to him were known many secrets of the banks and dells and of the woods and lonely trails; so gently and earnestly had he studied the ways of nature that his knowledge was a science, and his heart-touch with nature an open door to wondrous ways of helping his fellow men.

"Today, sweeter and more fragrant than the shy blossoms which he loved, and often brought in such profusion to us, stir in our hearts memories of many kindly deeds, of many gentle services to women and to little children. We know the faithfulness and steadiness with which he performed every duty. His face bore the mark of truth and sincerity, and Katherine Tingley says that the steadiness of Mr. Wythebourne's life was in accord with his profession of uprightness. His growth as a student was the growth of the great nature; when he took a step forward, he fell not back, and when the call came, he was found ready.

"Ralph Wythebourne loved poetry; his heart had been tuned and his will made strong by the study of poetry and of the deeds of heroes.

"But more dearly than all else he loved the Raja Yoga children. In them he saw the light and hope of mankind; in serving them he found his heaven. Who among you does not know this, you who have daily seen the swift step with which he sped to every service? Who among you does not know, had Mr. Wythebourne been asked to choose his death, that he would have said 'Let me die on duty, let me die serving the Raja Yoga children. Let me die for them!'"

Then followed a tribute from the father of one of the Raja Yoga boys who had been in Mr. Wythebourne's charge.

Mrs. Tingley spoke most feelingly of the dead teacher. She told of his faithfulness and devotion, his determined self-mastery, and the wonderful progress which culminated in the heroic sacrifice of his life in the performance of duty. She related many incidents till then unknown to any but herself, and showed clearly how the steady performance of duty had prepared this worker for his glorious and triumphant death.

Mr. Wythebourne's body, covered with the flag of the Raja Yoga School, which he had served so faithfully, was borne out of the Temple by his comrades, and in the hush of the twilight hour, was reverently carried through the grounds of the International Lotus Home, the scene of his devoted services, to the grove of eucalyptus trees beyond, the students and the children of the School following in silent march. There they dispersed, leaving the body in charge of the Young Men's Club, who watched during the night.

At sunrise the next morning the burial took place at the Point Loma burial ground, known as "Lotus by the Sea." The services at the grave were conducted by the Rev. S. J. Neill, a devoted member of the Universal Brotherhood and Theosophical Society. MARJORIE TYBERG

For the Benefit of Enquirers

REGULAR weekly meetings of the Aryan Theosophical Society, established in New York City by William Q. Judge, the second Leader of the World's Theosophical Movement, are held every Thursday evening at 8 o'clock in Isis Hall, 1120 Fifth Street, San Diego, California. These meetings are intended to meet that large and growing body of earnest enquirers who desire to know more of the different tenets of the Theosophical philosophy. Students from the Universal Brotherhood Headquarters at Point Loma, California, conduct these interesting gatherings, to which every truthseeker is cordially invited.

AMBITION

BYRON

HE who ascends to mountain-tops shall find
 The loftiest peaks most wrapt in clouds and snow:
 He who surpasses or subdues mankind
 Must look down on the hate of those below.
 Though high above the sun of glory glow,
 And far beneath the earth and ocean spread,
 Round him are icy-rocks, and loudly blow
 Coastading tempests on his naked head,
 And thus reward the toils which to those summits led.

The Day of Small Things

HAS it ever occurred to us that if we are fond of adventure and heroic deeds, if we desire to carry forward our boyhood's ideals of fights with wild animals, tigers, wolves and dragons of the deep, if we wish to take a hero's part in tragedy or comedy, or visit a house filled with ghosts and hobgoblins, we need go no further than the experiences of each day of our lives, and we shall find them, every one of them full of such adventures?

The little universe within, is the place where these battles must first be fought and won, before we are fitted for posts of fuller trust, and until this campaign is in some measure entered on, we are unfitted for a larger warfare.

No doubt there are many who are old campaigners. We may have gone under many a time before, and may have only recently taken up arms once more. It is well therefore that we should reconnoitre carefully the field of battle, and not spend our time looking through telescopes at distant peep-shows when the enemy is close at our doors.

Not a day passes but we stand in danger of the tiger of anger, the bear of ill-humor, the snarling wolf of criticism, the fox of cunning self-deceit, the parrot of empty chatter, the peacock of self-admiration. Ghosts of the past rise up before us, which only need careful scrutiny to disappear forever. Disappointments and dis-illusions come with tragical effect and give us the tempered strength of trial. Comedy throws away her mask, and shows us her laughing face when the happy dénouement unravels the dread and tangled mystery. And so the warrior of brave heart will go through each day with that "eternal vigilance" which is the price of liberty, with the star ahead which leads him ever onwards.

Do we realize that in this inner conflict the enemies we meet are a part of ourselves, that even the wrong done to us, may contain a sacred lesson that we may learn the divine forgiveness?

Sometimes we try to convince ourselves that if only circumstances were otherwise, how different it would be with us; how easy it would be to live the ideal life under other conditions. Reflection will show us that this cannot be so. A man is what he is, through the evolution of his own character; and this character alone will determine the nature of his comprehension and governance of the fiery tests of experience, through which Wisdom, Peace, and Truth are wrought out.

If then we are convinced that "Brotherhood is a fact in Nature," if we know that in this daily fight, we are each doing our part in the larger conflict, by which our brothers are freeing themselves and each other from self-made servitude, we shall know that our conflict is not alone. Behind the effort is the force of the World Soul on its onward course. In undertaking it we perform only our plain duty, and yet this duty is enlightened by the joy which recognizes noble comradeship, and the certainty that thus the sorrows of the world may be slowly dissolved away, though countless ages may roll before this be accomplished.

Are we wishing for wider fields of action? Let us first look within, and see whether we have won our spurs in the necessary present battle.

Do we long for recognition from the Great Ones, or from our Comrades? Recognition of what? Of the results of a battle scarce begun

or half won? Are they too not fighting? We do not want empty compliments on a battle-field. All we need is to pass round the word—"Take Heart." And from whom shall this recognition come, and what longs for it? Does not the *soul* of each one of us know well the soul of every other? Do we not know that the Great Ones are ever near to guide and keep, into that great compassion, into the fellowship of which they fain would draw us?

Let us then beware of deceiving ourselves. Each day may be a "Day of small things," but if we recognize how near to us are the duties we must first fulfil, we shall have learnt a lesson in practical occultism which may be to us a revelation. STUDENT

The Baptism of Consciousness

WE live along two strands of life at once. Of one we are conscious; of the other, scarcely at all. Yet even if unconscious of it in ourselves, it is often clear enough to us in others, especially in children. From the inner life a little child often radiates an emanation, an influence, of such purity as for the time to transform and ennoble our whole thought. But the child knows nothing of what it is doing, knows only that it is merry or interested or what not.

We get the same touch from a tree, a flower, or the planet of sunset and dawn. Only in the flower, that investing consciousness which in the child is merry or tired or thoughtful and in the man is mostly selfish or sensual or ambitious, hardly exists. There is at the heart of all the deeper life, the all-pervading in nature, the pure spiritual essence which lies in all its purity even beneath the foul current of desires and lusts of the very worst of humanity. Is not Christ's injunction to us to become as little children, perfectly comprehensible? With a partial similarity of meaning, he might have said become as flowers, but it would have led into a thousand byways of misinterpretation. We have to find the pure waters of the deeps of our being, the unpolluted spring of life and in it baptize our self-consciousness. The proto-typal self, the "Lady of the Waters" of the legends, is already there. The possible symbolism is endless. Those who have finally and fully done this, initiates, whose garments are washed white, have often been called "little children." It was these whom Herod tried to exterminate. The *childliness* of this symbol means simplicity, purity, not unwisdom or *childishness*, and often goes—as for example in the case of H. P. Blavatsky—with titanic strength of character and profound knowledge of life and science. It is by bathing in that water, springing in every heart, that consciousness of unity with all that lives, is attained. Sense of separateness of interests, sense of an advancement or of a purity beyond other men, are utterly dissolved. Then only is love, compassion, the *feeling with*, properly known or become, in its utter unselfishness. The life motive is now no more to take or to receive or to have, but to give, to radiate. The black quality of consciousness, the absorbing, is gone forever. Only the gold, the out-radiant, is left. STUDENT

New Cycle Notes

IT is by getting at the root of desire that makes it easy to eradicate the weeds that are constantly springing from it. To try to remove the weeds without getting at the root is a difficult and never-ending task.

The point of limitation comes to many when they are afraid to appear to do wrong.

A pure form of will is brought into action in the very opposite way to the development of the personal will. It is by giving way for others' sake in simply personal matters which do not involve a matter of principle, instead of holding one's outside ground and insisting on one's "rights." By this method, those we meet daily aid us in pulling out the root of all our troubles, and the way is made open for active positive operation from the center, when, continuously by right action, we rebuild on an impersonal model.

Intuition is truly a storage of past wisdom, and the key to unlock the storehouse is right action.

It is not loyalty to anyone or any principle to wait until a suitable opportunity occurs to try our faith. It is in the many actions done at once on the call of duty, that the true moment is found, and not by waiting for some special occasion. How can we hesitate, when everything in life is moving either up or down; it is our part to go on, and on, and on. The path of safety lies in continual action. STUDENT

TRUE INDEPENDENCE

THOMSON

I CARE not, Fortune, what you me decay;
 You cannot rob me of free Nature's grace;
 You cannot shut the windows of the sky,
 Through which Aurora shows her brightening face;
 You cannot bar my constant feet to trace
 The woods and lawns, by living streams, at eve:
 Let health my nerves and finer fibres brace,
 And I their toys to the great children leave:
 Of Fancy, Reason, Virtue, naught can me bereave!

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question (Continued from issue of September 3, '05.)
 What grounds have you for the certainty of your knowledge?

Do you not after all accept the Theosophical teachings merely on faith; in other words, how do you know your philosophy is the right one?

Answer (2) Although the certainty of one's position must in the last analysis come from actual experience and the application of Theosophy in daily life, as was attempted to be shown in the previous answer to this question—yet Theosophical literature has played an important part in establishing this position, and has had a great power in changing the thought of the world; and by the reiteration of the truths of the ancient Wisdom-Religion has pointed the way to its realization in practice.

A brief mention of some of the main teachings of Theosophy will serve to show that in the completeness of the knowledge presented, and in the rational, common sense and consistent explanation of the problems of human existence, it does give good and sufficient grounds for a firm faith in the beneficent purposes of life, and a philosophy that answers to every test of experience. There is not a single field of enquiry which it does not enlighten; it shows that knowledge is a unity, and cannot be separated into water-tight compartments; and that the pursuit of no branch, whether it be exact or experimental science, or religion or philosophy, can be divorced from ethics.

In the field of religion, probably more than in any other, have there been antagonisms and divisions; in addition, there has been, so far as the present era is concerned, the age-long conflict between science and religion, and between different schools of thought and philosophy—everywhere, strife and division. Into the midst of all this Theosophy comes as the great unifier. The different religions of the world it shows, verily, as springing from one primeval root, the ancient Wisdom-Religion. It needs but a little study from an unprejudiced and unbiased standpoint to find that Theosophy throws a new and clearer light upon the religious development of the race. And if we find that we have a key put into our hands which helps us to understand any one religion in itself, so far as that is possible, also the different religions in their relation one to another, is not that the test of the key, and does it not give warranty to the certitude of our convictions that here we do have an expression of the Truth?

Theosophy is the synthesis of Philosophy, Religion and Science, and because of this the student finds his life fuller and richer; no longer does one part of his nature starve because of his studies along any particular line. In fact, he finds that to attain the fullest possible knowledge he must acquire a balance first of all.

In the Theosophical account of the history and development of the human race, instead of the "scientific guesswork" and the elaboration of theories to fit preconceived ideas, we have again a key that fits all the locks and opens the doors into the past, even from the very beginning of this planet and this solar system. And the Theosophical account is supported first by all the known facts, as well as by the traditions and ancient records of the great races and peoples of antiquity in all parts of the globe.

In the main Theosophical doctrines of the Solidarity of the Human Race, Universal Brotherhood, Karma, the reign of Universal Law, Reincarnation, the Law of Cycles, the Dual Nature of Man, and his essential Divinity and Perfectibility—in these and the other teachings of Theosophy, we have an answer to the perplexities of human existence, an explanation of its problems, and a guide for the future.

All these points may be studied intellectually, from Theosophical literature; but as William Q. Judge has said, no one can study these teach-

ings without the life being affected thereby. The brain-mind may not be willing to accept them, because of its being enslaved by personal desire and selfish ambition, and to do so would necessitate a determination to live one's life on higher levels. But the inner, real man, the higher mind, knows they are true, and thereafter life can never be the same. The "little leaven that leaveneth the whole" has entered into the nature and, consciously or unconsciously, everything will be judged according to a new standard, to the extent to which the knowledge of Theosophy has been acquired.

How great the responsibility, then, for those who have seen the light, and perhaps with their lips accepted it, who turn away from it and choose darkness. To every student of Theosophy the time must come when he must choose either to join the forces of light and help on the human race, or consciously to oppose those forces and lend aid to the powers of darkness. Every teaching, every word of Theosophy is a challenge, it opens a new door and never more can we shut that door or go back to the old indifferent life; we must face the responsibility of the wider outlook, and of the knowledge—to whatever degree we may have it—of the Truth.

It is along these lines that I would answer the question as to the grounds of the certainty of the Theosophist's faith and his position. But if you are interested in Theosophy with a genuine interest, you will not be able to stop at the mere reading or the intellectual study of its teachings, for you will know no rest until you put them into practice to the utmost of your endeavor. And then the truth will be seen, that he that liveth the life shall know of the doctrine.

STUDENT

Question In a recent issue of a well known magazine I noticed that Theosophy was classed as a "new religion," being put in that category with a number of other, modern, movements. As the question has several times come up regarding the matter, will the *Theosophical Forum* kindly give a brief answer?

Answer A similar question is answered by H. P. Blavatsky in *The Key to Theosophy*, as follows:—

Enquirer. Theosophy, then, is not, as held by some, a newly devised scheme? *Theosophist.* Only ignorant people can thus refer to it. It is as old as the world, in its teachings and ethics, if not in name, as it is the broadest and most catholic system among all.

"Only ignorant people can thus refer to it," but it is indeed a pity that a reputable magazine should endorse the statement of the writer of the article in question, or that in quoting this statement it did not take the opportunity of pointing out the error. Or are we to assume ignorance on the part of the magazine also?

Abundant proofs can be found, by the enquirer, of the antiquity of Theosophy. The actual name was in use in the third century, when the "Eclectic Theosophical system" was introduced by Ammonius Saccas in Alexandria. But the best statement I know of is that in the constitution of the Universal Brotherhood Organization and Theosophical Society, where it is declared that this organization is "part of a Great and Universal Movement which has been active in all ages."

As for Theosophy being classed with the other modern movements referred to, this again shows woeful ignorance on the part of the writer—and here I do not speak of the classification of Theosophy as being modern but of its being put in the same category with these other bodies. And without going into any specification of detail, let it be sufficient to say that, in the words of Madame Blavatsky again, "Theosophy is the most serious movement of the age;" and it protests against all the faddisms and fanaticisms of the day. Theosophy is common sense; it is practical, humanitarian, unsectarian; and the Universal Brotherhood Organization and Theosophical Society in all its departments stands unique in this—that none of its officers or workers is salaried or receives financial recompense, but, on the contrary, all give their services voluntarily and find the greater joy in so doing.

Hence to class Theosophy with movements which are by inference mere money-making schemes, or which pander to the most subtle forms of selfishness and fanaticism, displays—shall we say merely ignorance?—or was there a possible intention to obscure the truth? STUDENT

TRUTH is a torch, but a terrible one; oftentimes so terrible that the natural instinct of us all is to give a side glance with a blinking eye, lest, looking it fairly in the face, the strong light might blind us.—Goethe

In the Land of the Rising Sun

(From Our Special Correspondent) TOKYO, August 8th, 1905

AT the quarters of the Russian prisoners at Himeji, a Russian language school has been established by the Japanese officials. The students of this unique school are Russian soldiers, nine-tenths of whom are illiterate. Over a thousand prisoners are attending the school and many of them are now able to write letters to their homes. At almost every station when the trains with Russian prisoners passed through, there were numbers of Japanese waiting to supply them with cakes and fruit and tobacco, and to show them countless little acts of courteous kindness.

One of the most significant movements tending to the further awakening of the East now going forward here, though perhaps unknown to the world at large, is marked by the presence of Chinese students in Japan. Eight years ago—in 1897—two students were sent to Japan by the Chinese government. There are now attending various colleges here no less than 2641. The majority of them are between the ages of 20 and 30; but one of them is 60 and another 64. The writer of this letter is acquainted with a number of these students; and has found them to be men of high moral character and quite remarkable intellectual ability. According to a late Imperial Chinese edict, students who have graduated from Japanese Colleges will be eligible for public offices in China without other examination. Heretofore the examination for public officials has been purely literary and the method has remained unchanged for centuries. This all important innovation therefore means that in a few years, enlightened and progressive men will take the places of the old conservative anti-reformers in China. Japan has learned much from China in the past; and now in her turn the former has an opportunity to render noble service.

It will no doubt have been observed that during this great war there has been very little talking on the Japanese side. Their plans have been matured and carried out silently, while those arch-talkers, the newspapers, have been given to understand that the country is not run entirely for their benefit; and that military and naval operations on which the fate of the Empire depends are not conducted merely to provide a sensation for newspaper readers. In a word, the press in Japan is free, but at the same time it is held to be responsible. There is liberty but not license.

Considering the general conduct of the people during this critical time the military correspondent of the *London Times* writes as follows, all of which the writer of this can heartily endorse:

The attitude of the Japanese people in the presence of this epoch-making triumph

is a sight for men and gods. They have the grand manners of the ancients, and their invariable attitude throughout the war, whether in the hour of victory or in that of disappointment, has been worthy of a great people. No noisy and vulgar clamour, no self-laudation, no triumph over a fallen enemy, but deep thankfulness, calm satisfaction, and once more reference of the cause of victory to the illustrious virtue of the Emperor of Japan. If this be the Yellow Peril, may the fates grant that we catch the infection of it by closer and more effective alliance with a people so worthy of our warm regard!

STUDENT

Japanese Poetry

POETS in Japan are fond of little vignettes of verse, which, like the sketches of Japanese artists, are singularly brief and to the point. The following example was written by a famous poetess named Chiyo:—

Asagao ni tsurube torarete morai mizu.
(By the convolvuli) (well bucket) (being taken) (gift-water)

This is rendered into English verse by Sir Edwin Arnold as follows:—

“The morning-glory
Her leaves and bells has bound
My bucket handle round.
I could not break the bands
Of those soft hands.
The bucket and the well to her I left:
Give me some water, for I come bereft.”

The Japanese poet says all this in just six words and leaves it to the imagination of the reader to fill in the outlines.

Another curious example of a short poem is quoted by Professor Chamberlain:—

The poet Basho was one day out in the country with a friend when the latter, happening to spy a red dragon-fly, threw off the following:

Aka tombo— Literally:—(Red dragon-fly)
Hane wo tottara (if take off wings)
To-garashi! (ripe pepper-pod!)

That is:—Pluck off the wings of a red dragon-fly and you have a cayenne pepper-pod!

Basho reproved his friend for this cruel fancy and at once amended it as follows:—

To-garashi Literally:—(Cayenne pepper-pod)
Hane wo tsuketara (if had wings)
Aka tombo! (red dragon-fly!)

That is:—Add wings to a ripe pepper-pod and you have a red dragon-fly.

Theosophy Opposed to Superstition

SUPERSTITION is belief in something which obviously does not exist; or belief in something as the cause of something else, when it obviously cannot be. That is the ordinary definition. But it is not the definition given by Theosophy. Theosophy is the deadly enemy of Superstition. It has its own definition, which we will come to in a moment.

The point of the ordinary definition lies in the word *obviously*. *Obviously* vary very much with times and people.

It is a superstition to believe that the moon has an influence on insane people. "Obviously." What *can* the moon have to do with it?

If we had been talking twenty years ago, we might have said: "It is a superstition to believe that the *sun* has an influence on insane people.

Obviously. What *can* the sun have to do with it?"

But since then we have learned that the sun-spots, moving across the great disk every eleven years, *do* produce magnetic storms on earth. And some insane, and even sane, people are influenced by magnetic storms.

So twenty years have sufficed to take a belief out of the realm of superstition into that of science. For all we know, another twenty years may so add to our knowledge about the moon that the general belief as to the connection of the moon and insanity may also no longer be superstition but science.

Superstition Must Yield to Science

Reichenbach, a scientist of about half a century ago, believed that metals and crystals emitted a kind of light. That was *then* superstitious, for "obviously" they did nothing of the kind. But now we know that they do, in spite of the obviousness. So that belief is not now superstition. Reichenbach called the light "Od," and we call it X-Rays. For some curious reason, you are superstitious if you call it "Od," and scientific if you call it X-Rays.

It is superstitious to believe in ghosts. Why? Because we know they don't exist. How do we know it? Because—because—well we just *do* know it, that's all! Yet has any one ever *proved* that they do not? Never. A hundred years ago it would have been superstition to believe that a man's image could suddenly appear on a piece of paper and stay there for ever. That is photography. I do not know anything about ghosts, and never saw one. But I can easily imagine that the images of us all may be permanently fixed in the ether somewhere and somehow, where there is no piece of sensitive paper looking on to catch them. And those images would be ghosts if some one in a peculiar nervous condition happened to see them. But

Theosophy Has Nothing to do With Ghosts

Theosophy has nothing to do with ghosts. For these reasons Theosophy declines to have anything to do with the ordinary definitions of Superstition. There are a very, very few beliefs which we can say are obviously untrue or impossible.

But plenty of beliefs are erroneous. To which of them should we attach the word Superstition? Speaking as a Theosophist, I would suggest that *any* belief may—*whether true or not*—be superstitious if held superstitiously. There are some minds which hold all their beliefs in that way. In what way?

They would *rather* suppose a queer, weird, unusual, cause for an event than a perfectly competent commonplace cause. When a bell rings, it is never a rat or a visitor, but a ghost. When their ear burns, they do not think first of a mosquito, but first of some one talking of them at a distance. If the house trembles a moment, it is not the wind, but an earthquake in China. It may *be* an earthquake in China, but the chances are fifty to one it is the wind. If they feel qualmish in the morning, it is not last night's supper, but because there are "evil influences" about.

They do not *think*; they are too agog with the marvelous. They know so much about the next world that they know

nothing of this. They know so much about ghosts, auras, and states of consciousness, that they have no room to know anything about themselves. They can see on the astral plane so clearly that they are

blind to their commonplace duties on this one.

Superstition then is rather a state of mind than a particular belief. A man may refuse to go to sea on a Friday, go under a ladder, or be the thirteenth at a table, and yet not be superstitious. He may have what he thinks is perfectly solid and commonplace evidence that these things are bad policy to do. And another man may refuse to go out in the rain uncovered, from a superstitious attitude of mind. He may not be refraining because he will catch cold, but because the rain will wash his magnetism out of his astral body. He has never seen his astral body, and does not know any real thing about magnetism; and he *does* know about taking cold. But it is in that way that the superstitious mind gets things upsidetown.

Superstition, then, is the antithesis of Theosophy. Theosophy requires that a man apply his mind fully to what is around, and react to it in the highest way, throwing himself into every duty and every act of brotherhood. From that absolutely sane basis he will develop sanely and normally into higher and higher states of consciousness, reaches of intuition and wisdom, "spiritual planes."

Superstition is connected with the disorderly part of the brain mind, and is *beneath*—not beyond—the intellectual. It is that species of wonder which *blocks* the work of intelligence, instead of aiding and leading to it.

H. CORYN

Writing: Cleancut and Slipshod

CLEARNESS and accuracy of expression in writing are points the importance of which can scarcely be exaggerated. The general carelessness and lack of discipline, so characteristic of the present day, are responsible for a slipshod and confused style of composition, which, while it reigns supreme in the newspaper, lurks even in college text-books.

It is often said that in these modern and rapid days we cannot bind ourselves down by the elaborate English of bygone writers. This may be true; but it is no excuse for a *bad* and *obscure* style. If we are to have a newer and more modern English, let it at least be clear and precise.

It is a capital mistake, but one that is often made, to sacrifice too much of the past; and to discard the virtues of our ancestors, as well as their vices. For, if old methods were slow and cumbrous, they were at least thorough; and the slovenliness in present-day writing is simply due to neglect of study and training in the art of literary expression. Before we plead the right to cut loose from ancient tradition and carve out a bold and original style of our own, let us be sure that our qualifications entitle us to claim that right; and that we are not merely making a showy excuse to cover our inefficiency.

If there be an up-to-date style which is not only up-to-date but accurate and clear as well, the humble critic is ready to welcome it and accord it the meed of grateful praise; but he knows how to distinguish the genuine from the counterfeit, and can tell very well whether the originality is due to genius or to want of education.

There are some rules of composition which are external, which will survive the rising and sinking of continents, and which apply equally well to Egyptian hieroglyphics, cuneiform inscriptions, Chinese ideographs, and modern print. These we can scarcely afford to slight, even today. To begin a writing or a speech with a few introductory words which will show the reader or hearer what you intend to discuss, so that he can understand what follows; instead of leaving him to gradually discover your drift from a medley of disjointed remarks—this is one of the most important points; yet how often is it ignored!

In English, the most difficult and necessary thing to learn is how to arrange your clauses and phrases and words so as to avoid ambiguity and give emphasis; and this is a point that is sadly neglected in our hurried and superficial curricula. It is possible to be brief and yet clear, and it is a noble and excellent art, well worth the time and pains taken in acquiring it.

The study of Latin and Greek is of the greatest possible value in giving us that thorough understanding of the relation of words to meaning which is so necessary to a clear writer. To be able to turn English into Latin, or Latin into English, it is absolutely necessary to analyze thoroughly the exact meaning of each word and clause. Nothing teaches one the grammar of one's own language better than does a study of Latin and Greek; and the same may be said, though perhaps in a less degree, of modern languages.

Education at the present day is careless and superficial to a surprising degree, consisting chiefly of a mysterious process known as "getting through" certain books and standards; and most of the students get through scatheless and emerge on the other side as free and untrammelled as when they went in.

It is a fatal blunder to scamp the earlier stages of a work in order to push on to the later ones. If a learner cannot master the first difficulties, he will never master any. Every day spent on acquiring thoroughness in the rudiments means many days saved in the advanced stages. Therefore it is impossible to attach too much importance to a thorough discipline in the homely "three R's"—in clear reading, accurate writing, retentive memorizing, accurate ciphering, and such like. These things are the hands and feet of our progress and as such are indispensable. Do we not all fail because of our inattention and want of mental discipline?

Freedom and originality in style are excellent things, but let us be careful not to confuse them with slovenliness and incapacity. STUDENT

The Two Threads in History

A WELL-INFORMED Copenhagen correspondent of an English daily suggests the existence of an actual conspiracy to provoke war between England and Germany. It is manifested by the appearance of inflammatory articles in certain newspapers of both countries; and by the continued narration to the Kaiser of remarks alleged—falsely—to have been made by King Edward. More than once the conspiracy has come very near success.

Such a conspiracy—though the source of it never became publicly known—was unearthed in 1887. The object then was to provoke war between Germany and Russia. A personal interview between the then Czar and Prince Bismarck brought to light the fact that the Czar had been victimized by forged documents purporting to represent Bismarck's intended policy on the then burning Bulgarian question. Had it not been for that interview there would have been war.

It was not the only conspiracy of the kind that came under Bismarck's notice. Another of them—and from the same source—precipitated the Franco-German war. The beginnings of another were checked by the recent Anglo-French rapprochement.

The forces of good and evil in human life, accentuated in their conflict as they have not been for ages, work through agencies out of view of the ordinary student of history, and usually beyond the cognisance of those who seem to be and think themselves the only manipulators and leaders in great events. The keyboard of those agencies is often the set of little events which, apparently due to chance, precipitate or bring about such formidable and far-reaching results. It is on the causes of these little events, the pregnant "accidentals," that the real student of history will fix his attention. He will begin with the faith that they are not accidentals, and he will seek the threads connecting them all. If he can find them for the last five centuries he will have the clue to much of the history of all time. The task is not hard. The threads, in the hands of humanity's good and evil Genii, are only two. STUDENT

Spanish Home Difficulties

IT is said that the remains of the Feudal System constitute the real cause of the acute and growing distress in Southern Spain—especially the provinces of Andalusia and Estremadura. Most of the land is here held in vast estates, the peasants being tenant farmers of very small holdings. Their agriculture is therefore very primitive and the least failure in their crops means ruin. Then they turn wildly and despairingly upon the great landlords as so many robbers. This is happening now, and in some places there is a sort of reign of terror. The spring drought has reduced hundreds of thousands almost to starvation. In Cadiz, out of a population of 70,000 no less than 20,000 were asking for assistance. Then there is a depreciated currency, general high prices, and taxation for the useless army and navy. If these peasants had their little holdings of the State, and would combine together for the purchase of farming machinery, they need not live so perilously near the margin. STUDENT

Cuba's Present and Future

CUBA, with no navy and but little army to waste money on, is naturally prosperous. The financial year closing on July 1 finds her with a clear surplus of 22,000,000 dollars. A part of this will be used in public works, part in paying the debt still outstanding to the revolutionary army. Every industry, says Minister Quesada, has grown; every part of the country is prospering beyond expectation. And he looks forward to the doubling of the national wealth within a few years. He may well do so. The resources of the island still await development. There are twenty million acres of unclaimed land, more than half of which is dense forest. What mineral possibilities it may have are scarcely known. So far there is but little mining save for iron. But all in good time. C.

A French Marriage Custom

The death of the French painter Bouguereau has reminded the rest of the world of a curious law of his country. When well on in life he desired to marry a young American girl, like himself, an artist. His mother, aged 71, was then living, and since she refused her consent to the marriage, it could not, according to French law, take place. She maintained her embargo throughout the remainder of her life, 20 years. Not till her death at the age of 91 could the artist, now 72, accomplish his desire. His bride was then 46. H.

Some Views on XXth Century Problems

The Ideal of the Army

A contemporary calls attention to the "decadence of the ideal military life" in some of the great armies of Europe. But it does not say what the ideal is. The highest ideal of an army is certainly not responded to by a set of spick and span automata. It is something much grander than that and has come down to us, losing in grandeur as it came, from a far and forgotten past.

Perhaps the true army ideal does not contain the idea of aggression, but of defence. And the defence is to be unselfish; for the soldier is not to think of himself but of his country. Holding this constantly before him, he will gradually become unselfish in all parts of his nature.

The soldier stood habitually in the double readiness to obey to death, to the letter; and to initiate on his own account when no orders applied. And the intense and loyal readiness to obey was thought to react on the mind of his superior, evoking the instinct to safeguard the interests and comfort of those who had so unreservedly placed themselves in his hands.

The soldier was no automaton, though he obeyed to the letter. His mind was alert to comprehend the plan of which his duty was a fragment, to carry it out in the best way, and to act in the best way where no command applied. And he tried to do the routine duties in such perfection that no after inspection was necessary; he tried to be worthy of trust.

The common readiness to sacrifice life, the common love of country, the common conception of their external selves as parts of a machine made for a purpose each held dear, begot a fine comradeship between the men, and a comradeship of another order between them and their officers. The latter recognized their responsibility to set an example, were even sterner in performance of duty than their men, and permitted themselves to ask nothing they would not, if need came, do themselves; which indeed, when themselves in the ranks, they had not done. Superior comforts and luxuries were not the mark of officership.

The army thus become a school, of which there can be no like, for the development of superb character. It was almost an epitome of nature. It was stern only in the external. Comradeship is *love*; patriotism is *love*; true obedience is *love*; attention to duty rested on *love* of principle. The soul guided all. And with such links in every direction, why should any soldier fear death? It could not touch the links. They held that the dead man knew of what was done by his comrades for the shell he had left, felt the spirit in which they did it, felt their abiding comradeship; and in his turn sent back to them his thought and his heart as a portion of their strength to go on. And after a rest he came again to birth in the country for which he had given his life.

These are fragments from the ideals of military life taken from a very old book which we hope may one day be known everywhere. For though the cycles of wars may sometime close, the principle of the army is eternal—growth through duty, through thought, through a common love; attainment of rank only through such growth, and therefore *naturally*; and that perfect comradeship which makes the strength of one that of all, the interior acquired riches of one the wealth of all.

What shall not mankind achieve when it understands "*The Ideal of the Army*."

The American Type

PROFESSOR ROSS of Nebraska has been asking himself questions about the American people, what is its present, what is its promise for the future. The American type is, or was, that of the people who first came here, men and women who wanted independence and freedom and dared a then difficult journey and unknown conditions to get them. The peopling of the East U. S. from Europe was duplicated in the peopling of the West from the East. "It is the more ambitious and spirited that have 'gone West,' and since the younger and more flourishing communities have had the higher rate of natural increase, a large part of the American element in our population are descended from men who had the metal and the pluck to become pioneers,"

This is the foundation of the American type, and its keynote is energy. But the type is changing, and we can only say that in a hundred years it will be quite other than now. Foreign immigration now stands at about a million a year. This of itself is a formidable dilution of the original stock. And the original stock appears to be trying to kill itself. Firstly it throngs to the cities to let off its energy. Professor Ross speaks of "the saurian ferocity of business competition, the whirl of activity that leaves neurasthenia, heart failure and Bright's disease in its wake, the killing pace of our working men"—and so on. So it has to submit to the degradation of type that is inseparable from the habits and conditions of modern great cities. And by conscious choice the family is becoming smaller and smaller.

It is perhaps to the West that we must look for the type of the future American. There the deadly thumb-mark of the great cities is much less conspicuous; to the West the South-Europe immigrant hardly penetrates; the mind of the West is not polarized dollarwards as in the East, it is still plastic, can still take other ideals. There the "race-suicide" methods are in much less vogue. The atmosphere is less tense, more human. The East is a superheated imitation of the old civilization. The West still has its choice to make. And it is receiving more and more freely, as the East now can not, the ideals radiating from the Universal Brotherhood and Theosophical Center at Point Loma.

So the true America and American are being born in the West, and from them the East must get the light of the new civilization. STUDENT

France's Unemployed

THE French Chamber of Deputies recently appointed a Commission to consider the question of the unemployed. Some minds attribute the difficulty to the accumulations of capital in a few hands; the Commission to the increased use of machinery in agricultural districts with the result of such a cheapening of agricultural products that the small holder cannot live. He therefore throngs to the cities, no less than two-thirds of the population of Paris, for example, consisting of such immigrants. The Commission suggests the State-fostering of industries in the country, a plan pursued in Russia where the State subsidises about 50. An objection is that most of these, though pursued in the country, keep the worker off the land. The plan is only half a solution. Why not encourage the federation of conterminous small holders, so that they could purchase and share the use of the modern machinery which otherwise remains exclusively in the hands of the capitalist?

The Commission has introduced a bill providing for a special inquiry into the kinds of industry that may be carried on in families or small village factories that will furnish complementary resources to the farm hand.

STUDENT

Today's Cowardice

A FRENCH writer makes so close an analysis of the roots of cowardice, in one sentence, that it amounts to a definition. "Cowardice," he says, "is based on the profound conviction that death is the greatest of evils, because life is the greatest of goods."

In truth, cowardice results from men having lost the art of holding life; and have therefore to take what comes to them. Life is an essence that reaches us in many ways. How to make it for ourselves we have forgotten. We get a thrill of it from the good opinion of others; a large dose when they look up to and admire us. To lose the good opinion and the admiration is a loss that is feared, and so arise all the hypocrisies. To grasp the soul in self-consciousness firmly is to have one's own key to life. Men's good and evil opinions of us can then no more give or take; we are indifferent to all save the good opinion of that divine light; thence come the only thrills that are valued. And death is no more feared as soon as we find that it cannot take from us that real and abiding life. Pain is now felt in a new way.

We are no more self-identified with that part of the nature, whether physical or mental, that is in pain. Still noting it, we are now above, not in, it. Transcending fear, we have transcended cowardice. STUDENT

Archeology Paleontology Ethnology

The Stupendous Ancient Temples of Java

THE island of Java is usually thought of merely as one of the East Indies, where rice and coffee are grown. It will be a surprise to most people to learn that in Java is some of the most stupendous and wonderful ancient architecture in the world, as there is also in the Ladrões and Carolines and in fact all over the archipelago.

The finest structure is the Temple of Bara-Budur in the center of Java. Situated on a hill rising from the plain, it presents to the eye a perfect mountain of architecture. It is in the form of a gigantic terraced pyramid in seven stages, and the lowest stage is 497 feet square. On the summit of all is a cupola, 52 feet in diameter. The incredible richness, detail, and elaborateness of the building and ornamentation exemplifies the well-known Hindu style. There are over three miles of bas-reliefs, which comprised originally 2141 pictures of infinite variety and consummate art. To mention only one detail—on the outside of the wall of the second stage there are 104 niches, each with a statue, and between the niches are other statues; and inside the same wall are 568 bas-reliefs.

The whole of this work is executed in the *bardest and most intractable kinds of lava and trachyte*, and Professor Alfred Russell Wallace remarks that: "The amount of human labor and skill expended on the Great Pyramid of Egypt sinks into insignificance when compared with that required to complete this sculptured hill temple in the interior of Java."

At Brambanam, or Parambanam, not far off, are the ruins known as the "Thousand Temples," consisting of an outer parallelogram of 84 small temples, a second of 76, a third of 64, a fourth of 44, and a fifth or inner one of 28; in all 296 small temples. In the center is a large *cruciform* inner temple.

The whole country for a distance of 60 miles, says Wallace, "abounds with ruins, so that fine sculptured images may be seen lying in ditches or built into the walls of enclosures."

In other parts are ruins of forts, palaces, baths and aqueducts; and at Modjo-Agong, over a large stretch of country, every road and pathway shows a foundation of finely laid brick-work, the paved streets of some old city.

The criticisms and conjectures of archeologists on all this are as usual often puerile and ridiculous. It seems to be the aim of the theorist to find out the smallest possible theory which will contain this particular set of facts; and the existence of other ancient buildings, such as those of Central and South America, Easter Island, or Central Asia, is ignored. If only archeologists and historians could find some way of unifying their labors, instead of each theorizing independently of the others, the results would be more comprehensive and less contradictory. While one offers an explanation which might conceivably account for one set of ruins, another offers a theory which barely covers another set of ruins. But neither theory will do for both. And what explanation, except the Theosophical one, will account for *all* the ruins? Again, why are historians so timorous and niggardly in respect to time, when geology and astronomy juggle airily with millions of centuries?

Observe too the straits we are reduced to by the necessity of accounting for such workmanship. If we deny the ancients skill, we must give them infinite time; if we grudge them time, we must concede skill. And then the cruel-tyrant-and-gigantic-slave-labor hypothesis, which does fairly well for the Pyramids, will not sculpture a masterly statue in trachyte.

The hundreds of statues are said to be all of the Buddha Gautama Shakyamuni,

THE PYRAMIDS OF GHIZEH

which reminds one of the baby who calls every man "Pa," or the revivalist who thinks a wave of enthusiasm is Jesus Christ. The Jains, whose religion is pre-Buddhistic, recognized and depicted many successive avatars or Buddhas. The Bamian statues even, and other northern Asiatic ones, have thus absurdly been dubbed Gautamas.

Another point in which the archeologist airs his simplicity is this. Round the base of the temple runs a pavement of uncemented stones, which, having been removed in sections, disclosed underneath *another terrace*, larger than the others, but not so completely sculptured. He infers that the builders *made an engineering blunder* and, finding their foundations insufficient, had to turn the ground-floor into a foundation! Is it reasonable to suppose that architects who could plan and execute such a stupendous work would make our familiar engineering blunders? There are seven stages above the earth; the *eighth* is below.

He also takes comfort in the idea that these builders did not know of the arch. The prehistoric Americans, the ancient Greeks, the Egyptians, and the "Cyclopeans" all used the overlapping style of roof and portal; but they did know of the arch, which has been discovered in ancient American ruins. The lack of cement also connects these builders with Mycenæ, Baalbec, parts of India, Cambodia, the Pacific islands, Central America, and Peru.

To conclude, we have in Java the vestiges of an era of gigantic and consummate skill and enterprise and of profound knowledge and culture; all of which is connected by many links with similar evidences all over the world; and which more than proves the claims made by H. P. Blavatsky on behalf of the prowess of ancient humanity and the universal diffusion of the Wisdom-Religion. And in connection with these evidences of ancient wisdom we have, in the theories, evidences of modern folly which mark a sad contrast. It is well that we are now on the up-cycle—for we need to be.

STUDENT

Herodotus on Scalping

IN connection with the subject of the affinity between American aborigines and eastern Asiatics, the following particulars given by Herodotus of the habits of the Scythians is peculiarly interesting, horrible and revolting as it is:

"When a Scythian overthrows his first enemy, he drinks his blood; and presents the king with the heads of the enemies he has killed in battle; for if he brings a head, he shares the booty that they take; but not, if he does not bring one. He skins it in the following manner. Having made a circular incision round the ears and taking hold of the skin, he shakes it from the skull; then having scraped off the flesh with the rib of an ox, he softens the skin with his hands; and having made it supple, he uses it as a napkin; each man hangs it on the bridle of the horse which he rides, and prides himself on it; for whoever has the greatest number of these skin-napkins, is accounted the most valiant man."

The Trend of Twentieth Century Science

Electrical Perplexities

A CONTRIBUTOR to a scientific contemporary quotes certain newspaper accounts of a recent storm, and asks how the reported damage harmonises with the current theories of the action of lightning.

A barn was destroyed, the account given being that "the sides of the barn were burst outwards as if by a giant charge of dynamite, and the roof was tossed fully 100 feet away." No fire occurred, though the barn was full of dry hay. Other accounts of the same storm describe the shattering of telegraph poles, rafters and other large pieces of wood. The contributor describes the effect of a flash that struck his own premises. After knocking a hole in the roof, 4 inches by 6, "it jumped to a timber about 6 feet away, a timber 6 inches by 6 inches by 12 feet. The end of it, for some three or four feet, was splintered into matchwood, and the timber torn bodily from its fastenings. Two braces attached to it with heavy iron spikes were neatly pried off without being broken." He then asks his question: "Everything about the building was as dry as it is possible to make timber; yet where the wood is torn to pieces as if by dynamite, there is no sign of scorching. What is it which does the actual work done by the lightning?" No hypothesis seems to fit all the freaks recorded of this one storm. The furniture in one house was knocked about "in all directions." The barn walls and roof were burst outwards and upwards. Had that been done by a sudden and tremendous heating of the air, the heat would have been enough to ignite the contained hay, dry and dusty. But that did not happen. The beams and dry telegraph poles were "splintered to matchwood," yet with not enough heat to light a splinter. The rafters of a certain wall were ripped to pieces, but not lit; on its way down through the wall the lightning stopped a moment to kill one of two brothers in an adjoining bed.

Evidently the force at work is capable of exciting molecules to an intense motion among themselves which is not the motion called heat, and which may not become heat, rupturing their cohesion. But that does not account for the moving about of furniture, and some of the details of this storm are worth adding to Camille Flammarion's collection of lightning freaks.

STUDENT

Hidden Secrets in Science

READERS of Lamb's essays well know that it is not now considered necessary to burn down the whole house in order to roast the pork. It is agreed that that is a wasteful method. And in a few years it may be regarded as equally absurd and wasteful to burn millions of tons of coal a day to run the world's machinery. At present we get our needed energy by locking up atoms into a small chamber called a molecule. Then we have at our disposal the energy they were previously wasting by rushing about in their aimless way. To burn coal is to unite its atoms of carbon and hydrogen with atoms of oxygen. The heat is one form of that energy which in another form showed itself in the rushing about of the oxygen. We translate it again into the rushing about of a piston.

But the new way of getting energy will be by letting atoms out, instead of locking them in. They will however be much smaller atoms than those to which we now give that name. In fact the latter constitute the containing chambers of the former, just as the latter are in their turn chambered into the little cells called molecules. Science calls the former ions or electrons. They are, according to the latest conceptions of science, intensely anxious to get out, and as there are very many of them in an atom, the sum total of their anxiety represents an enormous force—so much so that Professor Thomson calculates that a gram (15 grains) of hydrogen contains energy enough to lift a thousand tons more than a hundred million yards; and a pint of water would drive the machinery of America for a day. The problems are to find and use the key of the door that keeps them in, and to translate their energy, when they are let out, into a serviceable form. But it is safe to say that if this universe is watched and guided by intelligence, man will not be allowed to find that key till he has outgrown the desire to blow his fellows to atoms with guns. There must be a good many secrets held back from him till

the arrival of that day of commonsense and brotherhood—if indeed there is any difference.

STUDENT

Test Tube Tides

WE usually associate the idea of tides with oceans and rivers; but it appears that there are tides in much smaller quantities of fluid, even in little laboratory vessels of mercury used for barometric readings and other purposes. They require a microscope for their detection; but they are there, attesting in a minute degree the reality of the pull of sun and moon throughout the day and the week and the month.

And there are other movements of these little surfaces of mercury. Close observation shows that they are not flat but in continual small undulation, having the appearance of a sheet of water into which a stone has been thrown, rippled. These of course are due to the earth tremors, which never cease for a single second, and of which an earthquake is only the extremest form. The earth's interior is never still, any more than is the interior of our own bodies; and like some phenomena of the latter, the earth's movements exhibit signs of the lunar seven-day touch.

STUDENT

A New Theory of Photography

IT now appears that the change in the silver of sensitive plates which constitutes the formation of the image is not chemical but electrical in its nature. For Professor Dewar has shown that the image is made even at temperatures so low as to approach what is called the absolute zero. At that point all ordinary chemical action is suspended.

Light, as is well known, causes negatively electrically charged bodies to lose their charge. It escapes as ultimate corpuscles, electrons. According to the new theory it is the escape of these from the molecule of silver chloride or iodide that causes it to lose its chlorine or iodine—or rather to fall apart—so that metallic silver, as the image, now stands alone.

STUDENT

A Fragment of Ancient History

ABOUT 10,000 years ago—but it may have been 20,000—a naked gentleman residing in Pennsylvania stepped on a piece of extremely rotten wood, wet with recent rain. All around, though it was also rotten wood, it was harder. Whether he had one or two legs we do not know.

This brief piece of history, so full of local color and dramatic possibility, has but lately become known. The way it got out was this. A miner at the Eagle Hill colliery, Pottsville, Pennsylvania, has uncovered a slab of anthracite coal stamped with the impress of a man's foot. To the unscientific person this may not seem much of a find. But it means that man was in existence in this country during the formation of the coal beds. There was no other footmark on the slab. What a pity that our palmists do not study the foot as well as the hand! Then we could have known what sort of a man this was.

STUDENT

Dieting Hay-Fever

HAY-fever, it appears, is due to overfeeding. At any rate it can be cured by underfeeding—that is, as we count underfeeding, which is eating just enough for real need. A correspondent of the *British Medical Journal* reports that for years he suffered from hay-fever and asthma, which nothing relieved. But since his adoption of the above indicated treatment—three years ago—he has been perfectly free from both, and his long lost sense of smell is returning. It is a question, he says, of the quantity of food taken. He takes just enough to keep his weight 12 pounds below that which it used to be. If he forgets himself and goes beyond that point, his symptoms begin to come back. The prescription is, he asserts, infallible.

His general health has also greatly improved, and at 45 he is much more vigorous than he was ten years previously. The letter concludes with the remark that he finds the prescription unpopular with his patients. They would rather sin and take drugs. What is true for hay-fever would doubtless be equally true of many other chronic maladies from which we suffer and for which we take so many "cures." STUDENT

The Boundless Resources of Nature in Lomaland

AMONG the many remarkable natural features which are observable in the region where Lomaland is situated, is the peculiarity of the distribution of animal life and plant life. Instead of finding only a comparatively few kinds of insects and plants, each well represented in quantity, we find an enormous, an endless, variety of different kinds, of which by far the greater number exist only in very small quantities. Never a year does the Nature lover live in Lomaland, but he discovers new plants and

Lomaland Photo and Eng. Dept.

A FILIPINO SCHOOLHOUSE, JOLO ISLAND, P. I.

new insects that he has not observed before and perhaps will not see again. Careful research will reveal plants growing in some special out-of-the-way locality, and nowhere else found. Particular atmospheric and climatic conditions may any day produce an immense quantity of some otherwise unobserved insect, which disappears as rapidly as it came.

The explanation for this state of affairs seems to be that in Lomaland we have *possibilities*—say, rather *potentialities* or *capabilities*—existing in enormous richness and profusion, but in a state of minimum development; all however, keeping unbroken the thread of their existence, and waiting in readiness for the arrival of those conditions which will give them opportunity and usefulness.

In short Lomaland is, in natural as well as in other respects of which we know, a land of germs, seeds, buds, and promises. We have seen many people come hither from the moiling world and have their latent seeds of aspiration and genius spring into a wondrous and unexpected fruition from the soil of their character which had lain fallow so long that they thought it was exhausted. The soil is begemmed with germs of life, the breezes tingle with buoyant energy, the sunlight sparkles with growth and creative impulse.

It needs only a very slight climatic change, and anything in the way of fauna and flora that is needed can be quickly produced. And the climate, in its turn, is so sensitive, so dependent on a multitude of conditions, none of which are fixed, that nothing is impossible.

But Nature herself bends in obedience to higher Laws which reside in the collective will of all who are working for the welfare of future humanity—the Helpers, seen and unseen. And may it not be possible that these Laws have decreed that Nature in this spot shall hold back her greater exuberance until there is established the nucleus of a race of men who will know how to work in harmony with

her; a race that will not exploit her and butcher her and waste her; a race that will not neglect but appreciate Nature? Perhaps Nature waits for us to show that we can use well the resources we already have, and is ready then to bestow more. STUDENT

Natural Magicians

HERE and there, scattered through the animal and vegetable kingdoms, we come across powers which, if possessed by man, would entitle him to rank as one of the legendary magicians of antiquity. And some, too, are *black* magicians—witness

the magnetic eyes of the rattlesnake.

There is a little plant, the sea-pink, armeria, or thrift, which manages to make dew for itself through the hottest summer days. It grows in dry hot desert sand close to the sea, flourishes well and throws up flowers in astonishing profusion. Under a burning summer sun its leaves will often be covered with large drops of water collecting and trickling down the stem. No one knows how it manages its little bit of laboratory work. It may even form a direct combination of oxygen in the air with the hydrogen of its cells. That would be no more difficult than picking carbon from carbon dioxide, which is a feat performed by nearly all plants. There are indeed a few phenomena, such for example as the occasional possession of copper by strawberries, which suggest that some plants can even fabricate elements and perform alchemy.

Magical powers in the animal kingdom are numerous. There are the electric batteries of certain fishes, operated by their wills. There is the subcutaneous lamp of the glow-worm. There is the extraordinary sense of direction possessed by ants and migratory birds. There is the foreknowledge of storms, earthquakes and volcanic eruptions shown by many animals. And of late there has been some tendency to credit certain birds with the power of altering their weight-relation to the earth, as an explanation of the extraordinary heights to which they rise and the rapidity with which they do it. And there is the power possessed by dogs of detecting that their master stood for a fraction of a second on a particular spot an hour before. Add these powers together and

give them to a man, and you have a very fair magician. Is there any reason why man should not have what his inferiors possess? Or, say rather, "why man should not be able to use;" for the powers are universal, lying in the all-bountiful bosom of Nature, and it is man's desire to *have* that alone prevents him from enjoying. STUDENT

THE SONG OF THE SEA

CHARLES GOFF

ROLL by kingdoms of the north,
And mainlands of the south,
And hurl my fierce battalions forth
On regions parched with drouth;
Against wild cliff and rocky wall
I fling my shattering waves,
And wail a requiem over all,
My many million graves.

I labor on beneath the sun,
And hail the sultry noon,
And when the lingering day is done
I leap toward the moon.
I revel in the lightnings' fleet,
And when the storm raves high,
The thunders of my billows greet
The thunders of the sky.

Within my breast I safely hold
The secrets of the past,
And heaped-up stores of pearl and gold
Lie in my caverns vast;
The wrecks of ages dark and strange,
Beneath my waters deep
Rest on, thro' calm and storm and change,
In everlasting sleep.

By islands of the east and west
I burn, I foam, I rage!
And wander on in wild unrest,
And ceaseless pilgrimage.
By bleak and barren lands I moan,
I lave each torrid shore,
And toll my waves from zone to zone,
Till Time shall be no more.—Selected

Theosophy's Message to Children

WHEN, during the darker cycles of human evolution, the great truths concerning man's life and destiny fade out from the minds of men, a piteous thing happens to the children of the race. For when the teaching that man is a soul, persisting through many lives upon earth, dies out, the dark and limited conception of one life on earth, followed by an eternity in some state either too undefined to satisfy, or too horribly defined to give any assurance, creeps into the human mind. Then it is that men learn to fear death, and then it is that they begin to think more about the change they call death, than they do about life itself. This death that is the inevitable end of every life is emphasized and dwelt upon; the most pious assert that all life is a preparation for death; the departure of the soul from the body is attended with some ceremony, supposed to suggest the significance of the change that has taken place. Sometimes, even at the time of death, it seems as though the veil has been lifted a little, and a slight assurance is felt that the break is not so complete as the mental darkness of the age seems to indicate. On the other hand, although the ceremony of baptism of infants has been insisted upon by many, and though we celebrate birthdays, and though the birth of many babes is an occasion of rejoicing—notably when the question of some worldly inheritance is involved—it is a fact that the incarnation of a soul has come to be treated with the most commonplace acceptance, rarely removed from merely personal interest. Thus we see, that in its ignorance, though the world does in a measure, recognize the departing soul, it does not realize the significance of the step taken by a soul at birth. The poet tells us "the soul contains the event that shall befall it," and Theosophy teaches that for a brief moment the Soul looks, before entering earth-life, at "the event that shall befall it." And then unrecognized as a Soul, stepping from the existence that is unhampered by a physical body and its desires into a new earthly vehicle, the Soul leaves its place of rest and realisation and enters—the life we know. During early childhood veil after veil falls between the waking consciousness and the light of the Soul; the realizations of the resting period between earth-lives are so obscured that only the fires of sorrow in later life make them felt, and the utter ignorance of the vital truths of child-life results in—not a golden childhood of joyous growth, but a warped development from which it is impossible later to evolve a rounded character. Thus has it been in the world. But the special message of Theosophy to children is that, thanks to

the three great teachers, H. P. Blavatsky, Wm. Q. Judge and Katherine Tingley, who have given to the world the teachings of Theosophy, there are now many who recognize the Soul in every child that is born, there are those who turn in thought to the unborn children of the race, and who yearn to help them in every stage of their journey, thus making a path of light for all Souls who come to earth. STUDENT

Loveless Marriages

THE words of Judge Robert Grant of the Probate Court of Massachusetts have weight in the consideration of any legal question. His opinions anent the much discussed divorce problem have peculiar weight because, in addition to his legal and trained knowledge of this and problems bearing upon it, he has given the question of divorce special study, not only from the standpoint of the law but of ethics. Small wonder that his opinions offer marked contrast to the statements made by certain members of a certain other profession, many of whom have very evidently never really studied the question at all.

In a recent interview with a correspondent of *The Globe* Judge Grant said:

"The clergy may platitudinize at will over the evil of divorce, but there is another side to the question. The evil of loveless marriages could have things said about it that would sound very logical.

"Divorce, far from looming up as a menace to civilization and a sap to national individuality and preeminence, affords a necessary means of escape from tyranny and brutality, and an often beneficial remedy to blind suffering. . . . Divorce, far from stigmatizing the woman who by resort to it has freed herself from the abuse and ill-treatment of a brutal husband, should, on the contrary, confer a particular distinction. It should be regarded as evidence of self-respect and a brevet of morality. Why make supineness and submissiveness feminine virtues? Why should a woman suffer any indignity that a man, simply because he is her husband, might see fit to subject her to? Has she not as much personality as the man, as high aspirations, as well-developed a moral sense as he has? Why, then, should the finger of scorn be pointed at her for asserting herself, for saying to the man who would drag her down: 'I have my life to make, my self-respect to maintain, and this I cannot do if I remain in bondage.'

"The children, you say—will not the children be happier and better, adopted by a second father, who will cherish and honor their mother, than as the mute witnesses of, and participants in, a domestic hell pre-

CHILDREN

LONGFELLOW

Al! what would the world be to us
If the children were no more?
We should dread the desert behind us
Worse than the dark before.

What the leaves are to the forest,
With light and air for food,
Ere their sweet and tender juices
Have been hardened into wood—
That to the world are children:
Through them it feels the glow
Of a brighter and sunnier climate
Than reaches the trunk below.

sided over by a domestic bear, who is their legitimate father? Religion and laws can regulate neither marriage nor divorce; the method of its stimulus is to be found in the assertion of that instinct called love. The human heart rebels against the slavery which binds human beings in the cruellest bonds because by their foolishness, want of wisdom, or through the intervention of parents or friends, they have missed the divine as well as the civil purpose of marriage. It is permitted in these days of advanced thought to have doubts in all matters. No doubt to the morose mind the prevalence of divorce and its growing popularity may mean degeneration of the family instinct and decadence of the race. For my part I see in it the higher development of the ideals of purity and self-respect.

"What is more needed is a uniform marriage law and the curbing of the ecclesiastical zeal in encouraging marriage. If clergymen were as fervent in deterring their parishioners from rushing into unfit marriages as they are to prevent marriage after divorce, their services to society would be of much greater significance."

THE following extract from a letter written to his wife by a Japanese soldier will give a good idea of the Spartan sentiments that animate the men. Honor on the field of duty and glory is their chief thought, and this thought far outweighs all other considerations.

My dearest, I especially ask you strictly to observe the following rules, which I herewith send you:

1. Never accept presents in money or kind from any one; to do so will be to bring shame on your husband.
2. Keep all my letters from the front, and do not hand them about for everybody to see.
3. Think that our parting at Shimbashi was a last farewell, as though you had accompanied my body to the temple; and that presently you will receive the news of my having traveled over the plains of battle and entered paradise.
4. Do not expect to see me back; think that I have gone to meet an honorable death.
5. When news comes of my death repress your sorrow.
6. After my death live on the pension you will receive from the government, and carry on the worship of my ancestors.
7. Remember that you are a soldier's wife and behave accordingly.
8. Do not fail to visit the families of those who die in battle, and to condole with them.
9. Be respectful to your parents and the aged; treat your inferiors kindly, and keep your own spirit pure and noble.
10. Be careful never to disgrace the honorable name I have given you at the cost of my life.

The writer of this letter, Corporal Yamazaki Unosuke, was formerly a workman at the Shubunsha Lithographic Press in Tokyo. He was sent to Korea early last year, and served with great credit in many engagements. At the battle of Fenshuiling he discharged his duties as orderly with astonishing quickness and boldness, and, though wounded himself, saved the life of a comrade, First Class Private Tanaka, whose wounds he bandaged to the neglect of his own.

In the engagement which terminated in the occupation of Maerhsan he was severely wounded in the head, and died on the way to the bandaging tent.—*Ex.*

WHEN a Japanese baby is born it is customary to plant a tree. On the child's wedding day the tree is cut down and is given to a cabinet-maker. Furniture made of the wood is regarded as one of the chief ornaments of the new home. A beautiful and deeply symbolic custom.

The First Step Downwards

A FIFTEEN-YEAR-OLD girl was recently arrested, charged with having forged checks, amounting in all to \$600. She was employed by a millinery firm, and was selected to carry checks and money to the bank. She also delivered the purchases of the wealthy customers. The sight of the fine hats and dresses, and of the money, proved too great a temptation to her, and she began over a year ago to forge checks in order, as she confesses, "to be a real lady and have lots of fine clothes."

This young girl was known to her employers, and to the teacher at the night-school she attended, as bright and industrious. At her home she was looked upon as a model child. No one; however, in home or school, or at her place of work, had inspired her with any truer ideal of life than the possession of fine clothes.

Some one is responsible for this omission. What about all the women with whom she was constantly associated?

Many young girls are in a position to be similarly tempted. What is to be the positive teaching and influence that shall make for their choosing the right instead of taking the first step in a career of crime?

Women must *individually* accept the responsibility of making their lives a protest against the false, so that wherever it shows itself, it shall receive the check that hinders its insidious work of poisoning the minds of the young. STUDENT

IN startling contrast to the fanatical and illogical views expressed by certain religionists on the sister-problems of marriage and divorce, is the following, clipped from a Jewish religious journal:

Society must alter its views as to the sanctity of marriage. Yet the appeal to be made to the law *will not produce the desired result*. The law is not strong enough to check the evil, which is conceded to be a real one, for law, in matters so dependent upon a relation so bound up in the most intimate feelings of mankind, cannot hope to remedy matters wholly. The appeal must be made to the individual. A false conception of marriage is current. Marriage is not regarded as a sanctification of two beings in a holy desire to be of service to each other, to develop their powers, to realize more fully than in any other relation that great principle of life, to bear with one another; and it is instead accepted as a perfunctory and necessary act established by an enactment of law. Our preachers should strive to inspire a loftier ideal of marriage.

SOPHIE MAYER, the mother of six children, has just passed the examination for admission to the bar before the Appellate division of the Supreme court, at the head of nearly 1,000 candidates. In 1876 this woman, then Sophie Rosenberg, created a mild sensation in Warsaw by graduating from the Gymnasium with honors equivalent to Harvard's Summa Cum Laude. She received for this a silver medal from the Czarina.

She became a teacher and lecturer in the Warsaw schools, a position which no Jewish woman had ever before attained.

She married Adolph Mayer and they came to America. Her husband was admitted to the bar, but an injury to his eyesight limited his field. Mrs. Mayer, besides bringing up six children, used to read him his references and help with his briefs. She found time in odd moments to keep up her general reading with the above result.

It is said that people born in California have unusual chances to live to a great age. Certainly the history of Donna Eulalia, who died at one hundred and thirty-seven years of age, is a case in point. She lived not far from San Diego. Her birth record is beyond question.

GOD thought—
A million blazing worlds were wrought!
God willed—
Earth rose, while all creation thrilled!
God spoke—
And in The Garden love awoke!
God smiled—
Lo! in the mother's arms, a child!

WHISTLER'S PORTRAIT OF HIS MOTHER

OUR YOUNG FOLK

The Raja Yoga Question Box

THESE two great Frenchmen found and opened new paths of knowledge.

1 Who was Bernard Palissy?

ANSWER—Bernard Palissy was a French potter and naturalist. He had no regular education, but he loved nature and loved to learn. At twenty he started off on foot and traveled through many countries. Everywhere he studied nature and the arts. He returned to France and resolved to find the secret of making enameled pottery. He succeeded after sixteen years, and he learned to decorate his ware with the forms of flowers, shells and insects. Bernard Palissy gave lectures on natural history in Paris. He was far ahead of his time and taught many great truths about geology and physics. Palissy was a leader among the Huguenots. He suffered persecution and was once condemned to die, but his art saved him.

2 Who was Philippe Pinel?

ANSWER—Philippe Pinel was a famous French physician who devoted all his talents to reforming the treatment of insane people. Their sufferings at that time were terrible, for it was thought that they were never safe unless they were chained, and also that they must be tortured in order to be cured. Philippe Pinel believed that firmness and kindness and unwearied patience would be a better cure, and that with this treatment they could be given a little liberty. He stated his ideas boldly to the learned doctors of Paris, and after much opposition, he tried his plan. It proved successful at once. Philippe Pinel grew famous; many doctors came to study the new method. Doctor Pinel was so firm himself that he never yielded to low desires, and his heart was generous and full of love for humanity.

HELP ONE ANOTHER

"HELP one another," the snowflakes said,
As they cuddled down in their fleecy bed,

"One of us here would not be felt,

One of us here would quickly melt!
But I'll help you, and you help me,
And then what a big white drift we'll see."

"Help one another," the maple spray

Said to his fellow-leaves one day;

"The sun would wither me here alone

Long enough ere the day was gone;

But I'll help you and you help me,

And then what a splendid shade there'll be."

"Help one another," the dewdrop cried,

Seeing another drop close by its side;

"This warm south breeze would send me away

And I should be gone ere noon today;

But I'll help you and you help me,

And we'll make a brook and run to the sea."

"Help one another," a grain of sand

Said to another grain just at hand;

"The wind may carry me over the sea

And then, Oh! what will become of me?

But, come my brother, give me your hand,

We'll build a mountain, and then we'll stand."

—Selected

A Closer Bond With France

ONE of the pleasantest days ever spent by the children of the Raja Yoga School was that on which they entertained as their guests Commodore Adigard (in command of the French fleet lying in San Diego Bay) and the officers of his staff. Of course they came to Lomaland really as Mrs. Tingley's guests and it was not their first visit, by any means. Yet the children particularly claimed them and the day was one long to be remembered for all felt that the ties uniting this nation with great and glorious France were being strengthened in a very real sense.

You know, Buds and Blossoms all over the world, that the Raja Yoga School is inter-

national in more than the ordinary sense. Not only are children here from all over the world but they are taught that deeper, higher, truer patriotism which sees all nations—so far as they live justly and do right—to be members of one great world-family. France, that noble land where the light shone more than once while Europe lay in darkness—France, the land that reached out a helping hand to us just when we most needed it—France, the land of Joan of Arc, of Madame Roland, of the Empress Josephine, of brave Lafayette—do you wonder that the Raja Yoga children love France and love to pay honor to her representatives?

Now you know the deeper reason why the day was long to be remembered, not alone by the children but by the Commodore and his men. They saw the children in the School, at class work, in musical work, in out-of-door drill and callisthenics. When Commodore Adigard spoke to his bright-faced little hosts and hostesses, he said that what particularly impressed him was the *international* character of the School and the *promise of universal peace* that it held. He said—in most cultured English by the way—that nothing in all his two years' cruise had impressed him so deeply as the work and régime of the Raja Yoga School. He urged the children to try harder than ever to be worthy of the training they were receiving for, said he, "you are destined to carry a new light to the world and to be powerful agents in bringing once again to the world the age of true Brotherhood." Several of the children replied to his remarks by simple, clear, ringing speeches such as only Raja Yogas can make.

But the best was to come—a visit of some of the older Raja Yoga

boys themselves to Commodore Adigard on board his own ship *Protet*. Here again the Commodore, after welcoming them in his own apartments, spoke of their wonderful School and of what particularly favored boys they were. And then the flag-lieutenant, at the Commodore's command, took the boys around the beautiful great vessel—a man-of-war—showing and explaining to them all the parts. How interested they were when he explained—in fluent English, too—all about the working of the great guns and the torpedoes, the delicate chronometers, yes—from the overhead rails for carrying the projectiles down to the big coffee-pot and exquisitely clean bakeries. Even more impressed were the boys with the courtesy shown among all on board, officers as well as men. How quietly and courteously were orders given! How promptly, cheerfully, and unquestioningly were they always carried out! Surely the discipline of the *Protet* may serve as an example, and it was the inspiration of this manly courtesy, far more than the sight of the well polished guns, I fancy, that led the boys to give a ringing "Three cheers for France," at the close of the visit. A RAJA YOGA TEACHER

What Is Cruelty?

THERE are many conceptions of what constitutes cruelty. Count Vasili relates the following incident, which, he tells us, occurred in the immense bull-ring of Madrid some years ago: It was at the time when the great *espada* was Cuchares and the incident occurred during a *fiesta*. As was then the custom, live sparrows were enclosed in the *bandilleras* which the *torero* affixes (at the greatest possible risk to himself) to the shoulders of the enraged bull. The paper enclosing them, of course, bursts and the birds fly out. As far as they are concerned, it is a pretty sight. But on the day referred to, one of the *cuadrilla* wantonly hit one of the birds and killed it. Says the Count: "In all my life I never beheld such a sight. Ten thousand spectators stood up, wildly gesticulating and threatening death to the cruel *torero*. Some even threw themselves into the arena, forgetful of the bull, forgetful of everything, determined to seize and handle the heartless man as he deserved." That, in their opinion was cruelty—the torture of the bull was quite something else. So ideals differ and have differed and doubtless will continue to differ, the world around and the ages through!

Facts Worth Knowing

EXPERIMENTS have been made recently in the use of peat as a fuel for locomotives. It was found that peat is more quickly consumed than coal, but that it makes an exceptionally hot fire, and—makes no smoke. Peat is also cheaper than coal. There is abundance of it to be had; in the bogs of Maine is a great store, and in one place in Massachusetts there is said to be enough to supply fuel for all the railroads now entering Boston for the next two hundred and fifty years. The peat bogs of Ireland may yet furnish a smokeless fuel for the steam engines of Europe. This would mean a new industry for Ireland.

THE French army will soon be uniformed in khaki. The characteristic *képi*, or military cap is to disappear. It will be replaced by a gray helmet for full dress, and a soft hat for use on other occasions.

Meetings Resumed

Point Loma Students again at the Isis—Music and Recitations by Raja Yoga Students—Good Addresses—Large Audience

ON last Sunday evening the Theosophical students resumed their meetings at Isis Theatre after a vacation of four weeks. The theatre was filled to the doors with an appreciative audience.

The program was varied and of unusual interest. Aside from the musical numbers, which included several songs by a chorus of the older boys and girls of the Point Loma Raja Yoga school, and two selections by the Boys' String Quartet, there was a recitation by Ruth Westerlund, one of the Raja Yoga girls.

Two addresses were given, the first being by Master Montague Machell, his subject being "Raja Yoga Work in California." In part he said: "A great teacher once said, 'By their fruits shall ye know them.' This is how we can best judge and realize the real scope and meaning of all Raja Yoga work. We would not have the public know our work only by the description we give them of it, but by seeing and observing for themselves the results obtained. Yet these results must not be expected all at once. A seed planted does not become a tree immediately. 'Rome was not built in a day.' It must be remembered that this is a seed time and many are the seeds that Katherine Tingley is sowing for your State. And yet, although we are only now planting, results begin to be seen—results that give greater promise than in any system of education yet established in the land.

"Probably the feature most observed by visitors to the Raja Yoga schools is the superior results obtained in the mental attitude of the children. There is no system under which the mind of the child is so much strengthened and quickened as under Raja Yoga. This is probably because the alert and vigilant attitude demanded is not a thing that the children are taught to bring to their arithmetic class to solve a problem, to preserve and keep for emergencies only, but it is made the constant, everyday, natural condition.

"We are taught to be eternally vigilant in guarding against our lower natures, our selfish wants, and weaknesses. Thus, this mental quickness is a firmly planted principle, and something that cannot be swept away by any slight circumstance. Another example set by this system is that of a comprehensive education. You may say that all our schools have quite as wide a variety of studies as the Raja Yoga schools. This may be so; but too often in the ordinary schools one subject is extensively developed at the expense of others, a balance is not attained. This is plainly demonstrated by some of the examples of strangely, almost humorously one-sided geniuses produced in the world today. In the Raja Yoga school, education is based on a perfect balance of all the faculties, which is the keynote, in fact, of the whole system.

"Not only have these examples been set by the Raja Yoga system, but others of a more important nature, have been set to all lovers of this 'Golden State,' who earnestly desire to improve their home and national life. These are examples of the heart-life. For we know that true knowledge and wisdom can only come from a pure heart and mind, and this is made a guiding principle in the lives of the children. We know that by purifying the minds of our citizens we purify their motives and so purify and cleanse their national life.

"We have not to look far to realize that in some of the affairs of human life *conscience* has no part. In such conditions injustice dominates and suffering and *despair* follow in its train, and the innocent and unguarded are dragged into the vortex. Look at our worldly affairs today and study the signs of the times!

"The Raja Yoga system when properly grasped helps one to cultivate the conscience, it aims to free man from selfish desires and *cowardice*. It is indeed an inspiring force, a knowledge that will in time leaven the whole lump, and raise man to his true position in life.

"Shame on those who for love of *sordid gain* will attempt to block the

progress of this *voice of Righteousness*,—this angel of Light.

"Mrs. Tingley has often told us that California is to be a centre of light and learning of the West, and all is being done that can be done to prepare to receive these larger responsibilities to be borne by this state.

"Raja Yoga schools have been established along the coast, Lotus Groups, Boys' Clubs, and meetings have been started and beginnings made toward a clearer realization and a fuller practice of the principles of the Higher Life.

"This is the result in part, of five years' work of the Raja Yoga system in spite of the many obstacles which it has had to overcome,—in spite of the interference of those whose whole life is a struggle for the realization of their own selfish ends; and last, but not least, the ignorance of a large number of 20th century people!"

"Build Thee More Stately Mansions, O, My Soul," was the subject of a paper read by Miss Ethelind Wood. In part she said:

"Short-sighted persons have often wondered at the devotion of Theosophists for Katherine Tingley, the master builder of character. Others of evil intent have called that devotion by many names, and perhaps they believed what they said, for the walls that cover true discernment are quickly built by ambition, selfishness, avarice and sensuality. And so, as you know, many have used their effort and their talents in the attempt to tear down her work, her building in the character of the men and women and little children who come within the range of her help. Their attempt was fruitless, as it always will be, for their weapons are made of stuff that perishes, while her structure is the immortal fabric of the soul. Small wonder that the students at Point Loma, men and women, distinguished in many lines of life and from all quarters of the globe, deem it their greatest privilege to assist in this upbuilding of the human race. And as the work of the master builder is good all through, in all its results and upon all planes, so the growth of this spiritual seed planted by H. P. Blavatsky, will bring intellectual and material growth, will build San Diego, uplift its people, educate its children, and bring a real and lasting prosperity to all. H. P. Blavatsky brought back a knowledge of the great truths of life, the deepest lore that the world has known; she wrote books so much in advance of the science and thought of the day, that their progress since then has been a steady verification of her teachings; but it was what she did not express, it was what she withheld because men were not ready to receive it, that is beginning to show now at the root of the things you wonder at. Each year, through the devoted trust in Katherine Tingley, brings the larger growth of the true life to her students, and thus through their knowledge and their example the world's children shall advance. The building goes on apace—much of it you see—more of it you do not. The children of the Raja Yoga school are taught and helped day by day to build their own lives ever greater, ever purer, and with the clearness of childhood they understand the simple science of that building. They know that selfish and sordid thoughts and bad actions bring their results as surely as good thoughts and good actions bring theirs. And they know that the greatest building in life and character is done only by the hearts and the hands that do not work for self. If so we build, life indeed is joy in hope, in compassion. Each day brings its promise and fulfillment, its interest and its growth."

"Build thee more stately mansions, O my soul,
As the swift seasons roll!
Leave thy low-vaulted past;
Let each new temple, nobler than the last,
Shut thee from heaven with a dome more vast,
Till thou at length art free,
Leaving thine outgrown shell by life's unresting sea."

—San Diego News

Theosophical Meetings for Sunday Nights

Public Theosophical meetings are conducted every Sunday night in San Diego at 8:15, at the Isis Theatre, by the students of Lomaland.

Theosophical subjects pertaining to all departments of thought and bearing on all conditions of life are attractively and thoughtfully presented.

An interesting feature is the excellent music rendered by some of the students of the Isis Conservatory of Music of Lomaland. Theosophical literature may always be purchased at these meetings.

Art Music Literature and the Drama

Public Monuments—Why Are They So Seldom Works of Art?

WHEN one sees a headline such as this "Public Monuments Recently Erected" one knows pretty well what to expect, a scathing indictment of the vulgarity and ignorance displayed and the amount of money spent—and a list enumerating the various artistic crimes perpetrated in various cities. It is easy to sneer and to criticise, and not difficult to display smartness in sarcasm and denunciation, but it is evidently quite difficult to "do something better."

Why is it so hard to get fine public monuments? There are men who can produce such works; but where are the people who want them? Are they to be found in the ranks of those who have the direction of municipal affairs? To read the daily press of the United States is to find one's self forced to wonder if love of what is noble and beautiful characterizes the majority of men who hold prominent political offices. Art is the expression of ideas, and what idea can our ordinary civic administrations express? Can the noble expression of a noble idea be called into being by a community that has put the basest of ideals into the place where honor and justice *should* be enthroned? Shall not the soul of the artist respond: "They led us away captive and now require of us a song; how can we sing the Lord's song in a strange land?"

I have before me an illustration of the statue of Jeanne d'Arc, at Rheims, in France, by the late Paul Dubois, and am forcibly impressed with the fact the dominant idea will express itself, no matter what the theme may be; and here the dominant idea is academic principles. The statue seems to be a fine and dignified expression of academic principles; but was the Maid of Orleans an expression of academic principles? There have been honest soldiers, whose noble characters could have been fittingly expressed by such worthy and admirable workmanship, but the divine illumination of Jeanne d'Arc called for a corresponding illumination of the mind of the artist, and a belief in and a respect for such a state in the public, or at least in that part of the public concerned with the erection of such a statue. A desire to pay homage to the illustrious dead, even if honest—is it not the same thing as a desire to honor in daily life the principles that made those dead ones heroes?

"Your fathers slew the saints, and ye build their sepulchres." Why? Is it because you now love those qualities for which your fathers slew the saints? Or is it to hide from yourselves the fact that you are no better than they, and would do, aye and are doing, as they did?

Not till men of high ideals and pure lives can find a place in municipal life can we expect to be able to evoke from the realm of Art its highest and noblest work. We ask too much when we demand that the artist shall carry this burden besides his own, and give us a pure and noble work, which our municipal life has neither the power to evoke nor the capacity to appreciate, if by chance the miracle should be accomplished.

R. MACHELL

THE Muses seem to have chosen their devotees often from the lower walks of life. We find that some of our greatest singers have been the children of cooks, shop-keepers, coachmen, porters, and, says one authority—evidently ranking them in the same category—school-teachers! The story of La Gabrielli, one of the greatest singers of her time, was a case in point. Walking one day in the garden, an attaché of the Italian court heard a child singing with remarkable sweetness. He was attracted and on investigating found her to be the daughter of one of the royal cooks. The father not having the means to educate the girl, she was taken in charge by her discoverer, the father being induced to give her up by the assurance that she had a "gold mine in her throat." The giving to Italy of a great *prima donna* was the result. The case of our beloved "Jenny Lind," practically adopted and educated by the Theatre, is strikingly similar and these are but two of many.

It is said that Tisias of Himera was the first to reduce chorus singing to a regular system. The founder of Greek chorus music was Stesi-chorus, and a statue was erected by the Greeks to his memory. It was sometime later that Alcæus and Sappho became leaders in Grecian musical culture, as well as Grecian poetry, for in Hellas the two arts were inseparable.

The Grey Stone Tablets of China

SCATTERED all over China, by roadsides, in village streets, and in temple court-yards, are granite tablets carved deep with inscriptions. None of them are modern as the West reckons modernity. Few were erected since the Declaration of Independence was signed in Philadelphia, but some are much older than others, writes Francis H. Nichols, in his book, *In Hidden Shensi*:

Most of them record the virtuous deeds of mandarins, who lived and died during the last two dynasties, but occasionally one meets with an inscription that tells of something that happened long ago; a bit of philosophy suggested by some incident in history; a memorial of an illustrious Emperor, or sometimes an inscription on a spot made famous by a great event, like a battle or the birth of a sage. Stone

"Success is in the Silences
Fame lieth in the Song."

BAS-RELIEF FROM THE ARCH OF TITUS, ROME

THE MARSHES OF GLYNN—FRAGMENT

SYDNEY LANIER

AS the marsh-ken secretly builds on the watery sod,
Behold I will build me a nest on the greatness of God:
I will fly in the greatness of God as the marsh-ken flies
In the freedom that fills all the space 'twixt the marsh and the skies.

By so many roots as the marsh-grass sends in the sod
I will heartily lay me a-hold on the greatness of God:
Oh, like to the greatness of God is the greatness within
The range of the marshes, the liberal marshes of Glynn.

tablets are an institution peculiar to China. Much of the so-called ancestor-worship is really only a resort to this national method of raising an enduring monument to previous generations.

In the carvings on the grey stone, far more than in the ponderous and stilted literature, the soul of the Chinese speaks. Besides recording events for public interest, the tablets often serve as repositories of the best thoughts of individuals. When to one of the old yellow race—whom we like to cartoon—there comes a great thought, he weighs and measures it. If it stands the test of his reflection he treasures it silently for years, perhaps forever. He regards it as an illumination of his soul by a higher power. It becomes his ambition to transmit to those who shall follow after him the one great idea that has flashed across his life. On a stone by a roadside, he has his soul's light carved where men may see it. Usually it finds expression in an epigram or a verse of poetry, but occasionally it is pictured in the carving of a flower or the outlines of a face.

To me the tablets of Shensi always possessed a strange charm. They seemed a part of those strong, deep, repressed fires that, underneath the mask of national stoicism, have smouldered at the foundation of the Chinese nature since time began, and which may some day flash forth with a concentrated brilliancy that will startle the world.

Theosophy Overcomes Worry

WE exhaust our strength in our impatience at our work and the conditions that surround us. There is nothing that comes to us which we could not do easily with true adjustment, but we waste our forces in our worries.—*C. B. Newcomb*

The above aphorism gains enhanced force for a Theosophist, with his larger and clearer view of human life and human nature. For two of the most important lessons which Universal Brotherhood workers are learning to apply in their daily life are that the obstacles to right living and successful achievement spring from an ungoverned lower nature, and that true adjustment follows from a focusing of the mind on that which is central and permanent in our nature.

Worry can always be traced back to fear and selfish desire, those polar forces that alternately freeze and burn the heart. Calm reason shows clearly the foolishness of anxiety, but yet we are paralyzed by it. Impatience we know to be a hindrance, yet we submit to its interference. We have not yet learned to stand still in a calm place and let the winds and waves surge past. It needs faith, trust, courage, dignity, silence.

All these virtues can be preached in the world but it needs the light of Theosophy to drive them home with the force of conviction. A thinking person will find in Theosophy—*lived* Theosophy, not mere book learning—a stable foundation for these maxims; and even the most thoughtless can see the visible results of Theosophy when it is made a living power.

It is of no use to subdue lesser desires, only to fall into the clutches of larger ones. Where shall the heart find a place of rest, if not in the sublime faith in all things great and noble which Theosophy alone seems able to arouse in men? Where else can I find fulness for my void, and voices to people my silence? What else can give us the strength to stand still and adjust all these forces?

The first step in mastering such a force is to disentangle the self from

Lomaland Photo and Eng. Dept.

A CORNER OF THE GARDEN AND LAWN

it and recognize it for an alien influence. Hence we must find the true Self. Trust in an exterior Power has enabled many a devotee to rise superior to the entanglements of desire; but such trust is too often exploited by theological influences. An *intelligent* trust, which cannot be exploited, is what men will find in Theosophy. STUDENT

New Centers in London

THE tides of our work have been steadily rising in London, notably since the time early in April when the European Headquarters underwent re-embodiment at the Raja Yoga Institute, 91 Avenue Road, N. W. There have been many signs of this advance. At the Headquarters, the charm of the new building, lecture-hall, school-rooms and grounds, has brought sunshine to the workers and children alike; and a fresh dignity has been added to the public meetings there. The rendering, in public, of symposia at the various Centers; the increase of public interest; the augmented ranks of active workers; their realization of the growing influence of the work in Europe as well as in America and other lands; the greater efficiency, vigilance and mutual cooperation, are matters for rejoicing.

Another new and interesting feature of our Work, is the new home of the Brixton and South London Center, at 386 Clapham Road, London, S. W. This spacious building, surrounded with large grounds and beautiful shade-trees, affords ample facilities for enlargement of the activities of the Work in this neighbourhood.

The beauty and extent of the grounds, equally with the classic and spacious Greek Hall, its adjoining large Assembly Room

and Conservatory, and the ample accommodations in the building, are the surprise and admiration of all. The directing of the enlargement of the Work at this Center, by our Leader, Katherine Tingley, has shown a foresight which is a promise of even better things to come. How fortunate for the work that there was a nucleus of faithful workers who had implicit trust in this foresight and the willingness to carry it out. It was here that the members from 91 Avenue Road, London, united with the Brixton members in celebrating our Leader's birthday. FRED J. DICK

THE GREEKS AT THERMOPYLAE

BYRON

THEY fell devoted, but undying;
 The very gale their names seemed sighing;
 The waters murmured of their name;
 The woods were peopled with their fame;
 The silent pillar, lone and gray,
 Claimed kindred with their sacred clay:
 Their spirits wrapp'd the dusky mountain,
 Their memory sparkled o'er the fountain:
 The meanest rill, the mightiest river,
 Rolled mingling with their fame forever.
 Despite of every yoke she bears,
 The land is glory's still and theirs.
 'Tis still a watchword to the earth:
 When man would do a deed of worth,
 He points to Greece, and turns to tread,
 So sanctioned, on the tyrant's head;
 He looks to her, and rushes on
 Where life is lost, or freedom won.

The Progressive "I"

TO everyone there come moments of reflection with their opportunity for self-analysis; but how many, instead of using the opportunity, seek rather to get away from their inner selves and to lose themselves in the whirl of social life or unprofitable occupations. But this serves only to delay the inevitable facing of one's self. It must come sooner or later; and happy the man who uses his opportunity that comes to everyone, by striving to realize more deeply his divine nature.

Let us consider for a moment who and what is the "I," the self, that is so important to everyone of us.

At the outset, it will be evident that this "I" is much more elusive, and has a wider range than we have perhaps imagined. Recall what were the occupations, the ideals, the objects sought for, in the daily life of this "I"—say, ten years ago! At that time our minds were filled with projects and ideas which have long since passed away. And yet in those days we were wont to say—"I know or believe this or that," "I accept or dislike such and such conditions or environment," "I have ideals towards the attainment of which I am devoting my energies and daily thought."

Where are they all now? How many are gone—completely, or nearly so; and yet are not their results built into our life, as the consequence of the experience which they have brought us? Others have changed and widened, but in some measure still remain the same and still affect our life.

But what about the "I" that sought them and was apparently identified with them? Is that changed too? Is the "I" of today the same as the "I" of yesterday, or of ten years ago? So great is the change sometimes that one is almost inclined to believe it cannot be the same. And yet we somehow feel that it must be the same. And, too, however great the changes which the future may bring, the "I" will ever remain the same. We feel that this is true, but the reality which lies behind all appearances eludes us, and we are led to think what will be the end of it all, and what and where is this real "I" which lies behind.

Is not the real Self a ray from the Divine, Eternal Self of all being, towards which we are wending our way through the clouds of illusion and ignorance which daily surround us? Outwardly, and in the selves of our everyday life we appear separate; but in the deeper, real Self we are united, and this deeper self-consciousness is the divine heritage of all men.

As we thus gain the knowledge of self we learn to distinguish the true from the false, and to look behind the appearances which separate us, one from another, and hinder us on our journey to the Light.

There are thus two selves, two "I's"; and the pathway of progress can be traveled only by controlling and conquering the lower by the higher. It is not an easy task, but there is, to one following it, an ever increasing

joy, as well as new opportunities and new power to help his fellow men. It requires courage, and resolute will, and the humility of recognition of how much there is to learn, together with the assured confidence in the existence of the goal to be attained and in the divine power within each that makes the attainment possible.

A great ideal, sadly misunderstood, has for long been held out to the Western world, of the man who took upon himself the mistakes and transgressions of others. This ideal is possible for everyone of us. It is the positive identification of the "I," the true, real Self, passing through its series of disillusionments, with that of every other human being. For all of these "Selves" must recognize sometime their oneness. When we realize this, even in part, we shall not feel inclined to criticize or blame our brother, but on the contrary shall know that we ourselves must share the responsibility with him, and that each one of us is and must be his brother's keeper.

STUDENT

FRIENDS IN COUNSEL

DEAR COMRADES: Great is our debt to early pioneers along the pathway of the inner life, who charted out the winding track, erected danger signals, and recorded observations for our use. One of the most important warnings they have handed down, is to avoid depending on the periodical return of what are called "our better moments," and they have also said that we should struggle on undaunted, even when the cyclic law allows our lower tendencies more power. For days or even weeks perhaps, we live in the full sunlight of the soul. The joybells ring continually within the heart. After a while the climax point is reached, and once again the prison walls of our environing flesh close round us, shutting out the light, and all the melodies of the supernal world are drowned amid the noisy, roaring voices of the lower self. Our knowledge of the Higher Life is blotted out, and nothing now remains but the sweet memory of brighter days, to keep alive our faith in the unseen. The Elder Brothers of the race have said that light and darkness, day and night, must alternate unceasingly. They tell us that our ecstasies and times of inward gloom are but the crests and hollows of the waves of life's unresting sea. If we give way to exultation on the rising flood, if we succumb to dull despair on the declining wave, we are in danger lest we wander from the path and lose ourselves in treacherous swamps of doubt. The daily consciousness in which we live, derives much of its color and intensity from the condition of our vehicle, the body, which as a part of Nature's realm is susceptible to all the varying fluctuations taking place beneath her sway. Taught by the past, the wise man waits in times of obscurity, holding tenaciously his ground, in sure and certain hope that morning, when it comes, will dissipate the gloom of night. Taking advantage of the surging flood to reinforce his efforts, patiently resting on the ebbing wave, he works in unison with Nature's rhythmic flow, and shares the mighty forces of the partner in his work. It is most pitiful to read the lives of pious persons who have had no knowledge of this law. When in the course of cyclic change their spiritual vision waxes dim, they are bewildered and enquire: "Hath God forgotten to be gracious? Hath he in anger shut up his tender mercies?" Not knowing of the cycles which affect their instrument, the body, they imagine the gigantic Person whom they worship "hides his face from their petition." Surely the light we seek is never dimmed, although the mirror of the mind may vary in reflecting power. When we have learned to watch with calm dispassion the tidal movements of the mental life, then may we learn to live in that transcendent consciousness that knows no varying tides.

STUDENT

BUT the dreams which issue from the soul of nature, are to great actions but the inspiration and the guide. We drink of the living waters of the imagination only that we may be strengthened for the daily task, it may be for the daily drudgery, which is none the less divine because it is of the earth. . . . If on the other hand we apply the master touch of sympathy and good fellowship, which is greater and better than pity, we shall get a little of the illuminating wisdom which brings right thought and act. Sympathy is always imaginative, bringing to us true pictures and true knowledge of the work of aid which lies before us. Sympathy makes human minds so plastic that words are hardly needed to find out the cause of another's trouble. Sympathy translates itself into action almost without the aid of human speech.—Katherine Tingley

THE OLD DIVINITIES

SCHILLER

THE intelligible forms of ancient poets,
The fair humanities of old religion,
The power, the beauty, and the majesty,
That had their haunts in dale or play mountain,
Or forest by slow stream, or pebbly spring,
Or chasms or wat'ry depths; all these have vanished;
They live no longer in the faith of reason!
But still the heart doth need a language, still
Doth the old instinct bring back the old names,
And to yon starry world they now are gone,
Spirits or gods, that used to share this earth
With man as with their friend; and to the lover
Yonder they move, from yonder visible sky
Shoot influence down; and even at this day
'Tis Jupiter who brings what'er is great,
And Venus who brings everything that's fair!

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question I have noticed the statement that none of the officers or workers in the Universal Brotherhood Organization, nor in any of its departments, nor in the Raja Yoga School, receives any salary or financial recompense. Do you not believe that the workman is worthy of his hire; or would you abolish money altogether?

Answer Is it not somewhat of a big jump at conclusions to make the inference, as is done in the question, that because no one in the Organization receives any salary, *therefore* we believe so and so, or would abolish money?

Do we believe the workman is worthy of his hire? If a man is working for food and sustenance and for material things for himself and family, what is meant by his hire? Surely that which will enable him to procure those things; and the medium through which he can do so is money—which is the medium at present employed in the world. And it must be perfectly clear that money in itself is neither good nor bad, but that all depends on the use of it.

But if a man is working for humanity, what is his hire? He is not working for food nor houses nor land, neither for himself nor his family. Can the moral and spiritual help which a great Teacher gives, or which we as disciples and students try to give, have a money value? What is the money value of a pure and compassionate thought; or of a deed resulting from such a thought?

But it may be said that a man must live. What would you have all the clergy and ministers of the gospel do? In one of her lectures given at the Isis Theater in San Diego, Katherine Tingley said she would like to see all the clergy and ministers work at a trade or profession to earn their living—and a lover of humanity would not seek for more, he would not strive after wealth or luxury—and then to devote the rest of their time to helping humanity. In this way they would find, she said, not only a deeper knowledge and greater power, but a larger freedom in proclaiming their message. We all know there are good and noble men in the different religious denominations in which the system obtains of paying salaries, and we honor their self-sacrificing labors for the good of their fellows, and, too, there are many of these who lament the system and know they are hampered by it. And while the system remains as it is, there will remain the incentive for the selfish and ambitious to make their profession of faith, and offer the word of truth *for a salary*.

The Universal Brotherhood and Theosophical Society and its various departments offer no such inducement, and this, as one of the most binding rules of the organization, *effectually excludes those who would otherwise enter from motives of self-interest*.

If one would quote from Scripture, it is well to look at the context, and there are other statements in the Bible which should also be noted and have their due weight. What interpretation then are we to put on the following—taking the whole statement and not simply a part of it, as was quoted in the question:

And in the same house remain, eating and drinking *such things as they give*: for the laborer is worthy of his hire. (Luke X, 7.)

There is no mention of a salary here or of financial recompense. Then read the whole of the third chapter of Micah.

The heads thereof judge for reward, and the priests thereof teach for hire, and

the prophets thereof divine for money: yet will they lean upon the Lord, and say, *Is not the Lord among us?* none evil can come upon us.

Therefore shall Zion for your sake be plowed as a field, and Jerusalem shall become heaps, and the mountain of the house as the high places of the forest. (Micah III, 11, 12.)

How different is the following picture:

Ho, every one that thirsteth, come ye to the waters, and he that hath no money: come ye, buy, and eat; yea come, buy wine and milk without money and without price.

Wherefore do ye spend money for that which is not bread? and your labor for that which satisfieth not? (Isaiah LV, 1, 2.)

Have we not one of the signs given us here of the true teacher, and a warning against those who offer spiritual truths for money? And what then is the "hire" of those who seek to help humanity? Is it not in words there c
The below.

Q

But the not bac learn to ganizati not an

No o needs.

of it, as we so orten see. Money, like so many things in physics (heat, electricity, water, for instance), seems to have the two factors of (1) bulk and (2) efficiency. A large fortune in the hands of a nobody is like a large mass of water at a low level or of electricity at a low potential; it is not effective to do work. But a little money in the hands of a competent person is like a high head of water or electricity at a high potential.

The power of money depends mostly on the motive behind it. A rich fool can do more foolish things than a poor fool, but he cannot do wiser things. Money bestowed in lumps does little good and often seriously embarrasses the recipients, forcing them to invent unnecessary ways of spending it. The widow's mite is what does the good.

Money should follow work, not be the incentive to work. Most people, planning an enterprise, would collect the money first. The man of wisdom and faith strikes courageously out in small beginnings, and money comes to his needs at the right time and in the right amount. The former method uses money to the least possible advantage, the latter to the greatest.

It is not money that does the evil, but the mean motives behind it. But money is a machine which increases the facility for doing evil. STUDENT

Reflections and Refractions

H. P. BLAVATSKY speaks of the necessity, on the part of those who would be fully serviceable, of persistent, unceasing devotion. Katherine Tingley, in another way, according to her epoch, advocates, inculcates, and infuses the same. . . . Devotion does not mean either the doing or the non-doing of any particular thing or things, but that unswerving attitude, which cannot be shaken by any environment, which surmounts all obstacles. The fundamental identity on these points of H. P. Blavatsky and Katherine Tingley is marvellously clear.

In chemistry the word circulation signifies "the repeated vaporization and condensation of a substance in distillation." Physiologically the heart is the great organ of circulation of the blood—therefore the basis of animal life. This leads to the conception of a circulation through the universe, from plane to plane, with a center of activity for all. The circulation,—is it not osmotic action? And the organ, is it not the spiritual sun?

There is nothing more fundamental than life. It is homogeneous and belongs to all. Intelligence is more differentiated. He who lives must do it in all, or he only lives partially. He must "shed the light acquired" on all his deeds; and only in shedding the light can he share the life. STUDENT

The Non-Negro Masai of Tropical Africa

WHAT has happened to the Indians in America is also happening to similar peoples in Africa. Races which have degenerated from an ancient prowess are being compelled to give way before the rising tide of energy in the white race. The Masai of East Tropical Africa have agreed to the reservation system under British Government and protection.

We regret the terrible victimizing of simple faith and natural virility before the corrupting and faithless advances of modern civilization; yet we realize that, though the white man incurs future penalty for whatever of wrong there has been in his acts, still eternal justice has also a natural penalty for races that have degenerated.

The Masai inhabit a territory between the Victoria Nyanza and Kili-

ma-Njaro, consisting of vast tracts of grassy plain and some small elevated farm lands. They have been noted for their fierce character and valiant defence of their lands, but the gun has subdued them.

The gun has subdued them, and also—what else has subdued them? Another of the white man's devastating attributes, here called by the Dutch name of "rinderpest." For it seems that the atmosphere of the white man is death to the cow (a sacred animal in ancient science). The rinderpest has taken away the Masai's occupation; perhaps some scientist will benefit the world by inventing an inoculation against this terrible visitation of Providence.

Splendid Opportunity for Inventions

The Masai are not negroes, and for centuries have preserved the purity of their race. They are Semitic (?) and may have immigrated from Arabia. Handsome, stalwart, with long narrow faces, superb carriage and haughty bearing, they have excelled as herdsmen and warriors, and value their freedom.

Since the cattle disease wiped out their herds, they have signed the agreements which assign them two large reservations, where they will live as agriculturists, to be governed and protected by British administrators, and to receive education and farming implements. The vast pampas pass over to European enterprise.

The Coming of the Message

IT is impossible not to notice the resemblances between the civilized worlds of two thousand years ago, and today. The same contrast of great poverty and luxuriously spent wealth; the same stress of speculative intellectual activity, tending toward materialism, as the science of Alexandria hurried on in its discoveries; the same eclipse of faith; the same tendency to dabble superficially in Indian philosophy and magic; the same hatching of little broods of strangely creeded people gathered about some impostor or enthusiast. And through it all, the hope, the sense, the intuition, that something new for man was at hand. "It would seem," says a writer in the *Spectator*, "as if the coming of Christ were the crystallization of a large and uncertain hope that permeated the lives of Jew and Gentile alike, a hope that long before it became, or was, accepted as an Epiphany, was a living force in the lives of men. To Virgil's Italy a divine event was at hand, announced by the throbbing of earth and sea and sky."

One is sometimes tempted to wish that Jesus the Enlightened had come a little otherwise, and a little later. A hundred years later, after a long period of infamy among the rulers of Rome, came four rulers of a nobler type, with Marcus Aurelius as their culmination. Suppose that the Teacher, and that Emperor who came so very near the vision of truth and who always sought it, had met. It would almost seem as if that little cycle of rulers had been prepared so that in the mind of the last the purest of the old waters of paganism should blend with the new. But the obscure sect had then no hearing; its Teacher was almost unknown, or known but as a half crazy and unlettered Jewish enthusiast. And when the light which he had brought into the world reached the mind of Rome, it was already darkened with dogma and inane dispute. If Jesus and Aurelius could only have spoken! But in the hands of Constantine the light was only an engine of policy.

Now the earth is trembling again with that long stilled expectancy. The message will try again to make its way into the hearts of men. And though it must take some verbal form, in its essence it will be an illumination of minds; faith and hope with wide wings touching everywhere; a melting of hate into brotherhood; the golden light of the inner world flooding the outer; the thinning even to transparency of the erstwhile heavy curtain of death.

Japan's Waived Indemnity

THE upshot of the peace negotiations has provoked some research into the precedents of indemnity payments. International law authorities agree that they are in the nature of ransom. The winning power, being in possession of the enemy's territory, or being about to take possession of some of it, agrees to take a money payment in substitute. At the Peace of Tilsit, Napoleon, in actual occupation of Prussian territory, exacted an indemnity in lieu of retention of any of this territory. The armies of the Allied Powers were in occupation of Paris when in 1815 they agreed upon an indemnity to be paid by France. Similarly when in 1871 German armies were in occupation of Paris and

other parts of the country. So also when in 1878 Russia, with Constantinople in her hands, arranged for the payment to her of an indemnity by the Sultan.

The waived Japanese claim for an indemnity did not rest on any of these precedents. Russia proposed to remain in occupation of Manchuria. Under these circumstances Japan, believing her own liberty threatened, undertook the war. She has demanded no compensation for releasing occupied Russian territory; but only the vast expenses of the war. And with extraordinary generosity she has foregone the claim, leaving us all her debtors. Her record, for courage, for endurance, for courtesy, for magnanimity, is now flawless. It will stand in gold on the pages of history.

From the lessons of this war let us understand the need and the meaning of International Brotherhood. STUDENT

Ceylon's Opportunity

THE evil days of the Congo rubber trade may perhaps be numbered. Ceylon is coming forward as a very formidable rival. In the Congo the reported total of cultivated trees is 60,000,000. But besides that this is an admittedly "shot" estimate, it includes all the wild vines and plants as well as those actually under cultivation.

But in Ceylon, during this year, another 100,000 acres will be brought under cultivation, to be added to the present 220,000 acres. At 250 trees to the acre, this means 80,000,000, including no wild plants. In three years at most Ceylon will be equal to the supply of all the rubber needed in the world, and the product will be of the finest possible character.

The present contributions of the island to the world's necessities are mainly woods and spices. In the former is she extremely rich. There are about 420 varieties, ranging in durability from the cashu-nut tree, which when felled decays in a month, to such trees as the ebony and satin-wood. Thirty-three of these harder growths are in constant use for ship and house building, and the island exports some very beautiful woods for ornamental furniture.

The cocoa-nut is to the Ceylonese almost what the bamboo is to the Chinese. It makes food and drink; a valuable oil; rope, nets, and matting; drinking vessels and spoons. The leaves make torches, the stalks fence-poles. And the wood makes everything else.

The archeologically minded violinist will not forget the tradition that he owes his instrument to the genius of Ravanon, a mighty king of the island in its legendary golden days.

For ages Ceylon has been rising from the sea, and evidently proposes at some time to rejoin India. India conquered and civilised her once; and it may be that before that, in some forgotten epoch, they had a civilisation in common because there ran no sea between. Now she is waking to modern life a little in advance of India. C.

Holidays for Slum Children

LONDON is witnessing an interesting method for improving its health, bettering the physique of its next generation, and creating that love of country life among its half-outcast children which may later do something to relieve its congestion. The plan consists in deporting them to the country or by the sea for a fortnight of the summer. On one single morning lately no less than 20,000 of them thronged the outgoing trains. The average cost for the fortnight per child is about \$1.25. Where the parents can afford it they pay; where not, it is paid for them.

In thousands of cases the child has never before seen a field or the sea. Their home letters are sometimes extremely amusing. One says: "We saw a beast coming towards us; it looked very hungry, so we crept into some bushes and hid, but it did not eat anything that time." The "beast" was a cow. Another is surprised by the cordial manners of the country people among whom she was boarded. "The people down here are very humble. If one meets you in the street he would always stop and speak to you."

The great point to be attended to in this work is that the city shall look after its own poor. If it is in the hands of any particular religious denomination or Church, contributions from wealthy members of other Churches will necessarily be checked; the city will never develop that sense of responsibility for its children which does so much for the character of the citizens, and the parents are apt to transfer themselves from one Church to another where they think the surest results are to be got. C.

A Question of Color

COMMENTING upon the sixth annual session at New York of the National Negro Business League, a prominent newspaper declares "that the business negro has earned his right to a respectable attention."

Among the members of the League which met under Booker T. Washington were prosperous bankers, real estate and insurance agents, editors, publishers, managers of steam laundries, manufacturing establishments, an opera house, together with owners and operators of a street railway, and electric light and power plants.

This report is a striking contradiction of the persistent effort that obtains to deny the colored race any chance of advancement, under the plea that the negro can never be educated into a civilized effective citizen.

A colored author has lately collected some interesting information on this point. He shows that in the United States there have been two senators and seventeen congressmen, besides many diplomats and officials of national, state, and municipal life, all of African descent. There are over 30,000 school teachers and professors, 2000 lawyers, 1500 doctors, dentists and pharmacists. Negroes have taken out 500 patents, have published 400 books, own and edit 12 magazines and 300 newspapers. They own \$900,000,000 of real and personal property.

In the face of these figures a prominent clergyman believes that "education will only intensify the problem's dangerous features, complicate and make more difficult its ultimate settlement."

This sounds rather like fear than any desire for human progress.

Outside the United States under different conditions, less prejudiced (is it fair to say "less prejudiced?") we cannot forget that there are many instances of worthy examples of this race. The death, a few years ago, of Sir Conrad Reeves, the Chief Justice of Barbados, removed a high government official, respected by all throughout the West Indies as possibly few white men have been. Do we remember that Dumas was of African descent? Can we forget Toussaint L'Ouverture, the magnanimous slave who successfully opposed the great Napoleon, while showing such consideration and humanity towards his conquered foes that the world was amazed. Civilization had very few instances to equal it then. Many other instances may be recalled.

Instead of shirking our responsibilities while they are relentlessly growing heavier, should we not realize quickly that we as a nation, owe this race a self-assumed debt which cannot be ignored? This nation placed the negroes where they are and this nation must recognize that fact or fail in its duty. P. M.

Mexican Volcanoes

THE number of volcanoes already known and visited in Mexico is 156. They are nearly all either extinct or dormant. They occur mostly along the Pacific Coast and in the States surrounding the Federal District; sometimes isolated and sometimes in groups. According to a contemporary, in Lower California there are 5; Sonora 9; Sinaloa 8; Durango 14; Tepic 15; Jalisco 15; Michoacan 17; Colima 7; Hidalgo, Tlaxcala, Mexico, Federal District, Puebla, and Morelos, 50; Vera Cruz 10; Oaxaca 6; and an unknown number in Chiapas.

Many of these volcanoes may become active at any time, since a volcano can sleep for centuries and give no sign of life.

The geological evidences point in several cases to comparatively recent eruptions of considerable magnitude, but the destruction of the Mexican annals has deprived us of the historical evidence. The region called the Pedregal, in Federal District, was formed by an extensive eruption of Ajusco which took place centuries ago; but there are human remains among the lava.

The only eruptions recorded are those of Colima, Jorullo and Ceboruco. Colima erupted in 1576 and has done so frequently since, being still active. Ceboruco exploded in 1870, causing the most serious eruption recorded in recent centuries.

Popocatepetl is one of the highest peaks in America, 17,784 feet. The crater is not a cone but a bell, 2700 feet wide at the greatest width, and 1200 at the smallest. It has been dormant for probably many centuries, and nothing but sulphur fumes escape from the crater. Immense quantities of sulphur are extracted from the crater for commerce; and Cortez is said to have obtained from it sulphur for his powder, thus giving rise to awe and superstition among the Indians.

According to old traditions, Popocatepetl, Ixtaccihuatl, and Ajusco appeared in a very short time, after a violent earthquake which came accompanied by deafening subterranean noises. The ground gradually rose up until the three mountains appeared vomiting lava and rocks. E.

Some Views on XXth Century Problems

The Way to a New Race

SOMEBODY asked Luther Burbank why his selection methods could not be applied to man. If in plants and fruits every desirable quality can be developed, and all useless or objectionable ones be removed, why cannot the same be done in the case of man?

He replied that this had always been the dream of his life. As we do not suppose he belongs to the frantic biologists of the school of Grant Allen who would kill or sterilise all members of society that did not come up to a certain standard, just as Burbank burns tons of plants which exhibit variations he does not want; nor to the equally frantic medical moralists who would hypnotise children out of their vices; we must credit him with some special views on education which from a thinker like him would be worth hearing.

You cannot pair men and women as if, like plants, they had no wishes of their own. Nor can you destroy all the children of a family save one, as you do the members of a litter of puppies. Nor is there any need. You cannot appeal to the consciousness and will of a young plant so as to induce it to put out the kind of flower you want. You cannot modify the seeds developing in the depths of a flower. But the barriers do not exist in our dealings with the human plant, the child. It is certain that every child is born with its moral and intellectual limitations; but it is equally certain that no modern educational system save one brings it anywhere within sight of these limits. And the enormous power of parental influence, the interplay between the consciousness of the mother and that of the child, is almost entirely neglected. When women, in the interest of the child, consciously endeavor to live during that period in the gracious radiations of their own souls; when they hold each hour sacred and make each hour beautiful; and when the method of training in operation at Katherine Tingley's Raja Yoga Schools are learned and practised by educationalists everywhere—one single generation will suffice to transform humanity, to compress millenniums of evolution into thirty years.

The real secret of Raja Yoga lies in the atmosphere which is maintained about the children. Just as the famous Swiss entomologist produces superbly beautiful variations in his butterflies by a mere change in the temperature in which they are reared, so, spiritually and mentally, can the same be done with children. But the teachers must sound no false note; they must live, in sight and out of sight, in thought and act, the lives they would have the children live. The atmosphere is created by self-sacrificing love, by ideals realised, by pure thought; as well as by natural beauty of surrounding and diet, by music and by art. STUDENT

Humanizing the Prison

SIR OLIVER LODGE, whose mind appears to be roaming at large, though always wisely, has been pleading for a better, a more commonsense treatment of the criminal. The adjectives are interchangeable. He pleads that the prison may be made an

alembic in which the refuse of humanity shall be transmuted into useful citizens. Several journals have taken the matter up, and there is some chance that the dead weight of public opinion may be lifted a little.

We have already noted that in Japan the prisoner is expected to work at something useful, and a proportion of his earnings is held in store for him against the day when he shall go out. If he does not know a trade he is taught one, or more than one. Afterwards, Prisoners' Aid Societies meet him and see that he has the opportunity to practise what he learned within the prison walls. By consequence, as against our system, thousands of years of work are done yearly which in our country are wasted. Habitual criminals are rare, as against the many thousands that our system carefully perpetuates. The prisons are self-supporting as against the costly institutions of our country.

Propositions made in England, following Sir Oliver Lodge's paper, are these:

That the silence rule should be relaxed for good conduct, the relaxation taking the form of classes for study and discussion, necessary books being supplied. That an extra reward for good conduct should be in-

struction in singing or other form of music, and that both music and reading aloud should be supplied during the hours of labor so far as the nature of the labor permits. And that in all cases a useful trade or employment shall be taught and practised.

"On the reformative side," says one paper, "the plan we have so long pursued has resulted in a most flat and abject failure. Our object clearly ought to be to make a good man out of a bad one—if we can; or, failing that, to translate a wilful cumberer of the soil into an implement of utility. This last is within our power, and in the doing of it lies our chief hope of curing those defects of character which are the roots from which our criminal classes spring." STUDENT

Child Gardeners

THE public schools of Cleveland, Ohio, are working a plan for interesting the children in gardening and flower-growing. The "Home Gardening Association" purchases seeds in quantity. These are divided into packets of such size as to cover the price

at one cent per packet. Lists of the seeds are furnished to the children, who make their own selection; and with the packet comes a card with simple directions. Prizes are subsequently given for the best gardens.

The success of the plan was immediate. In 1901, 121,000 packets were sold; in 1905, 220,663 packets and 13,000 bulbs. Now it has spread beyond the city and from out-of-town schools the orders already run to 100,000. The work of separating the large parcels into the children's packages gives employment to a considerable number of women during two months of the year. In some of the schools no less than 85 per cent of the children have gardens and write enthusiastically about them. And the natural taste thus engendered can never again die away. No child in whom the love of flower-tending has awaked can ever be anything but healthily discontented with the bricked and boarded squalor of the average city. It is part of the solution of the city problem.

It is now many years ago, during her work among poor women and children, that Katherine Tingley insisted upon the importance of flower-culture for the full and healthy development of child life. To her are due the essentials of the above plan, and her ideas are being practised with most gratifying results both in America and England. At Point Loma the plan is under her personal direction, and it was the sight of some of the Point Loma lady-students and children at work in their gardens that was used by certain newspaper agents as the basis of the story that she "made" her students—women and children—"work in the fields!" ONE OF THE STUDENTS

Race Suicide

RACE-SUICIDE seems to be a more serious factor in American life than even President Roosevelt had imagined. An official bulletin just issued by the Census Bureau yields on analysis the following results:

"At the beginning of the Nineteenth century the children under ten years of age constituted one-third, and at the end less than one-fourth, of the total population of the country." "In 1860 the number of children under five years of age to 1000 women fifteen to forty-nine years of age, was 634; in 1900 it was only 474." These figures do not apply to immigrants, nor to Hebrews.

It follows therefore that though the American population proper is still increasing, it is doing so at a diminishing rate; it will not be very long before it increases no more; and then, if the situation continues unchanged, it will decline. Moreover a growing proportion of our increase consists of immigrant Italians, Germans, Irish and others, and their immediate progeny. Of 59,000 children born last year in Manhattan only 12,000—or one in five—were of American parentage.

President Roosevelt looks at these figures almost as if they stood alone. But they must be taken in conjunction with other pointers. For example with the increase of insanity; with the real shortening of the life-length underneath its slight apparent lengthening; and with the increase of some diseases. All together show a decline in the primary American vitality. The only real remedy is a saner, wiser, education of the children. The ideals of education in practise at Point Loma must be studied and made universal for they are sane, wise and far-sighted. STUDENT

Archeology Paleontology Ethnology

Historic Ruins of Iona's Sacred Isle

SOME years ago the historic ruins on the Isle of Iona, Scotland, were conveyed by the Duke of Argyll to trustees for the Church of Scotland. These ruins are of great interest in connection with the early evangelization of Britain.

The cathedral of Iona has been strengthened and is being roofed so as to be used again for public worship. The other ruins are preserved.

In 563 A. D. Columba crossed from Ireland with twelve disciples, and established on Iona a community which had wattle huts and a chapel of similar

material. They converted the northern Picts, including the King, Brude, sent out missionaries to distant regions, and planted churches. The reputation of Iona and its monastery as a center of Celtic Christianity lasted long after Columba's death, but in 795 the Norsemen burned the buildings and devastated the island. In the 12th century, after the suppression of the Columban order, two Roman orders, the Benedictines and Augustines, established themselves on Iona, and these flourished until the Scottish Reformation, after which the island and its relics passed into the possession of the family of Argyll.

The ruins of St. Oran's Chapel are the most ancient. This chapel is thought to have been built by Queen Margaret, sister of Edgar Atheling. The cathedral is 12th or 13th century. There are scanty remains of a library, so famous that Pope Pius V was credited with the intention of visiting it. There is also the burial place known as the Reileag Oran, where lie kings of Scotland, of Ireland, and even of Norway. The island was held sacred, especially for burial, even by distant sovereigns; and the tombstones are most interesting relics. STUDENT

The Ruins of Borsippa and the Tower of Babel

THE story of the Tower of Babel is one out of many mythoi which depict the unsuccessful attempt made by the renegade Atlantean giants to build up an earthly kingdom of might and knowledge which should defy the truth and light. We have also the Grecian story of the Titans who attempted to storm heaven by piling up three mountains; and there are similar stories preserved in all mythologies. The "lightning-struck tower" is one of the symbols of the Tarot cards.

The Atlantean giants attempted to establish a dominion of sorcery upon earth, but were defeated by the "Sons of Light," that is, by those Atlanteans who remained faithful and transmitted the light to future races. This was the war between the Gods and the Titans, the Pandus and the Rakshashas, the Heroes and the Giants, and so on. The result was a "confusion of tongues"; that is, the doctrine of these builders became divided and they split into factions which scattered over the earth.

But, besides applying to this particular case, the symbol of the Tower of Babel has a general application to all cases where an attempt is made

Lomaland Photo and Eng. Dept.

TEMPLE OF ROMULUS IN THE ROMAN FORUM. A CIRCULAR DOMED TEMPLE BUILT BY THE EMPEROR MAXENTIUS IN HONOR OF HIS DEIFIED SON ROMULUS

to scale the heights of wisdom and power by rearing up a structure on a false basis. Sooner or later the lightning from the insulted sky will topple it over.

But now arises the further question as to whether there was or was not, on the plains of Shinar (Babylonia), an actual tower connected with the legend; and, since the Babylonians did build towers, and these towers (being of sun-dried brick) did crumble, it is easy to understand that popular belief, which ever demands a concrete symbol, would designate a particular tower—probably the greatest—as being the one

alluded to in the story; just as the Greeks used their own Mt. Olympus, and other nations their own respective topographies.

In the light of these views, a recent account of the ruins of Birs-Nimrud figures merely as a study of Babylonian antiquities, and we may leave the Babel mythos out of the question.

The tower of Akkerkuf, two hours northeast of Bagdad, was once thought to be Babel. But now that honor has passed to the tower of Birs, formerly Borsippa, which is the ruin of the famous Temple of the Seven Spheres. This temple was in seven rectangular stages, diminishing in size as they rose, the lowest 727 feet square; each stage was colored differently to represent a planet, one of them probably being overlaid with gold for the sun, and another with silver for the moon. On the top of all was a shrine.

What is left today is a hill of debris 156 feet high, which is continually diminishing; and from the summit projects a tower of brick-work which has been split in two by lightning and is surrounded by bricks that have been fused by lightning. The bricks are 13 inches square and three inches thick, stamped with the name of Nebuchadnezzar in cuneiform. They were cemented with natural bitumen.

As to the contents of a Babylonian temple, as learned from archeology, Dr. E. J. Banks says (in an eastern exchange):

The Babylonian temple consisted of two distinct parts—the tower and a series of rooms about its base. If one could look back to the time when the Babylonian temple was in use he would see a magnificent barbaric splendor seldom surpassed. The long, narrow hallways, always obscure, to lend them awe and mystery, were lined with the statues of the gods and kings. Some were in gold, others in marble or diorite; some were clothed in dresses of inscribed gold; the stone of others was tinted to give it a natural or striking color; the eyeballs were of ivory; the pupils were of precious stones, and it is possible that their heads were covered with false hair to impart to them a lifelike appearance. About their pedestals were vessels of precious metals and stones, wrought into fantastic shapes and constantly filled with food and drink.

In my own excavations at Bismya, in central Babylonia, hundreds of marble lamps, vases carved with figures of animals and men, or inlaid with ivory and precious stones, present an almost perfect example of a Babylonian temple service; these objects now form some of the rarest treasures of antiquity. STUDENT

Man's Responsibilities to the Lower Creation

WHAT goes on in the insect world is so far removed from our own notions of the fitness of things that we can scarcely venture to criticise it from the ethical standpoint. Insects will prey on each other, and in other ways behave, as if the individual were of no importance whatever. The same thing goes on in those minute lives which, as physiologists tell us, make up the collective life of the human body.

A French entomologist, M. Charles Janet, has made a careful scientific study of the ant, and has found that this insect is liable to a constant series of terrible (as it seems to us) accidents. To begin with, he may fall into the pit dug for him by the ant-lion, which is a familiar sight in Lomaland. If he escapes this, there is the tiger-beetle which preys upon him. Spiders too will catch him on a thread and raise him into their net to be devoured, or will catch him direct on his trail. But worst of all are the insects belonging to the hymenoptera family, which lay eggs in the ant. One kind takes advantage of the fact that an ant is fighting with another ant, to drill a hole in one of the combatants and deposit an egg, which produces a larva that gradually consumes its host. Another kind of hymenopter, it seems, paralyzes the ant by stinging it, carries it off, deposits it in a hole with other paralyzed ants, and fastens an egg to the mass, thus providing food for the larva. The fact of not killing the ant seems here to be an important point, and the inference is that it remains alive. Could a more terrible fate be imagined?

We shudder at these physical horrors, but really if one comes to consider what human beings do to one another's hearts, these horrors might be even excelled. Have I never laid an egg of malice in a brother's breast, there to germinate and gnaw at his heart? What *must* our mental life look like to a being (and such exist) able to see it as we see the insect life? And—oh horror—are these creatures perhaps, faithful to a pitiable necessity, enacting the dramas which we, as thought-creators, impose upon them?

Perhaps a spider owes its existence to the fact that it is ensouled by a human thought of cruel greed. And possibly the ancient belief in metempsychosis may be taken as meaning this very thing; not that a human soul inhabits an animal body, but that human beings throw off thought-forces which may ensoul animals. When will man cease to regard himself as a puppet of fate, or a reckless vandal, and realize his duties and privileges as a creator and guardian? E.

GOD OF THE OPEN AIR

HENRY VAN DYKE

THOU who hast made Thy dwelling fair
With flowers beneath, above, with starry lights,
And set Thine altars everywhere—
On mountain heights,
In woodlands dim with many a dream,
In valleys bright with springs,
And on the curving capes of every stream;
Thou who hast taken to Thyself the wings
Of morning, to abide
Upon the secret places of the sea,
And on far islands, where the tide
Visits the beauty of untrodde shores
Waiting for worshippers to come to Thee
In Thy great out-of-doors!
To Thee I turn, to Thee I make my prayer,
God of the open air!—*Selected*

The Lupine

THE word *lupinus* means "wolfish, ravenous," and it is suggested that the plant was so called because it devours the soil. Such an explanation may, however, appear to some more academical than probable; and possibly the name may have arisen from a more profound knowledge of its properties and *correspondences* which has since been lost. Nevertheless it is a fact that the lupine can, by means of an acid which its roots excrete, decompose a volcanic soil; and for this reason it is useful as a first crop in a new region. It has been used in Mediterranean countries since classical times, for forage, and for the seeds which are eaten, and for ploughing in to enrich the soil. The Romans also used the seeds as coins. White flowers and yellow flowers also occur, and garden varieties are cultivated.

Practical Teachers of Agriculture in Bavaria

A CONSULAR report from Germany speaks of the measures taken by the government of the Kingdom of Bavaria to promote scientific agriculture in that country. Agricultural schools have been established in 31 towns, and these are presided over by teachers who "in addition to an academical education, must be generally efficient in botany, geology, chemistry, physics, zoology, and natural history." The schools are open from November to March, when there is nothing doing in the fields; and peasant farmers for a nominal fee can attend courses on cultivation and fertilization of the soil, the succession of crops, the best sources for seeds, stock-raising, etc. They are also instructed in accounts and general commercial knowledge. The unfortunate teachers, already well-equipped in the upper story, as we have seen, have, during the remaining months, to become peripatetic practical instructors in agriculture, giving free lectures, forming cooperative clubs, and advising the farmers. The results are said to be excellent. One hopes these teachers are adequately honored and remunerated, for a man combining all that knowledge and executive ability is worth his weight in gold.

The Masai and the Bees

Schillings tells of a Masai who walked one day up to a nest of bees, thrust his naked arm into it and brought out piece after piece of yellow honeycomb, which he distributed among the white man's carriers. "Why did the bees not sting you?" the astonished porters asked. "Your work is to carry loads," he answered. "But my home is the steppe, and it is mine to enjoy all I find in it. The bees sting you, but they love me."—*Exchange*

"To Him That Overcometh"

IT was while he was in prison, daily awaiting a summons to the guillotine, that Thomas Paine wrote *The Age of Reason*. It was while imprisoned in the Bastille for too liberal writing that Diderot conceived and began to fashion the plan of his encyclopædia. It was out of his desperate, lifelong battle against disease, poverty and despair that the marvellous poems of Sidney Lanier were born. It was upon the wreck of a life-long invalidism that Elizabeth Barrett Browning builded all that was best in her genius and in her life. It was while dragged through the streets of Rome in chains that the philosopher Epictetus found self-mastery and his real strength. And so it goes. The list might be lengthened. The pages of history are filled with the record of deeds and lives, heroic not so much for what was accomplished as for the obstacles that were surmounted in the process of accomplishing.

We are so often told that the real test of a soul lies in the motive, not in the actual deed done. It is true, and it is because we do not realize this more fully that the pathway of life is strewn with wrecks. There is in too many a fatal love of luxury, a fatal clinging to personal comfort,—or what is believed to be that,—a fatal facility for looking at everything from the standpoint of the personality. When obstacles loom up before those who do this they quiver, quail, wince. They lose heart, for the personality has no faith in itself, no trust in that power which always steps in to save at the last moment the one who struggles unselfishly. They lose sight of the horizon and the sky, for this obstacle completely obscures. It grows apace as they stare at it. Looking away, as they do, from their own source of power, little by little they lose sight of that power. They forget that there is within their breasts that which is absolutely unconquerable, absolutely incapable of fear, something that likes obstacles in fact, for it realizes that without them, as stepping stones, one could not climb upwards.

It is in the obstacles of life that we find,—or may find if we choose—our greatest opportunities, the obstacles placed in our way by others, by events, by certain tendencies in our own natures. He who is conscious that he is a Soul, he who shrinks not from effort, he who is not so much concerned about himself as he is about others,—such as he will welcome obstacles. At least, from them he will not shrink. He will

march boldly upon them, and, strange to say, if he does he will invariably discover that they are only one-tenth as formidable as they appeared to be. Often and often they disappear at the first bold onslaught.

There is a rare honesty in the one who shrinks not before obstacles. The Soul realizes that all are of our own making, all have precipitated themselves into the present out of the great storage-house of the past. The issues of twenty lives may have to be met at some turning point,—some crisis. Then does everything depend upon whether the choice is selfish or unselfish; for it is just in proportion to the personal element in the nature that fear steps in, and fear, if allowed to rule, will ruin all. It will paralyze the will, weaken the strong right arm, absolutely thrust the Soul itself back into the sepulchre called the personality. In that lies the test of whether or not one is pure in motive, whether or not one is perfectly honest.

The real obstacles which the Student has to encounter are those which he meets in his own nature. Circumstances may hinder,—but if the nature rings strong and true circumstances may easily be mastered. Those who should help may persecute,—but if the Soul is in command let not the one so persecuted despair. Help will come at the critical moment if only the arms are not laid aside, if only the battle is not given up. It is when the inner battle begins that one sometimes is tempted to lose heart. Every opportunity may be lost,—just because some selfish tendency cropped up at the critical time, dashing down like a card house all that had been built up, perhaps by years

of sincere, unselfish effort. And the disheartening thing about this sort of obstacle is that we never see it,—until too late. We rarely waken to any weakness until some great disaster has been wrought by it. It is the price we pay for letting the personal motives have their way. It is the price we pay for not being eternally vigilant. Yet in this very fact lies our great opportunity. It is the opportunity to conquer this weakness, to step upwards upon this obstacle instead of allowing ourselves to be crushed beneath it. There is no logic in shedding tears or pitying ourselves or throwing out lines, here and there, in the hope of gathering in pity from others. The obstacle exists,—we built it ourselves, it may be into the very fabric and foundation of our own natures,—it is there. Nothing can change that fact. But is it bigger than we are? Is it stronger than the Soul? Is it greater than will? We did not see it last

COUNT each affliction, whether light or grave,
 God's messenger sent down to thee. Do thou
 With courtesy receive him; rise and bow.
 And, ere his shadow pass thy threshold, crave
 Permission first his heavenly feet to lave.
 Then lay before him all thou hast. Allow
 No cloud of passion to usurp thy brow,
 Or mar thy hospitality; no wave
 Of moral tumult to obliterate
 The soul's marmoreal calmness. Grief should be
 Like joy, majestic, equable, sedate;
 Confirming, cleansing, raising, making free;
 Strong to consume small troubles, to commend
 Great thoughts, grave thoughts, thoughts lasting
 to the end.—Selected

week nor even yesterday, perhaps. That only proves that we have taken a step ahead and passed some turning point, and it should really be a matter for congratulation, not despair.

Let us then *not* despair. Let us fight as if we proposed to win, not as if we merely would like to if we could. Let us overcome. To our own stature will be added every inch of the obstacle that we rise above, to our own strength will be added that of the enemy we overcome, though it behooves us not to think of that but rather of humanity which is waiting, waiting, *waiting* for the help of those who are destined to share the insights of a pure philosophy with all the world. Slowly are new motives, new insights, new forces, becoming active in human life. The cities of the future will be ruled and will be builded by those who have overcome. GRACE KNOCHE

Women in the Arts and Crafts

REGARDING the excellent success that woman is making in the "Arts and Crafts," Delia Austrian writes in *The Twentieth Century Home*:

"Another woman has won an enviable reputation for her tinting and coloring of metals, and her unique ideas on the setting of jewelry. As a child, she heard of the marvelous effects produced with copper as known to the earliest Egyptians and Chinese, and was determined to reclaim the lost art. She made the strangest compounds and tested them. She worked and failed—worked and failed—until finally she reproduced many of the wonderful color-effects known to the jeweler centuries ago. She applies this secret to copper and brass, giving these metals unique effects, and then fashions them into bowls, lamps and jewels. She has rings set with jewels of historic value; turquoises of rarest colors. She loves the baroque pearls with their wonderful tints of rose, pink and gray. She binds leaves together with sapphires and diamonds; sets choice East Indian pearls and diamonds into conventionalized forms, and decorates serpents with pink tourmalins and yellow sapphires, symbols of varied thought."

This work offers many opportunities for women to make use of their love of the beautiful by creating what are really works of art.

OUR papers contain almost daily reports of children abused, starved, ill-treated or abandoned by their parents. To-day the officers of a city not a thousand miles from here report the rescue of a starving seven-months-old baby. The mother and father of the child had been holding a drunken revel in the house for over a week. The baby was nearly starved to death and an aged grandfather was staggering about the house, weak from hunger. Yet there still exist the extremists who grow maudlin over the "divine rights of parents."

ALL the celebrated generals of old Japan, writes a contemporary, were adepts in flower arrangement and found their minds made clearer by practicing their art before going on the battlefield. Yoshimara, the founder of the art, lived in the latter part of the Fifteenth century. A very religious man, he spent much time and money in erecting temples and shrines, but, being dissatisfied with the floral decorations of these places, he instituted a new system whereby the offerings of the gods should represent care and thought. His followers compiled rules and formulated principles along lines of the highest philosophy.

A Yorkshire Queen of Song

THERE died recently in a small west riding town, England, at the ripe age of 86 years, Mrs. Sunderland, known many years ago as "The Yorkshire Queen of Song." To this generation she was a name only, but when she bade farewell to the public in 1864 she was in the front rank of English singers. She possessed a voice of brilliant quality, immense power, and extensive compass, specially fitted for oratorio which has always been so popular with the English of all classes. Far back in 1833 when Mrs. Sunderland, then Susan Sykes, was but a girl of fourteen, she sang in the Huddersfield Parish Church, walking to and fro from Brighouse to Huddersfield every Sunday for years. It is said

that once, when she sang in an Oratorio at Christ Church, Leeds, she walked from Brighouse to Leeds and back the same day, a distance of thirty miles; and all this without any fee. Fancy our modern prima donnas walking any distance to sing to the public, much less without a financial reimbursement, and a substantial one too. But this Queen of Song seems to have been one of Nature's children, she sang without fee simply for love of singing. For thirty years she was beloved and admired by the English public, summoned to sing before Queen Victoria and associated with the greatest artists of the middle century. The great Titiens after hearing her sing in a concert embraced her and told her "she had the most charming voice she had heard in England," and Jenny Lind and Grisi were there at the time. But so evanescent is fame that this singer, once famous, has now for years been but a memory, living quietly in her native town with her husband, receiving occasional visits from noted singers like Antoinette Sterling. Her townsmen established a prize fund "to be applied to the encouragement of vocal music, and to be closely identified with Mrs. Sunderland's name." There was a fullness of character in the women of those pioneer days which was theirs through simple living. STUDENT

A WATERFALL AT KATOOMBA, THE BLUE MOUNTAINS, NEW SOUTH WALES, AUSTRALIA

THE following two bills were introduced simultaneously, one in the Minnesota legislature, requiring an interval of five days between the issuance of the marriage license and performance of the marriage ceremony; the other in the neighboring state of Wisconsin repealing a similar law. The repeal in the latter case was prompted, it is said, by the loss of fees to Wisconsin ministers and Justices of the Peace because so many young people felt they could more easily fly to a neighboring state than wait five days. The former are, of course, unanimous in condemning the unwise haste of young people who cannot wait five days before taking the most important step in anyone's life. But no one has had anything to say as yet about the motives of the ministers and Justices in complaining as to their loss of fees!

PRINCE WISZNIOWSKI, so well known for his efforts in the cause of progress, is forwarding an association for founding in Spain a school of agriculture for women and girls, on the lines of those already initiated by Queen Alexandra at Sandringham and Lady Warwick at Studley. A ladies' committee has already been formed, under the presidency of Queen Maria Christina.

Of all countries Spain would seem to need most the uplift of a new and practical interest in agriculture. It would not seem unfitting, perhaps, should destiny decree that this impulse be given by women.

OUR YOUNG FOLK

The Raja Yoga Question Box

THESE two Americans began their art work before the colonies were settled enough to offer many opportunities to artists.

1 Who was Benjamin West?

ANSWER—Benjamin West was one of the earliest American artists. He could paint well when he was nine years old. He lived in Philadelphia among the Quakers. They tried to discourage his love of art, but they could not keep him from painting pictures. At last they held a meeting and decided that such a great talent must be given for a high purpose, and consented that Benjamin should study art. Some generous friends sent the boy to Italy. There he soon made himself famous. He was received with respect when he went to England where the rest of his life was spent. Benjamin West painted many history pictures; he introduced the custom of painting the figures in the costume of their own times. He

never forgot America, but did much to help American art students who came to London by advising them and teaching some of them in his own studio.

2 Who was John Copley?

ANSWER—John Singleton Copley was the first American-born artist who worked in the colonies before the Revolution. He had no teacher, and he had seen very few fine pictures when, at seventeen, he decided to be an artist. Copley worked hard and gained great skill in painting portraits; he gathered many pupils about him in Boston. He went to Italy to study, and then, as the war of the Revolution had begun, he settled in England and went on with his work there. John Copley painted some famous historical pictures. In New England today may be seen many interesting portraits done by his hand for the old colonial families.

THE LAND OF PRETTY SOON

ELLA WHEELER WILCOX

I KNOW a land where the streets are paved
With the things that we meant to achieve.
It is walled with the money we meant to have saved,
And the pleasures for which we grieve.
The kind words unspoken, the promises broken,
And many a coveted boon,
Are stored away there in that land somewhere,
The land of "Pretty Soon."
There are uncut jewels of possible fame
Lying about in the dust,
And many a noble and lofty aim
Covered with mould and rust;
And oh! this place which seems so near
Is farther away than the moon;
Though our purpose is fair, we never get there,
To the land of "Pretty Soon!"

Five Minutes' Delay ---The Story of a Trunk

ONLY five minutes' delay—people have lost five minutes many times and mislaid keys and—yet surely no harm could come of just five minutes' delay!

There was a busy scene in one of the student-rooms when a certain trunk was being packed for its trip around the world. It was going with other trunks, and this one happened to

be most important. The others had been packed and were safely off the day before, but some of the articles for the last trunk were not quite ready and it was held over—and then the key and the five minutes' delay.

However, the key was found and off went the trunk and the hurrying helpers forgot all about it.

But that five minutes *did* matter. The trunk missed the train and the people when they reached New York would have missed the steamer to Europe had they waited for it there. At Paris, where it was so needed, cabled inquiries revealed the whereabouts of no trunk. At Geneva inquiries showed that the trunk was following as fast as it could and if the people could only wait long enough it would probably catch up.

But these people could not wait. They were not sight-seers. They had their hearts and hands filled with earnest work and time was precious—more precious than I could give you any idea—so they had to go on, hoping that by the time they reached Geneva the trunk would be there waiting for them. No. They went on to Cairo where a longer stop was made. Still there was no trunk. The thread seemed to have been broken somehow, or perhaps a mischievous, wandering pixie had taken possession of that trunk somewhere and bewitched it. Other "five minutes" were made up, but that particular five minutes wasn't.

The travelers went on. Perhaps it would be at Colombo, Ceylon. Ah, no. At Kobe, Japan, there was still no trunk; and at last, after a stay at Honolulu, they reached San Francisco and from there came on home. Where was the trunk?

Save for cabled assurances to the contrary, the travelers would have believed that the trunk had never left Point Loma, but the fact was that it had followed them around the world and some weeks later reached home, unopened, travel-stained and weary-looking. You may imagine what the travelers thought when they opened it and took out the articles that would have been—in their place and at the right time—so precious, but that now were not needed and, in a few cases, useless.

Nothing in five minutes' delay? I tell you, it counts, boys and girls, it counts for great work lies waiting to be done. UNCLE FRED

A Young Girl's Presence of Mind

DEEDS of heroism are inspiring whatever the circumstances, but when a brave boy or girl stands out as the doer of some splendid act of service for others, a particular glow is felt in our hearts.

A few weeks ago a little mountain girl in North Carolina proved herself a real heroine. She lived with her father and several small brothers and sisters in a wild and rugged region far up in the Black Mountains. Her mother had died a short time before, leaving her, at fourteen, the little mother of the family. One morning as she was busy with her housework she suddenly heard a great crash and roar, and running out saw that a huge slab of earth had separated from the mountain and fallen directly across the railroad track below. With rare presence of mind she realized it was nearly train time and that something must be done to avert a frightful accident. Seizing a red petticoat she ran like a deer to the track, reaching it just as the big locomotive came thundering along. She waved her signal frantically; the engineer saw it and had just time to "reverse" the engine and bring the train to a stop less than ten feet from the avalanche. The frightened passengers poured out of the cars and, realizing the awful fate they had escaped, surrounded the little girl and showered her with praises and thanks. Enough money was collected and given to her to enable her father to buy a more pleasant home for them farther down the mountain. This seemed happiness enough, but one day a representative of the railroad came to their pretty home and told them the company wished to reward the courage and foresight of this young girl in saving the train from destruction. Her dearest dream had always been to have an education, and it seemed like a fairy tale come true when the man told her the company would provide for her the best possible education. So this fall our little heroine will enter school in the city near her mountain home and it is safe to say there will not be in that school a happier girl, nor one more eager to learn. COUSIN ALICE

Facts Worth Knowing

IN an Indiana forest reservation Mongolian pheasants are being raised in large numbers.

A VALUABLE plant is the alfalfa grass which has transformed many of the barren tracts of the northwestern part of the United States. Alfalfa has a long history; it was brought from Media to Persia in the time of Darius, and thence to Greece and Italy. One Greek writer on agriculture devoted almost an entire volume to the culture of this grass, and the Roman writers also mention its great utility. The plant was named *medica* in Persia and *lucerna* in Italy. Alfalfa is the name given it by the Arabians and this is the name it bears in Spain where it grows abundantly.

THE forestry station of the state of Kansas supplies farmers with five hundred thousand trees annually. No charge is made for these as the object is to encourage the farmers to start groves. A wonderful change has taken place in the climate of Kansas since the clumps of trees planted have grown big enough to serve as a protection from the winds. It is stated that they break the blizzards in winter and the hot winds in summer and that a failure of the crops has not been known of late years.

THE CHILDREN'S HOUR

THE BOY THAT LAUGHS

I KNOW a funny little boy,
The happiest ever born;
His face is like a beam of joy,
Although his clothes are torn.

I saw him tumble on his nose,
And waited for a groan;
But how he laughed! do you suppose
He struck his funny bone?

There's sunshine in each word he speaks;
His laugh is something grand;
Its ripples overrun his cheeks,
Like waves on snowy sand.

He laughs the moment he awakes,
And till the day is done;
The school-room for a joke he takes;
His lessons are but fun.

No matter how the day may go,
You cannot make him cry;
He's worth a dozen boys I know
Who pout, and mope, and sigh.

Lomaland Photo and Eng. Dept.

WE ARE COMRADES

DEAR CHILDREN: I must tell you about Monk, the street-car dog of New York, a shaggy, yellow dog, with big brown eyes, a tail which curls, and two soft, beautiful ears. About six o'clock in the morning, Monk usually appears at one of the car barns, and spends a great part of the day in traveling to different parts of the city on the street cars. She prefers the horse-cars, but when she wishes to go to the west side, jumps on a trolley and transfers to other cars. She is very sociable, and likes to stay around the barn, when the men are off duty.

Monk will sit on a horse's back and will run for a ball. One day she was found fumbling in the pockets of a man who had fallen asleep. She would put one paw in a pocket and carefully pull out some sugar which she ate. It seems that the man had been feeding her with sugar for some time before this. Monk is a great pet with all the men but has no favorites and treats all alike, from the superintendent to the street car drivers. She often visits the homes of the men, but goes oftener to one home where there is a baby than to any other. This proves that she is a friend of the children. Don't you think so? COUSIN CHARLOTTE

The Palm and the Pine

A GREAT poet has told this story: Far in the frozen North a Pine-tree grew. The snow fell round it like a soft white blanket. At night, when the world was cold and still, the stars shone, like bright shining eyes, looking down.

The Pine-tree stretched out its green branches and, though they trembled and shook in the wintry blast, it held up its head and grew straight and strong.

Far in the sunny south a Palm-tree lived. Soft breezes played around it and warm airs fanned it, and the waters of a fountain rose and fell with a soft murmur. Gay flowers grew about and when they went to sleep at night, the silver moon shone and made shadows that peeped and played upon the ground.

Sometimes the sun was so hot that it almost withered the Palm-tree, but it waved its long graceful leaves and made a little breeze.

The Pine-tree thought of the Palm in its distant home, and the Palm-tree loved the Pine.

At dawn the Pine would rustle and say—"Good morning, brother, may we serve well, to-day."

And at twilight the Palm would wave and sing—"Good-night, brother, may the night bring peace, and the morning, joy."

And both in their hearts would whisper,—“How close akin the world is, and how strong is love!”

THE TREE'S FRIEND

The Sea in the Desert

DEAR CHILDREN: How many of the little folks who read the NEW CENTURY PATH, know, that in order to get to Southern California from the East, they must cross a real true desert? A great deal of southwestern Arizona and southeastern California is desert land. You will travel in the cars the whole of one day or all of one night in crossing this part of the country.

When you wake in the morning and find yourselves riding through low barren sand hills with small bushes of sage and cacti, scattered here and there over the ground, you will know it is the beginning of the desert. All the morning, along the horizon line on either side, those same dreary looking mountains will seem to be following you. They seem to be the same, but only because the mountains throughout the country are similar in form and color. Later in the day the mountains will appear to grow smaller and move away, and the great desert plain stretches out on either side for miles and miles. Grey sage brush, glossy dark green grease-wood bushes, and flat-leaved prickly pear grow thickly all over this part of the desert except where the white alkali covers the ground. On these alkali plains nothing will grow.

Perhaps the train will stop somewhere in the desert to give the thirsty engine a drink of water, from the big red water tank. You will climb from the car and walk a little way out into the desert but you will not go far. How still it is! not a chirp of a bird, not a sound of any living thing. The sun beats down on the dry sage brush and white sand and dazzles your eyes. You feel the hot sand under your feet as you walk about. Sand, sage-brush, sun and silence! It is indeed a strange country.

There is, in the southwestern part of this desert, a great basin or sink, like the dry bed of some great lake or sea. It is about seventy miles long and fifty miles wide and sunken more than two hundred feet below the level of the sea. A strange thing has happened there this summer, as it happened fourteen years ago. The great Colorado river has overflowed its banks, filling this hollow and transforming it into a sea. It is called Salton Sea and usually lasts for sometime and finally dries up leaving the wide empty basin as before.

In time past, so long ago that there is no record of it except as a story or legend, a tribe of Indians lived where is now this Salton Sea. One day, without any warning, a wall of water twelve feet high swept down upon them, filling the sink and forming this strange sea. Quickly, the Indians ran to the foothills and when they reached them in safety and turned to look back, they saw a strange sight. Two great white winged birds, as they thought them to be, appeared from the direction that the water came and swam about upon the sea. The Indians watched these birds with much anxiety. Indeed, they were quite terror stricken at the sight of them for they feared they had come to destroy their tribe.

They had never seen sail-boats before and did not know they had sailed up from the Gulf of California and entered the sea where the river had overflowed. When the birds, as they thought, drew near the shore and white men came out from under their feathers and began to feed the birds with logs of wood, the Indians were much astonished.

The story of the white birds on the Salton Sea was told by an old Indian chief, now living, who belonged to this tribe of Indians. The chief probably heard it from his grandfather, whose grandfather, most likely, told it to him. For this happened long ago, children. AUNT EDYTHE

Art Music Literature and the Drama

A Genius of the Seventeenth Century in England

THERE is to be held in Norwich, in the near future, a celebration in memory of Sir Thomas Browne, that unique genius of the Seventeenth century, who has been called "the poet, the rhetorician, the magician of sonorous and melodiously cadenced English." He, with the group of contemporary prosaists, Sir Francis Bacon, Jeremy Taylor, Bunyan, Baxter and Sir Isaak Walton, who sprang up after the Elizabethan Era of literature, rendered valuable service in the moulding of English prose and in the development of its style.

Thomas Browne was born in 1605—three hundred years ago—his life stretching over that stormy and perilous period of the Civil Wars and Commonwealth. Apparently undisturbed by the stirring events, constitutional changes and political tragedies then shaking England, he led a calm, studious but busily active life at Norwich. He was a physician and a philosopher, a profound student and a deep thinker. He had travelled in many countries, knew many languages and had a liberal knowledge of the world and of the affairs of men. His was a singular, penetrative and original mind, and his writings are full of deep and searching meditation upon the changing tide of human fortune and the fate of nations. The treatise on "Urn Burial" teems with noble passages of solemn, majestic eloquence. His *Religio Medici* was not intended for publication but, as he himself said, he composed the treatise for his "private exercise and satisfaction." It is full of speculations on the influence of the stars, interpretation of dreams, conjectures of the soul's state before birth and after death, etc. It was translated into several languages during his lifetime and had the distinction of being placed on the *Index Expurgatorius* of the Romish Church. This is readily understood when we come across such passages as the following: "All things began in order, so shall they end, and so shall they begin again; according to the ordainer of order and mystical mathematicks of the city of Heaven. . . . There is surely a piece of divinity in us; something that was before the elements and owes no homage unto the sun."

In his old age, the honor of knighthood was conferred upon him by Charles II, an honor well merited for it is said that around him, from childhood to old age, was "a certain air of mystery and consecration as of one dedicated and for whom nothing could be common or unclean, to whom the visible world seemed an hieroglyphical and shadowed lesson of the thoughts of God."

It should be of especial interest to Americans to know that in those early days of the Colonies, he prophesied the future and inspired greatness of this country.

STUDENT

IN old Sparta there were celebrated the great Carneian games, which have been so overshadowed by the greater games of Olympia that we have well-nigh forgotten about them. In these games musical contests took place and there were dances of maidens as well. The city had a special building for its musical work, erected by Theodore of Samos in the market place. It was here that Homer's poems, among others, were chanted, and thus preserved in the minds and hearts of the people for many hundreds of years.

POETRY is not a treasury of facts. Fact (or what the world calls fact) is forever fluctuating. The world of so-called facts is a kaleidoscope changing with each shake of the wrist of Time. What we call fact today may be fantasy tomorrow. But poetry stands firm. When a poet has truly said a thing, he has said it for eternity. It takes its place with the Parthenon and the Pleiades.—Edward Markham

THE object of a movement of world-wide interest recently started in Europe, is to insure the preservation of valuable historical manuscripts. Within a short while there was held at Liège an International Congress for the reproduction of facsimiles of these manuscripts. It was also proposed that national bureaus be established in order to make them accessible in all countries.

Palace of Albrizzi, Venice

EVERY foot of ground in Venice is so valuable that there is little room for gardens, but here and there, as is shown in our cut, a few trees flourish luxuriantly, adding a delightful contrast to the vertical lines of the stately palaces of the old-time merchant princes. The Albrizzi Palace is about three hundred years old and is noted as the residence of Isabella Albrizzi, a distinguished authoress and a friend of Byron.

One of the finest libraries in the world is the Marcian Library in Venice, which has been reopened this year. It contains many rare old manuscripts, some dating back as far as the Eighth century, besides over 100,000 volumes, all of which will help build the city's future greatness.

RIO AND PALAZZO ALBRIZZI, VENICE, ITALY

IT is related that one day when Rousseau was painting an oak in the forest of Fontainebleau, he was approached by a peasant, a wood-cutter. The man, staring at the picture which was in progress, suddenly exclaimed: "But, sir, why are you making that oak when it is made already?"

THERE are upon record the names of nearly two hundred and fifty members of the celebrated Bach family who distinguished themselves in music.

STRADIVARIUS entered upon the golden period of his life when nearly sixty and he was long past sixty when he made the "Dolphin," his masterpiece.

THE Vina is the principal Hindu musical instrument, being a lyre or guitar of four strings. The tone is delicate, and though somewhat metallic, not unpleasant.

Universal Brotherhood Organization

Central Office Point Loma California

Birthday Anniversary of the Theosophical Society

TO celebrate the thirtieth birthday anniversary of the Theosophical Society, a meeting was called by Katherine Tingley of the students of Lomaland. Two sessions were held, the first being attended by the older members, and the second being a general meeting, as some could not attend the first.

On September 8th, 1875, at H. P. Blavatsky's residence at Irving Place, New York, a meeting was held at which it was decided to form a Society, to which at a second meeting, September 18th, the name "The Theosophical Society" was given. Thus in reality, September 8th, 1875, was the real birthday of the Society. At that meeting besides Madame Blavatsky, there were present William Q. Judge and several others. Mr. Judge opened the meeting as temporary chairman, and proposed the permanent chairman, he himself upon motion then acting as secretary of the meeting.

At the anniversary meeting at Lomaland, several of the members spoke in regard to the occasion, and then Katherine Tingley said in part as follows:

"The hour is significant. If we could look behind the scenes there would be much that would inspire us because of the promise of the hour, and because of the light that is in our hearts and the hope that Theosophy gives to the world. It is a significant time; a time of mighty meaning and high purpose; a time when we, the devoted followers of H. P. B., meet to pay tribute to her work and her purposes, to reunite ourselves with the past, to go back in memory to those early days when she was working so hard for the establishment of this philosophy.

"It is truly said that she is with us, because the impress of her life, her unselfish, superb, altruistic life is touching the hearts of men. It has ingrained itself into the deeper life of the world and must stay, must ever be an incentive, a power for good.

"I go back to the time of the beginning of this work, and see the body of people and see H. P. B., and I do know she was utterly alone with the exception of that faithful heart, William Q. Judge. This is no reflection on those others who in their earnestness were striving to help, but they were so in the dark, so unable to understand either her or her work. . . . H. P. B. was there at that cyclic time, . . . she fitted in at the very moment. She was there for that purpose. The age had been moving in one direction, and she had come as a light with this superb knowledge to start it in a new direction. All over the world at that hour, there was a baptism of the spirit; all humanity was challenged and the real battle for humanity, for this time, in this cycle, was begun at that moment. That was a mighty moment, a sacred moment, when H. P. B. in the silence was touching the hearts of men.

"The greatest tribute we can pay to her and to her work which was so stupendous, is to clear the air, to put new life into the work in such a way that we can rewrite history; that is, to take up the threads of the great work as she began it, and give it to the world in an absolutely true and correct statement. We must be a link with the future; we must bind ourselves with the future and push ourselves forward in the thought of how we can utilize this time to link all the mighty purpose of her life with all that shall be in the times to come."

The Leader then read the following letter written to William Q. Judge by H. P. Blavatsky, on the occasion of the Convention of the Theosophical Society in America in 1888 and then published in several papers throughout America:

"To Wm. Q. Judge, General Secretary of the American Section of the Theosophical Society.

"MY DEAREST BROTHER AND CO-FOUNDER OF THE THEOSOPHICAL SOCIETY:

"In addressing you this letter which I request you to read to the Convention, I must first present my hearty congratulations and most cordial good wishes to the assembled delegates and good fellows of our Society and to yourself—the heart and soul of that body in America. It is chiefly to you, if not entirely, that the Theosophical Society owes existence in 1888. Let me, then, thank you for it, for the first and perhaps for the last time publicly, and from the bottom of my heart, which beats only for the cause you represent so well and serve so faithfully.

"Theosophy has lately taken a new start in America, which marks

the commencement of a new cycle in the affairs of the Society of the West, and the policy you are now following is admirably adapted to give scope for the widest expansion of the Movement and to establish on a firm basis an organization which, while promoting feelings of fraternal sympathy, social unity and solidarity, will leave ample room for individual freedom and exertion in the common cause—that of helping mankind.

"The multiplication of local centers should be a foremost consideration in your minds, and each man should strive to be a center of work in himself. But let no man set up a popery instead of Theosophy, as this would be suicidal, and has ever ended most fatally.

"Since the Society was founded a distinct change has come over the spirit of the age. Those who gave us commission to found the Society foresaw this now rapidly-growing wave of transcendental influence following that other wave of mere phenomenalism. Even the journals of Spiritualism are gradually eliminating the phenomena and wonders to replace them with philosophy. The Theosophical Society led the van of this movement; yet Theosophy, pure and simple, has a severe battle to fight for recognition. The days of old are gone to return no more, and many are the Theosophists who, taught by bitter experience, have pledged themselves to make of the Society a "miracle club" no longer.

"Orthodoxy in Theosophy is a thing neither possible nor desirable. It is diversity of opinion within certain limits that keeps the Theosophical Society a living and healthy body. According as people are prepared to receive it, so will new Theosophical teaching be given. But no more will be given than the world on its present level of spirituality can profit by. It depends on the spread of Theosophy—the assimilation of what has been already given—how much more will be revealed and how soon.

"It must be remembered that the Society was not founded as a nursery for forcing a supply of occultists—as a factory for the manufacture of adepts. It was intended to stem the current of materialism, and also that of spiritualistic phenomenalism and the worship of the dead. It had to guide the spiritual awakening that has now begun, and not to pander to psychic cravings, which are but another form of materialism. For by materialism is meant not only an anti-philosophical negation of pure spirit and, even more, materialism in conduct and action—brutality, hypocrisy, and, above all, selfishness—but also the fruits of disbelief in all but material things—a disbelief which has increased enormously during the last century, and which has led many, after a denial of all existence other than that of matter trite, to a blind belief in the materialization of spirit.

"Men cannot all be occultists, but they can all be Theosophists. Many who have never heard of the Society are Theosophists without knowing it, for the essence of Theosophy is the perfect harmonizing of the divine with the human in man, the adjustment of his godlike qualities and aspirations, and their sway over the terrestrial or animal passions in him.

"I am confident that when the real nature of Theosophy is understood, the prejudice now so unfortunately prevalent will die out. Theosophists are of necessity the friends of all movements in the world, whether intellectual or simply practical, for the amelioration of the condition of mankind. We are the friends of all those who fight against drunkenness, against cruelty to animals, against injustice to women, against corruption in society or in government, although we do not meddle in politics.

"I should like to revisit America, and shall perhaps do so one day, should my health permit. I have received pressing invitations to take up my abode in your great country, which I love so for its noble freedom. I am urged too to return to India, to help in the great and hard fight there for the cause of truth; but I feel that for the present my duty lies in England and with the Western Theosophists, where for the moment the hardest fight against prejudice and ignorance has to be fought.

"Meanwhile, my far away and dear Brother, accept the warmest and sincerest wishes for the welfare of yourself, personally, and at the moment when you will be reading to them the present lines, I shall—if alive—be in spirit and thought amidst you all.

"Yours ever in the truth of the great Cause we are all working for,
(Signed) H. P. BLAVATSKY." OBSERVER

THOUGHTS OF BEAUTY

KEATS

A THING of beauty is a joy forever:
Its loveliness increases; it will never
Pass into nothingness; but still will keep
A bower quiet for us, and a sleep
Fall of sweet dreams, and health, and quiet breathing.

Theosophy to the Working Man

THEOSOPHY is essentially a philosophy for the worker; while for the sentimental dreamer, it holds no alluring prospect of selfish ease; for "the peace that passeth all understanding" and the rest that cometh to the righteous, are the result of strenuous active warfare, waged against all that is evil. Is it not apparent to all thoughtful minds that *work* is the keynote of the part we are expected to play during our earth lives? Has not "work" been the war-cry of all the great Reformers? Take the maxims of any Teacher worthy of the name and see if an "arm-chair" existence finds a word of praise. Turn to history and the lessons it teaches, do we not find in every case that self-indulgence and luxury are the precursors of a nation's downfall?

The lot of many of the workers today is a hard one, but Theosophy teaches that it need not be, and that in the coming ages it will not be so.

But how will this come about? Is it not possible to picture a time when laziness, idleness and indifference to the commonweal will no longer be possible, because of the spread of the true spirit of human Brotherhood, and the awakening sense of responsibility that is part of the message of Theosophy to the world? In those days selfish ease will be considered ignoble, unworthy of a man; and the nobility and dignity of the worker as such will be recognized. Does not the simple ideal, held in the mind, and the desire to be a helper in the world, create a healthy feeling of true self-respect and self-reliance?

Let us pause for a moment, and think how our ideals mould our lives, for, consciously or unconsciously, do we not all bend our energies and turn our minds into the direction that will lead to their fulfillment?

Where in the world shall we look for the constructive element? Is it not among the workers? Are not they the true builders? Think for a moment what a large part the working man plays in the life of the world today. The food we eat, the clothes we wear, the houses we live in, the pictures, books, music, all the necessities and refinements of life, depend upon and represent some one's work.

Unfortunately, through a false value placed upon many things, through ignorance of the true purposes of life, and the nature of man, some work has come to be looked upon as honorable and dignified, worthy of a man's best efforts, while other work, although necessary to the common weal, is regarded as void of honor, and as being even base, "menial."

But Theosophy comes with this message to the working man, "No work in itself is either honorable or base, but it is the workman that makes it so." All the great Teachers of the world have said the same thing, giving the injunction to "do all to the glory of God" to "do all for the sake of the Supreme."

To paint a great picture, to build a superb temple, to write a song that shall stir the hearts of all men to live noble lives,—these indeed are noble, honorable lines of work, calling out the best that is in us to the glory of God:—but, so say or at least think some—if we judge by their actions—to work on the streets, to clean out a sewer, the common laborers' work, where is the honor or dignity or glory to God in that?

The International Brotherhood League, which is the humanitarian department of the Universal Brotherhood Organization and Theosophical Society, and which accentuates Theosophy put into actual practice, has for one of its objects, "To help men and women to realize the no-

bility of their calling and their true position in life."

A nation's greatness depends, not on the ideals of a few, but on the level of the general consciousness, on the common ideals, on the heart-feelings of the masses, on their standards of honor and dignity, and especially on their ideas of *duty*. What would it mean then for the workers, the working men and working women, to realize the nobility of their calling and their true position in life? "Their true position in life." What do we mean by this? Is it not the position of men as men and of women as women,—as souls, with the divine spark at the root of their being, illuminating and guiding their innermost lives? What work could help but be ennobled and dignified if such ideas actuated our lives?

In whatever we do, the quality of the work done is the outcome of the hidden thought life. Those who dislike their work, will never put their best into it, nor will it ever dignify them nor they it; and the same is true of those who work simply for the sake of the payment received. The higher energies will not respond, the heart-touch is wanting, and the work suffers.

In the present condition of things, it is necessary, generally speaking, that work should be paid for, but we all know the difference that exists between the man who does his work simply for the sake of the payment, and the one who while needing the money, also puts his heart into his work and cares primarily that the work shall be well done.

The Theosophic ideal stands out as a radiant sun, throwing light upon all the dark places and the hard problems of life. It brings home to us that the question of human solidarity can no longer be evaded; that men are souls, and that the point in evolution is reached where men and women must act as souls in their workaday lives and in their smallest deeds. The unity of mankind is beginning to be felt as it has not been for ages, and that the work of each one helps or retards, in a very real sense, the progress of the whole. The meaning is being forced home to us that the old saying is true, "Nothing is small and nothing is great in the divine economy." All our troubles come from the lack of the spirit of Brotherhood, and through the forgetfulness of the divinity of our higher natures.

So this is the Message of Theosophy to the working man; it sheds a new light on the purposes of life, and whatever the occupation, so long as it does not tend to evil or serve the evil powers in the world, it can be made dignified and noble, and be a beneficent power for the upbuilding of the human race. STUDENT

Thoughts on Reincarnation

WHAT a vista of hope and encouragement Theosophy gives to us in the teaching of Reincarnation! To know that we, the soul, are immortal: that death is not the end, but the doorway leading to another phase of life and conscious being, wherein we gather the spiritual harvest of all our purest and best thoughts and all our high ideals and noble aspirations; that from thence we return to earth, strengthened and refreshed, to resume the battle of life, and essay once more the conquest over the lower nature.

How far more reasonable and soul-satisfying is this teaching than the old idea of one life of a few short years, and then an eternity of rest or punishment. Who would not rather live life after life, striving ever, climbing ever, seeking to help others in the renewed opportunities that each life brings, with the goal before us that each of the great Teachers has proclaimed—of perfectibility?

This goal cannot be gained in one brief life, nor by mere wishes, nor by reading and intellectual study, but only by earnest and strong endeavor, by helping and sharing, having compassion for others in their sorrows and their joys, and holding out the strong hand of Brotherhood to those who are discouraged.

"Bear ye one another's burdens" was and is a divine command, and he who truly loves his fellow man will hail in this doctrine of Reincarnation one of the greatest boons the beneficent Law can confer; for by it he is assured of the opportunity for the fulfillment of his desire to serve. And just as the tired worker takes his night's rest in order that he may rise refreshed and strengthened for the duties of the morrow, so does the soul take its rest leaving its worn-out body and this physical world for a time; that it may return again ready once more to take up the glorious opportunities of a new life in a new body, and so take a new step forward on the pathway of life. STUDENT

THE MYSTERY OF PURPOSE

JAMES RUSSELL LOWELL

THIS life were brutish did we not sometimes
Have intimation clear of wider scope,
Hints of occasion infinite, to keep
The soul alert with noble discontent
And onward yearnings of unstilled desire;
Fruitless, except we now and then divined
A mystery of Purpose, gleaming through
The secular Confusions of the world,
Whose will we darkly accomplish, doing ours.

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question In what way is the Universal Brotherhood different from other Fraternal Societies, of which there are so many in the world today?

Answer In the first place, its very name indicates the difference, one of the marked differences, namely that it is *Universal* and recognizes *all* men as brothers.

Secondly, it recognizes Brotherhood as a fact in Nature, and not as a mere sentiment, depending upon man's good-will, or upon his being admitted into a certain order, by going through certain ceremonies, etc.

And thirdly it is not for personal benefit, or even for what is called mutual benefit, though it must follow that both of these will accrue, according to the law, but it is for the benefit of the whole of humanity, first and last and all the time.

STUDENT

Question I have noticed that at one time you speak of the Theosophical Movement and at another of the Theosophical Society. What distinction do you make between the two?

Answer The Theosophical Movement has been active in all ages. There has never been a time in the history of man that there has not been a power working either openly or unnoticed for the spiritual uplifting of humanity, and never has the world been left without its teachers and Helpers. And the great Teachers of the world are not, as is supposed by so many, isolated from one another in their work, even though they come ages apart, or to different peoples. For they all belong to and represent the Theosophical Movement.

But the Theosophical Movement is not confined only to the fostering of religious ideals, but to everything that helps on the real progress of man, in science, art, the drama, ethics, etc., and the history of the future will show the links existing in all ages and all lands. It will show, too, the existence of a great Brotherhood of Sages, Helpers and Messengers, handing down through the ages the truths of the Wisdom Religion; and that to this Brotherhood belong the great Teachers, Krishna, Buddha, Jesus, Zoroaster, Hermes, Confucius, Plato, Æschylus, and many others whose names are not recorded, and, in our own day, Blavatsky and Judge and our present Leader,—all are Messengers of the great Brotherhood.

Such, then, is the Theosophical Movement. From time to time organized efforts are made through a society or organization to carry out the purposes of the Theosophical Movement. Such a Society is the present Theosophical Society, or as its name now is, "the Universal Brotherhood Organization and Theosophical Society," founded in 1875 by H. P. Blavatsky, and continued under the leadership of her successors, William Q. Judge and Katherine Tingley.

At the end of every Century, during the last quarter, a special attempt has been made, in one form or another, similar to that begun by Madame Blavatsky, and many of these can be traced by the student. One of the most noteworthy of these was in the third century of this era, started by Ammonius Saccas, and called the Eclectic Theosophical system. It was then that the name Theosophy was first definitely used in connection with the Movement, though the teaching was known under other but equivalent names in past ages.

Every movement or society started for the benefit of humanity has had to face opposition, and the most subtle has come from those who have adopted its name and have professed to follow its teachings. And so in this age, there are those who use the name Theosophy, and certain societies which call themselves Theosophical, which this organization, under the Leadership of Katherine Tingley, successor to H. P.

Blavatsky and William Q. Judge, cannot recognize and with which it refuses to be in any way identified. For a Society to use the name "Theosophical" does not constitute that society a part of the Theosophical Movement; it is the actions that are the test, and the practical application of the teachings in daily life.

On the other hand there are many people and many Bodies of people who do not use the name "Theosophical," some of whom perhaps never heard of it, who yet are workers in the Theosophical Movement; but the Universal Brotherhood Organization and Theosophical Society is the Body in this age, specially organized with the definite purpose of teaching Theosophy, and making it a living power in the life of humanity.

STUDENT

Question Does Theosophy postulate a First Cause in the sense of God, as a Creator, etc? I have heard it said you do not believe in a personal God, and I cannot understand what position you take regarding the origin of things.

Answer There is so much contained in the question that it would not be possible to fully answer it without far transcending the space allotted. And while indicating the lines of an answer, we would urge the enquirer to read Madame Blavatsky's writings, from which we quote the following. We also recommend *Searchlight*, No. 6,—“Report of Debate on Theosophy and Christianity,” in which a clear idea is given of the Theosophists' conception of God.

In the Proem to *The Secret Doctrine*, H. P. Blavatsky writes:—

The Secret Doctrine establishes three fundamental propositions:—

(a) An Omnipresent, Eternal, Boundless, and Immutable PRINCIPLE on which all speculation is impossible, since it transcends the power of human conception and could only be dwarfed by any human expression or similitude. It is beyond the range and reach of thought—in the words of Mandukya, “unthinkable and unspeakable.”

It is difficult for some to appreciate this position, taken in Theosophy. What they wish for is a God only a little removed from themselves, with human attributes, to whom they can carry all their little troubles and cares, and all their personal affairs. St. Paul declared, “there be gods many and lords many,” and there would be little need of comment except that these people at the same time proclaim their God to be Absolute, Supreme, Infinite; and do not realize that the two statements are not compatible, or both logically tenable.

H. P. Blavatsky further says:—

To render these ideas clearer to the general reader, let him set out with the postulate that there is one absolute Reality which antecedes all manifested, conditioned, being. This Infinite and Eternal Cause—dimly formulated in the “Unconscious” and “Unknowable” of current European philosophy—is the rootless root of “all that was, is, or ever shall be.” It is of course devoid of all attributes and is essentially without any relation to manifested, finite Being. It is “Be-ness” rather than Being, and is beyond all thought or speculation.

And in *The Key to Theosophy*, Madame Blavatsky thus expresses it:—

Our Deity is the eternal, incessantly *evolving*, (not *creating*,) builder of the Universe; that *Universe itself unfolding* out of its own essence, not being *made*.

We cannot conceive of the “origin of things” in the sense of a first creation. Such is unthinkable, but on the other hand Theosophy teaches Cyclic Law as being absolutely universal and governing the birth and growth and death of worlds and universes as well as of man. As we and everything in nature have our periods of alternating activity and rest, so does the same law apply to the universe. “The appearance and disappearance of Worlds is like a regular tidal ebb of flux and reflux.” This is also one of the teachings of the *Bhagavad Gita*:—

All worlds up to that of Brahman are subject to rebirth again and again, but they, who reach to me have no rebirth. Those who are acquainted with day and night know that the day of Brahma is a thousand revolutions of the yugas (ages) and that his night extendeth for a thousand more. At the coming on of that day all things issue forth from the unmanifested into manifestation, so on the approach of that night they merge again into the unmanifested. This collection of existing things having thus come forth, is dissolved at the approach of night, O son of Pritha; and now again on the coming of the day it emanates spontaneously. But there is that which upon the dissolution of all things else is not destroyed; it is indivisible, indestructible, and of another nature from the visible. That called the unmanifested and exhaustless is called the supreme goal, which having once attained they never more return—it is my supreme abode.

STUDENT

A Royal Carpet Factory

FROM several points of view this matter possesses much interest. For over 300 years the people of Wilton, near Salisbury, England, have made carpets. While the modern machine-made carpets lose color and wear out in a few years, a genuine Wilton would despise itself if it did not last 100 years! The factory at Wilton is now making a carpet 41 feet by 19 feet for a lover of change who wishes to replace his present carpet, though it has been down only 45 years. The "Costly Wiltons, or Axminsters, into which one's feet sink luxuriously, are all hand-made, and the slight machinery used has not been seriously altered since the ancient Egyptians compelled their daughters on marriage to provide at least one carpet for their future homes." The carpets are, of course, of wool, and each knot is tied separately, so that a square yard contains about 186,000 knots, and costs about \$30 per square yard.

The press of foreign competition, and the rage for things "cheap and nasty" have pressed heavily on the Wilton carpet-makers, and they were on the verge of having to close the establishment, when the Earl of Pembroke, whose family name is Herbert, came to the rescue—the second time an act of similar helpfulness had been shown by the same family; for the 10th Earl helped the Wilton carpet-weavers in the middle of the 18th century, when they were in similar difficulties.

Now the romance of the matter is, that Earl Pembroke is Lord Steward of the King's Household, and all that he has to do is to send in an application to himself as Lord Steward, and after due examination to issue Letters Patent for the "Wilton Royal Carpet Factory." Associated with the Earl of Pembroke are the Earl of Radnor, and a few others. A romantic story is told in this connection. Lord Radnor's Castle is built on a triangle, with a tower at each corner symbolizing the "Trinity." It was the custom of the late Earl to bow three times daily to these towers, but when he died in 1900 he carried his secret with him. Lord Radnor has since found that there was an old legend in the family—"Owner of Longford where'er ye be, turn and bow with bends full three, and call on the name of the Trinitie, or castle and lands will pass from thee."

However this may be, it is a sane and healthy sign to find such men as Lord Pembroke and Lord Radnor come to the relief of these Wilton carpet-weavers, some of whom had been working for 50 years at their trade. It is one of those acts of wise helpfulness and sympathy which tend in no small degree to lessen the harsher feeling of caste. It is one of those sweet "touches of nature which make the whole world kin."

Nothing can be more refreshing than to find, in these sordid days of "paying" work, a breath of the old spirit of craftsmanship.

A New Aspect of Business

THAT times are changing, and that a strong tide is setting in the direction of Brotherhood is evident from more sources than one. In the statement recently made by Chairman Shonts of the Panama Canal Commission, a new standard is set up for all public and governmental enterprises. On his return to New York, he said:

We found the first thing of importance to be housing and supplying 20,000 men. When our government first took hold of the canal everything was directed toward making the dirt fly. I think this was a mistake. Time should have been given toward preparing for the task by making arrangements to take care of employees.

Instances are no doubt familiar to all of care and attention being paid to employees, but as a secondary consideration. Mr. Shonts says it should come first.

If this proposition is put into operation, as without doubt it will be, we shall be afforded an object lesson of the practical application of Brotherhood ideas to business relations. And as if to make the lesson stronger, we have as comparison the former attempts to build the canal. Then the health of the men seems to have been totally disregarded. They died almost as rapidly as imported. The work on the canal instead of being forwarded, was delayed year after year. Thousands of lives were sacrificed and millions of dollars lost—wasted. The canal remained unbuilt.

Who can doubt that the Brotherhood and humanitarian method will not only not delay the work but, besides insuring ultimate success, will actually accelerate it? S. H.

Speculators in Cuba

SEÑOR QUESADA, the Cuban minister to this country, in replying recently to certain charges against the financial administration of his government, lets in some light upon a very ugly situation.

Cuba, it appears, proposes to add something to her debt in order to complete or carry further forward the payment of arrears due to her soldiers of the insurrection. For this she is being blamed.

Quesada's reply is that the payment must not be longer deferred if foreign speculators—he is too courteous to say American—are to be checkmated. These men are buying for about 15 cents on the dollar the soldiers' certificates of the amounts due to them and as soon as possible they will demand from the Cuban government the full dollar. The poor soldier gets a seventh of his money, and six-sevenths leave the country in the pockets of the speculators. The latter are known to be working hard and are already running the claims in on Congress. Quick payment is therefore greatly to the interest of the soldier; it makes no difference to the country's ultimate expenditure, since the money must be paid some time; and it keeps the money in the country. Sent Post-paid to any part of the world

- ADDRESS BY KATHERINE TINGLEY at San Diego Opera House, March, 1902 - \$.15
- A CHURCHMAN'S ATTACK ON THEOSOPHY (G. de Purucker). Just issued - .15
- ASTRAL INTOXICATION, and Other Papers (W. Q. Judge) - .03
- BRAGAVAD-GITA (W. Q. Judge). The pearl of the Scriptures of the East. American edition; pocket size; morocco, gilt edges - 1.00
- COMING RACE, The; or the New Utopia (Bulwer-Lytton), paper - .15
- CONCENTRATION, Culture of (W. Q. Judge) - .05
- DEVACHAN; or the Heavenworld (H. Coryn) - .05
- ECHOES FROM THE ORIENT (W. Q. Judge) - .12
- 21 valued articles, giving a broad outline of Theosophical doctrines, written for the newspaper reading public.
- MYSTERIES OF ANTIQUITY (G. de Purucker). Just issued - .15
- FREEMASONRY AND JESUITRY, The Pith and Marrow of the Closing and Coming Century and Related Position of (Rameses) - .15
- 8 copies for \$1.00; per hundred, \$10.00
- GREEK SYMPOSIA, as performed by Students of the Isis League of Music and Drama, under the direction of Katherine Tingley. Already published (fully protected by copyright):
- 1 THE WISDOM OF HYPATIA - .15
- 2 A PROMISE - .15
- LETTERS THAT HAVE HELPED ME (W. Q. Judge) - .50
- An aid to aspiring students of Theosophy.
- LIGHT ON THE PATH (M. C.), with Comments. Authoritative rules for treading the path of a higher life. The most beautiful edition of this classic ever issued. Pocket size, embossed paper black leather - .75
- LIGHT ON THE PATH (in Spanish); paper - .50

Lotus Group Literature

- LOTUS LIBRARY FOR CHILDREN
- Introduced under the direction of Katherine Tingley.
- 1 THE LITTLE BUILDERS, and their Voyage to Rangi (R. N.) - .50
- 2 THE COMING OF THE KING (Machell); cloth, gilt edges - .35
- LOTUS SONG BOOK. Fifty original songs with copyrighted music; boards - .50
- LOTUS SONG—"The Sun Temple," with music - .15
- LOTUS GROUP INSTRUCTION BOOKS. Manual No. 1—Evolution Series - .10
- Set of twelve leaflets for No. 1 and No. 2, per set - .05
- Lessons for use in undenominational Sunday-schools
- NEW CENTURY SERIES. The Pith and Marrow of Some Sacred Writings. Ten Pamphlets, issued serially; Scripts, each - .25
- Subscription - 1.50

Already published:

- SCRIPT 1—Contents: The Relation of Universal Brotherhood to Christianity—No Man Can Serve Two Masters—In this Place is a Greater Thing.
- SCRIPT 2—Contents: A Vision of Judgment—The "Woes" of the Prophets—The Great Victory—Fragment; from Bhagavad-Gita—Co-Heirs with Christ—Jesus the

- Man (the only known personal description).
- SCRIPT 3—Contents: The Lesson of Israel's History—The Man Born Blind—Man's Divinity and Perfectibility—The Everlasting Covenant—The Mysteries of the Kingdom of Heaven—The Burden of the Lord.
- SCRIPT 4—Contents: Reincarnation in the Bible—The Mysteries of the Kingdom of Heaven—The Temple of God—The Heart Doctrine—The Money Changers in the Temple
- OCCULTISM, Studies in (H. P. Blavatsky). Pocket size, 6 vols., cloth, per set - 1.50
- VOL. 1.—Practical Occultism. Occultism vs. the Occult Arts. The Blessing of Publicity - .35
- VOL. 2.—Hypnotism. Black Magic in Science. Signs of the Times - .35

The Higher Dignity

AMONG the many qualities that are so much needed by our civilization today, and that we must expect to see arrive in the train of renewed life-energies which Theosophy is bringing to the world—is a new ideal of *dignity*. Past types of dignity have ceased to exist, along with the ideas and sentiments which inspired them; and the age, in its transition period, has not yet gained a new faith upon which to found a new standard of manliness. The monkey element in our make-up is unduly prominent, swagger takes the place of dignity, and the only form of *presence* which is at all common is that which manifests itself physically as the accepted symbol of prosperity and pride.

Dignity must not be confounded with self-conceit, which is its opposite. Self-conceit does not by any means contribute to the dignity of a

man in any one's eyes but his own. It usually renders him an object of derision. It is a form of meanness, and sooner or later must diminish the moral and physical stature. And self-absorption is also a form of meanness; and though a self-absorbed individual may be ever so stiff and haughty, he will lack the warmer and more generous qualities that are essential components of true dignity.

In fact true dignity cannot be grounded on any narrow or sordid foundation, but requires to be based on a sense greater than the sense of self, and on a self-esteem too great for vanity. It must not be sought for itself alone, for that would be peacockery; it must spring spontaneously from a profound conviction as to the grandeur of one's *real* Self. The way to it lies through genuine humility; not the false humility which is a subtler kind of self-love, but the humility which would come to a man in the silence, from a realization of the utter littleness of his personality.

We see the dignity of human nature show forth whenever some calamity or serious emergency calls for a momentary shedding of our little protective masks of affectation and convention, and for a *uniting* of interests and energies in a common cause. The selves disappear and the Self shines forth ennobling each brow.

With lost faith and knowledge and grace, genuine bounties and prerogatives have become lost to man; and he has had to replace them with those spurious imitations that are so belittling to him. Thus there is Vanity, that lying means of extorting an undeserved reputation and unearned incense; it is tinsel. And there is the sounding brass of impudence, and the rusting iron of brute force, and the heavy lead of selfish indifference; all replacing the true gold of a sterling character.

Losing Loves & Cherished Delusions Many people go through the mill of disillusionment, and lose one by one their loves and cherished delusions. But how often, having no resource beyond, do they merely become cynics and take refuge in the eat-drink-and-be-merry policy, or the eat and drink policy without being merry.

But, to a Theosophist, death means Resurrection, and buried delusions merely fertilize the soil for a better crop. He has faith in a fuller life which will be ready for him when he is ready for it. Theosophists will not need to cling so tight to the false beacons of ambition, vanity, and the like, as do those who believe these to be their only resources.

Theosophy enables disappointed disillusioned people to make a fresh start in life and do over again in a better way those things which they have bungled. It revives the interest in life, and brings back the joy of living and doing. It has caused many a crestfallen and listless individual to hold up his head and pull himself together, for it has ennobled his life by giving it a meaning and a purpose.

We expect to see people who will think it undignified to be anxious about their own little interests and fears; people who will not allow themselves to be blown about by the currents of fancy and fashion; people who will not care to join in a scramble for money or position. Anxiety, restlessness, and greed are forces which debase; they are the foes of dignity.

Foes of Dignity are Restlessness & Greed The assurance that there is something genuine beneath all the superficialities of life is an assurance worth having indeed, and Theosophy has brought it to many and can bring it to all.

The students of Lomaland have some experience of the dignity that is given to life by cooperation in Theosophical and Brotherhood work. This feeling is far different from the narrow spiritual complacency of a sect. A sect is hide-bound by a fixed formula and does not grow or expand; it cramps its adherents and sets a barrier between them and outsiders. But the life at Lomaland is not permitted to die down and become encrusted like that. It is constantly spreading its boundaries so as to embrace new elements. It seeks to diffuse the spirit of life broadcast and thereby to revivify dead centers everywhere; not to draw people into its fold. Thousands of people visit Lomaland, see, and depart; carrying with them inspiration which will help them, and help them to help others; but they do not carry away membership forms or diplomas, and most likely do not know anything about Theosophical teachings. They have seen human life with a new dignity in it, and the sight has aroused their own slumbering forces. There is a *je ne sais quoi* about

the people in Lomaland, and especially the children, which infallibly sets people thinking. It marks the birth of a new dignity which will grow and expand until it spreads over the world and glorifies human life.

H. T. EDGE

The Coming China

CHINA is somewhat quickly awakening to a sense of her national unity. It is said that the average Chinaman, at home, is not patriotic. In a sense that is true. But he has the basis of patriotism. Not fully realizing himself as a member of a great homogeneous nation, he does nevertheless feel himself as one with his family, clan, and village. The feeling only needs that expansion which will come with the newspaper, the railway, the telegraph.

In January, 1905, there were 2400 Chinese students in Tokyo. Six months after, they were nearly 5000 in number. They are learning modern civilization from the Japanese, and in preference (now) to doing so in America, England or Germany. More than half have been sent from China by an arrangement between the Japanese and Chinese governments. By an edict of the Emperor, Japanese degrees are the equivalents in honor and status of the old Chinese Literary and Confucian Grades.

These Tokyo Chinese students have lately organized themselves into a Club. It contains 4500 members, has a large library, dining and reception rooms; and holds constant meetings for the discussion of all matters affecting China. It is really a patriotic club and is semi-officially recognized by both governments. But in some ways the members a little overshoot the ideas of the home authorities. For example they now write, publish, and circulate secretly as far as they can all over China four journals advocating various things and ideas—such as China for the Chinese, the expulsion of the Manchu Dynasty, a representative Parliament, or the abolition of the Empress in favor of the Emperor. But the keynote of them all is a call to their countrymen to awake to a new destiny. Large numbers of the students are in training for official posts in their own country, in order that those whom they will then govern may be freed from the rapacity of the existing holders. They are looking in fact to the establishment of a new régime to replace the old and traditional one. When these young men begin to return in a steady stream to their own country, full of new ideas which they received predigested as it were for them by Japan, China will experience a great stir and awakening.

STUDENT

Is "The Press" a Scapegoat?

WE hear a great deal about the evils of the Press; and, though there is no doubt as to the fact of the evil, a doubt may well arise as to whether the blame is entirely assigned to the right quarter. In other words, is not this "Press" perhaps a scapegoat upon which the public loads the burden of its guilt? A well-known jest describes a "company" as an organization which has neither soul to save nor body to punish; and this is not the only case where people transfer blame from their own shoulders to an abstraction.

From the point of view taken by someone who is not of the people—say a sovereign—it would seem that the people love scandal and slander and sensational reports, and print them for circulation among themselves. The sovereign would make no distinctions between editors and readers, and would not accept the excuse of "Please, Sir, it wasn't me; it was the other boy." He would simply say that the people had no right to publish bad papers.

In fact the Press is the people, and the people publish scandal because they like it; and if one paper refused to publish it, they would start another paper which would. It is our mirror, wherein we can see exactly what manner of nation we are.

We are all, every man and women of us, responsible in the matter. We shall have good papers when we demand them. We do have a few good ones because we do demand them.

The power of the Press—that is, of the people—is becoming so strong and unruly that one of two things will be necessary to control it: either despotic power or a public conscience. Community of interest is often supposed to be a sufficient check on popular government; but it means that the majority will let things slide, while an energetic few will get together and promote the interest of their clique. Something more is needed.

STUDENT

Unanswered Problems Concerning the Moon

A FOOLISH child can ask questions that a wise man cannot answer. But progress is made by keeping the inquiring habit of mind to the fore. Professor Shaler of Harvard has raised several problems concerning the Moon which are highly interesting though perhaps insoluble. One point is particularly striking: we know that there is a constant rain of meteoric dust upon the earth from the dissipation of meteors in our atmosphere. Upon snow surfaces this dust can be seen at times. But for our atmosphere the meteors would not vaporize but would crash down upon the surface of the earth, breaking down all projections, and covering everything with their fragments. As they fall to earth continuously of course no life could exist. But on the moon, which appears to be surrounded by the merest apology of an atmosphere, if by any at all, there are no signs of meteoric bombardment, for the mountains preserve their sharp clean reliefs and the brilliant white streaks and differently colored areas keep their distinctive characteristics. It would seem as if Professor Pickering's idea that the white portions are snow, or some similar substance, explained this difficulty in part, for snow would be constantly re-forming and covering the meteoric particles. But there are many difficulties in the way of accepting the snow theory, and astronomers have not yet admitted it even as possible.

Another curious question arises as to the cause of the southern hemisphere of the moon being so intensely rugged and scarred with great and small mountains, ring-plains and craters, while the northern hemisphere is mostly covered with smooth surfaces resembling ocean beds.

The question of changes taking place on the moon at the present day is not settled yet, the divergences of opinion being wide. Altogether, when we find that there is such difficulty in gaining any exact information about a body so close to us, comparatively speaking, as our satellite, it should make us very cautious in admitting dogmatic statements about Mars or the other planets, which are hundreds of times as far from us as the moon.

R.

Modern Barbarism in Africa

RECENT foreign news has described how an entire nation in Africa has been wiped out by the military representative of a civilized nation, in pursuance of the colonial expansion of that nation. The native nation numbered 80,000 to 100,000. Of these, 1400 were killed in battle; and the rest, men, women and children, were driven into the desert, and, the water-supply having been cut off, left to die of thirst. The dead "lay in heaps and mountains," and the general cabled home that the nation was no more and that the success of his country's arms was vindicated.

We refrain from mentioning names, as to do so would deflect attention from the real evil and merely gratify other national self-righteousness and censoriousness.

The occurrence demonstrates that modern culture and civilization have not softened the manners of barbarous ages. But they have taken away any excuse which barbarous ages might claim on account of unenlightenment; and they have added the intolerable vice of hypocrisy to the vice of cruelty. The action shows a crass stupidity as hideous and out-of-place as the cruelty. For what success could ever come of a colonial policy which begins by exterminating all the workers and producers? Even from the sordid viewpoint of commercial advantage, the policy condemns itself; and this is leaving out the higher question of the violated laws of justice and mercy and their terrible reprisals.

Let not the nations point at one another in hypocritical censoriousness and self-righteousness, but let all reflect that this outrage has taken place in the midst of a civilization in which all share, and has been rendered possible by a mutual toleration of vices. No nation could have acted thus if its fellow nations had been morally strong enough to unite in forbidding it. But mutual jealousies and mutual toleration of faults paralyzes the hand of justice, and we can only hold up our soiled hands in pious horror at deeds which we are powerless to prevent.

STUDENT

A Thrifty City

They are municipalizing other things beside the street railways in England. One small town—Widnes in Lancashire—has tried the experiment of municipalizing gas. It is eminently successful. Gas is supplied to users at about 30 cents per thousand feet—about one-third of the usual price here. As the cost of manufacture was but 22 cents, the town made a large profit with corresponding reduction of municipal taxation. A.

Some Views on XXth Century Problems

Conceiving Heaven

A writer in the *Spectator* at once laments and rejoices that we cannot frame for ourselves any stable conception of the nature of life after death. A picture of it which seems admirable and inspiring at one epoch, or to one generation, is out of date in the next, and is often even ludicrous. And yet he thinks that if we could reach a stable conception, and had any way of proving that it was correct, no more food would remain for imagination. "Aspiration hemmed in by certainty would lose all power to soar If the knowledge we crave were granted, men would surely become more material, more earthly, more secular."

Why? Surely the writer is, without knowing it, himself a materialist. His last sentence implies that though vision is denied us, we should, if we had it, find heaven expressible in terms of earth. We should see that it would only be a matter of time to get as tired of it as we sometimes think we are of earth life. Then we should aspire to it no more, and return from our vision to plunge deeper into sense.

May not the failure to conceive ultra-corporeal life be like the scientist's failure to conceive the ether? He starts with the idea that etheric substance must be somewhat like physical substance, and so he tries to explain its structure to himself in terms of what he has seen, balls elastic and inelastic, whirlpools, wires, rippled surfaces and so on. Hence all the hypotheses successively fail and are discarded.

And similarly with the pictures of heaven. Not recognizing that we are dealing with an altogether different state, we make pictures compounded of what we have seen and heard in *this* state.

But if—with Christ, who said The Kingdom of Heaven is within you—we conceive of heaven as the state of the soul, its habitual consciousness, we can then understand that the entry into heaven can be made at any time. It is union with the soul so as to share its consciousness.

Every act that we do may start from heaven or from earth. An act of service may be done from love or for payment. And every perception may be from heaven or earth. A forest may be looked at in its beauty, in its intense but quiet life, or as so much timber. A symphony may be heard as sublime music or as a mere set of sequent sounds. We can choose heaven or earth for every act and for every perception. And practiced habit, year after year, in going heavenward, will at last unveil glories in life now inconceivable.

Exactly what acts and what perceptions will be those of our disembodied life we cannot say; at any rate only those can say who have achieved final union with the soul; and they cannot say because we could not understand. But of the *state in which those acts will be done* and those things perceived, we can form a good, and a better and better, idea. And in this as in other matters the teachings of Theosophy will become fuller and fuller as fast as the world evolves to receive them. STUDENT

Uneducated Missionaries

THE author of *Bushido, the Soul of Japan*, speaking of the influence of Christianity upon the recent rapid development of his country, puts his finger upon the weak spot in all missionary work. The missionary has no education appropriate to the work he has undertaken. "Ignoring the past career of a people, missionaries claim that Christianity is a new religion, whereas to my mind it is an 'old, old story,' which, if expressed in intelligible words, that is to say, if expressed in the vocabulary familiar in the moral development of a people, will find easy lodgment in their hearts, irrespective of race or nationality." The missionary has not informed himself of this vocabulary nor entered sympathetically into the mind of the people who use it. If he knows anything of their religion at all, he knows through the handbooks of unsympathetic Christians—as, for example, he will go among Buddhist peoples armed with a "knowledge" of Buddhism obtained from such books as that of Monier Williams. Let him try *The Light of Asia* instead. He must reverence where the natives reverence, if he would have them reciprocate. His mind is out of perspective, out of tune with his work,

out of tune with the minds of those whom he would convert—if he will have it that Christianity is a new religion, if he will not see with Dr. Nitobe that it is an "old, old story." He must try to find out how that story—the incarnation of the World-Spirit for the help of humanity—is told among the people to whom he goes. Then, in their own phraseology, he can accentuate to them their own gospel, clear it of superstitious accretions, purify it, touch it with new energy. And when he comes back to his own country, he is quite likely to meet—especially of late years—missionaries to us from the East trying to do for us what he has been trying to do for their people!!! And they are too clever to make the mistake of ignoring or denouncing Christianity. STUDENT

Reading God's Purposes

YOU can of course get any sentence, expressing any sentiment, from a page of print, by the simple method of neglecting the intervening words. But only a lunatic would say that the sentence was the meaning of the author.

By a similar method the Reverend Campbell Morgan has been reading the purposes of God for the far East. He finds through a study of recent events that God intends America to evangelise the East. "He has for it"—America—"a mission as clearly defined for His purposes as He ever had for the Hebrews, and if you compare the sins of the Hebrews with those of the Americans I think the comparison would be in favor of the Americans." The data upon which he fastens his attention for the purpose of reading this message are two: The acquirement by America of the Philippines; and the entry by Americans through the now open door into China. "China waits for the evangel, and God has caused this people to enter into the open door."

Let us point out another little event or two, written on parts of the current page which the Reverend Campbell Morgan curiously neglects. A relatively obscure Asiatic Power suddenly arises, hurls back the incursions into Asia of a mighty Christian Power, gives an unspoken warning to all other Christian Powers that they must take no more nibbles at China, and none at Korea, attracts the attention of all Asia as its protector and begins to awaken China to a consciousness of her immense strength. According to the Reverend Campbell Morgan's own principles, why do not the signs indicate that it is *Japan* that is to evangelise Asia and especially China with *her* evangel? If we are going to try to read the purposes of God from the study of events, let us at least select the largest of the events to read from. STUDENT

Reform by Literature

A RECENT epidemic of suicide in Vienna has stirred a Viennese learned Society to consider the reason. Finding, or believing, that the epidemic is due to a previous and still continuing epidemic of what we here should call "dime novels" and the

English "shilling shockers," the Society has decided to give prizes to the authors of healthy novels and to publish the same at a price below cost.

But can good fiction be written for a prize? Would not the Society do better with its money by buying the right to publish existing novels of living authors; and by publishing in the cheapest form the great stories that have now become classics? Boys would just as soon read the romances of R. L. Stevenson as lurid accounts of the doings of *Dead-Eye Dick* or *Highwayman Jack*; and grown-ups would rather. If you touch one part of an author's mind—as you do by reading any of his books—you have got an introduction to all the rest of it. The keynote of the whole mind begins to sound in yours; which implies a good deal in the case of a mind like Stevenson's. Here is a chance for one of our multi-millionaires; instead of founding a free library, let him print one. And let the cheap reproductions differ from the run of such things by being well printed and unabridged. The effect might show in a reduction in our annual list of ten thousand homicides. But a still more marked reduction would follow a reform of the daily press. Whilst the columns we look at every morning are filled with minute accounts of the last murder, with pictures of the victim and imaginary drawings of the way he was butchered, we must expect hypnotic suggestion to be effective. C.

The Trend of Twentieth Century Science

Evolution among the Metals

PROFESSOR DARWIN'S recent and much talked of address applies the idea of natural selection and variation of type to the inorganic as well as the organic world. He even applied it to political institutions and States, arguing that the same process obtains all through nature.

Perhaps he did not press his idea as far as he might. In the organic world we find plants and animals slowly changing in response to slowly changing external conditions. Thus if the climate of a country is getting colder, the animals will be putting on thicker coats. Some of the variations that appear will be unstable, disappear at once or in a few generations, because they have no particularly advantageous relation to the surrounding conditions. Others which are well in relation with surroundings will become fixed and stable; and the total group of such fixed qualities mark a species. But if this species is to persist, it must be content to change slowly with slowly changing conditions. If it cannot, then it will disappear, as have the gigantic reptiles of the past. And there will be new ones which have the harmony with the surroundings that their predecessors failed to effect in themselves.

All this is well known for plant and animal life. But if, as Professor Darwin argued, the same law works in the inorganic world, we can deduce several truths which are not yet uttered in ordinary science.

In the first place there must have been elements in the past which now exist no more than exist the flying reptiles. Is there any evidence? One little bit from an unexpected quarter, for which we expect very little consideration. In Plato's account of Atlantis, purporting to have been obtained from the Egyptian priest Solon, it is said of the Atlanteans that "they dug out of the earth whatever was to be found there, mineral as well as metal, and that which is now only a name, and was then something more than a name—*orichalcum*—was dug out of the earth in many parts of the island, and, with the exception of gold, was esteemed the most precious of metals among the men of those days."

Is "*orichalcum*" an extinct metal which had to go because it could not accommodate itself to changed terrestrial conditions?

Secondly there must be new metals and other elements appearing. Why may not radium, thorium, polonium and others be new evolutions?

And thirdly there must be slight variations going on in elements that we think we know all about. One piece of gold or one block of sulphur may not, in its finer self, be exactly identical with another, though as yet the difference may be too subtle for our tests. There may be royal gold and plebeian gold.

Professor Darwin might have also suggested that human consciousness, besides being one of the forms of life that must change with changes in its material environment, may even be a factor in those very changes, perhaps a very potent one.

STUDENT

How to Eat

WE do not know that any body has ever yet defended the practise of bolting food, though a great number, probably the vast majority, do it to a greater or less extent. But a series of scientific experiments have now shown its entire impropriety. We are not constructed on that principle. Some animals are; for example the dog.

The latest investigations are anatomical, and the movements of swallowing have been carefully recorded. In animals such as man—soft-food-swallowers—the soft palate, *epiglottis*, sides of the pharynx and fauces in general, are thickly muscular. They are intended to act on the principle of the squeezing press. As food is undergoing mastication portions of it are taken into this muscular chamber at the back of the mouth and compressed. The thoroughly masticated and nearly fluid, quite smooth, portions go down the throat, the rest are returned to the tongue and teeth for more perfect reduction to a paste.

In such animals as the dog there is no such squeezing apparatus; the parts at the back of the pharynx are thin and but slightly muscular. There is practically no chewing, the food being merely broken into masses which as it were fall down the throat.

Previous investigations have been physiological. One of them was thus reported by Sir Michael Foster, perhaps the most eminent living physiologist: "The adoption of the habit of thorough insalivation of the food

was found to have an immediate and very striking effect upon appetite, making this more discriminating and leading to the choice of a more simple dietary, and, in particular, reducing the craving for flesh food. The appetite, too, is beyond all question fully satisfied with a diet which has a total considerably less in amount than with ordinary habits is demanded." A much larger part of the digesting is done in the mouth; subsequent processes are quicker and easier; there is less time for fermentation; and those elements in the food which are the chief sinners in this respect are withdrawn early from the digestive tract into the system. The brain cells are therefore not poisoned, consciousness is clearer, and more energy is available for the other purposes of life. A writer in *The Dietetic and Hygienic Gazette*, describing perfectly correctly the effect of prolonged and perfect mastication, says: "In all cases it can be said that there is an extraordinary change in the general health, much more joy of living, increased power of work, and freedom from the infinitely troublesome concomitants of chronic illness." In a word it may be said that perfect mastication, so perfect that the tongue can no longer detect a solid granule, transforms the food from an alien thing into the eater's absolute property. Swallowed otherwise it remains alien and an enemy.

STUDENT

Intrusive Electricity

A WRITER in *The Inland Printer* recently contributes an interesting little paper on the sometimes serious difficulty in newspaper printing caused by the accumulation of static electricity on the sheets, making the work of separating them very difficult and causing much loss of time. It was noticed that no printer was bothered in this way during June, but that—in Chicago—the trouble was at its worst in the first two months of the year.

Temperature had nothing to do with it. There is little to choose between the temperature of the pressroom in winter, with the doors and windows closed, and the same in summer with everything opened. And it was found that the variations of the barometer were also without relation to the variations in the presence of electricity.

The hygrometer gave the solution. When the air was humid there was no accumulation of electricity. When the air was dry the trouble was at its height. Some relief was obtained by putting wet sponges on the delivery board of the machines. But the sponges soon got their maximum charge and required to be connected by wire to the ground. Finally the real remedy was found to lie in placing pans of hot water about, and opening the hot water radiators. The walls of the room contained sufficient metal pipes, wires, and so on to do the rest.

STUDENT

New Science in Navigation

THERE have of late been several noteworthy applications of science to navigation. One of them is on the lines of wireless telegraphy, by which a ship makes its location known throughout its entire journey, not only to those on land but to other ships coming within a certain range, provided they have apparatus tuned to the reception of these common messages. Another avails itself of the sound-carrying power of water. By its means the sound made by the screw of another ship can be heard at a distance of several miles. The sound is multiplied and transmitted to the man on watch. Delicate thermometers have of course been used for a long time for the detection of distant icebergs. Now comes an invention for making the ship's log a mechanically registered record. A specially made chart lies between the compass needle and a pointer, and is perforated at short intervals by an electric spark passing between them. Other parts of the apparatus mechanically register speed, stops, condition of the sea, etc., etc.

The only bar to the adoption of these things are human stupidity, which cannot see their advantage; and cupidity, which will risk lives rather than spend money.

STUDENT

Chess Possibilities

IT has been estimated that the number of ways of playing the first ten moves on each side in an ordinary Evans' Gambit is 16,951,882,910,054,000,000,000,000,000. If every human being on the face of the earth were to play without cessation at the rate of one set per minute, 217 billions of years would be required to go through them all. Still there are people who know all about it. W. R.

Instances of the Effect of Deforestation

WITH regard to the effect of deforestation upon climate, a German meteorological expert quotes the following facts: The forest area of Greece has been reduced to only 16 per cent of its former amount, and an increase of temperature and decrease of rain has followed; especially in Attica, which was heavily forested 3000 years ago, but where now hardly any rain falls and the heat is such that "the Olympian games would be hardly possible" [supposing these were celebrated in Attica!]. In the Sinaitic peninsula there are only treeless deserts; but thousands of years ago the Israelites lived in a luxuriant and fertile country there. Palmyra, whose site is only a desolate waste of stones and ruins, was once a verdant oasis. In Mexico the Spaniards cut down the forests in the mountains and droughts and floods now prevail. In Upper Egypt, where 100 years ago rain was abundant, drought now prevails. In Algeria the forests have been cut down on a large scale since the middle of last century, and dry weather has increased. In Venezuela the level of Lake Tacarigua has been lowered by deforestation. STUDENT

A Travelling Nest

ON the steamer which travels in the Gulf of Paria 50 miles in one direction and about 15 in another along the coast of Trinidad, two swallows have built a nest close up under the awning. When steaming she is about a mile away from shore, and, when she stops at different places, lies about a quarter of a mile distant; and one may often see the birds flying backwards and forwards to the land whilst the boat is waiting for passengers. It is not likely the birds can have any settled home on shore, because the steamer goes in different directions on alternate days and sometimes remains stationary in the harbor at Port of Spain. So they are most truly "birds of passage," and one wonders where the little ones will eventually find themselves—in town or country or on the steamer? B. G.

Ginseng and Its Cultivation

THE Consul-General at Hongkong furnishes inquirers with some information on the subject of ginseng, of which, as a profitable crop, so much is heard. It is indigenous to certain sections of the United States and to northern Asia and Japan. The Chinese, who have used it from time immemorial, indorse it as a superior tonic and invigorator, hence there is a permanent market for its sale.

Rolling and hilly ground is best suited for its cultivation. It has an annual stalk but its roots are perennial. The seeds require two years

Lomaland Photo and Eng. Dept.

THE TRAVELLER'S TREE

Urania speciosa, The Traveller's Tree, is among the characteristic vegetation of Madagascar. It has a graceful crown of plantain-like leaves growing in a fan shape at the top of a lofty trunk, and supplying a quantity of pure cool water. Every part of it can be used in building.

no chemist's shop unprovided with more or less of it. The root of jin-seng is straight, spindle-shaped, and very knotty; seldom so large as one's little finger, and in length from two to three inches. When it has undergone its fitting preparation, its color is a transparent white, with sometimes a slight red or yellow tinge. Its appearance, then, is that of a branch of stalactite. The Chinese report marvels of the jin-seng, and no doubt it is, for Chinese organization, a tonic of very great effect for old and weak persons; but its nature is too heating, the Chinese physicians admit, for the European temperament, already

in their opinion too hot. The price is enormous, and doubtless its dearness contributes, with a people like the Chinese, to raise its celebrity so high. The rich and the Mandarins probably use it only because it is above the reach of other people, and out of pure ostentation. The jin-seng grown in Corea and there called Kao-li-seng, is of very inferior quality to that of Mantchouria. STUDENT

FOREST TEMPLES

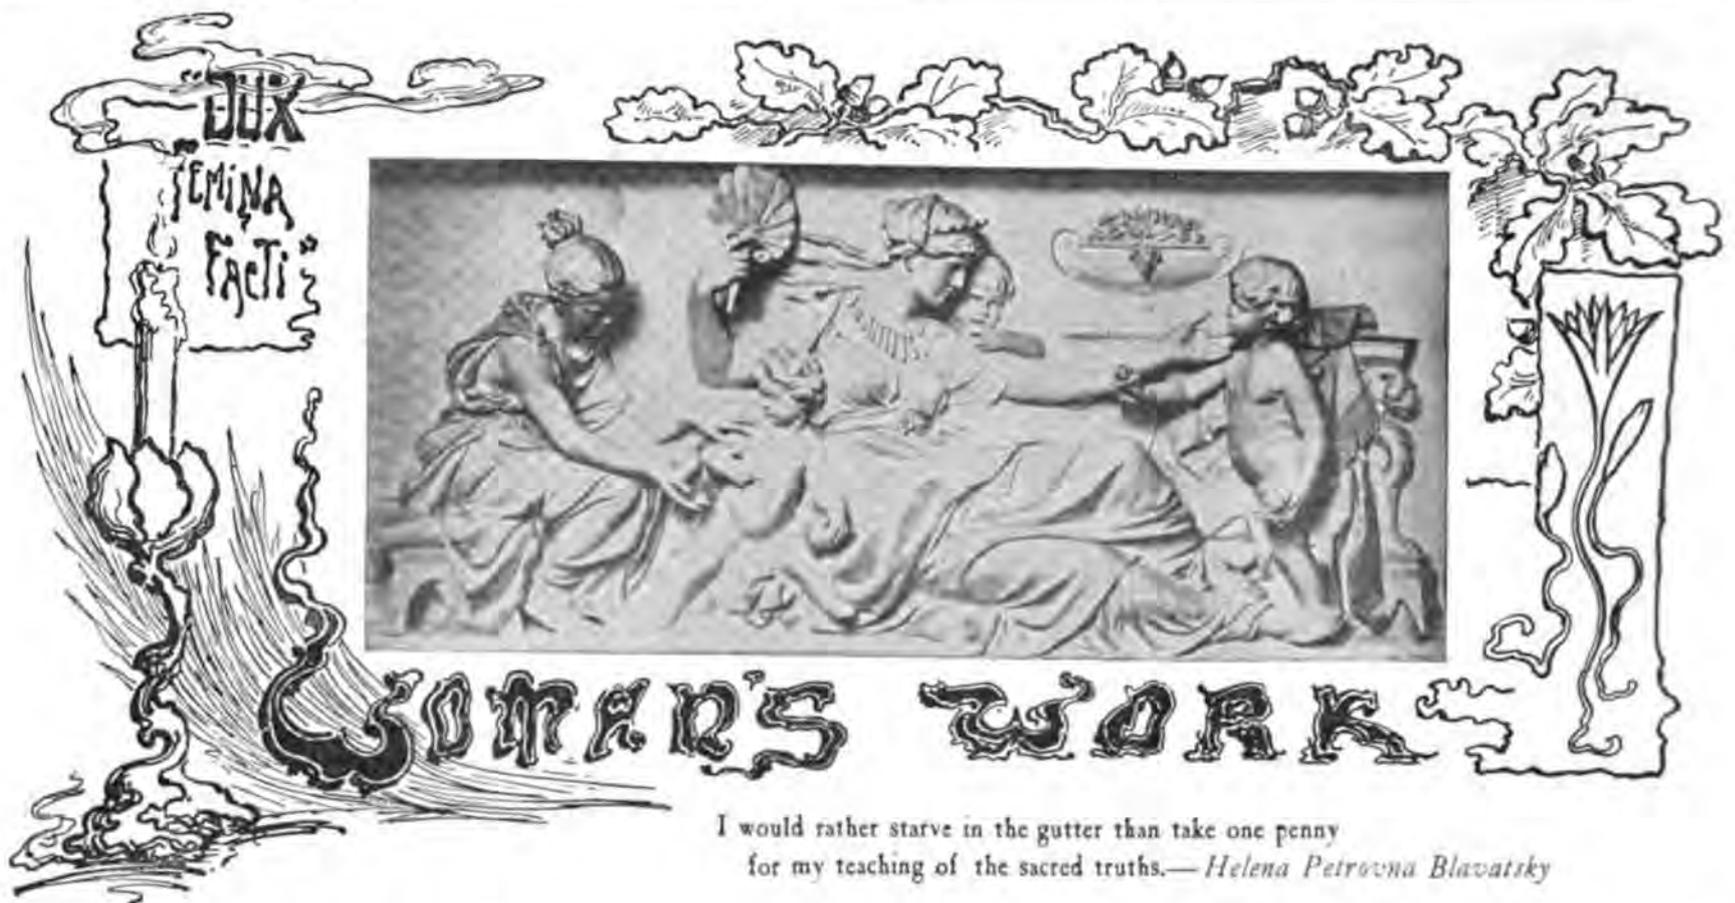

BRYANT

THERE have been holy men, who hid themselves
Deep in the woody wilderness, and gave
Their lives to thought and prayer, till they outlived
The generation born with them, nor seemed
Less aged than the hoary trees and rocks
Around them; and there have been holy men,
Who deemed it were not well to pass life thus.
But let me often to these solitudes
Retire, and, in thy presence, reassure
My feeble virtue. Here its enemies,
The passions, at thy plainer footsteps, shrink,
And tremble, and are still.

A Home of Rest for Horses

A HOME of Rest for Horses exists near London. Its chief object is to enable poor people to give their horses a week or two's rest, thus preserving the life of the animals from premature exhaustion by continuous work. On very easy terms a horse can

be rested and cared for until it is able to work again in comfort. Horses can also be loaned to those whose animals are being rested. Horses which are declared by the veterinary surgeon to be worn out are mercifully destroyed. The institution also provides a permanent home and pasturing for "old favorites" past work, thus obviating the necessity of killing faithful and loved servers. Let no cold reasoning of "what's the use?" mar the wisdom of merciful actions. STUDENT

I would rather starve in the gutter than take one penny
for my teaching of the sacred truths.—*Helena Petrovna Blavatsky*

"Esprit de Corps"

FOR one who has longed that her sex might lay aside the empty embroideries of life and take up its elemental tissues, it is an inspiration and a joy to come in contact with the life-giving current pulsating through the hearts of the women of Lomaland and moving their springs of action along the lines of highest endeavor.

Much is written and said in praise of the new woman, her virtues, her altruism, her clear vision, her strong heart, her high and true conception of life, all of which is well deserved.

"What is civilization?" asked Emerson, and some discerning person replied, "The influence of good women." It is not too much to say that the moral and intellectual hope of the world lies in organized womanhood. Federation is a great force in welding and harmonizing and making effective the efforts of women, and the hundreds of thousands of organized women in this country represent much of the intellect and heart, the culture and influence, the highest hopes and noblest possibilities of the American people. Yet their work falls short of its greatest possible and most lasting influence because they are neglecting the corner-stone on which the edifice they are rearing must rest. Devoted as they are to the welfare of humanity; feeling their responsibility for the betterment of the home, the state and the nation; giving study and thought and effort to the building up of character in children; loyal to the other sex to an extent which sometimes leads them away from truth, they yet fail utterly, as a body, to practice among themselves that simple yet most excellent virtue which might be termed "esprit de corps."

It is the possession and full expression of this rare quality which distinguishes the Lomaland women from their sisters who are as yet world-claimed and convention-bound. It is this which gives them an advantage over any other body of women of whom I know or have ever heard. Here women speak kindly, admiringly, justly of each other, and it would not seem fitting to mention before a Lomaland woman the becoming hat or the merely beautiful face of another. For not only are they awake to the thought and demands of the new time, but their interests are centered in the essential facts of life and character rather than the circumstantial and ephemeral. Not only are they conscious of their humanity, their moral personality, but also aware of their own spiritual dignity; shams and insincerities have been put aside and certainty and knowledge found. Intelligent, united, their very impersonality gives them the clear vision to look beyond the personalities of others, especially of their own sex, and to see only the real and the true.

This brings the true spirit of comradeship which gives solidarity to unity

and makes possible awakened power and compassion which characterizes these women of Loma Hill, qualities that cannot be defeated or gain-said. It is this that is seen and felt when one comes among them, and one wonders what, generations hence, will be the extent of this influence, now just beginning to be manifested. Already in a strategic position which commands victory, as educators of public opinion, with increasing loyalty to the idea, increasing interest in unselfish work for others, nothing will be impossible to them.

Ruskin speaks of "God's thought in womanhood" as expressed in the Madonnas of the Old Masters. Methinks there is just as fine and true, and certainly a far more practical expression of it right here, in our own day and generation. And as Ceres walked through the fields and made them bloom, so the footsteps of the women of Lomaland will be etched in deeds of love and joy and service, in happier homes, finer children, wiser schools, juster laws and holier lives—all made possible because these women are indissolubly united, with faith in one another, confidence in their Leader, and trust in the unchanging and beneficent Law.

LUCY W. BRADLEY

(Miss Bradley, now a resident visitor at Lomaland, is well known in the higher journalistic world. She visited Point Loma some months ago, then came again, and was so taken with the life and work of the Students that she now expresses herself as determined to make Lomaland her home.—ED.)

Words of a Pioneer

ONE of the interesting characters of old New England days and a type of womanhood rather in advance of her times was Mary Wilder White.

Mary Wilder was born in 1780 and spent most of her life in Concord. At twenty she was married to a young Frenchman who owned large sugar plantations in the island of Guadeloupe, and at once set out on the long journey to her new home. They arrived on the island just as one of the negro insurrections broke out, in which she lost her brother, who had gone to seek his fortune there; two months later her husband died of yellow fever. Thus she found herself, in a strange and hostile country, with friends and fortune gone, in a position in which it was as dangerous to stay as to leave. However, she finally escaped and returned to Concord. Several years later she married Daniel Appleton White and spent four happy years, in spite of ever failing health, in her new home in Newburyport, where she died at the age of thirty.

In the book recently published by her daughter and grandniece, *Memorials of Mary Wilder White*, many extracts from her letters to friends

are given, which reveal the strength and beauty of her nature and show her to have been a thinker, with ideas about the position of women worthy a place beside the more enlightened views of the Twentieth century. In one letter, to a Mr. Rockwood, a valued friend, she wrote:

I am gratified extremely to find you disposed to consider woman as "rational and human." That we do not more frequently conduct ourselves like reasonable beings is the fault of man, who, by the attention he pays to the exterior, seldom fails to convince us the more difficult attainments of moral and intellectual excellence may be easily dispensed with, provided the person be pretty and the air and dress fashionable. When one reflects a moment on the manner in which woman has been treated, it appears rather more wonderful that she preserves her rank among intelligent beings than that she is often vain and trifling.

Further she adds:

I know Mary Wollstonecraft is held in general abhorrence, and some of her principles I detest, as undermining the foundations of social life. But I do not think she has been by her writings more injurious to her sex than those good people have, who so long have impressed themselves and us with the belief that we were meant as the mere baubles of an hour, neither capable of being the companion and friend of man, nor the instructress and guide of youth.

Again, in a letter to a woman friend sent with a copy of Gistorve's *Female Duties*, she says:

To me, I confess it appears one of the best works of the kind I have ever read. He has preserved the good medium and has not thought to make us either Amazons or babies—goddesses or idiots. . . . He is unquestionably superior to Fordyce, Bennett and all that class of writers who degrade woman to infancy and allow her scarcely any real virtue except humility.

When we remember that in those days a young woman was taught unquestioning obedience and to have a most humble estimate of her personal importance, such ideas, thus frankly expressed, are really extraordinary. And we who live under the changed conditions which have come about in the past hundred years, owe a large debt of gratitude to such pioneer champions of the cause of the higher womanhood as Mary Wilder White. STUDENT

A COMMITTEE appointed by the National Educational Association recently reported (and substantiated the report in all details), that women school-teachers in the United States are paid, on the average, somewhat less than street-cleaners. In pay they must be reckoned below the lowest grade of unskilled street workers. Only four cities in the United States—Chicago, Washington, Columbus, Ga., and Meridian, Mississippi—pay their women school-teachers as much as they do their sewer cleaners, and two of these cities employ negroes for the latter work, which may account for the difference. Question: how many street-sweepers and sewer-cleaners would not relinquish their "professions" if they were reasonably certain of receiving larger salaries for less laborious kinds of work elsewhere? What, then, is the holding force among our teachers—men as well as women? Evidently it is not in all cases a sordid and selfish one!

MADAME EMMA NEVADA, the singer—who is, by the way, a native of California and whose girlhood was spent beneath its eternal sunshine and among its glorious hills, relates the following story of her last visit to Queen Victoria at Osborne House, not long before the Queen herself died:

"I was singing one of the songs the Queen, in her gracious way, asked me to sing to her, when my eyes suddenly filled with tears. It seemed so very ridiculous. But a vision of my old home in the hills at California came before me. I used to sing as a child, and imagine I was before all kinds of audiences. In those days colored portraits of the Queen appeared on cigar boxes. I used to beg the empty boxes from my father and his friends. Often when alone as a child I would prop the empty boxes on chairs and imagine I was singing to the Queen. The scene came back to me suddenly, that day at Osborne, and for a moment I was a child again, singing to my empty cigar boxes."

When the Soul Speaks

THE power of instant decision, which has been described as lacking in most women, has recently been demonstrated in a number of instances in a very remarkable manner.

Recently, while driving her own automobile, a New York woman, rounding a sharp curve on a very narrow road, saw, just on the further edge of the small bridge, another machine which had been stopped on account of a blasting signal given by some workmen. There was no room to turn around and about six seconds only in which to decide what could be done.

To go forward meant certain injury, if not death, to the occupants of both cars. Immediately she made up her mind to jump the little stream. As the automobile reached the bridge, she turned it with all her might to the left, almost at right-angles, and shot it down the bank and across the little stream, landing in the mud on the bank beyond.

No one was hurt and it has been declared that the feat was without precedent in automobile racing, as an exhibition of courage, clear sight and instant decision.

To give, briefly, another instance: A Philadelphia girl, who was playing golf with no one near but a little caddy, heard the screams of women and children in the park behind. Turning, she saw bounding towards her a big, red setter, foaming at the mouth, and followed by a crowd of men and boys. The little caddy started to run at the cries of "mad dog," but realizing the girl's helpless condition, clumsily grasped a golf-club as if to defend her.

She immediately threw him behind her and, grasping her own stick, placed herself in the correct position for driving a ball. Just as the dog sprang for her throat, with all her strength she brought the heavy iron-clamped driver around, catching the dog squarely behind the ear and breaking his neck.

When the crowd came up, the girl, in answer to many questions, said, "All this passed through my mind in a second. You see the dog was coming so fast I didn't have time to think slowly, and suddenly it occurred to me that there was really nothing to be afraid of, and that if I could hit a little golf ball just how and where I wanted to, I could surely hit a dog.

"I said to myself, 'you must think the dog is a ball and nothing more,' and I tried hard to. When he got close, I picked out the place where I ought to hit him—and that was all."

There is an unselfishness that is labored and stiff and uncouth, about as like the finer unselfishness exemplified in these instances as the geometrical gazelle

of a Persian tile is like the graceful brown-eyed creature of the hills. It bears the same relationship to the soul that moonlight bears to the sun. The higher unselfishness is something quite other, an instant response to the Soul's own call, as is proven by its motive, which is not the gaining of some selfish or personal end but the quick assuring of the welfare of another. Were the soul recognized to be what it is, the life's own Councillor and Light, we would see that such heroism as is referred to here is really the natural and easy thing after all. The wonder is, in these stirring times, not that we read of such instances but that we read of so few. STUDENT

IN former times, as soon as the gates were closed at night, especially in Seoul, all the men used to remain in their houses, because the ladies of the rich classes had the privilege of going out at that time, deeply veiled, with little paper lanterns in their hands, says a writer in the *Fortnightly Review*, in an article about the women of Korea. They glided from house to house, visiting their friends. But thieves began to make use of their opportunity to rob them of their jewels and the custom has been discontinued.

Now, in rare cases, they may go out at night, but deeply veiled and accompanied by their husbands. The women of the lower classes are sometimes seen in the streets by day-time, deeply veiled, dressed in green garments with little red sleeves, whose only use is to hide their faces.

THE LADY OF LIGHT

Written for *Lucifer* by GERALD MASSEY, during the lifetime of H. P. Blavatsky, its Foundress and Editress

STAR of the Day and the Night!
Star of the Dark that is dying;
Star of the Dawn that is sighing.
*Lucifer, Lady of Light!

Still with the purest in white,
Still art thou Queen of the Seven;
Thou hast not fallen from Heaven,
Lucifer, Lady of Light!

How large is thy lustre, how bright
The beauty of promise thou wearest!
The message of Morn'ing thou bearest,
Lucifer, Lady of Light!

Aid us in putting to flight
The shadows that darken about us,
Illumine within, as without, us,
Lucifer, Lady of Light!

Purge with thy pureness our sight,
Thou light of the lost ones who love us,
Thou lamp of the Leader above us,
Lucifer, Lady of Light!

Shine with transfiguring might,
Till earth shall reflect back as human
Thy likeness, Celestial Woman,
Lucifer, Lady of Light!

With the flame of thy radiance smite
The clouds that are veiling the vision
Of Woman's millennial mission,
Lucifer, Lady of Light!

* Lucifer is the planet Venus, the Light-Bringer, the Morning Star, the pale, pure herald of Day. It is no profane title, and is used in the last chapter of Revelations as descriptive of the Christ. In ancient theologies the deities were symbolically androgynous, hence Mr. Massey's beautiful idea.—E.V.

OUR YOUNG FOLK

The Raja Yoga Question Box

THESE two Americans brought many gifts of mind and heart to the service of their country and of the world.

1 Who was James Russell Lowell?

ANSWER—James Russell Lowell was a great man of letters. His home was in the university town of Cambridge, Mass., and his father and mother both loved learning and taught their son to love it too. They opened up to him the treasures of poetry while he was a little child. The boy grew up to be a famous scholar and a man of noble mind. Lowell was first a lawyer, then an editor and a professor at Harvard University, where he succeeded the poet Longfellow. He wrote many beautiful poems; some of these are full of fun and wit. Lowell also wrote essays, and gave many fine addresses and public lectures. In this way he shared with

others his great knowledge. James Russell Lowell served as a diplomat, and was sent as United States Minister to Great Britain and also to Spain.

2 Who was John Hay?

ANSWER—John Hay was a statesman, a diplomat, and a man of letters. As secretary of state he made more than fifty treaties with other nations for the United States, and in all of them he showed how wise and noble, and how successful a statesman can be. John Hay began to write poems when he was a college-boy. Later he wrote a book of beautiful essays about Spain. When he was President Lincoln's secretary he planned with his fellow-secretary, John Nicolay, to write the story of Lincoln's life. They began then to write down what the President said and did every day, and later they wrote a book about this great man.

THE FLOWERS IN AUTUMN

SUSAN COOLIDGE

THEY know the time to go!
The fairy clocks strike their inaudible hour
In field and woodland, and each punctual flower
Bows at the signal an obedient head
And hastes to bed.

Doway and soft and warm.
No little seedling voice is heard to grieve
Or make complaints the folding woods beneath;
No lingerer darts to stay, for well they know
The time to go.

Teach us your patience, brave,
Dear flowers, till we shall dare to part like you,
Willing God's will, sure that his clock strikes true,
That his sweet day augurs a sweeter morrow,
With smiles, not sorrow.

has come into use, a kind that has more brotherhood in it. This new diplomacy is said to have been introduced by an American statesman, John Hay.

In 1901 John Hay, then American Secretary of State, said in an address that he thought the time was past when diplomacy meant falsehood and trickery, and being clever enough to set traps so as to gain advantages over other nations. He said the world had progressed to a point where the representatives of the Powers could meet in a spirit of frankness and sincerity, and without the wish to injure any nation on earth. He said many other things that showed that for a long time he had had an ideal of the comradeship that might exist among the nations. It is known that he had done the very wisest thing that anyone who has an ideal can do—he had lived it himself. When John Hay, as diplomat, met the representatives of other nations, he behaved with so much sincerity and tact, and with so much consideration for the rights of others that he taught the world a lesson in the new diplomacy.

A man who succeeds in doing so great a thing as this must have learned to set aside mean things and to choose the better, nobler side of life. He must have made use of every opportunity to learn about great and noble ideas.

The greatest opportunity that came to John Hay was when he met Abraham Lincoln. He was only a boy, but he was modest and observing, and was even then a good judge of human nature, and had a quick sense of humor. Abraham Lincoln became young Hay's friend; this friendship had a great influence on the boy, and helped to form his character, and give him while he was a mere lad, broad and noble ideas about patriotism. It led to a second great opportunity for Abraham Lincoln found John Hay so steady and so discreet that, when he was elected president of the United States, he chose John Hay for a secretary. From that time until Lincoln's death John Hay was the Presi-

Brotherhood in Diplomacy

BROTHERHOOD among the nations!

This is what the world needs, but how will it ever be brought about! How will the nations learn to act toward one another not only with honor and dignity but with compassion, as good comrades? Of late years much has been written about the nations coming to a better understanding in their dealings with one another, and it has been said that a new kind of diplomacy

has come into use, a kind that has more brotherhood in it. This new diplomacy is said to have been introduced by an American statesman, John Hay.

dent's confidential messenger. He carried the President's messages to the generals on the field of battle during the Civil War, and did many other important duties. It is stated that John Hay never forgot any of the President's orders, and that he never once behaved carelessly or indiscreetly in delivering the messages. You see John Hay was learning to be a great statesman. After many years President McKinley chose John Hay for Secretary of State. By that time Mr. Hay had served long as a diplomat and had represented the United States in several countries, everywhere conducting himself with such tact and sincerity and firmness that people had great confidence in him. President McKinley had confidence in him, too, and stood by him. They worked together for a high ideal. At the time when the different nations would have seized parts of China and destroyed her as a nation, John Hay acted for the United States in such a wise and brotherly way as to prevent this greedy seizure. This was how he introduced brotherhood into diplomacy. He believed that strong nations should protect the weak, not insult nor rob them. To-day the United States stands in a commanding position among the Powers and better able than ever before to help the world, and this is to a great measure due to the work of John Hay and the new diplomacy.

A RAJA YOGA PATRIOT

Submarine Forests

SUBMARINE forests, together with much of marine plant and animal life would be practically unknown to most people, but for the recent invention of glass-bottomed boats.

The apparatus in itself is very simple, being merely a long box or trough a foot or two wide, having for a floor a thick piece of glass. This box is set into a hole cut through the bottom of the boat, running lengthwise through the center, the glass resting in the water. This arrangement gives opportunity for a number of people to sit in the boat and gaze through the glass, down into the water as the boat is rowed along.

The continual ripple upon the water prevents one from seeing very far down into deep water; the glass lying flat on the water prevents the ripples and enables us to look down through it, to considerable depths. To peep into Nature's underworld in this manner is a great treat, for we always enjoy watching and studying plants and animals which are living in a free and natural state. It is a most entrancing sight to see the many colored fish darting about among the gracefully waving sea-mosses and plants.

Monterey Bay, California, has lately been found to contain a beautiful submarine forest of sea-oranges and a remarkable growth of sea kelp and weeds of different varieties, some of the plants being thirty feet in height. This discovery was made in a glass-bottomed boat. The Bay of Avalon, Santa Catalina Island, has also many submarine wonders and many glass-bottomed boats may be seen being slowly rowed along near the shore, carrying people who are enjoying the sight at the bottom of the bay.

If this semi-tropical sea has such wonders to charm and interest us how delightful it would be to study the much more luxuriant growth of submarine plant and animal life in the tropics!

COUSIN EDYTHA

THE CHILDREN'S HOUR

THE SECRET

“WHERE does the clerk of the weather store
The days that are sunny and fair?”
“In your soul is a room with a shining door,
“And all those days are there.”

“Where does the clerk of the weather keep
The days that are dreary and blue?”
“In a second room in your soul they sleep,
And you have the keys of the two.”

“And why are my days so often, I pray,
Filled full of clouds and of gloom?”
“Because you forget at the break of day,
And open the dreary room.” — *Selected*

DEAR CHILDREN: I was very much interested in the letter about Fifi and Lucifer (you know they are both friends of mine) and the intelligence of cats, and I quite agree with “A Raja Yoga Teacher,” that they are not nearly as much appreciated as they deserve to be. Here is a true story of Kitty-boy-oy, of whom you have heard once before. She had two kittens in a barrel in the stable, and they were much admired by everyone who passed that way. This made the fond little pussy-mother anxious, and, one day Kitty-boy-oy and the kittens disappeared. At first no trace of them could be found, but Kitty-boy was watched and was seen coming down from a big table which had been placed across the rafters away up in the roof of the stable. What trouble she must have had in getting the kittens up there! For a long time although Kitty-boy came regularly into the house and stayed with the family, no one ever saw the kittens, but one day the Mistress was ill and obliged to stay in her room. The Master on his way up to see her, met Kitty-boy on the stairs and listened to a long story in cat language which, unfortunately, he could not understand.

But, what do you think? Presently, in came Kitty-boy with Yellow Coon No. 2 in her mouth, and jumping on the bed, she put him down beside the Mistress and sat down to rest and purr! Of course then the Master realized all she had wanted to tell him, how, “now that their eyes were open and they could walk about, their present very elevated nursery was not at all safe, and would he come and help her to get them down and into a safer place.” He went at once and fetched the other little fellow, Kitty-boy running contentedly by his side, and soon the whole family were comfortably established much to Kitty-boy’s satisfaction.

Kitty-boy understands Raja Yoga and trains her kittens beautifully. She also plays with them in a most scientific way to strengthen all their muscles, and she sits patiently for a long time, gently waving her tail from one side to the other, which seems to be the game the kittens love best of all!

COUSIN BEATRICE

DEAR CHILDREN: The other day I read about some seed that were planted in the mountain streams of California. These seed were much livelier looking than any seed you ever have planted, and there were one hundred and twenty thousand of them. They were seed-fish from the State fish hatcheries, and it took twelve teams of horses to carry them from the train to the streams. M.

LONG ago the Cherokee Indian named the turkey the “Oo-coo-coo,” because of the musical notes which he would hear from a flock of these birds, living undisturbed in their forest home. It is supposed that our Pilgrim Fathers, in hunting for their first Thanksgiving dinner, disturbed a flock of Oo-coo-coos, which flew away calling “Turk, turk, turk,” and thinking this was their natural cry, called them turkeys.

RAJA YOGA GIRLS WHO ARE STORING UP DAYS “THAT ARE SUNNY AND FAIR”

MANY dogs are trained to herd sheep; but did you ever hear of birds acting as shepherds? Nevertheless there are birds in Venezuela, called cranes, that are trained to do so.

A crane is a large-sized bird with very long legs. These birds live in large flocks in the forests. They make their nests on the ground. The eggs are pale green in color. There are usually ten eggs in a nest. The baby crane keeps his downy coat for several weeks before his feathers begin to grow. Cranes can run from danger better than they can fly, and they can also swim.

Usually they walk about in a very dignified manner. Sometimes when they feel more lively, they jump and dance about like little children at play. It is a comical sight to see them spread their great wings and go whirling about. They certainly look as if they were trying to dance fantastic dances.

When cranes have been captured and trained, they become very useful. They may be trusted with the care of a flock of sheep or poultry.

Every morning they will drive a flock of ducks or chickens to their feeding ground and bring them all safely home at night.

A tame crane shows great love for its master and soon learns to obey his voice. It will follow him about and show delight when he caresses it. It will also guard him from danger and will attack with fury any enemy. It is a bird with great courage.

In so many ways have these cranes shown superior intelligence and made themselves valuable, that they have won great affection from all the families who are fortunate enough to own them. AUNT EDYTHE

DEAR BOYS AND GIRLS: Have you ever heard of a horse receiving medals for his services during a war! There seems to be no record, but it would be interesting to find out if “Volonol” has any companions in glory.

“Volonol” is the name of the beautiful charger who carried Lord Roberts, one of England’s most successful and beloved generals, through the African campaign of 1878. His great achievement was the famous ride from Cabul to Candahar, a distance of three hundred and eighteen miles, which Lord Roberts accomplished in twenty-three days with a flying column nearly 10,000 strong. “Volonol” was decorated by Queen Victoria. School of Antiquity

Interesting Papers at Isis Theatre Sunday Night—Recitation and Songs by Raja Yoga Girls—A Youthful Musical Composer

A MOST delightful program was given by the Point Loma students at the Universal Brotherhood meeting at Isis Theatre last Sunday evening. The stage settings and decorations of green and blossoms were even prettier than usual, and the musical program was an unusually enjoyable one. The Raja Yoga Girls' Chorus gave three songs in a most delightful manner, and little Ruth Westerlund gave an effective rendition entitled "The Daffodils."

The musical event of the evening was a song by Miss Ethelind Wood, "Build Thee More Stately Mansions, O, My Soul," the music for which was composed by Master Rex Dunn, one of the Raja Yoga boys. The music and Miss Wood's exquisite rendition of it elicited much praise from the delighted audience.

As neither of the speakers announced for the evening were able to be present, Miss Edith White read Mrs. W. T. Hanson's paper, "Theosophic Life for Women," and Mr. J. H. Fussell read Mr. Machell's paper, entitled "The School of Antiquity and its Great Mission."

From the former paper we quote as follows: "It is said that 'woman's work is never done.' This is absolutely true; woman's work is never done. It can never be finished until the end of the world, for she is the torch-bearer and whenever she lowers her standard the flame burns low, and there is confusion and disaster. It is no set job like the building of a house, the digging of a well or the keeping of a store. Women have no eight hour laws. These are all material things and deal with concrete time, the hours of the day and the night. But woman's work is of another order and is not measured by time. Can you ever finish the training of a soul for eternity? This should be essentially woman's work—the training of children; not all necessarily to be the mothers of children, but all guide-posts and examples to show them the way."

Mr. Machell's paper was in part as follows:

"What is the School of Antiquity, and what is its mission? To understand this it is necessary to have some idea of the Theosophic philosophy, which alone can give us a clue to the nature of man and his destiny. In Theosophy alone do we get any clue to the enormous gulf that separates the more educated human souls from the mass of mankind. For no other system of philosophy today possesses the key to the mystery of human evolution. Even in the teachings openly given in such works as Madame Blavatsky's *Secret Doctrine*, there is enough told plainly to show that human evolution is a very long process, in the course of which the soul returns again and again to birth in this same world, gradually strengthening and purifying itself, and gaining wisdom and power to know and to understand the nature of life and its purposes. And it becomes at once obvious that some must progress faster than others, and in time be so far in advance of those, as to appear like souls from another world, wandering in a strange land among races of men so far behind them in evolution that they can scarcely find points of contact.

"It is in this conception of human evolution that we get a key to the meaning of the School of Antiquity. . . . We hold that there are souls whose progress would have entitled them ages ago to pass on to those states of being inhabited by those for whom this earth life in which we now live, has no more mysteries to unravel or lessons to learn; but who, feeling in their heart the tie of brotherhood with those who still struggle in the darkness of this lower world, prefer to stay with them and work unceasingly to lead them into the path of true progress. These are the teachers whom we call our Leaders and to them we give the trust of the disciple to his Master, the obedience of the soldier to his chief, the love of children to their parents. Without the teacher there is no true school. Almost all the nations that today claim to be civilized have lost even the tradition of such schools and such

teachers; therefore the name of the School of Antiquity is most appropriate as indicating that the aims and methods of this school have not been drawn from the same sources that inspire modern educationalists. It follows from what I have said that such teachers, appearing on earth again and again, life after life, have gathered round them groups of disciples and led them as far along the path as they have been able or willing to go, and in each new life the Teacher will naturally seek to find and gather together again these scattered disciples of former lives, and will endeavor to reawaken the old enthusiasm for progress and for the helping of humanity that inspired them in former lives, and to teach them a little more, and to lead them a little further, and so to form a school—truly a School of Antiquity.

"Now, these teachers have one great aim, and that is to lead humanity on to the happy path of true Life from which it has wandered, and though they may seem to make a selection which does not seem justified to the ordinary observer, in their choice of disciples, the thoughts that I have suggested to you on the past history of their work will give a sufficient explanation of some of the apparently strange selections made in the choice of disciples. Their objects are impersonal, and they use the best means to accomplish their great purpose. Having held the position of Leader and Teacher in other lives, they know what they have to do and how to do it better than any of their would-be advisers, helpers, or critics.

"The true Teacher is one who has the power to call out in the disciple his own unsuspected wisdom, to stir in him enthusiasm for, and love of, the right, and to make him know his relation to all that lives, so that he may become a worker for humanity.

"As is the Teacher so is the School and if any seek to enter such a School as the School of Antiquity in order to get knowledge or power or illumination with which to shine before the world, he is courting certain disappointment. The existence of such an ambition in the mind makes it impossible for the student to get into harmony with the School or the Teacher and such an one is thus by his own nature shut out from getting what he seeks. But those who are stirred by one unselfish desire to be of use in the world, can come into harmonious touch with the source of human wisdom, even though they may have countless weaknesses to overcome and faults to correct before they can enter into the light that shines in the heart of the School.

"The School of Antiquity opens the door to the greatest of all joys, the joy of life lived rightly, and it calls for men to enter in and learn the secret of happiness. The Inner School has never closed its doors, but men have made it impossible for the Teachers to establish the outer schools that prepare the disciples to enter the true School of the Mysteries of the Heart. The selfishness of the world has closed the door so long that we can scarcely believe that at last the door is opened. One has been found strong enough and wise enough to be able to plant the School of Antiquity on the earth again and its doors shall never again be wholly closed, for the outer court has been thrown open and the children have gone in. Already the light of the School is pulsing out over the world and stirring strange thoughts in the hearts of men, and waking old ideals, old longings for a nobler life. The work of the School has begun, and ere long the seekers for truth will know where to turn for the light, and they shall not be disappointed."—*San Diego News*

Theosophical Meetings for Sunday Nights

Public Theosophical meetings are conducted every Sunday night in San Diego at 7:30, at the Isis Theatre, by the students of Lomaland.

Theosophical subjects pertaining to all departments of thought and bearing on all conditions of life are attractively and thoughtfully presented.

An interesting feature is the excellent music rendered by some of the students of the Isis Conservatory of Music of Lomaland. Theosophical literature may always be purchased at these meetings.

Art Music Literature and the Drama

The Artists' Life in Lomaland—Its Purer Motive

THE contemplation of art carries the mind away from all that is inharmonious and sordid in human life, and bears it into the realm of the ideal.

Yet not all who follow art as a profession are so uplifted. There are few artists, at the present time, who do not feel the limitations of circumstance. Many have an inner conviction of power which they are prevented from expressing by the conditions under which they labor, and by ignorance of the divine laws governing life.

They yearn for a favorable time when they may become freed from the fetters of "conventional demand"; when they may speak in form and color the deeper feelings of the heart. Year by year they work, dissatisfied, but helpless to pull themselves out of the conditions of their environment. At last the struggle becomes too hard. Gradually they relinquish their ideals. The methods demanded by modern life bring "success"—and in time they become self-psychologized. They no longer feel the urge of the Creator within; their labors become a round of repetitions. The approbation of society is the ultimate reward sought, and no matter how pure the aspirations may have been at the start, the final results redound solely to the glory of self; emulation steps in and destroys the peace of the kindest and most gentle heart. A divine gift is prostituted to the demand of ambition, pride, selfishness and love of fame.

In Lomaland this is not the case, for a new motive is introduced into the artist's life. For *self* he substitutes a great and noble *Cause*. He feels a new inspiration, and finds that, in some way, he has been freed from the world's compelling force. Necessity for the conventional and popular in subject and treatment utterly drops away from his life. The Cause demands the highest which his imagination can suggest, the best which his hand can fashion. Perfection is the standard which it holds aloft. Lomaland opens wide her gates to genius and invites the true artist to enter and to create.

The artist finds that, by relinquishing his selfish motives, and doing his work that humanity may reap the benefits, he sets in operation a well-known law of nature, a law which Jesus illustrated in his parable of the talents, and when he said, "cast thy bread upon the waters, and it shall return after many days." A new power to achieve is realized, when we choose to give rather than merely take.

Katherine Tingley teaches that if we would bring into expression our ideals, we must live pure and unselfish lives, in order that the soul, which is the creative power, may use our faculties and our hands.

The ancient Greeks understood this truth and exemplified it in daily life. They have left the proofs in those incomparable models which today we use and learn from, but cannot equal.

The students in Lomaland are trying to live truer lives, to bring again the Golden Age to the world. Only in this way can we hope to raise art to its true place, as one of the mightiest powers in the world's spiritual advancement.

EDITH WHITE

The Book Beautiful

LOVERS of beautiful books will be glad to learn that at last it is possible for the cover of a book to glow with the warmth of Eastern jewel-work or the subdued lustre of ancient Persian or Chinese manuscripts, without the loss of perfect freedom of handling.

An English artist-craftsman, after years of experiment, has perfected a method of superimposing transparent unstretched vellum, that has been delicately treated, upon the most richly decorated surfaces for their protection and permanence. The two surfaces are so welded together that they become one. Not only do the colors shine through in all their native beauty, but the rich hue of the vellum gives an added warmth of tone that blends the whole design until it glows like lustrous iridescent enamel. The artist can secure the most wonderful effects of transpar-

FRAGMENT FROM A
WOODEN STATUE
FOUND IN
EGYPT

ent delicacy and almost evanescent charm, safe-guarded by the permanence which the covering gives to his work.

Not since the Venetians, in the Fifteenth century, introduced from the East the inlaying of leather with gold (tooling) as an addition to the then used blind impressions made upon it with dies and blocks, has there been such an advance in the art of book ornamentation.

This new device secures to the artist a full range of color and freedom of fancy. A limitless field of opportunity is opened for individual work without the aid of the reproducing machine. Our books can come to us warm with the loving touch of artist and craftsman.

Some of the most beautiful books that have thus far been made, are of dark rich-toned leather, into which medallions of bright-hued "Vellucent" have been laid. Delicate traceries of gold tooling enhance the beauty of the leather, harmonizing the whole.

Genuine merit and simplicity recommend this latest achievement of the book-binders' art. Vellum is the time-honored book-stuff, used from ages long forgotten, and its toughness, durability, and strength make it the most fitting binding for books.

BERTHA BUNDSMANN

To Keep the Light Burning

IN the whirl of enthusiasm with which Japan adopted some of the western customs a danger arose that the unique and priceless native art would be crushed out of existence like the useless engines of war of the past. This peril has not yet been finally averted, for today the principal Japanese Government instructors are teaching the European style of art derived from Paris and Italy. To discourage the tendency towards universal levelling, to rescue the sensitive spirit of art from the Procrustean bed of uniformity, the "Bijitsuin," or "New-Old School of Japanese Art" has been established. This aims at the preservation of the feeling and spirit of the past while accepting certain European principles. A wise combination of the arts of the two hemispheres may produce some interesting new developments, but anyway it is cheering to know that an organized effort is being made to save and extend the nobler ideals of the past while they are still alive.

In Europe the chance has been in some aspects almost lost; the Muse of Art breathes with difficulty; the soul of architecture is dormant, hypnotised by the marvellous engineering and mechanical skill which has usurped its place; sculpture has a very small place in the hearts of the people; and ornamental design is still largely a matter of superficial "decoration," purposeless, pandering to luxury, and only rarely the spontaneous outcome of a higher sense of beauty. To the production of un-inspired though skillfully executed pictures there is no end, but the fire of the art-life of the masses burns low.

America suggests a more promising field, for new experiments are encouraged here, and there is a feeling that something better than the best of the past should grow out of the splendid energies of the living present. But while national aspirations remain sordid and esthetic, while matters are calculated in money value, the art world will instinctively feel its separateness from the practical world and will drag on but a precarious existence. Yet the more real life is coming, and when the brighter cycle comes and the present sham existence has been worked through, Art and Life will be one again. So we wish godspeed to the *Bijitsuin* and the Japanese patriots in their uphill task of promoting the middle course in art and avoiding the extremes.

R.

MUSIC has been considered by the Hindus, as far back as written history goes and doubtless very much further, not only as one of the arts, but as closely allied to philosophy and mathematics. According to their oldest known records it is given divine origin. The Hindu scale has seven different tones, symbolized by the seven different planets, and in all Indian legend music is represented as being closely allied to the divine powers. It is related that not only men, but animals and even the trees and rocks listened to the singing of Maheda and were quieted and thrilled.

Universal Brotherhood Organization

Central Office Point Loma California

A Means---Not a Finality!

AS FIRE is wrapped in smoke, so baser motives often may be found combined with the most lofty enterprises that have ever been inaugurated for the benefit of man, and even workers in the sacred cause of Universal Brotherhood were warned by Mr. Judge lest they should be entangled in the low desire "to maintain a certain position before the world," as an incentive to their labors. Acceptance of the principle of Universal Brotherhood, should imply the wish to spread the practice of unselfishness, and the belief in human solidarity for the advantage of mankind at large. We must not wish the triumph of our Cause because of the prestige of being on the winning side, nor for the sake of the reflected glory on ourselves. To the ideal worker, our Organization appears merely as a means adapted to the spiritual regeneration of mankind, and all his efforts are in fact directed to produce conditions in the world at large which finally may culminate in the disappearance of the society as such, as scaffoldings are pulled down when a building is erected. When all the world becomes Theosophical, there will be little need for a Theosophical Society—as such.

The spirit of fraternity which lives within our ranks has for its main concern the drawing forth of all the latent graces and good qualities in humankind at large, and only takes an interest in a body of philanthropists to the extent that they subserve the end in view.

Our wish is not to crystallize a set of doctrines, nor to perpetuate a style of life, however much adapted they may be to present needs; but to revive the smouldering sparks of hope in the disconsolate, and hasten on the springtime in the world of men. The spirit of returning spring, which wakes the sleeping flowers and casts its gorgeous mantle on the naked ground, is perfectly impartial in the help it gives. Its stimulating flow reanimates the blushing rose and wakes the modest toadflax too upon the mouldering wall. Unheralded and unperceived, its genial currents permeate all vegetable life, pouring a vivifying stream through every graceful form. The founders of our Movement did not agonize and toil to make a little shelter far remote from contact with a noisy world, in which a favored few might gently pass their quiet days sustained by mutual services, varied by peaceful contemplation and the study of a book-philosophy. They willed to form the nucleus of a Universal Brotherhood: a nursery for young warriors and a training school for helpers of the race. The peace of Lomaland is only to be sought, as drops of blood retire into the inner chamber of the heart, to issue forth again with new impetuosity on their career of vitalizing, cleansing work throughout the body.

And while Lomaland has its peace, it is also a spot of intensest activity; for it is the heart of the world's spiritual life and from it continually go out vitalizing streams to nourish the heart life of all peoples.

Our sympathies are not confined to those whose names appear upon the members' roll. They are but fellow workers in a field as broad as sad humanity, pledged like ourselves to keep on working while a single child wanders unguided on life's devious ways. **PERCY LEONARD**

Humanity's Burdens---How May They Be Lightened?

FIRST, get at the children. Protect them from child labor, a scandal. See that during the years of their education they do not come frozen, breakfastless, and dinnerless, to school. Take them away from drunken, criminal, and incompetent parents. Make their school life pleasant; accustom them to music, flowers, colors, and cleanliness. Keep in touch with them after they have left school, and see that they have places open to them where the same influences of art and music will reach them, where they can proceed with any subject of education that attracts them, and where there is no sectarian control. These institutions should be open to all the poorer classes without reference to age.

Secondly: beautify the cities; obliterate slums, and replace them with gardens, parks, and the recent "model farm gardens," in which the children are practically taught every detail of country and farm life. A love of that life is thus awakened in them, and they develop an instinctive pressure country-wards, which, the moment opportunity offers, will take them there. One of these already exists in New York.

Teach in any and every way the dignity of labor, that is, of service. The man who is not serving his fellows in whatever line is his and is open to him, is a drone whose life is wasted. There is a natural aristocracy to which any man or woman may belong, and to which all should try to belong. It does not consist of the idle, nor the wealthy, nor of those whose occupations we consider more honorable than others: but of those who do what they do in the spirit of service. The man who sweeps the street in the right spirit serves those who pass; the man who plays the violin well serves those who listen; the woman who serves her house and children as they should be served makes generations to come her debtor. If the spirit of work is unselfish and pure in the eyes of the Divine Law and Judgment, they do equally well, they stand equal; and sometime will know it.

All those who are behind in the modern race of life must be shown brotherhood in action, must be served by those who do it voluntarily, and must see that

they are being served. The ways of doing this are infinite, but "Charity Organization Societies" are usually not among the number.

And all the time we are waiting for that permeation of all classes by the spirit of brotherhood, which will not only alleviate but prevent the conditions implied in the question; and which will open the eyes of those in whose hands is the business of law-making to the necessary social and political measures for giving formal effect and embodiment to the New Spirit.

RALPH WYTHBOURNE, THE HEROIC RAJA YOGA TEACHER

On August 29th Mr. Wythbourne was drowned after rescuing one of his young pupils and helping others to shore.

"Greater love hath no man than this, that a man lay down his life for his friends."
—John xv, 13

Students'

Path

TOIL ON, THEN, GREATNESS

LOWELL

THERE never yet was flower fair in vain,
 Let classic poets rhyme it as they will;
 The seasons toil that it may blow again,
 And summer's heart doth feel its every ill;
 Nor is a true soul ever born for naught;
 Wherever any such have lived and died,
 There hath been something for true freedom wrought,
 Some bulwark levelled on the evil side.
 Toil on, then, Greatness! thou art in the right,
 However narrow souls may call thee wrong;
 Be as thou wouldst be in thine own clear sight,
 And so thou wilt in all the world's ere long;
 For worldlings cannot, struggle as they may,
 From man's great soul one great thought hide away.

The Age of Peace

IN this age of transition, with old things crumbling, and unknown, untried conditions arising in their place, the human race finds itself confronted by two mighty facts. One is that men must have some sort of physical and mental occupation; the other, that we have already reached a stage of mechanical skill which, if rightly directed, would render the satisfaction of our necessities so trivial a matter as to fail to furnish many with sufficient employment. And this in spite of the enormous wastage of our social system and the stupendous feat we have accomplished of conquering and developing three continents in four centuries.

It seems as though we have exhausted every known resource; we have enjoyed life, until now the decay of nations and the failing health of races warn us that our abused bodies will not endure any great amount more of gluttony, drunkenness, and vice.

We have turned to mental development, and now we read plainly in the criminal and insane statistics that aimless education without a solid moral foundation is fatal.

It seems likely that in this dilemma, we shall be compelled, as a matter of policy and for self-preservation, to take up our long-shirked duty as guides and helpers of our younger brothers of all degrees. There are so-called savage races, laboring under the curses and evils of what we are pleased to call "civilization." Is it not time that we began to realize more fully our responsibilities toward them? But there are also the animal and vegetable kingdoms. "For," as St. Paul says, "the earnest expectation of the creature waiteth for the manifestation of the sons of God. . . . For we know that the whole creation groaneth and travaileth in pain until now . . . waiting for . . . the redemption of our body (*i. e.*, our physical nature)."

As the self-boasted "lord of creation," it is the duty of man to develop to its highest possibilities every animal and vegetable form, whether it is directly "profitable" to him or not. Surely here is a task, worthy of the best energies of a nation, making its territory a garden, perfect and beautiful, in every detail of its peaceful happiness. There would be room for the exercise of the highest organizing faculties of man in the adjusting of the balance between the many forms of life; room for the greatest executive energy in maintaining that balance unswervingly. There would be scope for the most subtle skill of the chemist, the bacteriologist, the farmer, the botanist and the horticulturist. Landscape gardening would have limitless fields of action, and the artist and musician would find priceless opportunities of learning Nature's harmonies of color, form and sound. Even the spirit of chivalry would find that in defending harmless species of animals and plants against predatory and parasitical tribes, there are as great opportunities for the display of knightly qualities as on any tented field of human war.

And we venture to predict that such a national return to sane simplicity of life and nobility of purpose would not only serve the object of

furnishing healthy employment for the masses, but would also cleanse their minds and purify their morals more completely than all orthodoxy has yet succeeded in doing. Moreover, it is just possible that some of the secrets of Nature which science with its microscope has long and vainly sought, might be revealed to such clean, brave, nature-attuned, cosmic-minded, men of the fields and woods, who, by daring to acknowledge their brotherhood with all creation, would receive the full freedom of Mother-Nature's dominions.

Does it not certainly seem as though the plan were worth trying?

RALPH WYTHBOURNE

[It is of interest to state that Mr. Wythbourne was a frequent and valued contributor to the columns of the NEW CENTURY PATH, and over the signature of "Student" wrote many a thoughtful article.—ED.]

Theosophy in Business

EMERSON says, "There is a time in the life of a man when he is very careful that no one shall take him down, but there comes a time when he is careful that he shall take no one down." This seems to express almost the first change that Theosophy effects in a man's life. Every one knows the adage, "honesty is the best policy," and in theory believes it, but if we look at the business of the world today, or for years past, do we not find the practice in the majority of instances very different from this; and instead of it the unwritten rule is to get as much as possible and to give as little as possible. And how many of the business methods of today, if weighed in an even balance, could be characterized other than as sharp practices? Even in the very necessities of life constant watchfulness is needed to guard against adulteration and deceit. It is true that there are honorable exceptions; there are both employers and employes who regard not simply the interests of themselves, but of one another; and there are producers and manufacturers who know that their best interests are served by the production and sale of "honest and genuine" goods;—but that other methods obtain in a vast number of cases is, alas, too true.

What, then, has Theosophy to say to the business man as such? How many can give a satisfactory reason for the statement, "honesty is the best policy?" Many an instance can be pointed out of the *apparent* success of the exact opposite. Who can give a reason for it? We assert that no adequate answer can be given to these questions outside of Theosophy. And Theosophy gives the answer in its three main teachings of Universal Brotherhood, Karma, and Reincarnation. If Brotherhood be a fact in Nature, as Theosophy demonstrates, then any other policy except honesty is suicidal, and injury to one's brother is injury to one's self. There is no basis for justice and honest dealing outside of this fact of Brotherhood, and the knowledge that Karma, the law of absolute justice, rules the world. We fail to see it sometimes, but that is because we have forgotten the fact of Reincarnation and also that we cannot escape the reaping of the harvest we have sown, even though we have to wait until another life. This is the message that Theosophy has for the business man.

STUDENT

Reflections and Refractions

THERE are no external stimuli known that affect the sense organs, which cannot be made to affect some instrument in a far greater degree."

"A photographic plate, coupled with a telescope, will reveal the presence of millions of stars whose light does not affect the retina of the human eye in the least."

"By means of a microphone the tread of a fly sounds like the tramp of cavalry."

"The bolometer will note the difference of a millionth degree of heat. It is two hundred thousand times as sensitive as our skin."

"The amount of work done by a wink of the eye would equal a hundred billion of the units marked on the scale of a very delicate instrument."

"We have the ability to count about ten or eleven per second. An instrument has been devised which will count down to the hundredth part of a millionth of a second."

Such are some of the achievements of science by means of the delicate instruments manufactured to aid in its research into the mysteries of nature. Will not the race which invents and uses such instruments become so modified in consciousness that it will tend to evolve its own organism in the direction indicated by the instruments? STUDENT

European Notes

(By Our Special Correspondent)

SEPT. 7, 1905

SPAIN is a curious country. A remnant of antiquity—looked at from one point of view: an ultra-modern state—looked at from another. That delightful book *The Bible in Spain* suggests a civilization centuries out of touch with the rest of Europe, and, in some respects, there has been little change since it was written, sixty years ago. On the other hand, King Alfonso XIII touring through his domains on a motor-car of 35 h. p. is a startling novelty, full of hopeful significance. For this method of progression sets at naught all the solemnities of a royal visit. There is no time for officialism to hide ugly things from the ruler's eye—a time-honored practice in most countries, and especially in Spain. So it is probable that King Alfonso will, within the next few months, have obtained an unequalled knowledge of the realities of life in Spain. If I were a poet I would sing that Royal Motor Car. As an Irishman, I would erect a statue to it! What would Cervantes say or do, could he behold its flight?

Another contrast. In not a few of the towns of Spain the bakers' shops have been broken into by the starving population recently—so great is the distress. Meanwhile, the king is received with boundless enthusiasm wherever he goes.

I think he has captured the heart of his people, and will lead them out of their distresses, *if they will but co-operate.*

An eloquent and thoughtful article in the *Heraldo de Madrid* strikes the keynote of national deliverance not only for Spain but for all other countries. It is the reformation of family life in its many details. And it is the woman who has to play the chief part in this reconstruction. The article in question deals with the Congress on Domestic Economy to be held at Antwerp next year, and the hope is expressed that Spain will be represented there, and will apply the knowledge gained.

"DIVINE Service!" we say. Alas! unless we perform Divine Service in every willing act of life, we never perform it at all.—*Ruskin*

"Fair Japan" at the Lewis and Clark Exposition

IN these days of costly amusement productions it must be something extraordinary to appeal strongly for public patronage, and that "Fair Japan" is of unusual character as regards the amount of money invested—\$100,000.00—as well as the unique entertainment it offers, is the unanimous opinion of the majority of Lewis and Clark Exposition visitors. "Fair Japan" is an educational as well as most interesting attraction, and one may get a very thorough knowledge of its industrious people by paying a visit. In fact the first endeavor of the management in its production was to reproduce a miniature city of the Flowery Kingdom, and the results are certainly most satisfying.

Visitors enter from the Trail through an imposing gateway, a replica of the famous Temple of Neklo, and at once are struck with the genuine foreign atmosphere; quaint buildings of old and new Japan border both sides of the street; in them are occupied over 200 native workmen in 63 manufacturing and industrial pursuits. Reproductions of famous temples, and museums of old Japan curios will prove most interesting to all visitors, and the Japanese tea gardens, with the dainty maids serving tea and rice cake *à la* Japanese, are especially popular with lady visitors. In the Japanese restaurant both American and Japanese food and

service may be had at very reasonable prices. The bazaars are stocked with beautiful Japanese wares, rare Cloisonné vases, and rich embroideries and beautiful paintings on paper and silk by Japanese artists.

In the Japanese theater a numerous company of native performers present a diversified and lengthy program, including juggling, dancing, acrobatic feats, magic, sword contests, the now famous science of Jiu Jitsu, and thrilling scenes from the Japanese-Russian war.

A visit to "Fair Japan" is a visit to the Island Empire of the Mikado.

THE best part of every good work is always inexplicable; it is good because it is good: and innocently gracious, opening as the green of the earth, or falling as the dew of heaven.—*Ruskin—Elements of Drawing*

The New France

ACCORDING to Paul Sabatier, the eminent French author, his country has already reached the beginning of the way to the religion of the future. That is not the way he phrases it; but it comes to that. He describes the evolution throughout the country of "a spiritual condition which the papers can hardly describe, and of which the reviews, alas! bound up as they generally are with schools and parties, scarcely tell more." He can hardly tell more himself, so subtle is the condition he speaks of. We have come to feel, he says, that "we have all become citizens, . . . that we are members of one another with such intensity that it would require the language of mysticism or of poetry to express our sentiments and our sensations." A sign of this is the new *Union for Moral Action*, whose open, friendly and courteous dis-

cussions bring together men of all possible views and beliefs. Indeed "to say that they discuss with courtesy would be only a small fraction of the truth; they discuss with the consciousness of being all equally fallible human beings, who have much to learn from one another, and who, though taking opposite paths, have nevertheless a common aim."

He says the language of mysticism is required to express the change; and presently he uses it: "France of today has had her mysterious messengers; in the depths of her heart she has heard the words ringing: 'Seek no more among the dead, but go, march onward humble and yet confident in the future.' These emotions of a small number of chosen people have thrilled through the whole nation, and they are gradually passing into all the manifestations of her activity."

Those who know France know that this is true. She has been thrilled by the first pulses of that wave which in a few more years will touch all humanity and suddenly make a new era. She has not reasoned herself into this new state, nor been preached into it. There is no Rousseau; there are no Encyclopedists. It is not connected with any one religion. "Religion," says M. Sabatier, "appears less and less as a revealed metaphysic, more and more as a tie uniting man to man." France has only to look to it that in her enthusiasm she does not become blind to the attempt that will surely be made to readjust old fetters in a new form.

The New Manila

WHEN the Americans entered Manila they found it one of the filthiest cities in the eastern world. And there were all the consequences of filth—cholera, smallpox, plague, and nearly all the other fevers. For a long time there had been no street cleaning; under every house was a cesspool; drainage was forgotten. In the cesspools lived the family's live rations, pigs, poultry, and an innumerable army of rats.

Its death rate is now lower than that of many cities in our own south. Care has removed the smallpox, cleanliness the cholera, isolation and the destruction of rats the plague. The unspeakable accumulations in the streets have vanished, the cesspools are drained and dried. The natives resisted, of course; the oriental mind seems—excepting in Japan—unable to grasp the occult connection between dirt and disease.

It must be admitted however that the inhabitants had disposed of their dead properly—from a health point of view; but otherwise hideously. The cemetery was a large circle, surrounded by two walls. Into the space between the two walls, dead bodies taken from the coffins were placed, covered with quicklime, and bricked in. If the family owned this particular bit of space, there the body stayed permanently. If not, when the recess was again needed in the progress of time, the bones were taken out and flung into the central area—which, when the Americans first arrived, was a sufficiently ghastly spectacle.

Reforms are still in vigorous prosecution. The water and drainage systems are being brought fully up to modern standards. A large city hospital is about to be built; weed-choked roads are being cleared and hardened. At present the drainage—if the word can be used—though complete and effective, is primitive. Every night 1500 pails of refuse are collected and emptied ten miles out into the bay.

"Three hundred years ago," says Mr. Daniels, "Manila was the European metropolis of the Orient. Its area of trade included practically the world, and its harbor served as the clearing port for all the East. But the policy of Spain, by which the city's trade with the outside world was confined to the home country, brought about the commercial downfall of Manila."

Regulation of Marriages

ONE reads articles discussing the arguments for and against stirpiculture, or the regulation of marriages, and showing that on the one hand the welfare of the race calls for some regulation, while on the other hand certain existing forms of marriage regulation (such as the *mariage de convenance*) are most undesirable.

The fact is that marriage regulation, like so many other reforms, is most desirable, if there were any authority fit and able to administer it. As things are, the prevalent state of doubt and ignorance as to all questions concerning the real nature of man and the proper conduct of human life would prevent any unanimity from being secured. Or, supposing any body of authorities should agree as to a scheme for regulating

Some Views on XXth Century Problems

What Is a "Decadent?"

WHAT is a "decadent?" In the last years of the Nineteenth century there were a few minor poets in England to whom that term was applied; but though everybody seemed to agree as to its fitness, no one defined it. They had not much of an audience in their day; but it is now said to be growing.

The poems of Ernest Christopher Dowson have just been republished, with an introduction by Arthur Symons. This young man died at 33, having spent his adult years in alternations between debauchery and poetry-writing. "With a body too weak," says Mr. Symons, "for ordinary existence, he desired all the enchantments of all the senses. . . . Dowson had exquisite sensibility, he vibrated in harmony with every delicate emotion; but he had no outlook, he had not the escape of intellect. His only escape then was to plunge into the crowd, to fancy that he lost sight of himself as he disappeared from the sight of others. The more he soiled himself at that gross contact. . . ." etc.

A half brainless, will-less, emotional apparatus—is not that what it comes to? And with a trick, which he ultimately lost, or in which he lost interest, of registering his emotions in verse. Mr. Symons would have us believe that his soul was unspotted by the debauchery to which he subjected his body. "A soul 'unspotted from the world,' in a body which one sees visibly soiling under one's eyes; that improbability is what all who knew him saw in Dowson, as his youthful physical grace gave way year by year, and the personal charm underlying it remained unchanged."

If we define a man as a self-ruler, permitting those emotions that he will, evicting those that he will not, creating such as he finds worthy and destroying others, the decadent is not a man. He is the prey of whatever emotions happen to blow across his strings. Some of them may happen to be dainty, and if he have the trick of versification he will be a poet. Some of them are sure to be gross, and then, whether poet or not, he will be a debauchee. And since emotions left to themselves, always ultimately tend downwards, he will end by having only the grosser ones and become extinguished in debauchery. Sometimes they take a crazy turn; and the poet, become a pure debauchee, becomes also a lunatic. This was the fate of Verlaine.

Those who believe in reincarnation will recognise in decadents the remains of men. Their genius is the instinctive memory of a time when they stood high in the ranks of human evolution. Feelings were awake in them beyond the range of other men. But they voluntarily let themselves go, and, from being the masters of feeling, became its slaves. In this life they are echoes from their own once attained heights and from their own once permitted—but now involuntary—depths. Let us hope that for some of them that vast retrospect which comes to all at the moment of death may bring keen enough suffering, clear enough vision, to make them resolve to call back their departing will and take up their next birth as fighters against their own decadence. But if not—
STUDENT

Helpless Education

PROFESSOR TUCKER, President of the American Bar Association, in the recent annual address to the members of that body, advocated a very pale remedy for a very black evil. The evil is the taking by great lawyers of great fees from wealthy corporations or individuals for devising means and grubbing up legal technicalities to enable them to evade the law. And the proposed remedy is the adoption in all law schools of "an enlarged and comprehensive course in 'legal ethics,' to be taught by men of lofty ideals."

Does he really think that morality can be so taught by lectures as to be effective? Does he think that the great lawyers do not already know that their conduct is immoral? Professor Tucker is perfectly aware that what we call education is no moralizer. Why should it be? It is only education of brain, not of character. You might as well hope to make a man a good carpenter by sharpening his saw. Indeed the Professor himself remarked: "There is not a public abuse on the whole Eastern coast which does not receive the enthusiastic support of some Harvard

graduate." The only remedy lies with us. We would not associate with a man who had stolen a dollar, nor with the lawyer who had accepted ten cents out of that stolen dollar for defending the theft in a law-court. Multiply the dollar by a million and we feel nothing but respect—even if only a brain, not a heart, respect; for we mostly live in our brains—for the thief and his lawyer. There is universal public opinion against little thefts; there is not against big thefts. It is our dollar worship that produces the people and corporations which fleece us and the lawyers who show them how to do it.

The Falling Birthrate

DR. JOHN SHAW BILLINGS, commenting on the declining birthrate says: "So long as the present tendency of the people to aggregate in cities continues . . . so long the deathrates are likely to increase, and, therefore, the rate of increase in population due to excess of births over deaths will diminish. . . . This state of things has occurred before in the world's history in certain regions, as, for instance, in southern and western Europe during the decline of the Roman Empire."

His statement mixes two distinct conditions, both of which obtain: the decreasing birthrate, as noticeable in States with fewer large cities as with more; and the increasing deathrate, almost specialised in cities. The latter is necessarily an evil and the result of evils; the former not necessarily a symptom of evils. It may mean an increase of vice of various kinds. It may mean a degradation of vitality; or that consciousness is taking on higher activities. It may mean that the life-current, carrying souls to birth, is setting most strongly elsewhere, as once in the case of the parts of Europe mentioned by Dr. Billings. It is a fact that the decades of greatest decrease of the birthrate are also the decades of richest immigration. In other words, whatever the cause of the lessening birthrate, the pressure of the world current cannot be stayed; there is to be a great and increasing nation here. That is the real reason which makes the way to America from other countries the line of least resistance for so many thousands yearly. Great nations do not spring up by accident; each is a step, an attempt, the fruit of all former ones, a new organism through which the evolving spirit of humanity will achieve something new—in its turn to be woven into the fabric of the next.

The Two Silences

A WEST Coast paper prints a rather fine article on *The Power of Silence*, arguing that our great American vice is to dissipate our mental energy as fast as we make it, in talk. It counsels less talking and more thinking. One might think indeed that the editor had been reading some of the Theosophical works issued at Lomaland, the *NEW CENTURY PATH* and the *Mysteries of the Heart Doctrine!*

But if it is true that stored mental energy may be dissipated by talk, it is also true that energy may be dissipated by thought that does not run to words. If we could see the minds of the majority of people, whilst they work silently at something mechanical, we should find that they are merely saying within themselves those very same things which, were there a bystander, they would be saying to him. Nay, the subjects upon which their minds are drifting are even more discontinuous, mostly fragments of memory. These they work over and over again. Entire mental silence, where the mind is as it were held listening for something higher than itself, is almost a lost art. Is not that why our minds are confessedly unable to understand real truth or to know where now we only hope?
STUDENT

Charnel House Inspiration

PECULIAR forms of insanity seem to be in the air, inspiring people with grotesquely morbid ideas. There comes—from an engineer of Cologne—a suggestion that we should petrify dead bodies and then build cities of them. So the emanations of the dead, psychic and physical, into the world of the living are to be carefully husbanded so as to endure for thousands of years! Surely it must have been they that inspired the inventor's mind!

A CORNER OF THE QUEEN'S PALACE, AT THE RUINED CITY OF ANURADHAPURA, CEYLON

Ceylon is the seat of Southern Buddhism in a state of almost original purity. It was converted to Buddhism 300 B. C. by the missionary Mahinda, son of the Indian king Dhammasoka. The island is covered with extensive ruins of its former Buddhist glory, among which is the ruined city of Anuradhapura

Discoveries at Sinai—Man 10,000 Years Old

EXCAVATIONS in the Sinaitic Peninsula was the subject of a note on the archeology page of the *NEW CENTURY PATH*, vol. VIII., No. 43. Further particulars have since come to hand. The newspaper which discusses them indulges in some reflections which, in the days of H. P. Blavatsky, would surely have consigned the editor to the madhouse. But those who remember those days, and who have studied those great and inspiring teachings about the ancient world, which H. P. Blavatsky so generously offered to the silly sneering world of contemporary culture, will not feel particularly impressed by this tardy admission of a small fraction of her claims, nor inclined to join in the sudden outburst of bombastic applause lavished on the names of some of the explorers.

Nothing must be admitted until the proper authorities have had time to discover it in due academical form and give it the support of their names. Nevertheless, if we may take academic endorsement as marking the rear-guard of intellectual progress, we may congratulate ourselves on the fact that some of H. P. Blavatsky's teachings are now admitted *even by the authorities*.

"No one styling himself a 'scholar,' in whatever department of exact science, will be permitted to regard these teachings seriously. They will be derided and rejected *a priori* in this [19th] century; but only in this one. For in the Twentieth century of our era scholars will begin to recognize that the *Secret Doctrine* has neither been invented nor exaggerated, but, on the contrary, simply outlined; and finally that its teachings antedate the Vedas." — *H. P. Blavatsky—1888*

Now take the following bit of newspaper comment in connection with the above prophecy:

"Greeks and Romans are now seen to have been *mere moderns*, almost treading on our own heels, while far back we look down a long vista of culture and civilization, lasting through many thousand years and stretching around the whole basin of the Inland Sea. The explorers have given us a new conception of history, a new reading of the modern world, a new idea of human growth. They have literally dug out from the bowels of the earth, in the heat and solitude of exile, a new history of man."

Niebuhr the historian first discovered that there had been a temple in Sinai, but no one attributed any importance to it. Now however this temple has been actually

disinterred, and found to be the great sacred place of some great "Semitic" (as they say) world of the far past. There are proofs that it was very widely resorted to by pilgrims, both in the cubicles or resting-places discovered at the temple, and in the relics now on exhibition in a London museum. It is explained that the probable reason why we find so little trace of Moses and the Israelites is that this particular tribe and its history are swallowed up in the immensity of history. The Egyptians, says this London paper, really could not keep track of every little wandering Semitic tribe which they might have happened to enslave; and though the professors have done the best they could for the feelings of Bible lovers, they have had to recognize facts.

Great piles of ashes, the remains of countless pilgrim sacrifices, have been found. Tombs occur "in the shape of beehives," which reminds us of the Pelagic architecture of Mycenæ and Tiryns, and suggests that these alleged Semites may have been the Pelasgians.

In the exhibition of relics found in the temple are included beautiful bits of glass and mosaic; scent and perfume bottles with wax stoppers; reed pens with sharp split points, "to write on wax"; ivory hairpins, egg-whippers, and other luxuries of civilization.

But there was one other modern institution which these ancients had. They had a "paleolithic man." His

usual flint implements have been found there. And he was just as paleolithic then as he is now. Consequently he must have lived (says the paper) "at least 10,000 years ago, when the Nile Valley was filled almost to the summit of the hills with a great flood of water, and man foregathered on the mountain summits, a precarious tenant of a bare world."

Ten thousand years! We are getting on, slowly. As the paper concludes: "May there not be more secrets hidden under those yellow sands?"

The Mornington Islands

RETROGRADED as are the Australian aborigines from the standard of the ancient race they represent, a still more retrograde remnant of that race has been found. This is the Mornington Islanders.

Mornington Island is situated off the north coast of Australia, in the Wellesley Archipelago in the Gulf of Carpentaria. It was discovered in 1802, and has recently been visited by explorers. These found there a tribe of "blacks" entirely disconnected from those on the mainland. With a single exception they had never seen a white man. They were entirely ignorant of the use of clothes. Armed with spears and boomerangs, they yet fled from the approach of the white man; but, some of them having been induced to overcome their fears, conversation was possible through the intermediary of mainland native scouts, whose language was found to be sufficiently similar.

These aborigines exhibited the usual stoical mask of indifference, but could not suppress their wonder at the sight of matches and smoking. They do not build huts, but simply lie down on the ground behind a collected heap of grass. Baskets for carrying and canoes are unknown, bark being used instead of the former, and logs for the latter. They make fire by friction and eat fish, flesh, and fruit. There is a caste system based on ratios of consanguinity and designed chiefly to regulate marriage; and this would seem to be about the only relic of ancient economics they have preserved.

The Trend of Twentieth Century Science

Man, the Afterthought

PROFESSOR LESTER WARD, of the United States Geological Survey, appears in support of the contention that woman is really "the whole thing."

His argument is mainly biological, but he does not perceive that it tells heavily against himself. It proceeds thus:

Life begins as female. The female sex, which existed from the beginning, continues unchanged; but the male sex, which did not exist at the beginning, makes its appearance at a certain stage and has a certain history and development, but never became universal, so that there are probably many more living beings without it than with it even in the present life of the globe. The male is therefore a mere afterthought of nature.

Once that this "afterthought," this Frankenstein, had appeared, it began to develop in a formidable manner. The females always selected the best among them; or they fought, so that only the best and strongest survived; so that the strain steadily improved. Finally it got stronger than the female strain; and from that melancholy day dates the Subjection of Woman. Professor Ward perceives, however, over the eastern horizon swept by his stern gaze, the coming of a new day.

We will suppose his biological argument all correct, and see what follows. It is generally admitted that in the course of evolution the highest qualities appear last in order of time. It is at the level of the oyster that the male plays the insignificant role that Professor Ward regards as proper to him. The higher you go above the oyster the more prominent becomes the male. The beginnings of the brain appeared at about the same level as the beginnings of the male. Since then the brain has acquired a more and more tyrannous sway over the animal instincts. . . . And so on. If nature's plan of having no male was admirable, why was not her later plan of having one, equally admirable? And her still later plan of having the male dominant? But of course, as Huxley pointed out, other laws apply to man than to the animals; and no argument on one side or the other, resting on mere biological considerations, is worth the paper it is printed on.

Law or Accident?

AN Hypothesis advanced by one man, and an objection to it advanced by another, often throw interesting light upon the minds of the respective men. Especially is this true in astronomy. Herbert Spencer made an incursion into that science carrying his idea of universal law, of uniform process, and of the universe as a unit. The facts he specially considered were that "On the one hand we have the Milky Way, crowded with stars and clusters and gaseous nebulae; on the other, the regions about the poles of the Milky Way, barren in stars but rich in spiral nebulae." It did not appear to Spencer that this sorting out of the celestial constituents could be accidental; it showed that the universe was a whole and its parts mutually related.

The above description is true for the northern hemisphere; the stars and star-clusters are there crowded towards the Milky Way; the spiral nebulae avoid it. It is also true for the southern hemisphere, with an exception. There, the spiral nebulae and the stars meet in the Greater Cloud of Magellan. That constitutes, as it were, a bridge or channel.

Mr. Hinks of the Cambridge Observatory, lecturing at Bloemfontein, expounded the view that the arrangement is because it just happened so! The Milky Way is the plane on which the star clouds are mainly aggregated; the special nebulae are aggregated in clouds on another plane. "So soon," he says, "as we get rid of the idea of an organic whole . . . there seems to be no reason why things should not be just as they are." As to the Greater Cloud of Magellan—well, there is coal in England, there is gold in California; there are both in Rhodesia.

It is of course our old friend the Fortuitous Concourse of Atoms, dressed up again, in fact very decently disguised. He seems to come kindly to minds that cannot conceive wholes, or think of the universe and all that lives therein as the evolving expression of one immense consciously working Idea.

But some minds cannot "get rid of the idea of an organic whole;" and they are not the feeblest!

STUDENT

Utilizing Atmospheric Electricity

A RUSSIAN scientist has been making successful attempts to collect atmospheric electricity and turn it to account in work. He sent up a collecting kite to a height of 115 feet, from the top of a mountain. To the metallic string of the kite a micrometer was attached, and soon sparks began to flow. After a little, they became a continuous stream. A motor was then connected to the micrometer, and it immediately started at the rate of 5000 revolutions a minute. This it continued for an hour, but stopped when the wind stopped. The inventor thinks that if the kite were sent to a higher level, a proper motor attached to it would do a considerable and steady amount of work.

If he is right, we may be nearing the day when all our motive force shall be derived simply from the atmosphere—as well as, according to another invention, direct from solar heat transformed to electricity—instead of coal or oil with all the hideous and dangerous apparatus needed to transmute heat into electricity. Vessels will carry no coal, with an immediate doubling of their capacity for commerce.

STUDENT

Burke's Radiobes

MR. BURKE'S "radiobes" are exciting a good deal of criticism, not unmixed with feeling. His brother investigators should remember that he has made no claims, only suggestions; and has offered facts almost free from theory.

His facts are that in tubes containing sterilized gelatin and a particle of radium, tiny spots appeared, which in a few days became definite granules containing nuclei and closely resembling living cells. Tubes without radium developed nothing.

The granules behave mysteriously. If the tube is exposed to strong light or heat, they disappear into nowhere and nothing. But when they are relieved of these conditions they appear again. Under similar circumstances bacteria would die, but their dead forms would remain visible. The radiobes also differ from bacteria in that they cannot multiply in gelatin which has no radium in it. But in presence of radium they do multiply.

The most probable theory is that they represent an intermediate form between organic and inorganic matter.

As usual in these cases, a prior discoverer puts in a claim. A French scientist, M. Raphael Dubois, points out that in 1904 he had called attention to the same series of phenomena. That is a year ago; he should have done something more by this time.

STUDENT

Dress Colors and Health

IT appears that sunstroke is not caused by heat after all. The red end of the spectrum has nothing to do with it. It is the rays at the violet end, the chemical or actinic rays, that do the damage. It is these that the photographer filters off so carefully by his red screens and panes. They will pass through anything except a color filter and may do the damage even when they are so high up the spectrum as to be invisible. A medical writer mentions the case of an Egyptian army officer who had a succession of sunstrokes till he lined his helmet and coat with yellow cloth; then he had no more. In India it is known that a yellow robe is the most comfortable of all, despite the fact that it lets the heat rays through; and there may have been a physiological as well as other reasons for the yellow robes worn by a certain school of ascetic philosophers. Anyone who will wear a yellow dress on a very hot day, thus excluding the blues, will find himself much fresher in feeling, even if hotter, than if by wearing real blues he shuts out the heat rays.

In recent medical treatment, depending upon colored light, the same principles are employed. In smallpox it is desirable to quell the inflamed spots on the skin as soon as possible, to minimize scars. The patient is accordingly kept in red light, not for its own value, but because the irritating blues and violets are absent. But in certain morbid skin growths, it is this irritation we want, and we keep it up till irritation becomes destruction. Blue light in its utmost intensity is played upon the growth till the cells are irritated, inflamed, and at last killed.

Studies

Fakarava and Apia.

FAKARAVA is the second largest island of the Tuamotu Archipelago, a broad belt of seventy coral islands between $14^{\circ} 5'$ and $23^{\circ} 22'$ S. lat., and $134^{\circ} 25'$ and $148^{\circ} 40'$ W. long., now under the protection of France. Fakarava is made up of fifteen islets, and its oblong lagoon affords the best anchorage in the group. The largest island of the Tuamotus is Nairsa (Dean's Island), which is made up of twenty islets and has a lagoon 45 miles by 15. The islands are atolls. They are inhabited by a fine strong Polynesian race, which is dying out.

Apia is on Upolu, one of the three largest islands of the Samoan group. Upolu is 550 square miles, mountainous, well-wooded, and fertile. Apia, on a bay in the north, has a municipality directed by the consuls of Germany, Great Britain and the United States. Foreign traders and capitalists have acquired most of the land, and the Samoans, a fine race, seem alike incapable of adopting our civilization and of becoming enslaved.

Habits of the Cuckoo

MUCH mystery has always existed with regard to the habits of the cuckoo, and some naturalists have ridiculed the idea that the young cuckoo actually ejected eggs or young birds from the nest in which he was hatched. But an English ornithologist has published photographs revealing the young cuckoo in the act of doing so, and states that the facts may be verified by anyone who will carefully watch the nests of the hedge sparrow, robin, chaffinch, and other small birds, during the proper season. The cuckoo lays its egg on the ground and then carries it in its bill to a nest. The young cuckoo, while still blind, ejects the eggs of the owner of the nest by getting them into a hollow on its back—a sort of natural egg-cup, and thus throwing them out. After the young cuckoo gains its sight it ceases these inhospitable habits, and allows eggs and fledglings to remain.

Hecatomb of Wasps

RECENTLY the shore on the Gulf coast of Trinidad has been strewn for many miles with millions of large red-brown wasps, which have been washed over from the Orinoco in Venezuela. Some of them are not dead when they come in, and, being brought home in a bucket, have proceeded to walk when put out on the table! A traveler who has several times been up the Orinoco says that he has had to cut his way through dense masses of insects over there, so intense is the life and growth. No doubt when the Orinoco is in flood, rising as it does to the height of forty feet, it must sweep down many gigantic nests; and then the current carries the insects across the gulf and deposits them, together with seeds often sprouting, and sometimes snakes, on the tranquil shores of Trinidad. NATURE, THE CONSOLER

WORDSWORTH

NATURE never did betray
The heart that loved her: 'tis her privilege,
Through all the years of this our life, to lead
From joy to joy: for she can so inform
The mind that is within us, so impress
With quietness and beauty, and so feed
With lofty thoughts, that neither evil tongues,
Rash judgments, nor the sneers of selfish men,
Nor greetings where no kindness is, nor all
The dreary intercourse of daily life,
Shall e'er prevail against us, or disturb
Our cheerful faith that all which we behold
Is full of blessings.

SOUTH PACIFIC ISLANDERS AT FAKARAVA IN THE NAIRSA GROUP

California or Florida, whilst it might be trained to bear much wider extremes of climate. The fruit will keep for months and is but little hurt by rough packing.

C.

HORSES and cattle are believed to have an instinctive fear of wolves. On a recent afternoon the wolves in the London zoological gardens howled so ferociously that a horse in the street blocks away was panic stricken by it.

The only two animals besides the wolf for which domesticated animals never seem able to conquer their aversion are the camel and the bear. It has been noticed that when the camels in a traveling menagerie have been tethered at any particular spot, horses will shy and refuse to go near it, even after the animals have gone on their way with the rest of the show to another town.—*Exchange*

Feeding Young Humming-birds

WHEN I first crawled in among the bushes close to the nest, the little mother darted at me and poised a foot from my nose, as if to stare me out of countenance. She looked me all over from head to foot twice, then she seemed convinced that I was harmless. She whirled and sat on the nest edge. The bantlings opened wide their hungry mouths. She spread her tail like a flicker, and braced herself against the nest side. She craned her neck and drew her dagger-like bill straight up above the nest. She plunged it down the baby's throat to the hilt and

started a series of gestures that seemed fashioned to puncture him to the toes. Then she stabbed the other baby until it made me shudder. It looked like the murder of the infants. But they were not mangled and bloody; they were getting a square meal after the usual humming-bird method of regurgitation. They ran out their slender tongues to lick the honey from their lips. How they liked it! Then she settled down and ruffled up her breast feathers to let her babies cuddle close to her naked bosom. Occasionally she reached under to caress them with whisperings of mother-love.—*The Country Calendar*

The Pomelo

THERE are a good many foreign fruits of which we in this country know very little. But as the world gets smaller they are beginning to creep this way. The last to attract attention is a Chinese fruit, the Pomelo, apparently the original or radical citrus fruit—at any rate older than the orange, lemon, or grape-fruit, and cultivated in China for 2000 years. It is described in a Consular report as a cross between orange and grape-fruit, much more easily handled than the former and devoid of the bitterness of the latter. The tree grows quickly and bears enormously, even on poor soil; and it would certainly do well either in

Mercy, Charity and Hope are the three goddesses who preside over the Higher Life.—*Helena Petrovna Blavatsky*

WHEN the International Brotherhood League

The Growth of the Raja Yoga Work in Cuba

was founded in 1897 by Katherine Tingley—one of the objects of which was

To relieve human suffering resulting from flood, famine, war and other calamities, and generally to extend aid, help, and comfort to suffering Humanity throughout the world—

nothing was said about the great work that the League was shortly destined to accomplish in Cuba. Today, looking backward, it is easy to recognize in the Cuban work the first stepping stone toward carrying out the international plans outlined by the Foundress of the League. While the first work to be taken up was at Montauk Point, where aid was given to many thousands of sick, wounded and destitute soldiers who had fought for Cuba's liberty, the Cuban Work, strictly speaking, was begun immediately after the close of the war.

Peace had been declared and Cuba was free, but the little nation was no exception to the rule that the critical time was yet to come. Thousands were hungry and fever-stricken, the people were destitute, the industries paralysed. But, quite aside from this, there existed a widespread disintegrating force which seemed destined to mar the whole future of Cuba, unless prevented by the unifying influence of some conserving and unselfish effort on an entirely new line. Foreseeing this, Katherine Tingley transformed the New York Headquarters into sewing rooms and into rooms for the receiving of supplies that were being sent in by workers all over the world, in response to a "Cuban Relief Call" sent out by her. Within an incredibly short time, Katherine Tingley herself, with seven workers, tons of supplies, medicines, etc., left for Cuba, on board the Government transport "Berlin," which had been placed at her disposal free of expense by President McKinley who, with Assistant Secretary Meikeljohn, General Wheeler and others, had previously investigated and endorsed her work at Montauk Point. This was the "First Cuban Crusade."

Immediately after the arrival of the Crusaders at Santiago de Cuba, the big sign of the International Brotherhood League was stretched across the front of the imposing building which faced the "Plaza Dolores" and the Cuban relief work was begun. It was all very simple, with no hint or suggestion of red tape. Small wonder that the sick and starving crowded the plaza by hundreds and thousands day after day, for they were required to subscribe to no creed, they met no one demanding their conversion to any dogma as the wage of a dress or a din-

ner. It was the "Heart-Touch" which they felt and it was this to which

they responded. How the physicians and nurses worked, the Foundress herself more tireless than all, relieving the thousands who came to the Headquarters by day, and at night visiting cases of illness and destitution in little outlying homes! Most important, perhaps, of all connections made at that time was the meeting of Katherine Tingley with the Honorable Emilio Bacardí, a patriot who had suffered imprisonment, persecution and all but death for the sake of "Cuba Libre." He was at that time Mayor of the City of Santiago de Cuba, a position he still holds.

Many thousands of suffering Cubans were relieved, and when duties connected with the international work of the League called the Foundress and her helpers back to America and Europe, it was to Mayor Bacardí that the distribution of the remaining supplies, and those sent later, was entrusted.

Katherine Tingley saw within the natures of the Cuban people great possibilities and her heart was touched. In response to repeated petitions, she finally consented to bring back with her a number of Cuban children. This was a difficult undertaking, for at that time the Raja Yoga School had not been established, while her only object in bringing the children was to educate them to serve later in Cuba as helpers of their own people, thus strengthening the link already formed between the older nation and the new.

It was at the time of this Crusade that Katherine Tingley established the "First Cuban Liberty Day," March 12, 1899, later proclaimed by Mayor Bacardí as a National Holiday for all time. On that day four thousand Cuban children marched in procession out of the plaza of the International Brotherhood League Headquarters in Santiago de Cuba. It was on the anniversary of this day, one year later, that Katherine Tingley sent another commission to the Island with supplies; and at the Liberty Day celebration of that year the little children of Cuba were presented with a banner which Raja Yoga children all over the world had contributed to procure and send. The following brief extract from the leading Cuban newspaper at the time of the first crusade, is of interest:

This noble and humane institution has recently visited our suffering city, distributing food, clothing, shoes, medicines and medical assistance, accompanied by benevolent and kindly words, to all the needy poor and sick of Santiago de Cuba. . . . The whole city joins in expressing gratitude to the noble Brotherhood for the humane work done here.

The following brief extract is from a letter received by Katherine

OUR YOUNG FOLK

The Raja Yoga Question Box

THE beauty and harmony in the life of the universe are unfolded to our eyes by the true scientist.

1 Who was Alexander Von Humboldt?

ANSWER—Alexander Von Humboldt was a celebrated German naturalist. When he was a lad he resolved to travel and explore in order to study natural science in different parts of the world. He began early to study about the plants and rocks and minerals. In Paris he met a fellow scientist, Aimé Bonpland, who was also eager to travel. They set out to explore the Spanish dominions in America. They were gone five years and thoroughly explored Mexico and much of South America. They brought home a valuable collection of natural objects of every kind, among them six thousand species of plants. Von Humboldt afterwards travelled in Siberia. He and Aimé Bonpland wrote interesting books de-

scribing their travels and observations. Many people became interested in the study of geology and other natural sciences by reading these books.

2 Who was Linnæus?

ANSWER—Carl Von Linnæus was a great Swedish botanist. His father and his uncle were botanists. As a little boy he had a corner in the garden filled with plants gathered from the woods and fields and he soon had six hundred specimens in his cabinet. The great work that Linnæus did was to give names to the species of plants. Of course he had to know a great deal about botany before he could do this. He visited many countries in order to study plants, and had, besides, many specimens sent to him from all parts of the world. He did his work very thoroughly, and thus helped all students of botany. Besides being a botanist Linnæus was a physician and a teacher. The students at Upsala delighted in his lectures on botany.

LITTLE TEACHERS

LITTLE bird upon the tree,
What is that you say to me?
"Let your lot be what it may,
Keep a cheerful heart, I say."

Little flower, so bright and fair,
Breathe your lesson on the air.
"Be your influence, day by day,
Shed like fragrance round, I say."

Little fly, with silver wings,
Say, what lesson do you bring?
"Soon your life will pass away,
Therefore use it well, I say."

Little sunbeam, shining bright,
Teach me something by your light:
"Be you genial, blithe and gay,
Gladdening all around, I say."

Little brook, so fresh and clear,
Speak your lesson in my ear:
"As you go upon your way,
Mark your path with good, I say."

Little star with twinkling light,
Tell me what you say at night:
"Small may be the part you play,
Yet perform it well, I say."

All things that on earth I see
Seem to have a voice for me;
Ceaselessly, by night and day,
"Learn the truth we teach," they say.
—Selected

sects bottled in alcohol to illustrate the subject. No, the Raja Yoga pupils go, instead, for a ramble with their teacher, to discover for themselves the beauties and curiosities of plant and animal life which Nature has tucked away in the queer little nooks and corners of the many canyons winding down through the hills of Lomaland.

The ferns come early in the spring as soon as the heavy winter rains are over, and the canyons make it their specialty to drape their walls with delicate feathery maiden-hair or long slender sword ferns. In a far-away canyon, deep down between the high rocky walls, well sheltered from the hot sun grow the tall brakes. The teacher who discovered these treasures carefully gathers them so as not to disturb their delicate roots, thus preserving them for future growth. While he gathers them, he points out to his pupils, the clever means Nature has used to protect the young leaves by covering the unrolling stems with long, soft, light brown fuzz. A few weeks later when the wild flowers come, all the hillsides and every nook and cranny of the canyons will be explored to find some new and rare variety of plant or flower to add to the list of the many flowers and shrubs which carpet the hills and valleys of Lomaland.

After the wild-flower season is over, the children turn their attention

MR. WYTHBOURNE GATHERING FERNS

Nature Studies

RAJA YOGA boys and girls have a most delightful way of studying natural history.

The hours for this study are not spent on books nor using dried flowers, lifeless animals and in-

sects bottled in alcohol to illustrate the subject. No, the Raja Yoga pupils go, instead, for a ramble with their teacher, to discover for themselves the beauties and curiosities of plant and animal life which Nature has tucked away in the queer little nooks and corners of the many canyons winding down through the hills of Lomaland.

to the insect world and find many interesting creatures to watch and study. The trap-door spider and his nest are most interesting. The little round trap-door, about the size of a five cent piece, set into the ground, is fashioned with the skill of a true mechanic. The under side of the door, as well as the hinge, is made of fine white web, spun by the spider. Opposite the hinge on the under side are two tiny holes made in the web. These holes the spider uses to hold the door shut, in time of danger. You are almost certain to snap the blade of your penknife in two, should you attempt to open the door when the spider is holding it fast. Is it not marvelous what strength there is in such a little creature? "If you dig him out you will destroy his home,"

says the Raja Yoga teacher, "let us rather call upon him some morning very early and see him open his door and walk out fearlessly."

A good time to watch and study many creatures which are seldom seen by day, is in the morning, just when it is beginning to be light. This is the hour when many of the spiders, mice, gophers, rabbits and many other such creatures are out hunting their breakfast. So the boys plan with their teacher for an early morning class and are richly rewarded for their early rising.

Studying natural science in this way, the children truly see into the heart of Nature and learn to know the life and habits of the plants and animals they study. They learn of the great One Life which pulsates through every living thing and they feel their own kinship to all that lives. It opens their hearts in love and sympathy for all, and they grow to be wiser, nobler, more tender and thoughtful men and women because they have studied Nature in this simple brotherly way. **COUSIN EDYTHA**

"LEARN" is the title of a book of essays published a few years ago in China. In it the author, Chang Chi Lung, teaches his countrymen that education is the only hope for China. Chang Chi Lung is a venerable Chinaman whose great hope has been to make China once more a power in the East. He has established an arsenal, secured arms, and engaged a large number of Japanese drill instructors to drill the Chinese so that they will be more capable of defending China. The Chinese are not likely to become aggressive, but they have learned of late years that they must be able to defend their ancient kingdom.

LORD BEACONSFIELD once said to an assembly of young lads: "I believe that the youth who does not look up, will look down, and that the spirit which does not dare to soar is destined perhaps to grovel."

THE CHILDREN'S HOUR

Tim's Revenge

TIM was sobbing bitterly, "It's cruel, oh it's cruel, poor little Diamond—I'd like to—"

Margery's blue eyes were filled with tears, as she looked reproachfully at Tim, for the little dead canary had been very dear to them both.

"Oh dear!" she sighed, "don't make it worse than it is, Tim."

Tim stared in wonder. "What am I doing?" he asked. "Of course it's no good blaming Pussy, but Mr. Jones could have stopped her, if he liked."

"Yes, I know," returned Margery, "that's why it is so awful. I'm sorry for poor Mr. Jones."

Tim did not look as if he appreciated that sentiment.

"I don't think he is poor," he retorted, "he's just horrid."

"S'pose there's two Mr. Joneses," Margery continued earnestly, "like there is two of you and two of me. Perhaps Mr. Jones is sorry now, that he didn't catch Pussy, and knows it was his bad part that stopped him, like the bad part of you, that wants to hurt him right now."

Tim grunted. "S'pose he doesn't care," he retorted.

"Then he would be poorer than ever," Margery replied, "for the good part of him would be far away. I guess it's very lonely for any body then."

Hearing their mother call, the children went inside.

In his summer-house, on the other side of the fence, old Mr. Jones sat very still. His pipe dropped unheeded to the ground.

"Bother the children," he said testily, "I've something else to do besides stopping cats from killing stray birds," but in his heart, he knew, that he often drove his good part away, and that "it was very lonely" then.

Mr. Jones was very proud of his splendid vegetable garden. Some few days after the bird accident, Tim, in passing, saw a stray cow, just on the point of entering the open gate.

"Serve him right if she does eat his cabbages" was Tim's first thought, besides he was a little nervous about cows. But it was only for a second. "I thought him awful about the cat, then I am as bad myself," so Tim manfully tackled the cow, and drove her away.

Mr. Jones, shut up in his room with an attack of asthma, saw the whole thing from the window, and guessed the reason of Tim's momentary hesitation.

"Well, I'm bothered!" he said, and Margery's "poor Mr. Jones" sounded again in his ears.

After that the old man did some hard thinking. When he got about again, his first visit was to the bird-fanciers.

The children were working in their garden, when "Heigh you children!" from their neighbor called them to the dividing fence. There

stood Mr. Jones, with a brand new golden cage, in which were two lovely canaries.

"Here," said he, "are some birds for you, as you are so fond of them."

Tim felt like refusing. What could take the place of his dead pet? Margery's radiant face held him silent.

"You are very kind, Mr. Jones," she said, "what sweet little birds."

Mr. Jones walked away, clearing his throat, with an unwonted softness in his heart and feeling happier than he had for several days.

"Tim," Margery said softly, "you know Mr. Jones gave us these, because he is sorry about Birdie."

A great struggle went on in the boy's heart. To drive away the cow—that was all right, but to accept a new bird from his enemy—but his better nature won. "Come along, and let us hang them up, Madge" he said, "then we'll go and find them some chickweed."

To his astonishment, Tim found a great weight lifted from his heart. His joyous whistling penetrated Mr. Jones' parlor. Instead of the usual "Drat that boy," "Bless his heart" said the old man, "he has forgiven me for what I did."

"Tim," said Margery,

as they poked the chickweed between the bars of the cage, "I think your taking these birds, was a real hero's revenge." E. I. W.

ON the island of Elba, not long ago, a lighthouse keeper caught a swallow. This little bird had a small scrap of paper attached to one of its feet. The man unfolded the paper and found it to be a petition to the king, from a prisoner in the prison not far from the lighthouse.

The letter explained that for twenty years the writer had been confined in the prison for a crime he had not committed. He had made the appeal for help many times but no one would believe the truth of his story.

One day he was feeding the swallows that came to his barred window for crumbs. Suddenly he thought that if he could tame one, it might carry a message. The message might be the means of freeing him. At last he managed to catch one of the birds and tied his petition to its foot. Then he let it fly away.

The lighthouse keeper sent the letter at once to the Minister of Justice who has ordered the case to be thoroughly investigated, hoping that the prisoner may be found innocent of the crime.

Can it be, it only "just happened" that the little swallow was caught by one who would send the petition to the king?

Is it not rather, the great law of truth and justice working in this wonderful way which will end in setting the prisoner free? EDYTHE

WHILE the tiny tots of Lomaland are at the table in their pretty refectory, the birds hop up to the door. The tots are too wise to speak or even whisper just then, so birds and babies breakfast quietly together.

Point Loma Students

Their Addresses at Isis Theatre Sunday Night—Two Papers—"The Theosophic Life," and "Man's Nobler Calling"

AT the Universal Brotherhood meeting at Isis Theatre Sunday night, two papers were read by Point Loma Students, and an enjoyable musical program was given by members of the Isis Conservatory of Music.

Mrs. Bertha Bundsmann read the first paper, her topic being: "The Theosophic Life." In part she said:

"Despite the saviors who have come to save, despite the glorious souls who have walked and worked with men, despite the many true and faithful hearts uplifted through the daily struggles by Theosophic aspirations, it was not until the voice of Helena Petrovna Blavatsky proclaimed that Theosophy must become a living power in the lives of men and in the life of the world, that the vitalized germ was planted that should flower in the Theosophic life.

When Katherine Tingley took up the work left by H. P. Blavatsky and William Q. Judge, she was confronted with the stupendous task of creating a new world; for the seed of the Theosophic life would not germinate in the conditions created by our present civilization. This new world has been established, and its center is the city on the hill, and the archetype of the life there is the Theosophic life.

"The goal of the students of Theosophy is the achievement of this life beautiful. To reach it they have determined to live forever in the higher part of their natures, feeding and sustaining it by noble thoughts, high aspirations and purposeful activity. The altruistic life of Lomaland furnishes the school of experience for the quickened life of the soul.

"The Theosophic life is inclusive of all worthy human occupation. Theosophy does not break down and destroy, but builds up and regenerates. By awakened activity on higher planes it informs the old world shells with new spirit; not in some far off, abstract way, but expediently and practically.

"We have a Theosophic social life, which to the unseeing eye might seem to present a surface of monotone compared with the vivid gayety of the world's social life. But who that has learned to love the varying tones of pink, gray and violet that cover the face of nature in her quiet moods, would exchange them for the crude green and blue and red of the artificial painted landscape. The quiet Theosophic social life furnishes refreshment and recreation, never fatigue and nervous exhaustion."

W. Ross White read a paper entitled: "Man's Nobler Calling," which was in part as follows:

"In the Divine economy nothing is great and nothing is small.' 'Do what thy hand finds to do with all thy might.' Which means do not be waiting for what you think to be your real vocation to turn up, but do the duty which lies nearest you with all your might, for that is the real gateway to your proper vocation, or true calling in life. Longfellow tells the story of how, on one occasion, the angel Gabriel personified a shoemaker and sang all day at his work, for it was all the same to him whether he sang there or among the hosts of heaven. And we know that it is the teaching of the 'Voice of the Silence' that he who would be like the blessed masters of compassion, must tread the 'Secret Path.' He must be like the 'fix'd star in the highest heaven' that shines from out the spatial depth for all, save for itself. He must be content to remain unthanked and unperceived by man; wedged as a stone with countless other stones, which form the 'guardian wall' which protects humanity.

"This, verily, is man's nobler calling; this is his heavenly vocation. Man's nobler calling is to be of the highest use or service to his fellow men; and who is there who is so thoroughly acquainted with the Divine purpose that he can say, 'this work will benefit men more than another work?' From this it follows that in doing what may seem to be a very simple, or a very humble work, we may, by fitting it with the

right spirit, make it highly beneficial to mankind; and it thereby becomes our nobler calling for the time being.

"According to the Theosophical view of life, which of course is the only rational and scientific view, we have to learn to do everything and to do everything well. During the long course of our evolution we may rest perfectly assured that each thing we learn to do and to do well will in the great economy of nature, come in most fittingly for the service of mankind.

You may all have heard the story how, on one occasion, a great obelisk was being erected at Rome; and when it was found that it had to be raised just a little more, but that the ropes could not lift it that small distance, the whole mass of workmen were at their wits' end and filled with despair. Then an unknown voice from the crowd called out, 'wet the ropes!' This was done, and the work was accomplished—the great obelisk slipped easily into its place. Yet it seems a little thing to note how moisture makes a rope contract.

"The heavenly, world-penetrating voice of Theosophy proclaims that the time has come for man to clearly recognize the fact of his higher being, and to feel that his heavenly calling is not to live for selfish ends, but for the good of all—to help, to uplift, to guide and bless the whole world. For ages upon ages men have lived chiefly for self. Their desires have been towards self-aggrandizement. The results have always been disappointing; misery, strife and war are the harvest of the seed sown by selfishness. Surely it is time men gave unselfishness a trial. Who has not known parents so filled with unselfish love for their children that they have done without many necessary things for themselves in order that their children might have them? Now if this feeling could be widened out to all; if we could feel that we are all brothers and sisters; if we could let love rule our lives rather than treachery and so-called 'diplomacy'; if we could carry out the Scripture teaching, 'let every man look not upon his own things only, but also on the things of others'; if we could remember always that we are 'our brother's keeper'; then man's nobler calling would be realized, and the Golden Age would be very near indeed.

"Theosophy comes to the world in its time of great need, and sends a new note vibrating through all the domains of life. In a world filled with many forms of slavery it sounds the clear note of 'FREEDOM'; freedom from all kinds of bondage. To a world lying crushed and bleeding under the terrible weight of fleets, and armies, and the armaments of war it whispers hope and deliverance; and says—"It is time to try the nobler way—the path of Universal Brotherhood." To the man of business it says, 'you and all men are brothers, and you cannot cheat anyone without yourself becoming bankrupt.' 'There is no such thing as gaining by another's losses—you are the greatest loser in the end.'

"And to all those who are called teachers it says, 'behold the world which ye have helped to make—ye have lost the key of knowledge, and ye hinder them that seek to enter the temple of Truth.' To all, Theosophy proclaims man's nobler calling—the life of self-sacrifice, the life of helpfulness, the slow, but steady and sure transformation of the lower self into the higher; until all the realms of this lower world shall become like the higher world, where only one Will is loved, and only one Will is done."—*San Diego News*

Theosophical Meetings for Sunday Nights

Public Theosophical meetings are conducted every Sunday night in San Diego at 7:30, at the Isis Theatre, by the students of Lomaland.

Theosophical subjects pertaining to all departments of thought and bearing on all conditions of life are attractively and thoughtfully presented.

An interesting feature is the excellent music rendered by some of the students of the Isis Conservatory of Music of Lomaland. Theosophical literature may always be purchased at these meetings.

Art Music Literature and the Drama

The Motives of Ancient Art

“THE beauty of earth, except for some spots that our sordid industries have ravaged, has altered but little since the days of Augustus and Pericles,” writes Maurice Maeterlinck. “The sea is infinite still, still inviolate. The forest, the plain, the harvest, the villages, rivers and streams, the mountains, the dawn and the evening, stars and the sky—vary as these all may according to climate and latitude—offer us still the same spectacles of grandeur and tenderness, the same soft, profound harmonies, the same fairy-like scenes of changing complexity, that they showed to the Athenian citizens and the people of Rome. Nature remains more or less as it was; and besides, we have grown more sensitive, and today can admire more freely.

“But when we turn to the beauty special to man, the beauty that is his own immediate aim, we find that, owing perhaps to our too great wealth or excessive application, to the scattering of our efforts, lack of concentration, or to the want of a certain goal and an incontestable starting point, we appear to have lost almost all that the ancients had been able to establish and make their own. In all that regards purely human æsthetics, in what concerns our body, our gestures, our clothes, the objects we live with, our houses and gardens, our monuments, even our landscapes, we are groping so timidly, we display such confusion and inexperience, that one might truly believe our occupation of this planet to date from but yesterday, and that we are still at the very beginning of the period of adaptation.

“For the work of our hands there exists no longer a common measure, an accepted rule or conviction. Our painters, our architects, our sculptors, our men of letters—and we in our homes, our cities—seek in a thousand different contradictory directions for the sure, the undeniable beauty that the ancients possessed so fully. Should one of us by any chance create, join together, or discover a few lines, a harmony of form or color, that should incontestably prove that the mysterious, decisive point had been attained, it would be regarded as the merest hazard, as an isolated and precious phenomenon, and neither the author nor any one else would be able to repeat it.”

Would it be a hazard? If the art of Phidias is unapproachable, there must be a reason for it. When the art of the Golden Age began to deteriorate, the cause was rooted in the decline of that incomparable system of life which was the basis of all achievements, a fact which the world has not sufficiently recognized. It has taken note of the high moral standards of ancient Greece, it has followed the ideals of classic art, but it has not observed the link binding the motive and the work.

The genius of Greece was patriotism. Compare the great self-seeking machine, called modern civilization, with the pure and noble dignity of Spartan life, and say if there is any wonder that we have “lost almost all that the ancients had been able to establish.”

When the elements of personal glory and profit are eliminated from the motives of those who are striving to build up a great modern school of art, a new and surprising success will crown their labors. Then will it be demonstrated that genius is no accident, that it is no evanescent thing, no mere “precious phenomenon.” We have not looked in the right quarter for its origin. A decree of chance, we have called it, or an inheritance from our ancestors.

Those who understand the ancient Wisdom-Religion tell us that genius is the Soul’s expression and, like the Soul’s life, is real and permanent. It comes through selfless effort. The fruit does not ripen until after the

seed has been planted and the blossom matured. We cannot trace the cause, for we have not the vision to search the distant past. But we know the law, and we can enter into that life which accepts the inner Light—if we choose. We can make the conditions, which will bring again the genius of the past—if we will.

EDITH WHITE

The Musical Life of Our Children

IT IS the common observation of those who have had much contact with children and who have observed the effect upon them of present-day musical training, that not one child in ten takes any true interest in the instruction imparted. Indeed, far too many children acquire, instead of a love for music, a dislike for it because of the method of discipline imposed upon them by parents and teachers. It is needless to say that such a dislike warps the musical faculty for life.

To the student of human nature the reason for this is not far to seek, for, as musical instruction generally goes, it is not the soul which is invoked, but the body which is driven into the narrow grooves of mechanical training. “The letter killeth, but the spirit giveth life,” is as true of musical art as of Scriptural teaching. Mere cleverness is no evidence of true musical feeling, nor can the merely mechanical, that is to say, “technical” training inspire the listener. True musical feeling, even when the music itself is rendered with faulty technic, is more likely to uplift the soul than dextrous but empty execution.

Why are our teachers of children so blind to this fact? Why have they not sufficient knowledge of human nature to realize that the heart comes first and that it should be the object of every teacher of music to first arouse in the child a *love for music*. To place all one’s energy upon cultivating the fingers, leaving the soul to sleep or to rebel,

is simply to retard or make impossible all real musical progress. The central truth of music is that of the soul itself, and the soul should be left free to weave its mental vesture from the vibrating forces that arise from the heart. Of the utmost importance is it that those who have the charge of the musical life of the children should know these truths in their fullness. Yet where are those who know them?

STUDENT

The Letter in Shakespeare

FEW students of Shakespeare today are better qualified to interpret and criticize his plays than Miss Ellen Terry, who recently gave a lecture in London before the British Empire Shakespeare Society, which is reported to have been most interesting. Her theme was more particularly concerned with the letters in Shakespeare’s plays, of which there are thirty to be found. Among other things she said, “Modern dramatists avoid letters like the plague, but Shakespeare shows what vital parts of drama they can be,” and most interestingly did she analyze and point out their significance.

All effort which tends to stimulate the public interest in the higher drama and awaken a deeper appreciation of such great creators as Shakespeare and Æschylus, is a benefit conferred upon mankind. The power of the drama as an educative factor is so little realized these days and so much that is degrading and pernicious is given in the name of drama, that there is opportunity for a great work to be done by the champions of the True. Ellen Terry declared that Shakespeare had been to her the revealer, the teacher, of the greatest secrets of life. Katherine Tingley holds that only in proportion as one realizes Shakespeare to be what he was and is, one of the few who understood human nature in a rare degree and who, because of that, did grasp the true philosophy of life, can one hope to understand and worthily interpret his great dramas.

The Inner and the Outer

H. P. B. most clearly taught that the deeper life of the soul was of a nature unknown to brain mind perceptions. It is other than that conveyed in speech, just as heat is something quite different from any form of verbal explanation of it.

In that monumental article on "Psychic and Noetic Action,"* one of the most precious of H. P. B.'s teachings, it is most clearly proved that the spiritual and noetic activity of consciousness has little or no relation to the ordinary modes of thought and feeling. In fact, it suggests that to a mind inwardly conscious of the soul, the perceptions read into outer things, (from which result our crude ideas and emotions), are merely the results of a thought action restricted to a limited field of vision. Hence the reason of perverted ideas of life. Things in themselves are *other than we think they are*. The peculiar condition and mode of activity of our minds is the telescope through which we study the heavens—all the time hugging the awful illusion that the picture we receive, and the truth in *itself* are identical. Hence men imagine that the world is as they see it, little knowing that every mind has built up its *own* world according to its mode of action.

Now H. P. B. and all true Leaders have taught in every possible form that "man is the creator of his own destiny." This must mean that, as in the past we have allied our wills with particular desires or aspirations, so have we become and are today. Every habit of mind can be thus traced back to its inception, and its growth measured by the force and nourishment we allowed it.

As nothing grows without *action* and cultivation, it follows that the life of the soul—"Noetic action"—demands *scope* in the mind for expansion, and this implies silence of those other modes of thought and speech that absorb and dissipate the available energy in unnecessary channels. The *unnecessary* in life is the bottomless pit of negation and negativity.

As iron, in its crude state, is worthless for purposes to which it may be put when transformed into highly-tempered steel, so is the mind worthless as an organ of spiritual action while in its crude condition of lower worthless thinking. When highly tempered with purpose and purity, it will respond to higher forms of knowledge that must remain unknown to cruder forms of perception.

Even the cells of the physical brain, expanding to the awakened fire, will resound to tones and thoughts that sway the world; able to withstand every change of circumstance with calm dignity, just as the monuments of Egypt have withstood the changes of centuries.

We are not mere creatures of the day, but souls of a thousand incarnations, with stored up energies from eternity.

D.

*"Psychic and Noetic Action," Vol. 3 of *Studies in Occultism* by H. P. Blavatsky. \$.35 per volume. Pocket size, six vols., cloth, per set \$1.50. Sold by the Theosophical Publishing Company, Point Loma, California.

"Academic Courses" do not Spell Education

A PROMINENT educator is quoted as saying that, while men are pursuing courses in engineering and science, women are pursuing courses in the arts, and as wondering "whether the old-fashioned liberal training is not largely to be monopolized by women." He predicts that, if this condition continues, women will become the thinkers and metaphysicians of the future, and man a mere hewer of wood and drawer of water. Probably he attaches altogether too much importance to the "courses people are taking." Courses do not count for much. We want to know about the *real* training which goes on all the time, in the home, in business, and even in the colleges, and which trains the *mind*—not the mere mechanical powers of the brain and hand. Give me the organizing of a school, its discipline, and its moral training, and you may select the "courses;" anything that will exercise the attention and give an opportunity for practising discipline and self-command will do. And as to men and women, give me character and soul, and the

question of gender becomes comparatively insignificant. The authorities and experts are worrying over trifles and ignoring the real problems, exaggerating evanescent and superficial movements and not seeing the deep and persistent currents.

All these "courses" do not count for much. No amount of such cramming will make either an engineer or an artist out of inadequate material. *Men and women* are what is needed in all walks of life—people with their wits about them and their faculties under control, able to grapple with the circumstances that arise.

And so, if we are to prophesy anything from the character of the courses students are taking, we would prophesy that, unless they

take something else besides courses, there will soon be neither engineers nor artists, male or female. But we do not need to take so pessimistic a view; for people are wiser than their theories, and life is a better teacher than the professors.

STUDENT

Obituary

NEWS has been received from Easthampton, Massachusetts, of the passing away of Mr. Joseph West Green, husband of Mrs. Katherine Richmond Green, so well known to many U. B. members. Mr. Green was till his death a faithful member of the Universal Brotherhood Organization, and though not a publicly prominent worker, his efforts were often felt where most needed. Mr. Green came of the best New England stock, being lineally descended from General Nathaniel Green of Revolutionary War fame. He was a great lover of books and music, he was beloved by his townspeople among whom he had held positions of public trust, and he was an example of the best American public spirit. At Boston, on September 30th, 1889, he married Mrs. James H. C. Richmond, of Shullsburg, Wisconsin. It goes without saying that Mrs. Green and the four members of her family have every sympathy from all members of the Universal Brotherhood Organization.

A VERY ACTIVE CENTER IN HELSINGBORG

COURAGE!

BUT wherefore do you droop? Why look you sad?
 Be great in act, as you have been in thought;
 Let not the world see fear and sad distrust
 Govern the motion of a kingly eye;
 Be stirring as the time; be fire with fire;
 Threaten the threateer, and outface the brow
 Of bragging horror: so shall inferior eyes,
 That borrow their behaviors from the great,
 Grow great by your example, and put on
 The dauntless spirit of resolution;
 Show boldness and aspiring confidence.
 What! shall they seek the lion in his den,
 And fright him there, and make him tremble there?
 Oh, let it not be said! Forage, and run
 To meet displeasure further from the doors,
 And grapple with him ere he comes so nigh!

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question Some writers regard earth-life as an evil and as a condition to be escaped from as soon as possible? Is this a right view to take?

Answer From my understanding of the teachings of Theosophy, I do not think so. In one sense, since through our age-long selfishness and folly, we have made earth life so full of pain and sorrow, it may appear to be more evil than good, but from the standpoint of its being the only means by which we can rise to higher states of being, and affording us the opportunity of progress and development, through the reaping of the results of our selfishness, bitter as the harvest may be, it must be and is good. It is in accordance with the law; but it is also in our power, it is our destiny, to change this earth life into one of happiness. If it be a curse to be born on this earth, the curse is simply the outcome of our own past, and only we ourselves can remove it.

Earth-life as it is to-day may be an evil and to be escaped from as soon as possible; but *in what way* can we escape from it? Not by getting away from it as a plane of action, but by changing it; by transforming it, and making possible once again a golden age. STUDENT

Question In Theosophy, as I understand it, you teach the perfectibility of man. What will man do when this perfection is attained?

Answer The first thought that comes up in my mind in answer to this question, is, "wait and see." In the first place, we are very, very far from perfection, and is it not a fact that the full performance of our duty requires our closest attention, without speculating what we shall do millions of years hence, for the answer to the question would be at best mere speculation. Yet we are commanded by Christ, according to the authorized version of the Bible "Be ye therefore perfect," which in the revised version is given as a promise, "Ye shall be perfect." And surely it should be our endeavor to strive always for perfection. It is impossible for us to imagine a stopping place or a finality in evolution. All our experience is directly contrary to such a supposition. As each new step is gained, we find it opens new vistas of attainment, new possibilities of greater heights yet to scale, and should we attain perfection as men, that is, so far as evolution on this earth is concerned, there exists an infinity of worlds and suns in the unfathomable depths of space, and eternity before as well as behind us.

So you see, there is plenty to occupy ourselves with for a little while, without wondering whether there will be anything else to do when we get there.

There is a very significant statement made in H. P. Blavatsky's great work, *The Secret Doctrine*, given in connection with one of "the three fundamental propositions," established by it.

Further *The Secret Doctrine* affirms:—

(b) The Eternity of the Universe *in toto* as a boundless plane; periodically "the playground of numberless Universes incessantly manifesting and disappearing," called "the manifesting stars," and the "sparks of Eternity." "The Eternity of the Pilgrim (the immortal and eternal principle in man—in essence, one with the Universal Spirit) is like a wink of the Eye of Self-Existence." "The appearance and disappearance of Worlds is like a regular tidal ebb of flux and reflux."

This second assertion of the *Secret Doctrine* is the absolute universality of that law of periodicity, of flux and reflux, ebb and flow, which physical science has observed and recorded in all departments of nature. An alternation such as that of Day and Night, Life and Death, Sleeping and Waking, is a fact so common, so perfectly universal and without exception, that it is easy to comprehend that in it we see one of the absolutely fundamental laws of the Universe.

What a conception does this statement give of the eternal progress and development of the soul! It is stupendous. And in the face of this statement the question "what will there be for man to do?" will never be asked. Were it not for the teaching that man is divine, we could not face such a conception as that presented. And were not the superb generalization of the law of periodicity, or of cycles, as made, backed up by the whole of the teachings on this and other lines, it would be daring almost beyond belief, but at the same time it is so absolutely reasonable and simple that it *commands* acceptance. STUDENT

Question Can a real Brotherhood be established on an ethical basis apart from an economic one? Has not this been tried by different religious bodies, and failed? Wherein does your organization differ from theirs?

Answer The questioner evidently expects an answer, "No!" to his first question and in this we should agree with him; but we would also assert that in our opinion, neither can a real Brotherhood be established on economic lines apart from ethics. We know that in the world there are many who do separate ethics as a system from economics; but it is pertinent to ask whether in such a case either the ethics or the economics be worthy of the name.

It is well known that there are many shams and pretenses in the world, but the question is in regard to *real* Brotherhood, not to a pretense of it, and so it is right that we consider real ethics and real economics. Either of these without the practice of it, would be a mere empty word. But yet each may be considered from a theoretical standpoint, though the tone of the question appears as intended to convey the impression that ethics is mere theory, while economics is practical. Yet it would be manifestly unfair to take this stand, and just as incorrect as to consider only the theoretical side of economics while at the same time we spoke of practical ethics.

But Theosophists do not do this; for Theosophy which is not practical is *not* Theosophy. It would be a misnomer to call it such. The theory is studied of both these branches of human *activity*, in order that the mind may be intelligently directed towards, and become an efficient instrument in, the practical application of them in daily life.

But rightly considered, does not "ethics" include "economics," as one of its subdivisions. Webster, for a definition of ethics, gives "the science of human duty," and certainly the right "application of wealth or material resources" is a part of human duty, and as we know, the greater includes the less.

Thus a "real Brotherhood founded on an ethical basis" is also an economic one. The question is but an example, of which there are so many, of the idea of separateness, or the separation into, as it were, water-tight compartments, of the different phases of life. And herein is shown the need of Theosophy, the need for that which will unify and show the interblending and the interplay between all the various departments of human activity and thought. Brotherhood must include both these aspects, and indeed all departments of life.

It is in this that the Universal Brotherhood Organization differs from all partial, or limited, or sectarian, Brotherhood Organizations; it is universal in its aim and scope, and embraces not only all humanity, but all living things. It "is ordained and established for the benefit of the people of the earth and all creatures." STUDENT

THE cruellest lies are often told in silence. A man may have sat in a room for hours and not opened his teeth, and yet come out of that room a disloyal friend or a vile calumniator. . . . Truth to facts is not always truth to sentiment; and part of the truth, as often happens in answer to a question, may be the foulest calumny. A fact may be the exception, but the feeling is the law, and it is that which you must neither garble nor belie. . . . To tell Truth, rightly understood, is not to state the true facts, but to convey a true impression; truth in spirit, not truth to letter is the true veracity.—R. L. Stevenson

English Notes

(By Our London Correspondent)

Aug. 12th, 1905

EVERY day brings fresh evidence that England is in a critical stage. Critical in the scientific sense of the term. That is, the stage in a substance which immediately precedes its chemical transformation. In popular language one might say that a substance was then "neither one thing nor another." All departments of English thought and life seem to be in the stage of "neither one thing nor the other," at this present moment.

To a Theosophist this is an encouraging sign. Eternal law is acting in its customary way. A great cycle of transformation is upon us. Therefore the uncertainties of the hour.

The session of Parliament came to an end a few days ago. One cannot be accused of political bias in describing its achievements during the year as "neither one thing nor another." The same verdict applies to the political outlook, so far as internal affairs are concerned.

In the region of thought and religion the condition is similar. Radium has deatomised much of our accepted science, and our metaphysics are in a state of transition as a consequence. In Religion no one would dare to urge a dogma strenuously now-a-days. To be indefinite is the correct attitude of the pulpit where any claim to intelligence is asserted. The only phase of Religion that is pronounced in its ideas is Revivalism. This way leads to madness and pronounced mental chaos. Curiously, the Reconstruction of the Sixteenth Century was characterised by a similar outburst of ignorant fanaticism at its inception. What a crowd of cranks there were then!

Perhaps the only public man among us who knows how to do "the right thing in the right way at the right moment" is the King. There is unlimited confidence in him among all classes. His Majesty's latest achievement, the entertainment of the French Navy, has united the Nation for the moment.

I caught sight of the French sailors on their way to the Guildhall, and "cheered 'em like mad." Everybody was doing the same. The Frenchmen shouted "Hooray!" as though to the manner born. And, oh what a crowd it was to be sure!

Query? Is our internal unrest but an evidence of an approaching shell-breaking? Is England about to emerge—An International Entity?

LET us live; be it so.

But let us endeavor that death shall be progress. Let us aspire to an existence in which these mysteries shall be made clear. Let us follow that conscience which leads us thither. For let us never forget that the highest is only attained through the high.—Victor Hugo

The Swastica as a Popular Emblem

DURING the past four years the swastica has become a very popular symbol in the State of New Mexico and today it is worn by hundreds who have no knowledge of its significance. The manufacture of them in silver and gold has become a distinct industry although primitive methods are employed. Indians hammer them out of silver for sale to tourists who doubtless think that the Navajos from whom they are purchased hold it as one of their tribal designs. Mexicans form them in wonderfully beautiful filagree-work as hat and scarf pins, watch fobs, and in chains. Jewelers turn them out by the wholesale, one shop in Santa Fe employing three men sawing them out of sheet silver.

The members of an irrigation congress used the swastica as a badge of recognition, and the people who now wear them say, when asked, that it is worn for good luck.

Superstitions with Regard to Sneezing

AMYSTERY attaches to the question why sneezing has always been thought to be unlucky. Physiologically speaking, sneezing is a relief; and, if a devil is indicated, then surely it is a departing devil. But sneezing has usually been regarded as denoting "possession" and a verbal benediction has been considered necessary—a "God bless you!" or something equivalent.

According to the Talmud, before the days of Jacob men sneezed only when they were about to die; but Jacob broke the spell by dying of something else, and all nations were ordered to commemorate this exemption from death through sneezing by blessing God when anyone sneezed.

Nearly all nations, savage and civilized, attach importance to sternutation, and classical authors refer to prevalent superstitions on the subject.

STUDENT

An Ocean of Oil Wasted

THE still continuing disorders at Baku on the Caspian Sea have cost the world a year's output of the oil for which that town is famous.

All the extracting plants and the reservoirs have been destroyed, and the oil is running waste. The damage will take at least a year to replace and the loss will run far into the millions. There are 500 wells, and the annual production of crude oil is nearly 500,000,000 gallons. It soaks the whole soil, and the manufacturing procedures make the town the dirtiest on earth. Every now and then a new well breaks out and floods the entire district. A few years ago one of these suddenly sent a column 350 feet into the air, made a lake, and finally ran nine miles to the sea.

THE health of any state consists simply in this; that in it, those who are wisest shall also be strongest.—Ruskin—"Crown of Wild Olive"

Caught in the Web of Illusion

swine do eat." The restlessness which we see in men and nations is because the Divine powers of the Soul have been caught in the web of illusion, and turned to lower uses. The unrest of the world is an evidence that the Divine Spirit moves in man. Man tries a hundred things, but none of them satisfy because the aspiration of the better soul within cannot be satisfied *with anything short of the Eternal.*

In some respects the light brought to the world by Theosophy makes the misery and surrounding darkness more visible. But, if so, it also gives us the assurance that within all, and over all the Resistless Might of the Divine attraction ever acts—the ocean-fulness of the Divine Compassion claims us at last. Jesus gave the same teaching most clearly, when he told of the lost son returning home; the lost coin being found, the lost sheep, the *hundredth*, at last brought home to the fold. But in this, as in so many other things, the churches have gone in direct opposition to the teaching of the Master, and have wrapped the world in a pall of fear and hopelessness. A glimpse of the same great truth about man and his destiny is given in one of the writings attributed to Solomon—"He hath made everything beautiful in its season: also he hath set *Eternity in their heart.*"

Theosophy Teaches Man Is Divine

It is because, as Theosophy teaches, man is Divine, or Eternity is within the heart, that nothing finite ever can bring lasting satisfaction or peace. Other things are at rest, or at comparative rest here, "Everything is beautiful in its time," but the more truly man is man the less can he find amid the shadows of the present a pillow for his head, or a place of repose for his heart.

It is said by a modern historian that "as Columbus opened to the nations a new Hemisphere; and as Copernicus discovered the true system of the Universe; so Luther discovered the new world of the Spirit." And we can add that the great Light-bringer, H. P. Blavatsky, has disclosed the Divine in man, the most important revelation of all, and has given to the world a Divine hope, for "Out of the furnace of man's life and its black smoke, winged flames arise, flames purified." And she has revealed a universe that Copernicus never dreamt of, and a destiny for man infinitely more glorious than ever entered into the mind of Luther or Melancthon.

Things move very quickly in this new age. The nations that stood apart yesterday may clasp hands and hearts tomorrow. And by the very weight and strain of the world's great load of unrest, men, in thousands, may any day awaken to their divine nature and destiny, and casting aside the load borne too long, find true satisfaction and joy in moving in harmony with Nature; in living the Theosophic life; and in becoming more and more consciously One with

Awaken to Their Divine Nature

"That God, which ever lives and loves,
One God, one law, one element,
And one far-off divine event,
To which the whole creation moves."

(REV.) S. J. NEILL

The March of Cholera

MODERN sanitary and isolative precautions are about to be tested by no less formidable a barrier-breaker than the dreaded Asiatic Cholera. We almost forget that last century there were several immensely widespread outbreaks which did not rest till from Asia they had passed to Europe and from there to America. The first began in 1817 in India, crept slowly up to China, thence westward to Asiatic Russia, and then waited. After seven years it took up its journey again, moved along the border of the Caspian Sea and by 1830 had entered Europe. Then it travelled south to Africa and Egypt and west to both Americas. From first to last it was active for twenty years.

Subsequent epidemics, following more or less closely the same routes, have appeared in 1841, 1853, and 1865.

The present one is trying to do what its predecessors did. It began in India like them, and like them after going north-east to China has turned west into Russia and Persia. At the Volga it has rested eighteen months, but has now established communication with the Vistula and is moving along the western Russian frontier. Prussia it has already en-

tered. Will the rest of Europe be able to keep it back? And will the precautions of our officers at Hamburg prevent it from crossing the Atlantic?

The word Cholera includes two entirely distinct diseases. One, Simple Cholera or Autumnal Cholera is common in every country when summer is giving place to autumn. A variety of it is known as Cholera Infantum.

The real Cholera, Asiatic Cholera, Malignant Cholera, is the formidable enemy that Europe is now preparing to fight. It is of this that the mortality usually rises to fifty per cent. It would be better if the word were not used at all for the other.

The Cholera *bacillus* is killed by an extremely minute proportion of citric acid—the acid of lemon juice—dissolved in water. And it has been said that workers in copper were not attacked in any of the European countries.

A Paralysed Rival

OUR own oil industry will reap richly from the destruction of the Russian wells at Baku. For years there has been a race between the two, and Russia is winning. Here are a few of the figures: 1897—Russia 54 (million barrels), United States 60; 1898—Russia 62, United States 55; 1899—Russia 66, United States 57; 1900—Russia, 76, United States 64; 1901—Russia 85, United States 69. And so on. And it is with very antiquated methods that this vast total has been reached. When modern machinery has been installed, the disparity will be still greater.

But now for a year there will be no production in Russia. "Standard Oil" can command prices! And not only of oil but of coal, the alternative; whilst the Russian Government loses the \$100,000,000 which it would have received for the year's oil taxes.

To reach the world the oil has to cross the 460 miles between Baku on the Caspian and Batoum on the Black Sea. Three hundred miles is—or was till quite recently—done by rail; a pipe-line ran the remaining 160 miles.

According to the historian Vambéry there has of late been great religious activity among Russia's Mohammedan Tartars. He says that they have taken with equal and sudden fervor to the reading of Herbert Spencer and to the energetic proselytism of their own creed. A curious mental blend of past and present! Whether Turkey is behind them remains to be seen, or not to be seen; assuredly she would not object to see Russia put to a little extra inconvenience just now. C.

The Doukhobors

MOST people think that the curious sect known here as the Doukhobors—properly "Duchobortschi," meaning spirit-wrestlers—arose upon the doctrines of Count Leo Tolstoi. But as a matter of fact it is nearly two centuries old, and anyone who will examine its special tenets will find plenty of reason for thinking them to be an echo of one of the school of Gnosticism—perhaps the persistence to this day of a thin and deviously wandering but unbroken stream. Their Godhead is a trinity, Life, Light, and Peace. The human soul is a reflection of it, and therefore also a trinity, reason, will, and memory. Which element is supposed to be a reflection of which, we do not quite see. Within the soul the voice of God continually speaks; and the one business of man is to hear and obey. The soul pre-existed from always, but fell from purity in some past epoch. Its punishment is to be imprisoned in matter, the prey to the sensations it once voluntarily left its purity to seek. In this purgatory it must work out its own liberation. Christ, the Son of God, is the Sophia of the Old Testament, and the Incarnate Spirit of the New. The redemption of each man is the coming to birth of Christ in him, and the spiritual life of the man and the reborn Christ are thenceforward one. For that soul the world of sense has ceased to be. Their leader is the outward representative of Christ, and they have always given the leader for the time being autocratic power. There has been a sort of apostolic succession of them from the first. The present leader, Peter Verigin, is a man of remarkably potent personality and shows considerable tact in managing the affairs of his people. By his advice they have changed their name to "Christian Community of Universal Brotherhood." A small contingent of them has, or had, a communal center in England. STUDENT

Some Views on XXth Century Problems

The Art of Pleasure

THERE is a simple art which if practised for three months would make the most prosaic and monotonous of lives shine with new and rich experiences. It is the art of seeing beauty. Beyond it is another art, harder to practice—that of doing everything in the light of wider issues.

A little known philosopher relates how he started on the quest for beauty. He was alone in a squalid railway carriage. On the dirty floor was a dirtier, much be-trampled newspaper. Suddenly it occurred to him that if he could look deeper into the paper than the surface it must be surpassingly beautiful. Its molecules are giving off invisible light of every shade. At every touch it sparkles with invisible electric flashes. The atoms within the molecules are in swiftest motion, making new and exquisite patterns at every moment, and the flashes of light and electricity are born of that motion. In fact beneath the apparent deadness and squalor is inexhaustible and brilliant life.

The principle he had found, and which he developed till it transfigured his whole life, is that of seeing and thinking of all things in terms of their *life* instead of their apparent surface *deadness*. The deadness is merely the result of our extremely bad eyesight. The better our sight, the more should we find ourselves surrounded by inconceivably teeming life. It is a question of fact. The matter-of-fact person will take the surrounding world for what it is, alive beyond the conceiving power of imagination. The others, who think him an imaginative dreamer and arrogate to themselves the title of matter-of-fact—as if they had ever really confronted a fact in their lives!—are hypnotised by the limitations of eyesight, mistake the dirt on the shoes of Nature for Nature herself, and therefore live in utter squalor.

The other, the more difficult art, yet even more capable of redeeming the monotony of tasks if practised for a few months, is the cultivation of the feeling—really the knowledge—that with every duty well done something of the world's pain is lifted, human life's slow progress to its golden goal sensibly quickened. This is also a matter of fact, but it requires considerable training of the imagination to know it. For the imagination is really an organ of knowledge. What we call our organs of knowledge are mostly blinkers which through the ages we have carefully adjusted over our physical and mental eyes.

STUDENT

Slandering the Dead

HAVE the dead no rights? Or may they—so that they have been dead long enough—be libelled to any extent to spice a modern tale? One of the short stories that make up the bulk of modern periodical literature, ventures to introduce the character of Shakespeare. Considering the insignificance of the writer of this story, it is already a good deal for him to do. But when we find the greatest dramatist of the English-speaking race wantonly represented as a literary thief, it is surely time to protest.

To credit Bacon with the authorship of the plays bearing Shakespeare's name is perhaps merely foolish. But to represent Shakespeare as stealing from Marlowe the credit of *Romeo and Juliet*, and, we are left to infer, other plays—is something worse. If the writer maintains that the dead have no rights, we reply that his whole-cloth libel is an outrage against the *living*. Some of the greatest actions that men have ever done have been inspired by their ideals they have framed from the lives of great figures in history. By the deepest instinct of our nature we try to round out into a *general* greatness the men of the past who have done or written *anything* great, and by that attempt become ourselves the larger. The instinct may, unhappily, weaken as the passing years curse us into cynicism; but in childhood it is in all its strength. To the child it is a shock to find that Bacon was a prostitute. To take a *fair* character and gratuitously foul it with a charge that cannot be refuted, or, because the vehicle was merely fiction, that *will* not be refuted—is to drop poison into the springs of our highest life. Such a man is surely somewhere in the same class with one who should call a crowd together to watch his skill in train-wrecking. Might not the

editors see to it that the stories they print depend for their interest on something smarter, if not better, than the annexation and befouling of great names?

STUDENT

Great Britain's Opium Scandal

GOVERNMENTS appear to be sometimes behind, and sometimes ahead of, the evolutionary level of the men who compose them and the nations which elect them. Put the matter of the Indian-Chinese opium traffic to ten Englishmen of the middle class, and nine of them would express disapproval of it. Point out to them that they would be a shilling out of pocket by its abolition, and they would still be anxious to have it ended.

But make that ten the governing Cabinet, and not only will not one of them stir, but they will all get up in Parliament, when the question is periodically agitated, and advance reasons why nothing can be done. Nor, in the whole House of Commons, could a vote by any means be scraped together which would compel them to act—that is, compel them to enact their private convictions.

Many years ago, England compelled unwilling China, at the point of the bayonet, to receive this chiefest of all poisons, a poison moral as well as physical. In 1787, 3693 chests of opium were exported from India. By 1834 China was receiving 22,785 chests. She has now to receive 65,603 chests. She is as unwilling as at first. She appreciates as much as ever the vast evil being wrought on her people; she sees that in Japan the use of the drug is altogether forbidden, and that the Japanese Government has almost stopped its use in Formosa, notwithstanding the short period during which she has been in possession of that island and the drug's previous general use there. And finally she knows that Great Britain, a *Christian Power*, only reaps a miserable twelve millions of dollars from this particular export.

England's hand abroad is often beneficent, but she has more than one black debt owing to the Law. And a great navy will not put off the hour of payment by a minute.

Is not Japan now in a position to make a remonstrance felt? ENGLISHMAN

Rational Athletics

DR. FRANK LYDSTON, in the *Medical Journal*, "goes for" the idea that strenuous athletics lead to health; or, in other words, maintains that athletics pursued for health and for muscular power must be kept quite separate. That they are entirely confused almost every journal devoted to the subject bears witness.

The point to be attended to is to keep whatever muscles we have up to concert-pitch. A dead muscle lies slackly between its ends, like a violin string whose peg has slipped. A live healthy muscle is on tension, ready for instant activity, not requiring that the slack should be taken up before it can work. Athletics, for Health, need only be carried on to the point of keeping the muscles in this condition; in fact it is a condition, not a magnitude, that is wanted. A large proportion of the blood in the body is at any moment in the muscles; all of it goes through them at short intervals. But if they are not alert and tense it lags in them and therefore lags everywhere. And the bigger they are the more space for it to lag in. It is this function of the muscles—as energizers of the circulation—that the brain-worker needs. The athletics needed by the sedentary brain-worker, to be practised now and then through the day, are such as will put each muscle smartly through its paces a few times, going over the whole body. They should not include artificial weights, nor great strain. They should aim at alertness, not power, not much growth. Size of muscle should be strictly in proportion to the work it will be normally required to do. To develop it beyond that will make it a vampire, demanding the work it is now fitted for, and making great trouble, if it does not get it. The same criticism applies to the much vaunted exercises for increasing the breathing capacity. Such an increase implies increase in the size of the heart muscle, and both, when enlarged beyond the necessities of the body, of the daily work, constitute the evil known to medical science as hypertrophy, often a very troublesome condition to deal with, by no means free from danger.

Archeology Paleontology Ethnology

Cliff Dwellers

REMAINS of stone walls are found in Colorado, New Mexico, and Arizona. In the Mississippi Valley and west thereof mural remains are not found. These western plateaus are intersected by deep cañons, in the precipitous sides of which these stone dwellings occur, perched in almost inaccessible nooks. The stones are imbedded in good mortar and the walls are accurately angled and plumbed. The rooms are about 7 by 10 feet or less. Sometimes there are two stories, each 5 or 6 feet high. The walls are plastered internally, and there are cedar-wood sills still remaining. Watch-towers, with small windows, occur in the neighborhood of these dwellings. Vasquez Coronado, in 1540, found cliff-dwellers actually in occupation in Arizona.

The Tree of Life and the Cock

A CORRESPONDENT to a contemporary writes as follows:

It is a cardinal point of Chinese faith that their sun, or savior—God *Zas*—enters the world at midnight of the 24th day of the 12th month. On this occasion the golden cock of the "Tree of Life" naturally does not wait for the dawn, but, in honor of the advent of the spiritual sun, crows all night long. The Chinese "Tree of Life" is said to be a wonderful peach-tree, situated in the Happy Islands of the Eastern Ocean. The Biblical and the Chinese legends of the "Tree of Life" tally in many details, and point out the same moral. "Tartarus," or "hell," is directly under the roots of the tree. It is, however, but purgatory, a place of departed spirits, and not a place of everlasting torments. A commentator on the calendar of King Chu informs us that it coils up its leaves to a "height of 3000 miles," and that "a golden cock is sitting upon it when the sunlight dawns." An emperor of the Liang dynasty, Zuen Li, emphasizes the typical character of this golden cock by stating that when he "begins to crow all the cocks in the world are thus stirred up and begin to crow." It is the cock's function to awaken the glorious sun, which (in dispelling darkness) is held to disperse the evil spirits of night. These spirits, so the Chinese think, abhor the truth of the sun's light, and shrink back into the darkness of hell.

To the ignorant scholar the above seems a curious jumble of superstitions; but the student of symbology will find in it much that is familiar and much that is of interest. Reflecting that much of our own science and philosophy is highly symbolic and metaphorical in its language, he may conclude that the obscurity of this Chinese account is perhaps due rather to his own ignorance of foreign speculative language than to any fault of the account itself. For, after all, why are a "cock" and a "tree of life" more incomprehensible than H_2SO_4 or a "dislocation of the normal threshold of consciousness"? It is all a question of familiarity, and to sniff at strange formulas is quite as underbred and insular as to sneer at a foreign language.

This particular symbolism is however by no means exclusively Chinese; for, as the writer points out, the Tree of Life comes in our own Bible. So it does, for that matter, in many another Bible. There is the Scandinavian *Yggdrasil*, for instance, and the Hindu *Ashvatta*. "It would

be easy to accumulate from all parts of America the evidence of the worship of trees as an emblem of life, and their connection with the waters, the four winds, and the cross." (Brinton).

The idea that the arrival of the sun at a cardinal point indicates the descent of a particular influence upon earth, is universal; it is only in times of intellectual darkness that, losing the knowledge of true astronomy, we see in such epochs only meaningless coincidences, or, at best, atmospheric conditions.

The cock is also a universal symbol. He is sacred to Apollo, and gives notice of the rising sun. He is found

perched on church spires, some say because he was the war-emblem of the Goths and therefore associated with Gothic architecture. He represents, as do the Egyptian sacred animal symbols, some power of the soul, which can doubtless be evoked by the pure in heart, as a mighty aid; by the covetous, to their destruction.

Alertness, watchfulness, are in that power. Verily not for nothing does this creature send his clarion-call ringing through the darkness, to be caught up and echoed and re-echoed by his comrades of the same mysterious order. The cock may crow "because he cannot help it," but that is not much of an explanation after all. STUDENT

Timgad and El-Djem

ROMAN ruins abound in Algeria and Tunis, both along the coast and about 200 miles inland on the borders of the Sahara Desert. The most important are at El-Djem, the ancient *Thysdrus*, in Tunis, 100 miles south of Susa; *Tebessa* the ancient *Theveste*, 190 miles south-west of Carthage; and *Timgad*, the ancient *Thamagudi*, further south-west.

At El-Djem there stands out on the desolate plain a colossal Roman amphitheatre, only slightly smaller than the Colosseum.

It is 457 feet in the greater axis, and 392 in the lesser; while the corresponding dimensions of the arena are 253 and 188 feet.

The height is correspondingly great, but much of it must be buried beneath the sand which covers the ancient city.

This amphitheatre is constructed of enormous blocks in the usual massive style of the Romans, and has withstood the assaults of time, notwithstanding that it has been used by the Arabs as a fortress and as material for village construction, and that one sultan made a huge breach in the walls to prevent his enemies from using it as a stronghold.

Timgad, which has been partially unearthed by the French government is the most complete Roman city to be found anywhere. It was famous during the time of the earlier emperors when all this region was a Roman province. The two main cross streets, and the forum at their intersection, remain; and all the lower part of the walls of numerous temples, houses, etc. Rows of pillars still stand, and there is an arch of Trajan, with triple gateway, almost intact. At *Tebessa*, many temples and arches still remain standing, and afford a weird spectacle of contrast amid the desolate regions that surround them. STUDENT

✻ The Trend of Twentieth Century Science ✻

Medical Cannibalism

PROFESSOR ELIE METCHNIKOFF has recently granted a series of interviews to a writer who publishes the essence of them in a contemporary monthly. They lead up to the subject of old age, its causes and the way to avoid it. That is, the way to avoid it according to modern science; the real way to avoid it or postpone it is not even hinted at.

The subject develops out of the facts that (1) the cells of the body have a resisting power against invading germs and the poisons that the germs secrete; (2) they gradually lose it as the years go on; (3) there is a special set of cells, floating in the blood and distributed in the tissues, whose duty it is to destroy invading germs by eating them; and to remove by the same method dead or dying tissue—tissue, for example, that has been killed by a blow or cut; (4) these latter are sometimes unequal to their duty, and sometimes even turn against their possessor.

In adult life, special organs or tissues sometimes atrophy—dry, wither, and become more or less useless. This is due to the chronic irritation of some sort of poison. For example, the atrophied liver of drunkards is due to alcohol. When the irritation has reached a certain point, the scavenger cells of the blood, above referred to, regard the tissues of the poisoned organ as they regard tissues that have been badly injured by a blow or cut. They think it their duty to remove them. They consume their living juices, leaving only the dry framework. The organ is then said to be atrophied, and is almost or quite useless. The writer of the paper seems to regard this as an act of treachery, as when an army turns upon its government. But it is much more likely to be a mere mistake in judgment. The cells suppose the tissues to have what they have not, but ought to have—the power of replacing what has been poisoned to death; and in removing the dead matter they imagine they are rendering a service.

In old age there is more or less atrophy of *all* organs. All the organs are being gradually poisoned; and, as gradually, the poisoned fragments are being removed by the scavenger cells. What is the poison which is doing everywhere what the alcohol of the drunkard is doing for his liver? Professor Metchnikoff answers that question, but he does not even take up the question why the organs become unable to resist the poison. Here is the answer:

“The principal source of these poisons is entirely plain. Our digestive tube contains an enormous quantity of microbes, and many of them are capable of secreting substances more or less virulent. Our intestinal flora resembles the flora of forests in which one finds, together with mushrooms and other edible fungi, a great number of fungi that are venomous.”

In the intestine, then, lies the secret of old age; in the chronic poisoning from the secretions of microbes living there; in the inability of the tissues, after a number of years, to stand any more of it; and their subsequent atrophy due to the efforts of the scavenger cells to remove their dying particles.

And the remedy? We get no advice about moderation in eating, about careful mastication, about simplicity in diet, about the avoidance of foods that ferment. Yet it has been lately shown that by attention to these points, especially the second, all poisoning can be done away with. No; all that the Professor can think of is a way to *kill* the microbes rather than *prevent* them. The germ that causes the souring of milk will kill them, and so we are advised to drink sour milk, or cultures of the souring germ.

And why do the tissues weaken so that at last they cannot sustain themselves under the continuous dosage of the poison? We are told nothing of the ways in which the vitality is squandered from childhood onward, not even the chiefest—the waste of the creative power for sensual pleasure. The Professor's proposition, put nakedly, is that we should live on each other. It seems that if small quantities of healthy human blood are injected into the veins of a sound horse, the serum of this horse acquires a curative power over human anæmia. But in old age various organs are atrophied, besides the blood. Very well:

To quote the writer, “It is only a matter of injecting into horses, or other large animals, a certain fine emulsion of the human organ in question—the brain, the heart, the liver, or whatever it may be—to obtain, some five or six weeks afterwards, the serum to strengthen and up-build a corresponding organ in a state of weakness.” *But the emulsions must be got from the living organs, and the taking of them means the death of the man from whom they are taken.* How does the process differ morally from cannibalism or murder?

Thus far has modern medical science got! Neglecting the real paths of cure, the side track which it has taken, must, logically and inevitably, lead to this point. H. C.

Blinded with Half Knowledge

IF a pianist's fingers are stiff with cold and you warm them for him he will play better. And, up to a certain point, for every additional degree of warmth, the better he will play. Therefore the theory of there being a conscious pianist is nonsense; playing is an affair of thermo-chemical forces.

That sounds sufficiently absurd; but it is quite in line with newspaper comments upon some recent researches of Professor Loeb's on the heart-beat. It is known that some chemical reactions take place about twice as rapidly for every additional 18 degrees of temperature. It has been found that a turtle's heart accelerates at about the same rate, within certain limits of temperature, for the same increase. Therefore the heart-beat is an affair of chemical reactions, and—to quote a newspaper account—“another vital mystery has been shown to be dependent upon a law of inorganic nature, and the old doctrine of vital force has been buried still deeper under the growing mound of modern scientific investigation.”

The “vital force” is that entity which takes the mandates of consciousness—whether of man or nature—and carries them out through and by means of the forces of inorganic nature. That there is such an entity every man may know who wills to move his arm. His will is executed; but assuredly he does not know the mechanism by which the forces in his muscular fibres are started to action. It is not necessary that he should know; it is enough that the vital-force-entity knows. Shall we assume that the man was unconscious or that there was no man, merely because we find that the action is easier the warmer the arm? Yet this extraordinary confusion of thought is manifested whenever science makes a step in physiology. What is it that hinders men conceiving of a world-consciousness as the real cause of all that happens, the overruler of inorganic forces so as to make them yield higher and higher results—just as naturally as they conceive a human consciousness as the real operator whenever they see a living and moving human body? To one whose mind is really wide awake and not narcotised by a pre-determined materialism, the one is as obvious as the other. Such a mental recognition is the first step to that immediate knowledge of the world-self which the wisest of the ancients had. STUDENT

Vegetables as Medicines

A CONTEMPORARY suggests that in the case of the newly advocated “vegetable juice” cure for consumption it is not the totality of the product that does the work, but some one vegetable in the combination. We do not know which; one may have a special relation to the disease, or to the man taking it; and it may be a different one at different times that effects the invigoration.

There is no doubt that different vegetables have different effects upon the body, apart from their mere feeding value. From each we could extract something which would be a medicine for something. But hardly any work has been done in this line, and until it is we shall do most wisely in firing the whole charge into the patient. Some day the science of feeding will be known, and we shall change our dietary according to our need at the moment. But science and instinct are alike a long way from that point. At any rate, if instinct speaks, we are too dull to hear. Instinct probably tells us when we have had enough to eat. But—! Hence these tears! STUDENT

The Lakes of Finland

FINLAND may well be called the land of lakes, since lakes occupy about 12 per cent. of the area. Add to this 20 per cent. of marsh land and the innumerable fiords and inlets, and Finland is seen to be a country rich in water. In the south, where the lake illustrated is situated, there are 120 large and several thousand smaller lakes. The land surface of Finland consists of the oldest rocks, and they are rising from the sea. The country is well wooded, and such a combination must make the scenery very romantic and beautiful.

Reforestation in Southern California

RESPECTING the reforestation of regions in Southern California, a U. S. Forestry expert, speaking of the mountains in the Los Angeles and Santa Barbara region, reports as follows:

The young trees planted on the denuded mountain slopes last winter are thriving, despite the drought. Although on a large scale this work has been deemed experimental, conditions now justify reforestation work on a larger scale on these mountains in order to protect the sources of water supply.

About 500,000 young trees are now growing in the nursery in the San Gabriel mountains back of Pasadena, to be set on denuded slopes when they are two years old. To protect the nursery and newly planted trees twelve miles of fire lines have been recently constructed, which are broad paths cut through the brush along the summits of the prominent ridges.

In cooperation with the State the forest service is studying the question of forest planting for purposes of protection and wood supply, also methods of impregnating eucalyptus posts and piles to increase their life and the rate of growth and commercial value of white fir.

Can Animals Reason?

A WRITER in a contemporary uses the following argument in support of the claim that animals reason. We are conscious of our own reasoning, but not of the reasoning of another person; the latter we infer from his actions and from the analogy to our own case. Similarly we ought to make the same inference with regard to animals. Professor Romanes had a terrier which was accustomed to hold the food on its nose until the signal "Paid for" was given; and when his master one day said "Pinafore" instead of the expected words, the dog gave a start but recovered himself and remained awaiting the proper signal. A chimpanzee in the London Zoo became so expert that it could thrust a straw through any particular mesh of its

Lomaland Photo and Eng. Dept.

A VIEW OVER LAKE LAIVONSAARI, NEAR KUOPIO, FINLAND

cage that the keeper might indicate verbally by such phrases as, "Now the one near the keyhole." These actions must either be as intelligent as some of those performed by men, or else we are entitled to say that men also are automata. The only difference is lack of the power of speech. The case is quoted of a people called the Dammaras, in trading with whom each sheep must be paid for separately; their intelligence is not equal to the task of taking four sticks of tobacco for two sheep.

But, in such questions, endless confusion always arises because modern science does not understand the nature of the mind. Our mind is made up of many distinct factors. One part of it reasons, another contemplates the reasoning as a spectator. If the attention (still another factor) is directed elsewhere, the reasoning may still go on "sub-consciously." A man may be more stupid than a baboon, and yet have in his mental make-up a faculty higher than any the animal has. Ancient science distinguishes many different gradations of mind and consciousness, and analyzes the whole question in a way that would bewilder a modern western metaphysician. In view of this the question cannot be even correctly put, let alone answered, with our loose terminology and vague ideas.

THE HARMONY THAT BREATHES OVER ALL

J. G. PERCIVAL

THE world is full of poetry---the air
Is living with its spirit; and the waves
Dance to the music of its melodies,
And sparkle in its brightness. Earth is veiled
And mantled with its beauty; and the walls
That close the universe with crystal in,
Are eloquent with voices that proclaim
The unseen glories of immensity,
In harmonies too perfect and too high
For aught but beings of celestial mould,
And speak to man, in one eternal hymn,
Unfading beauty and unyielding power.—*Selected*

A Tree Older Than the World

THERE used to stand, and perhaps now stands, an oak-tree at Leamington, England, which is mentioned in the *Domesday Book*; and doubtless there are others in other parts of England. But in the New World trees exist which are believed to have a greater antiquity. A gigantic baobab of Central America, with a trunk 29 feet through, was thought by Humboldt to be not less than 5150 years old. Mexican botanists believe that a tree which they have now discovered is about 6200 years old. It is a cypress at Chapultepec, and they judge by the annual rings. The trunk is 118 feet in circumference. There is food enough for the most romantic

imagination, in contemplating the old Domesday oak, and reflecting that, through every eventful crisis of English history, it stood there, and was leaned against, and sat under, by people in every kind of costume just as now. But think of a tree that was a sapling 291 years before God created the world, and separated sea from land! and that was there all through the Flood and the Biblical history and the Egyptian and the classical, and is still there! E.

A Champion of Womanhood

IN the life of the late Lord Chief Justice Russell of England, we have an example of the power of an unfaltering devotion to principle. Love of justice was the very essence of his character and he spared himself nothing to bring justice about when once he had espoused a cause.

Although for thirty years Lord Russell was a prominent member of the English bar and the greatest Lord Chief Justice England has had, he was not an Englishman. In birth, descent, politics and religion he was characteristically Irish. His career as both advocate and citizen is intensely interesting and there are many notable instances which illustrate the strength and beauty of his character, but it is to his connection with one of the most remarkable cases in the history of our courts that we call attention.

Lord Russell was the friend of that most cruelly persecuted woman, Florence Maybrick, her able counsel during the long years of effort, on the part of her friends, to obtain her freedom. To the day of his death he was convinced of her innocence and labored unceasingly for her release. Although he died three years before this was accomplished, without a doubt, his powerful voice, lifted in the name of Justice, was more potent than any have realized in the final attempt made to right this wrong. It was chiefly, doubtless, because of his influence, that an innocent true-hearted woman was cleared of the infamous brand imposed upon her by those who plotted her ruin.

If what Lord Russell did for this one client were all, his life would be an example of high service to his fellows, for, in sacrificing as he did for the sake of righting the wrong done to a woman, he took a stand, in the real sense, in defense of wronged womanhood everywhere. His act has made it forever impossible for the woman in our courts to be quite so handicapped as was Mrs. Maybrick, forever impossible for the persecutor and the knave to succeed quite so easily as they succeeded in their plot to ruin her. A.

RUSSIA appears to have been the first country to see officially, as it were, the advantage of training women in the medical profession. A professor in the medical school in St. Petersburg volunteered to form the classes, and a patriotic woman, Mme. Rodstvenny, immediately followed with liberal gifts of money; so that, the governmental sanction having been accorded, the lectures began. That was in 1871. In consequence Russia has today quite a number of women of good family duly qualified who are able to minister to the needs of the peasants on their country estates.

These women medical students first proved their worth during the Crimean war, when, facing the hardships and dangers of the battle-field, they won the approval of the authorities and called out the gratitude of thousands of soldiers.

A whole army of women could be usefully employed in this profession in such a country as Russia where the distances to be traversed are so great. Lives must often be lost owing to delay in procuring medical assistance. And when we remember the hard study and trying ordeals to be passed through in order to qualify for this profession one feels that there must be many Russian women with strength of character, power of endurance and above all compassionate hearts—such women as will play a leading part in the future development of their nation. Today is, in the fullest sense, the Woman's Age and it behooves women to remain alive to its mighty significance and abreast of its opportunities. W.

The American Face

HENRY JAMES, the novelist, who with other tourists recently visited Point Loma and the Raja Yoga School, writes, in a recent *North American Review*:

No impression so promptly assaults the arriving visitor of the United States as that of the overwhelming preponderance, wherever he turns and twists, of the unmitigated "business man" face, ranging through its various possibilities, its extraordinary actualities, of intensity. . . . Nothing, meanwhile, is so concomitantly striking as the fact that the women over the land—allowing for every element of exception—appear to be of a markedly finer texture than the men, and that one of the liveliest signs of this difference is precisely in their less narrowly specialized, their less commercialized, distinctly more generalized, physiognomic character.

Mr. James is a keen observer and the impressions which "emerge from the fog of his own idiom" are usually more discriminating and delicate than those of less deep thinking critics of American life. So he sees in this very evident superiority of the women over the men more than the usual fact of the fineness of femininity. He sees the deep chasm between the levels at which the two sexes have arrived, the cosmopolitanism of the one and the provincialism of the other, and realizes that it is the feature of the social scene.

From his point of view the chief importance of these conditions lies in their fruitfulness of suggestion to the novelist and dramatist and the ironic poet. To the student of life, however, who longs for the full and equable development of both sexes, such a state of things has its deplorable as well as its entertaining side. Even Mr. James himself seems a little concerned because the woman is so usually deprived of the right kind of man for a helpmeet and the man of the right kind of woman. Yet if women suffer this deprivation, is not the blame largely their own? Has not the principal workable relation with men which too many have demanded and desired been simply that of financial support? Their love of luxury and display has been as potent as man's greed for gain in bringing about this narrow commercialism of not only the souls but the bodies of men, until it is shown in every feature and expression. Parasitism has its dangers, forever, and this efflorescence of the one sex at the expense of the other does not make for real worth and true power.

STUDENT

RECENT investigations made in England lead one to conclude that babies constitute about the only class not yet benefited by the march of civilization. Of every thousand children born in 1850, one hundred and fifty-four died as babies, yet according to a report made recently by the Bishop of Ripon, *the proportion remains the same today!* The reason given is "the ignorance of mothers."

But who is responsible for this ignorance? Not entirely the mothers themselves, many of whom work in factories, most of whom lack air and exercise, and all of whom are overcrowded and under-nourished. Where lies the responsibility? Plainly, it lies at the thresholds of those who, like Cain, guiltily question "Am I my brother's keeper?" And those are—ourselves, perhaps—certainly the fortunate and the well-to-do. M.

MISS FLEMING, an astronomer who is at present assistant in the Harvard Observatory, has just discovered another new star. It is in the constellation Aquila and has been named *Nova Aquila No. 2*, it being the second new star in that group to be discovered. It reaches nearly to the sixth magnitude. Of the last eleven new stars Miss Fleming has discovered eight. H.

THE LATE LORD CHIEF JUSTICE RUSSELL OF ENGLAND

IT is not what is done, but the spirit in which the least thing is done that counts. The real test of a man is his motive which we do not see, nor do his acts always represent it.—W. Q. Judge

OUR YOUNG FOLK

On Duty

DEAR BOYS AND GIRLS: This is how the Raja Yoga schoolroom looked on the evening when we held the memorial services for the sailors who lost their lives in the *Bennington* disaster in San Diego Bay. The boys standing in the garlanded ship carried wreaths, and the Raja Yoga girls afterwards marched in with wreaths and flowers. After some beautiful songs the boys and girls recited stirring words of courage and hope from the writings of great men. Americans, English and Cubans stood together beneath the stars and stripes and took part in this memorial ceremony.

Raja Yoga boys and girls, more than any other young people, I believe, have a strong feeling of comradeship to the brave and faithful who die at the post of duty. Do you know why? It is because they are trying themselves every day to live as if they were *on duty*. Does this mean that they always have long serious faces and never laugh heartily nor have any sport? No, indeed; but it does mean that they stand erect and look folks fearlessly in the eyes, and that they courteously receive their instructions from their teachers and guardians, who tell them what is the best thing for them to do at certain times, and when they have been told what to do—they do it. When night comes they can look back over the day and feel the glow of happiness felt by all who have been so earnest in their work and so fair in their play that every moment has been one of golden service.

A person on duty—a soldier or a sailor or a trained worker of any kind—is vigilant. He is on the lookout to see that the right thing is done. He never shrugs his shoulders, nor takes things easy in a slothful way, nor says "Well I cannot help it." He knows he is in the world for a purpose, and that in doing what is right and standing up every time for what is right, he is a kind of sentinel, and "on duty" as a soldier of the greatest cause of all.

The Raja Yoga boys and girls are trying to hold firmly to this thread of duty. If they live through a day having held to it without wavering, they are happy at bedtime. Of course tempers and laziness are two of the things that make young folks let go of the thread of duty, but if these two enemies are watched closely they can be kept away. Have you ever seen a boy or girl who has kept these enemies off, and held to duty for a whole week? If you have you will remember it, and you will feel like trying to do it too; for living "on duty" wakes up the dignity and honor in young folks so that their words and actions and their whole bearing are an inspiration, and call forth enthusiasm in other people, such as we all feel when we see brave soldiers and sailors responding instantly and unquestioningly to the call of duty.

You can see now with what a will and with what sympathy and brotherly feeling in their hearts the Raja Yoga boys and girls entered into the services held in honor of the sailors who, when the terrible explosion came, were at their posts, and died *on duty*.

A RAJA YOGA PATRIOT

THE Palace of Mines at the Lewis and Clark Exposition is a beautiful exhibit. It is a collection of the most remarkable gem minerals of the Pacific Coast and adjacent States. It includes amethysts and sapphires from Montana; green jade and garnet crystals from Alaska; rich golden green utahlite from Utah; and masses of transparent rock crystal from Calaveras, California. Southern California is rapidly becoming known as the treasure ground for gems, and from this locality came red, green and yellow tourmalines; pink beryls; topaz crystals of light blue; and many forms of the wonderful new gem mineral called kunzite, varying in color from pink to dark lilac. Five years ago the existence of kunzite was unknown and unsuspected. How many more such treasures does the golden land of California hold for the right hands? The great mountains and broad deserts have not yet yielded their full harvest.

RAJA YOGA BOYS AND GIRLS IN THE MEMORIAL SERVICES FOR
THE SAILORS OF THE BENNINGTON

LET it make no difference to you whether you are cold or warm, if you are doing your duty; whether drowsy or refreshed with sleep; whether in good report or evil report; whether dying or doing anything else.—*Marcus Aurelius*

THE CHILDREN'S HOUR

HANDEL

MARGARET JOHNSON

BARE and cold the garret chamber,
Gloomy with its shadows dim;
Haag with dusty drooping cobwebs,
Drapery weird and grim.
Suddenly, from out the shadows
Of the old, deserted room,
Came a strain of faintest music
Through the ghostly gloom.

While the night grew still to listen,
Soft and slow the music sighed
And, in melting minor measures,
Into silence died.
Say, what skillful, rapt musician
In the lonely room apart,
Thus made glad the sombre midnight
With his wondrous art?

From the moon, now bright, now hidden
In the clouds that crossed her way,
In the misty garret-window
Shot a slender ray.
Glanced upon an ancient spinnet,
O'er whose keys, with dust defiled,
Ran the eager, dainty fingers
Of a little child!

Boy, in after years the master
Of all mighty harmonics,
With a more than childish rapture
In thy lifted eyes,
Sately in the garret chamber,
Dim with shadowy mystery,
While the world slept in the midnight,
Angels talked with thee.

DEAR CHILDREN: These verses were written about one of the greatest musicians, whose name was George Friedrich Händel. He was born in Germany more than two hundred years ago. When he was a very little boy, he used to arrange his Christmas presents of horns, toy trumpets, drums and jew's-harps into a sort of orchestra.

His father wished him to be a lawyer instead of a musician, so he did not have much encouragement. One of his aunts took pity on him and gave him a little clavichord, which is an instrument that can be played on very softly. He carried it away up in the garret, and there, beneath the storks' nests, he would practice alone at night, when every one else was asleep.

Do you know what a stork is? It is a large bird with very long legs and in many places in Germany and Holland it builds its nest up on the roofs of the houses. Each family considers it a sign of good luck, whenever a stork makes a nest on their house.

When he was about seven years old, he went on a journey to a neighboring place, where he heard some fine music on the organ. He talked so much about it, that some one lifted him up on the organ seat and he astonished every one with his beautiful playing. After that he took lessons on the organ, harpsichord, violin and all the other instruments used in an orchestra. At the same time he kept up his studies in Latin and Greek, as his father wished. He soon progressed so rapidly in his music, that his teacher said he could not teach him any more.

When he was nine years old, he wrote either a sonata, a composition for the organ, or a church cantata for voices and instruments, every week. He composed many very famous pieces, some of which are played by our Lomaland orchestra. Although he became blind when he was about seventy years old, he still conducted his orchestra and played at public concerts for several years. It was a pitiful but at the same

Lomaland Photo and Eng. Dept.

A LOTUS BUD IN THE MEMORIAL SERVICE TO THE SAILORS

time a great sight, to see this blind old man, who knew his work so well and loved it so dearly, that he could still do it perfectly, even when he was old and could not see. For you know, if you really know anything *perfectly*, you can never forget it and you can always tell others about it, and that was the way with Händel. E.

The Raindrop Helpers

ONE day a lone cloud in heaven's shining blue shed a few tears because of its loneliness; and a playful breeze, sporting about, separated one from the other, a few of the drops thus fallen from the cloudlet. They fell at different places on the dry, hard soil; and they also wept because of their apparent uselessness; regretting their inability to skim along through the air and space as heretofore on the light, airy zephyrs. The earth eagerly drank them in, and they, to all appearance, disappeared forever.

Now, one day some children came out with their toy garden implements; for these little lost drops had fallen into a well-cared-for tiny piece of ground, tended lovingly by a little boy and girl—brother and sister. It had been given them for a double purpose; that of feeling with Nature and thus growing to understand and love her, and also for that health-giving exercise that is only attainable by familiarity with the soil.

These little ones began to hoe and rake and prepare the soil for the baby life in their seeds, so ready to grow into

the light and become beautiful and strong. When the little drops of water felt the soil being moved about, they sighed and said, "Perhaps we are going to be freed from our prison! if help does not come soon it will be too late, as we feel that we are becoming quite absorbed—as though something were draining our very life from us. Maybe they will dig us up so we can get back into the sunlight again."

As the day passed these little drops felt an unlooked for experience—a change in themselves they could not understand; they felt they were growing nearer and nearer the light, and that something was helping them along up through the hard soil.

It was the seed the little children had planted in the very places where those sad little drops of water had fallen, and had been absorbed by the growing plants, which they thus helped to grow; and there came to them much joy, as they found that the little plants were, in return, helping them back into the light—for thus does Nature work in mutual helpfulness.

The tiny drops finally understood, in their own little fresh way, that they were not lost nor useless; and then they were glad and sorry—glad they could help the little seeds, sorry that they were not large drops so they could help more seeds to sprout and grow. SISTER ALICIA

In this picture you see one of the little Lomaland patriots, for even the tiniest Lotus Buds here are patriots. They know what it means to honor the flags of the different countries and the soldiers and sailors who serve under them. Their eyes shine when they take part in a ceremony and their voices ring, and every one who sees them feels the tribute in their hearts.

A Raja Yoga Night

Point Loma Children at Isis Theatre—Delightful Music—A Youthful Orator—
Papers by Point Loma Students

THE Universal Brotherhood meeting at Isis Theatre last Sunday night was under the direction of the Raja Yoga children from Point Loma. The program was a varied one, and was rendered in a manner to please and delight an audience that filled the Theatre to the doors.

The opening chorus was by the children of the Raja Yoga school. Then came a recitation by little Margaret Hanson, delivered in Spanish, French and English. Two little girls rendered a piano duet most artistically, and a wee little boy, Geoffrey Barborka, read a paper about the children of Lomaland. Master Iverson Harris delivered an extemporaneous oration, pointing out the superiority of Greek literature over that of today. His treatment of the subject, command of language and self-possession were commendable. Little Margaret Hanson rendered a piano solo exquisitely.

Miss Elizabeth Bonn read a paper entitled: "The Heart Doctrine for Little Children." "The Doctrine of the Heart," she said, "is a living, transforming power that, entering into the lives of men, fills them with joy and light. It is that deeper knowledge and larger conception of life that comes through man's spiritual nature. 'Wherever the heart rules spirituality is, for the heart is the seat of the soul.' The Heart Doctrine is far above and beyond any mere intellectualism or work of the brain mind which of itself, however trained and educated, can never grasp this knowledge. William Q. Judge says: 'The power to know does not come from book study nor from mere philosophy, but mostly from the actual practice of altruism in deed, word and thought; for that practice purifies the covers of the soul and permits the light to shine down into the brain mind.' This deepest knowledge is also the simplest. There is not one who cannot understand it, who cannot make his life better by it. Children grasp this knowledge quickly and even seek it.

"You wonder at the Raja Yoga children of Point Loma, at their memory, their concentration, their power of thought, their fund of information, their artistic ability. You can see that they are not crammed nor overworked; there is nothing unnatural in their training. It is the outcome of the daily, continuous, unbroken life of the Heart Doctrine. It is illustration and proof of the truth in the extract given from William Q. Judge, that in the practice of brotherhood the light of the soul shines into the brain-mind and illumines it. Nowhere else in the world can this be done as it is done in the Raja Yoga school at Point Loma, for there a teacher who knows has made for the children the environment in which these things are possible. Years ago, H. P. Blavatsky wrote: 'If we had money we would found schools which would turn out something else than reading and writing candidates for starvation. Children should above all be taught self-reliance, love for all men, altruism, mutual charity, and, more than anything else, to think and reason for themselves. We would reduce the purely mechanical work of the memory to an absolute minimum, and devote the time to the development and training of the inner senses, faculties and latent capacities. We would endeavor to deal with each child as a unit, and to educate it so as to produce the most harmonious and equal unfoldment of its powers, in order that its special aptitudes should find their full natural development. We should aim at creating free men and women, free intellectually, free morally, unprejudiced in all respects, and, above all things, unselfish.' In pursuance of H. P. Blavatsky's idea this is what Katherine Tingley has fulfilled.

"Instead of being shut away from the world as some imagine, these Raja Yoga children are being equipped for life, and for a life higher and happier than now exists. They will not be unfitted for the world, but they will carry that life with them into the world. Those who see them running and racing in their games, their merry laughter ringing out, the joy of happy

childhood in every movement, and still their high purpose shining in their eyes, their loyalty to truth and steadfast devotion to duty—those who see this daily, verily believe that 'except ye become as little children, ye cannot enter the kingdom of Heaven.'"

Miss Ethelind Wood read a paper entitled: "Golden Days at Point Loma." In part she said:

"Every year has a few golden days. Sometimes they come in the spring, then in summer, and again in the autumn time. We cling to these days as they pass and we can't help dreaming of some clime in which the whole year will have nothing but golden days.

"Into all lives, even in the most unfortunate, there come times of promise, like golden days as it were. And to nations there come such times, times when they rise as on the crest of some sun-born wave; high into the sunlight of some mighty common purpose or ideal. They may sink back then, but they are never again as before. Some souls have seen the greater vision of that future time when all days shall be golden days; and there goes out from hearts such as these, an unvoiced pleading and a question.

"And the answer always comes, the teacher responds. Age after age these great helpers put men to the test to prove their sincerity, to find out whether men want life after life to be golden and true. Age after age humanity has failed to prove this, and that is why it was, upon the piled up failures of centuries that H. P. Blavatsky began her work and teaching thirty years ago. She had heard the heart cry and hers was the same response. She came with the same summons. She brought the same old test of sincerity and of courage that the great teachers have always brought. She called as the warrior calls, pleading with men to recognize their own divinity, assuring them that their dream of a time when all days should be golden days was not an idle imagining, but a vision of that which was true. But even she, so many were the weaknesses of humanity—even she could not change their dream into a reality at once. Yet today that has been done. Katherine Tingley has been the doer of it. Lomaland stands before the world today as the one spot where life is golden and where the days leave the real benediction in passing.

"Life in Lomaland is different from that of the outside world—as different as if it were that of another planet. In the world you have fragments, in Lomaland we have the whole. The world's picture often seems like the crazy repetitions of a kaleidoscope. When analyzed one sees nothing but disorderly and disjointed fragments. But repeated, they deceive by taking on a semblance of order just as the follies of the world are so common that they deceive us into thinking they are something else.

"In Lomaland, life, to be sure, is made up of units, fragments, perhaps, as in the world. But here lies the difference. Instead of being thrown together as people seem to be thrown together in communities, everywhere, without rhyme or reason, harmony or anything else, in Lomaland they take their places as parts of a great whole, a vast life picture. That is why life in Lomaland is no crazy patchwork, but is like a glorious mosaic, its fragmentary colors fitted into harmonious design by the artist genius who knows—the masterhand. Nor are the people, these parts of the great whole, just the same as those in the world, for their lives take quite a different tone. In Lomaland selfishness and harshness disappear, and the change comes not only from the glorious design, but from the softened tones and sunrise colors of the parts which form the whole. The very birds come near, the skies soften and bend low. Each morning the world sings anew her welcome as nowhere else on earth.

"Katherine Tingley has prophesied golden days for all humanity. Truly the beginning has been made, for the golden days are here and now in Lomaland."

Following the reading of the papers was a chorus by the children of the Raja Yoga school. The evening's entertainment closed with a selection by the Raja Yoga string quartet.—*San Diego News*

Art Music Literature and the Drama

The Musical Life of Lomaland—A Typical Concert

THE musical department at the Headquarters of the Universal Brotherhood and Theosophical Society, Point Loma, California, has reached such an important position and is showing such remarkable promise that a short account of a typical Lomaland concert will be found interesting. As Katherine Tingley, the Leader of the organization, has said "Music is not a mere accomplishment. It is a part of Life itself," and in the life of every student of Theosophy at Point Loma music plays a very large and indispensable part. Nearly everyone plays some instrument or sings in the choir, and all look forward to the weekly musical evenings as to times of refreshment and reinvigoration, when the mind is stilled and a whisper from a higher world steals in. The Leader, students and their guests assemble in the brilliantly illuminated Rotunda of the Raja Yoga Academy Building, a spacious hall, covered by the large dome which is so conspicuous for miles around Point Loma. The dome is entirely open from below and at night its airy framework of rare proportions stands out in fairy-like relief against the dark sky showing through the glass. The walls of the Rotunda are decorated in arabesque designs of light, soft colors, by one of our artist comrades. When the building is filled by the audience in student-dress, the effect is very picturesque.

Punctual to the minute the Raja Yoga children march in and take their places near the graceful double staircase, which is one of the distinctive features of this stately hall, and the orchestra prepares for the opening piece. Three years ago there were barely half a dozen instrumentalists here, now a full orchestra has been created—strings, brass, wind, etc. The remarkable progress made, in the short time of the existence of the orchestra, under the leadership of Mr. W. A. Rounds, is shown by the difficult and high class music it executes. Already its fine tone, its precision and artistic expression, delight the cultivated ear. Competent critics declare that in three years more the Lomaland orchestra will be second to none.

The first item on the program tonight is Schubert's *Unfinished Symphony in B Minor, Allegro and Andante*—one of the greatest tone-pictures ever revealed to man. As its majestic themes are rendered the gates of vaster worlds seem to open and choirs of stately beings weave an endless rhythm of creative song. Under its mystic spell a whirling globe seems to evolve, and at last, out of many throes and mighty efforts, the dry land appears, then green pastures, flowers and living beings. Upon each listener such a work as this, of course, produces a different effect but here the execution is so excellent as to permit the intuition to play unchecked.

To follow the stately music of Schubert without feeling conscious of an anticlimax within oneself is a difficult task but it is successfully accomplished by the "Tiny Tots," a large group of little bright-faced children who later give their action songs, "The Golden Boat," etc., with a spirit and vim that carries the audience away with enthusiasm. To see this very juvenile choir of a hundred healthy happy children pouring forth their songs as easily as the birds their melodies, and to know that they are truly a "band of brothers preparing to redeem the world," although a familiar sight, is one that always touches the hearts of the students and visitors as nothing else ever does. What a wonderful promise for the future is enshrined in these joyous hearts!

But a surprising feature is coming. One of the little people, eight-year-old Margaret Hanson, who is not yet tall enough to reach the pedals when seated on the piano stool, steps forward, and with faultless execution gives a rendering of a difficult Mozart *Sonata* with an artistic feeling and power worthy of a full grown performer. In fact, it has often been our lot to listen to professional musicians who had not a tithe of the expression and beauty of touch possessed by this little artist. When she finishes it is needless to say that she is recalled by the enthusiastic applause and compelled to repeat a portion of the piece.

Vocal music, particularly chorus work, is an important branch of the Raja Yoga system, and during the evening the special class of older children sing half a dozen part songs. Their well-trained voices, rich in quality and sweet in tone, ring out in perfect intonation and perfect harmony. There is something in these voices which comes from the pure and earnest lives of their owners and renders theirs different from the ordinary singing. The Raja Yoga children know that they have a great work to do in the world, and they are consciously fitting themselves for it. This aspiration is apparent in their voices. On this occasion they gave several Irish songs, "Killarney," "Kerry Dance," etc.

For five years the Lomaland children's choir has been an important feature of the work and has always been heartily welcomed at San Diego whenever it has been heard. When the crusade was in Cuba in 1903 the effect of the children's singing and playing there was electrifying. The credit of this great success is due firstly to our old and valued comrade, Mr. Neresheimer, who conducted the many choruses for several years with indefatigable energy and aroused a high spirit of enthusiasm for song among children and students, and latterly to Mr. W. A. Dunn who

has been a worthy successor. The vocal department here was one of the first to reach a high standard and the fame of the "Raja Yoga Chorus" has long since literally gone round the world.

A concert at Point Loma without Miss Hecht, our distinguished pianist-comrade, would be incomplete, indeed, and to-night she plays Beethoven's *Concerto in C minor*, accompanied by the orchestra, a most brilliant and masterly piece of work. In the opinion of many it marks the highest point in musical expression that has yet

been reached among us. The audience demands an encore with enthusiastic applause.

Space will not permit reference to every item but mention must be made of the String Quartet of older Raja Yoga boys, who work together in perfect unity, not one ever breaking the artistic *tout ensemble*. Their playing of Tschaiakowsky's *Andante Cantabile* was a finished performance.

Executive ability alone is not the only result of the efforts of the Lomaland musicians; there are budding composers stepping forward with success. The program of the evening includes a song by Miss Ethel Wood, composed by Master Rex Dunn, one of the Raja Yoga Boys—*Build Thee More Stately Mansions O My Soul*. Both air and accompaniment are dignified and original in treatment, and the composition shows more than promise. The young student has written other pieces and is now engaged upon a more ambitious work. This concert closes with a Wagner Overture by the orchestra, and then the children march out keeping time to the well-known lotus song *Young Crusaders*.

It is a matter of general observation at this center that a new feeling of unity is growing between the artists and the listeners; in fact, the separation usually so conspicuous at public concerts has disappeared here. The feeling now is of one animating consciousness of which the music is the expression for the moment, illustrating yet another and unsuspected working out of the unifying spirit of Brotherhood which has grown so strong here and which it is the high mission of the Universal Brotherhood Organization to extend till all the world sings the same glorious song of peace, joy and good will. OBSERVER

THE world would be richer if thousands and perhaps tens of thousands of wretched musical manuscripts were destroyed, but it is certainly poorer because of the fate of some of the manuscripts left by our great composers. Beethoven's cook once used a score of his precious leaves for kindling the fire. The original manuscript of one of Bach's works was once seized upon by a young gardener and tied around young apple trees. Many of Schubert's beautiful melodies lay for years in garrets, and the story is authentic of a valuable pile of manuscripts by an Italian composer being sold to a dealer in waste paper by the composer's profligate son. And these are but a few of the many who have served the world as only the genius can serve,—yet whose work has been lost sight of and obscured through no fault of their own. STUDENT

BUILD thee more stately mansions, O my soul,
As the swift seasons roll.
Leave the low-vaulted Past!
Let each new chamber, nobler than the last
Shut thee from Heaven with a dome more vast
Till thou at length art free,
Leaving thine outgrown shell by Time's unsteering sea.
—From "The Chambered Nautilus" by Oliver Wendell
Holmes

Universal Brotherhood Organization

Central Office Point Loma California

An Echo From H. P. Blavatsky

A WELL-KNOWN English religious writer, a man whose writings are read by many thousands of people, seems at last inclined to say what H. P. Blavatsky was vilified till her death for saying thirty years ago. But he is safe; she gathered the spears of the enemy.

After pointing out the many influences that are conspiring to win for the faiths of other nations the respect and attention of the Christian world, he says: "The study of comparative religion, combined with the fresh light obtained on the origin and history of the Christian Church, has, in fact, raised a new question in the mind of today. What we are inquiring for now is *the religion behind the religions*. . . . In physics there is looming into view the possibility of bringing all the diverse elements down to one. May we not, then, it is asked, hope for a similar process in the things of the mind and the soul? We are after the common denominator of the world's faiths."

Thus, then, he phrases the root fact upon which all *religions* rest: "If the force that is in me enables me to speak of force outside me, so, and by exactly the same right, does my inward consciousness, realising itself in thought, feeling, and volition, enable me to speak of an outside consciousness, possessing attributes of which these in me are a reflection, a derivation—the consciousness I call God." And he quotes Schleiermacher, who says of this ultimate religion: "The seeking and finding of the universal being in all that lives and moves, in all becoming and change, in all action and suffering. It is to have and to know, in immediate feeling, life itself as the infinite and eternal life."

Now for H. P. Blavatsky. Theosophy, she says, "is the essence of all religion and of absolute truth, a drop only of which underlies every creed. Theosophy is like the white ray of the spectrum, and every religion is only one of the seven prismatic colors. As the sun of truth rises higher and higher on the horizon of man's perception, and each colored ray gradually fades out, humanity will at last be cursed no longer with artificial polarizations, but will find itself bathing in the pure colorless sunlight of eternal truth. And this will be *Theosophia*."

As to the method of reaching Theosophy, she says: "It is only by studying the various great religions and philosophies of humanity. . . . that men can hope to arrive at the truth. It is especially by finding out and noting their various points of agreement that we may achieve this result." Must not the writer whom we have quoted, *have been reading her works?* In another of her books, speaking of the religion of primeval mankind, a mankind of which as yet science knows nothing, she says that it consisted only in the feeling of relationship to the omnipresent Divine. No creeds were necessary, no codes of conduct; all that came later. What sin could there be with the sense of that relation constantly present in consciousness?

The complete vindication of this great Teacher, all along the line, is nearer than her enemies suspect.

STUDENT

Educators Who Make Things Too "Easy"

IN a correspondence on "School Hours and Methods," which has been going on in the columns of a London weekly, the following remarks occur. The writer, a schoolmaster, is exculpating his profession from the very unearned charge of laziness, brought by another correspondent; and alleges that, for one thing, pupils are more exacting than they once were.

They no longer learn the valuable lessons of perseverance and application, and from long-continued "interesting lessons," which a correspondent so warmly advocates, they are unable to work alone, and in many cases even to amuse themselves alone. The wheel has gone round too far. The old days of pedagogues turned out far better specimens of boys than we do.

Discrimination is needed in this question. We may treat our children kindly and intelligently, but we need not stand in awe of them or bow down in humble adoration of their charming ways, as the parent of today seems to do. No doubt this general fear, on the part of adults,

to exercise their authority, is responsible for the giving way to children, of which the writer complains. But to pamper a child's faculties with "easy, interesting" lessons, and thus fail to call out his energies, is no kindness. It is part of the general system of spoiling. Without going back to any vicious system of cramming or unintelligent teaching, we may surely take good care to commence all education with a sound, vigorous, and thorough drilling of the attention, application, and memory, such as will equip the child with a first-class mental machine and make the rest of his education easy and happy. At all events those who have seen any so-called "educated" specimens with sieve-like memories, weathercock attention, and the stability of a jelly, will be pardoned for thinking so.

To anyone who has seen the Raja Yoga system of teaching in operation, the disastrous effects of parental weakness, in giving way to and being deceived by children's faults, comes as a revelation astounding in its force and frequency. Is it then likely that this so-called "love" has failed to creep also into the schoolroom—or, perhaps we should say, into the school-board, for the actual teachers get wiser by experience?

People who are so desperately afraid of hurting the pupil end by hurting him much worse, like a nervous dentist. It is childish nature to resist and be reluctant, but it is also childish nature to respond heartily to the firm strengthening touch. Let it not be said that we are advocating severity. Severity is the last resource of an inefficient teacher, by which he seeks to make up for his lack of influence. It goes hand in hand with indulgence. A teacher who has a firm will united with a kind heart can dispense with harshness and violence.

STUDENT

Theosophy in the Public Eye

THE following press clipping will prove interesting reading to all subscribers of the NEW CENTURY PATH. It is taken from the columns of a prominent contemporary:

Every man has an idea, in more or less definite form, of what constitutes success, and has formed an opinion as to the contributing causes and essential elements of its attainment. Mr. W. C. Giles of New York, a well-known railroad broker, who is at the Belvedere, was discussing the subject.

"There are just three rules for success as we know it," he said. "The first is unswerving honesty; the second is unceasing work; the third is ability. Given a fullness of the first two conditions, one may get along and accomplish the result with less of the third; but for true success the principles of honesty and work are indispensable. And by success I mean success in its truest sense. Honesty is purely a question of mental attitude. Dishonesty is a mental process, a condition of mind which must be carefully prepared in advance. To be dishonest one must plan it out, weigh this and that probability of being found out, consider this and that means of meeting such an emergency. He cannot be dishonest involuntarily."

"Do you think absolute honesty is attained in the business world of today?"

"Well," said Mr. Giles, smilingly sliding over the point, "I think the nearest approach to the ideal life that we have in this country is that of the Theosophists in California, in whose work I am deeply interested. They seek to attain the best moral, spiritual and mental planes and are sincere in their desire for brotherhood."

Notice

Attention is called to the importance of having all remittances to or for any of the different Departments of the International Theosophical Headquarters at Point Loma, California, sent either by postoffice money order or by draft. Otherwise responsibility for any losses must fall upon the sender. (Signed) CLARK THURSTON, *Chief of Finance*

For the Benefit of Enquirers

REGULAR weekly meetings of the Aryan Theosophical Society, established in New York City by William Q. Judge, the second Leader of the World's Theosophical Movement, are held every Thursday evening at 8 o'clock in Isis Hall, 1120 Fifth Street, San Diego, California. These meetings are intended to meet that large and growing body of earnest enquirers who desire to know more of the different tenets of the Theosophical philosophy. Students from the Universal Brotherhood Headquarters at Point Loma, California, conduct these interesting gatherings, to which every truthseeker is cordially invited.

Students'

Path

STAND FIRM

FRANCES DANA GAGE

THERE are moments when life's shadows
Fall all darkly on the soul,
Hiding stars of hope behind them
In a black, impervious scroll;
When we walk with trembling footsteps,
Scarcely knowing how or where
The dim paths we tread are leading,
In our midnight of despair.

Stand we firm in that dread moment,
Stand we firm nor shrink away;
Looking boldly through the darkness,
Wait the coming of the day;
Gathering strength while we are waiting
For the conflict yet to come:
Fear not, fail not, light will lead us
Yet in safety to our home.

Firmly stand, though sirens lure us;
Firmly stand, though falsehood rail;
Holding justice, truth, and mercy,
Die we may, but cannot fail:
Fail! it is the word of cowards,
Fail! the language of the slave;
Firmly stand, till duty beckons;
Onward then, e'en to thy grave.—Selected

What Constitutes a Gentleman?

WHAT, from the standpoint of Theosophy, constitutes a gentleman? The glamour of wealth never has succeeded, to any great extent, in deceiving others into considering its owner a real gentleman unless he possessed other qualifications. But good manners, self-possessed calmness, good taste, coupled with extravagance and an authoritative manner, have by the majority of people usually been considered as the characteristic marks of "a gentleman." Too often nothing was required in the way of good morals, nor of unselfishness. Indeed it was not so very long ago, and even by many today, that it was generally considered quite the proper and natural thing for a "young gentleman" to sow a generous crop of "wild oats"; and a large part of his gentlemanly prestige consisted of and was expressed by a system of requiring that his desires be regarded as of much greater importance than any one else's comfort. And as one of the qualities of the "gentlemanly" class has always been a dominating personal force, they succeeded in maintaining their position of assumed superiority over the less cultured. Even now a so-called aristocratic manner and slender hands and feet are accepted by many as proof of blue-blooded gentility.

But now the time has come for the adoption in addition of a new and truer test of rank and the appearance of the true Theosophic gentleman. Aristocracy, or that which passes as such, will no longer suffice; good morals are expected of every good man, and intelligence may be possessed irrespective of outward rank. What then shall be the new standard?

Perhaps dividing the word, although this is by no means new, may help us to find the answer: gentle-man. Such an one must be first a man, and he must be gentle.

We are reasonably well agreed as to what are the qualities that constitute manliness. A manly man must be brave, energetic, self-reliant, honest, truthful, true to his promise; and his general morality, if we judge only by appearances, must be such as to maintain his body in a state of good health. If we require the inner qualities of manliness, that is, from a higher standard, then we say, such a man must be moral not simply to conform to an outer standard, but be strictly moral according to the highest code. But now, in order to rank as a gentleman, we require in addition to these qualities that he shall be gentle; not soft nor weak, not obse-

quious nor tamely meek, not cringing; but gentle, and this necessarily involves many other characteristics because no one can be gentle who does not possess them.

The first, principal, and determining one of these qualities is unselfishness, for a selfish man cannot by any possibility be gentle in nature, though at times he may put on the appearance of it, because gentleness is the exact opposite of the hardness which selfishness inevitably produces.

Therefore the Theosophical gentleman will be essentially unselfish and all the qualities which go to make up his gentility will arise from that unselfishness. He will be kind to weaker persons and to animals; he will choose to suffer discomfort himself rather than to cause it to others; instead of being proud of the ability to compel others to obey him, he will rejoice in being able to dispense with the help of others in attending to his own personal needs, and will be always glad and ready to help others when they really need it, but not when it will merely indulge their laziness of mind or body.

But above all he will hold his strength at the service of the weak, the wronged and the oppressed. The same dominating personal force which others use for their own selfish purposes, he will use to defend the weak and helpless. This is a force entirely separate and distinct from physical strength or as the result of mental training.

Probably all of us have seen some frail, slight person overawe some one immensely superior in physical power. Call this force by what name you will, it is the attribute and the sign of the true aristocrat; of the man who is a law unto himself and yet obeying all law, asking no one's permission to do as he chooses, for he knows he chooses right and according to the law. And the Theosophical gentleman will place that force on the side of right and justice; meeting those others who use it selfishly, with their own weapon, the power of the will; but using this power in harmony with the divine will which cannot be invoked for self, thus making himself a shield of defense to those who do not possess it but who need protection and who, without such championship, would be unjustly oppressed because they lacked the power of self-defense.

Therefore the Theosophical gentleman will be essentially a warrior, ready at all times to use those qualities and powers which make him a gentleman, in defense of right. And the reason he will do so is because he understands that justice, righteousness and compassionate helpfulness are in accordance with the highest laws in nature, and that it is his duty as a gentleman to work and fight for them whenever and wherever he may be called upon to do so. And with all this will go courtesy and consideration for others. In fact all that was best in chivalry and knighthood will be revived in the conduct and character of a Theosophical gentleman. But the foundation must be in the character, for while culture and refinement are necessary characteristics they are not the first essentials, and without the deeper qualities, they are but an appearance and a mask.

The new standard of gentility and nobility is the use made of one's powers. And the first step in the establishment of a new Order of nobility and manhood was taken when the International Brotherhood League was founded by Katherine Tingley, the first of the objects of which is "To help men and women to realize the nobility of their calling and their true position in life." RALPH WYTHBOURNE

Reflections and Refractions

HELMHOLTZ in discussing the marvelous power of sympathetic vibrations brings out very forcibly the necessity of periodicity in them—a thing running all through nature—and of which even a good advertising agent knows the value.

The third chapter of Helmholtz' *Sensations of Tone* is the "analysis of musical tones by sympathetic resonance"; but in this chapter he repeatedly uses the term "sympathetic vibration"; in one place saying, "The astonishing nature of . . . sympathetic vibration will appear, if we merely compare the heavy mass of steel set in motion, with the light yielding mass of air which produces the effect by such small motive powers that they could not stir the slightest spring . . ." etc., etc. Is not this pretty close to some of H. P. Blavatsky's hints?

Shakespeare makes the ghost, in Hamlet, to say, "But that I am forbid to tell the secrets of my prison-house, I could a tale unfold. . . . But this eternal blazon must not be." Whence Shakespeare's detail, and precise knowledge on such matters, if he were not a conscious occultist? STUDENT

ENDURANCE

JAMES RUSSELL LOWELL

ENDURANCE is the crowning quality,
 And patience all the passion of great hearts;
 These are their stay, and when the leaden world
 Sets its hard face against their fateful thought,
 And brute strength, like a scornful conqueror,
 Clangs his huge mace down in the other scale,
 The inspired soul but flings his patience in,
 And slowly that outweighs the ponderous globe—
 One faith against a whole earth's unbelief,
 One soul against the flesh of all mankind.

THEOSOPHICAL FORUM

Conducted by J. H. Fessell

Question Was Madame Blavatsky a greater Teacher than Christ? Did she live on the same or a higher spiritual plane than Christ?

Answer Questions of all kinds are sent in to the Theosophical Forum, and some come up again and again in different form. One of these is in regard to the views held by Theosophists of Christ, his divinity and teachings. Such a question was answered only recently, and so it is not necessary to take up that phase of the subject now. The present question, as asked, is another variation of the same subject, but is it a profitable question? Theosophists regard Christ as a great Teacher, and Theosophy throws a great light on his teachings. He was one of the great Helpers of humanity; H. P. Blavatsky was another Helper, bringing the same message which was in danger of becoming a dead letter in the rush of the world's life in the maelstrom of materialism and selfishness.

Jesus himself is recorded as saying, "I am not sent but to the lost sheep of the house of Israel." And most of the other great Teachers have come to a particular race, country or people. But H. P. Blavatsky came not to one people, or one country only, but to the whole earth and herself visited most of the countries of the world, with the message of Universal Brotherhood that should unite the people of every race, creed and color.

No one can study the life, work and teaching of Jesus or of Madame Blavatsky, without realizing that each proclaimed the message that will redeem the whole world—if only men would follow it. It surely is not our part to discuss whether one was greater than the other, nor are we competent to measure either of these great souls; for they stand on heights far above those to which we ordinary mortals have attained and to them are due our deepest gratitude, and love, and reverence.

There are few today who understand or can form any conception of the stupendous work of H. P. Blavatsky, not only as a great ethical and religious Teacher, but in science and philosophy. The changes and developments that have taken place in religious thought, in science, in sociological and economic questions during the past thirty years have been amazing. To say that all this is the result primarily of the work and teaching of Madame Blavatsky would, to those who know nothing of her work and teaching, sound preposterous; but, being ignorant of that work and teaching they are absolutely incompetent to judge. The student of Theosophy and of Madame Blavatsky's work, and the work of her successors, knows and has the incontrovertible evidence that the changes in the world's thought along all lines is primarily due to the teachings of Theosophy.

Take the changes in religious thought, and the very fact that the bitterest opponents of Theosophy have come from the ranks of the dogmatic religionists is sufficient evidence of its influence in that direction. The demonstration that all the great world religions have come from a common source; that the fundamental truths taught in them are the same; the insisting on the pure teachings of Christ apart from theological dogmas and narrow creeds; the teachings of Universal Brotherhood, and of Karma and Reincarnation; have permeated the whole thought world; and the keen observer can trace the currents and waves of thought which make for the freedom and uplifting of mankind, back to the great original impulse given by H. P. Blavatsky.

In Science, the recent marvellous developments, the archeological discoveries, all bear witness to the truth of the statements made by her in her monumental work, *The Secret Doctrine*. But to know this, to

understand its full significance, one must read and study for himself.

No great teacher can be understood apart from the time in which he came and the condition existing at that time. As Madame Blavatsky herself said, she came "to break the molds of mind," to set the world's thought in a new direction, to strike a new keynote. For, thirty years ago, the whole of the "civilized" world was rushing headlong into materialism and sensuality. Look at the changes that have taken place since then and the signs are plain, the new keynote that has produced them is Theosophy.

The fear that some people have, regarding the influence of Theosophy, or that the teachings of Jesus will suffer through the acceptance of Theosophy, or that he himself will not be accorded his rightful place in the hearts of men, arises either from ignorance or from selfish ambition and lo-

Question Is it not a fact that a belief in Karma, to one who has had a life of hardship and disappointment, would accentuate the fact of his failure and embitter him?

Answer If one looked only at the past, this might be the case; but the doctrine of Karma does not only embrace the past, but also the future; or still more accurately, we might say that it shows how past and future are both included in the present. Let us for a moment consider the case referred to from the standpoint of (i) a belief in Karma, and (ii) disbelief, or ignorance of Karma.

In the first case, the man knows that he is reaping what he has sown, that the hardship and disappointment of his life have been just; that through them he has had the opportunity to pay off some old debts; and that *from this moment* even if he has not availed himself of the opportunity before, he has the power to sow that kind of seed that shall bring him a harvest of happiness in the future.

In the second case, on the contrary, the man regards his lot as unjust, and he either sinks down under it or it arouses his resentment; and it is in this case that he would most probably become embittered, and not in the other. Instead of realizing that the debt is his and that it is just that he himself should pay it; it appears unjust, not his and, too, he does not realize that he has the power to mold for himself a new future. For, logically, if the present is unjust, there is no guarantee that the future will not be, and consequently we are but the creatures of chance. Then, why should we strive, "let us eat and drink, for tomorrow we die." Is not the answer to the question plain? Do we not each of us know that it is because we *do* believe in law that therefore we have strength to meet the trials of life; and did we not believe in law then would our life be indeed hopeless.

On this subject, H. P. Blavatsky has written in the *Key to Theosophy*:

It is disbelief in the just law of retribution that is more likely to awaken every combative feeling in man. A child, as much as a man, resents a punishment, or even a reproof he believes to be unmerited, far more than he does a severer punishment, if he feels that it is merited. Belief in Karma is the strongest reason for reconciliation to one's lot in this life, and the very strongest incentive towards effort to better the succeeding rebirth. Both of these, indeed, would be destroyed if we supposed that our lot was the result of anything but strict Law, or that destiny was in any other hands than our own.

Karma—that Law of re-adjustment which ever tends to restore disturbed equilibrium in the physical, and broken harmony in the moral world . . . and preserve the balance of equilibrium, in virtue of which the Universe exists. STUDENT

An Emblem That Misrepresents

TRUTH is one of the most elusive of the desirable things. It might almost be said that there is nothing more unreliable than statistics or history, and we who are making history are largely responsible for the perpetuating of error.

Why is it that today there is a large and flourishing order, composed of educated and refined ladies whose objects are of the best, whose name and emblem are both irrelevant and improper? We refer to the Order of the Eastern Star, and venture the opinion that when the facts are well known to its members, the emblem will be changed.

In the first place, the star was seen by the three wise men, Gaspar, Melchior and Balthazar when they were in the east. The star was in the west, and guided them westerly to Jerusalem, thence southerly to Bethlehem, and thence easterly homeward. The so-called star was the Angel Gabriel who presided over the nativity of Jesus and guarded his mother, who was but fourteen years old at the time. The star with one point upward is the symbol of man with his arms extended, crucified and glorified. Says Mackey: "It represents God, all that is pure, virtuous and good, when represented with one point upward: but when turned with one point down it represents evil, all that is opposed to the good, virtuous and pure; in fine it represents the goat of Mendes." Tradition has it that St. Peter, he who denied his teacher and to whom Jesus said, "get thee behind me Satan," was crucified head-downward, as he was unworthy to be properly initiated.

The star is worn with two points up for the reason that the "jewelers who made the badges found it more convenient to make them hang from two points." This reason, if true, is about as sensible as some others that obtain among secret organizations. We have learned that the first lot of badges turned out for the Elks was patented from a moose head, and it was some time before the error was noticed.

It is not a fact that the age of symbols or of emblems is past, or that their meaning can be twisted with impunity. It makes a difference whether a man greets you with an extended open palm or a closed fist. It is sometimes a matter of life or death if a ship's flag is hoisted upside down, as it is an insult to turn a person's picture face to the wall. We do not look for a barber's pole at the entrance of a church nor for the pawnbroker's emblem on a courthouse. It is right and proper that the emblems should be used, as they are expressive and easily understood, and it is all the more wonder that they should so often be used out of place. The flag of the Red Cross and the white flag of truce are generally respected as shielding something worthy, and it is to be hoped that the officers of the Eastern Star will so change their emblem that it will better

represent them. If they, like the wise men, were to travel westerly and then southerly, they might see at Point Loma a nativity of children who will be the teachers of the coming generation. STUDENT

Tit for Tat

GERMANY has a clear case against Great Britain. In 1890 the two Governments effected a little bargain. Up to that time Germany owned Zanzibar, off the coast of Africa; and Great Britain Heligoland in the North Sea. They decided to change, and so since that time Heligoland has belonged to Germany. But it would appear that Nature did not approve of the exchange, and probably instigated by England (!), has been whittling Heligoland away. She not only topples cliffs into the sea, but is sinking the whole island. At the time of the exchange it was nearly four miles in circumference; now it is but three. In another 15 years there will be nothing left.

The only retaliation that we can suggest to the Kaiser is to induce Nature to do the same by Zanzibar. Is it possible that the Kaiser's hand is to be seen in the recent encroachments of the sea on Great Britain herself? C.

Artificial Diamonds

THE art of making diamonds has been given a step forward through a study of the diamond-bearing meteoric iron of Cañon Diablo. In a section of this famous meteorite Professor Moissan has found numerous diamonds—both black and transparent—together with graphite, and phosphorus and sulphur combined with iron. He has also made experiments to determine the effect of silicon, sulphur, and phosphorus. Iron was fused with a large mass of sugar in a crucible in an electric furnace. As soon as the molten iron had become saturated with carbon—partly from the sugar—a small proportion of iron sulphide was introduced, and the crucible was plunged into cold water. With rapid cooling as an essential, the carbon crystallized out from the center of the mass. The iron sulphide considerably increased the yield of diamond crystals, as did also the silicon, but phosphorus had no influence.—*Science Siftings*

Telescoping Space

The telephone has just notably extended its range of usefulness by contracting an alliance with the microphone or sound magnifier. By means of the combination, the inventor, who lives in Rome, held a conversation with a London office—a distance of 1000 miles. The telegraph will soon be an interesting archaic relic. When micro-telephony is also wireless, the speed of the world's commercial life will surely be doubled. H.

Great Issues of Little Things

WHEN an expert is called in to look at machinery, his examination is not like that of other men. The magnitude of the wheels and shafts does not impress him at all. He examines the *junctions*, the places which the eye of the layman passes over, bewildered and held by the crash and momentum of the whirling masses.

So is history written and studied, by laymen for laymen. The true expert has not yet spoken. And though with half their minds the majority believe that a guiding hand is at work in human affairs, with the other half they look only at the great wheels; they think that events are after all mainly worked out according to the size of the big battalions.

A legend describes how a great battle was once lost because a nail

loosened in a horse shoe. The general, hurrying to the field, was delayed. Our histories would call that an accident, give a line to it, a page to the battle, and a volume to the far flowing results of the battle—the fall of an empire, the supremacy of a nation. Of course it was but chance that made the blacksmith select among a thousand nails the single one that was defective. Still, if there be an intelligent Intelligence ruling or guiding human affairs, would it not be likely to work with a minimum of

Small Mis-takes Easily Corrected

force, to touch with a feather the blacksmith's hand in the quiet of the shop rather than press into the roar of the battle-field and turn the vast forces there in conflict?

It is said that Grouchy took the wrong road in his mission to meet Blücher and missed him. Napoleon went down. What shook Grouchy's memory or attention? As usual the histories invoke the facile Goddess Chance. But suppose she does not exist, and that at the nodal points where we think she works, something very different has to be sought! There are a myriad opportunities lying in the unwritten days and hours and minutes that precede every great and showy "epoch-making" event, places where the touch of a finger would suffice to turn the balance one or the other way.

All this field of research is so far not only unworked, but unsuspected. The historians never tell us anything, because they know nothing of the thread on which the pearls hang. They only picture the pearls.

Men will as they will; act as they will; will is free. But the results are beyond their present seeing; there is another factor of which they take no account. When they see its work they only murmur *chance*.

Chance the Will of a Certain Few

And its work blends in with theirs at every turn. It cannot prevent men willing evil; it cannot prevent their doing evil. Itself is indeed the will of a certain few among men. Its presence and work, age after age, will be the final checkmate of evil. But

so far it can only keep the prow of the troubled ship of humanity pointed to the light, save it from being overwhelmed in the sea of evil. It cannot compel men to will right; it cannot greatly force the pace of the slow, slow, ship.

This is a fragment of the Theosophical conception of history, one which will be given more and more freely as the world becomes readier to understand it. Humanity does not yet understand who are its great men. Mostly they move veiled among the masses, one only here and there standing forth visible. It is not they who fill the pages in connection with great events. They are usually as inconspicuous as the obscure moments and places at which chance is thought to rule. They are at present content to have their work called chance. Some of them do not yet understand the mode of their own work, do not know that they work at all in this mysterious way: only know that they passionately wish good to humanity. Their greatness is in that it is of humanity, not of their personalities, that they think first and last. Their souls are awake; they have brought themselves, through compassion, so close to the Light that would fain light and guide every man that cometh into the world—that will has in them a

Misconception of Greatness

strength possible to no lesser men; the will of the Light has become their will. As one moves one's body, not knowing how one does it, acting by the mere wish upon the intermediating elemental intelligence of the body: so the will to good of these men acts through a certain natural elemental medium—unknown outside of Theosophy—upon events, along lines of least resistance, non-resistance, and therefore at the points where chance is thought to rule.

Some, as said, know not at all, or know not fully, their secret connection with events. Some do. But of none of them, in this capacity, does humanity know anything. Whoever surmounts his selfishness, makes compassion his guide of feeling and action, knows the presence of the Light in his heart, he joins their ranks, whether he knows it or not, at first, or only after many lives. It is a Brotherhood, a "Lodge," an Order of Compassion. Its work is towards the point where human life shall become wholly redeemed, when the dissonances shall all be resolved: the ending of the prelude, the opening of the symphony. The door to this never non-existent Brotherhood of history-makers is open to all. Whoever in an act, balancing himself between selfishness and

Theosophy's View of His- tory Not Mystical

unselfishness, decides for the latter, has taken a step towards it. The great will has begun to blend into his. He has acted not only where he saw and intended, but also somewhere in contemporary history, where he did not see; something of human evil has

been deflected into the abyss.

This view of history, taught by the three Theosophical Leaders, H. P. Blavatsky, William Q. Judge and today by Katherine Tingley, may seem thoroughly mystical and, for a little while yet, be laughed at. But whilst awaiting patiently its general adoption, we know that in several quarters it will be carefully studied like other teachings from the same source, and then, its source *unacknowledged*, will be rewritten and re-spoken as original ideas. To that we are accustomed, and our only regret is that its great value will cloak much accompanying nonsense—even as, in the fable, Truth was compelled to take Folly under her cloak.

STUDENT

A Marvellous Corner of the Heavens

ONE of the favorite objects for owners of small telescopes to pick up is the double star Castor, one of the Twins, (Gemini). It is an "easy double," color white, and the components are fairly equal in size. Lately several things have been discovered about Castor which puts it in the category of wonders. First of all, Belopolsky discovered not long ago that one of the components had a companion very near it, and now the Lick observatory announces the finding of a fourth member of the group. Each of the bright stars thus has a companion, the two stars of each pair revolving round a center of gravity lying somewhere between them, and each pair also revolving round the common center of gravity of the whole system. The four stars are also traveling onward together while a fifth small star at a little distance partakes of the same direct motion. This singular complexity would alone be strange enough to make us wonder at such a spectacle of a family of giant orbs; but further, it is almost certain that one of the companion stars is a dark body, like a planet, but so immense as to be the gravitational master of the rest! There are many colossal "dark stars" being discovered now. These are not subordinate planets like those of our solar system, minute in size compared with their gigantic primary, but in some cases are of enormously greater volume than the brilliant companion-sun whose motion they control. How did it happen that the lesser component of such a double star should be so bright and glowing while the other, the leader of the system, is obscure? For the smaller body should have been the first to simmer down and darken. These anomalous pairs remind us of the theory of the Middle Ages, when men had lost the ancient knowledge, that the sun traveled across the sky while the earth stood still, for in those topsy-turvy regions of the sky such a thing may be said, without much exaggeration, to occur. The double-star 85 of Pegasus consists of a dark central body seven times as weighty as our sun, with a smaller brilliant sun traveling round it at high speed. The wonderful variation in the brightness of the brilliant star Algol is due to an immense dark body, almost as large as itself, coming between it and us regularly every 2 days and 20 hours.

The most brilliant star in the heavens, Sirius, has a dusky companion half as large as itself. To the complexities of these double, triple, and multiple systems add the singular variety of colors they present—some being contrasts of yellow and violet, orange and blue, etc.—and the mind reels when reflecting on the transcendent mysteries of creation in those regions. Truly "the undevout astronomer is mad."

STUDENT

Saghalin Island

TO get an idea of the size and shape of Saghalin Island, we may compare it with Cuba. It is a long narrow island, being 670 miles in length, while Cuba is 730. But it is not so wide as Cuba, and the area is only 24,500 square miles, while the area of Cuba is 43,300. It is as large as Holland and Belgium put together, twice as large as Greece, and nearly as large as Ireland. But mere area is a poor thing to reckon by. Many countries which seem so large on the map are really only small countries diluted with square miles, and the only difference between them and the smaller countries is that the places are farther apart and therefore harder to get to.

There are two rivers, the Tym, 250 miles long, and the Poronai. The central mountain ridges attain a maximum height of 5000 feet.

Saghalin has, under Russian occupancy, remained but a barren land, having been used as a penal settlement, and its resources not developed.

Its severe climate does not encourage agriculture and its harbors are ice-blocked. But it does possess great natural resources, which will now doubtless be developed. Its harbors can be navigated by a special kind of ice-steamer which has been invented. Its forests are very abundant, and, under wise management, will yield a continuous and abundant supply of fine timber. Then there is much coal waiting to be mined. But the most promising resource is the oil, which, according to one authority, is more abundant than in the oil regions of America. There are subterranean lakes of it, and they lie near enough to the surface to be readily tapped. The fisheries are the chief source of wealth at present, the rivers teeming with salmon, and the sea with herring. The superfluity of fish is coveted by the Japanese as fertilizer for their rice fields. There are also bears, foxes, sable, antelope, reindeer, seals, etc. The inhabitants (human) consist of Ainos, Gilyaks, Oroks, Japanese, and Russians. STUDENT

Nature and Drama

M. PÉLADAN maintains that the French public would appreciate higher drama than that to which their theatres mainly treat them. "Let the depraved," he says, "delight themselves with salacities and imbecilities; the people love high sentiments, superb phrases, and regal gestures; in this they show genuine taste. They want the hero to defend the weak and to chastise the wicked; they want to hear something more elevating than the gossip of the shops and see something finer than what surrounds them while they work; in this they show genuine aristocratic feeling. When they have a chance to choose between tragedy and obscenity, they won't hesitate."

But he would like them to see their plays in the open air. There is a Roman amphitheatre at the beautiful little city of Orange in Vaucluse. Here, in one week, it might be said that the whole history of drama was epitomised. It was a Berlioz festival; and they played his *Trojans*. But Boito's *Faust* was also done; and Shakespeare's *Julius Caesar*: and the *Oedipus Tyrannus* of Sophocles. Could we get an audience for those things in some little country town? The festival lasted a week, at a little place away down in the south of France.

There is another Roman amphitheatre at Arles, and another at Nimes; and at Champigny they have made one. The Romans knew how to see plays, and the French are learning. At the Champigny theatre there are three grassy stages, one above another; while at the back of the highest of the three rise a ruined Greek Temple and an old Mycenaean mill. You can have actual nature in the open air theatre, and if there are some things you cannot do, there are others which you cannot do anywhere else. Mr. Hartt, in the *Boston Transcript*, quotes Péladan on this point:

In an ordinary theatre, says he, when Semiramis, having resolved to die, has finished her tirade of fury, she can only leave the stage by way of the wings; at Champigny, she ascends from one stage to another till she reaches the hilltop, where her figure is silhouetted against the sky; and thus the myth can be given its true dramatic interpretation, and the dove that flies away when the actress disappears seems real. The natural stage-set blends with the fable and justifies it to the imagination. Plays that succeed in the open air often fail before the Parisian foot-lights, even when performed by the best players.

And would not the *moral* atmosphere of a theatre and its greenroom be as much bettered as its physical if it lay open to the sky and the winds brushed the surrounding trees?

They certainly do some things better in France. They reach the springs of nature more easily than we; and so they do better all the things that depend on that.

STUDENT

Great Debts of Great Powers

SLOWLY the debts of the great European Powers creep up towards their breaking point—whatever and whenever that may be. The debt of France is nearly 12 per cent of her wealth; that of Russia was 10.4 per cent; Germany 7.75 per cent; Great Britain 6.26 per cent. Whilst of the newer countries the debt of Australia is 4.18 per cent; of Canada 5 per cent; of the United States 1 per cent.

That is the true method of forming an idea of the debts. In terms of the population, the figures are very misleading. A poor country may have a relatively small per capita debt, which, considering the average poverty of the individuals, may be very heavy. The per capita debt of France is \$151; of Spain \$108 (very heavy); of Great Britain \$96; of Russia \$31; of Austria-Hungary \$24; of Germany \$10 (it should be remembered that France paid the cost of the Franco-German war); of Australia \$250; of Canada \$50; of the United States \$11. C.

Some Views on XXth Century Problems

A Disproved Assertion

OF all the dangerous assertions ever made in the name of science, that of Koch—that human and bovine tuberculosis were two entirely different things—was perhaps the worst. The first corollary was that the variety of tubercle to which cattle were subject, could not be communicated to man; and *vice versa*. And the second was therefore that it is safe to give to infants the milk of diseased or doubtful cows.

The assertion was instantly controverted by indirect and, later, by direct evidence.

The indirect evidence is the extraordinary prevalence of *intestinal* tuberculosis among children and infants. Various observers, making enormous numbers of post-mortem examinations of children dying of various causes, found the existence of more or less intestinal tubercle in 23 per cent., in 28 per cent., and even in 32 per cent.

This clearly pointed to a *food* infection, not an aerial. And some physicians now go so far as to deny that the lungs are ever, in children, the primary point of infection, and to assert that in them the pulmonary infection is secondary to intestinal in every case. It appears that in infants the epithelial lining of the intestine is always incomplete, and infection is therefore peculiarly easy.

The researches also pointed to milk as the vehicle of infection, since these high percentages were largely concerned with infants whose only food was that.

But the direct evidence in rebuttal of Koch's assertion was the experimental production of tubercle in cows by inoculation from human beings; and the occurrence of certain cases in which it was definitely shown that bovine tubercle had been communicated to man.

The question is really at an end, and it remains for municipal authorities to enforce the purity of the milk sold in their domains. New York is doing this. The examiners permit the presence of 30,000 mixed bacilli to the cubic centimeter (about 1-18th of a cubic inch)! At this number they draw the line; beyond it the bacilli of various kinds have things too much their own way.

It is easy to sterilize milk without hurting its finer feeding value by boiling. If it is heated in bottles up to 160F. and kept at that for an hour and the bottles then immediately plugged with cotton wool, the risk of trouble is almost nil. M. D.

Evaporated Wealth

AN eminent Frenchman has been saying some things about war which in these days sound very archaic. It is M. Brunetière, writing on "The Lies of Pacifism." Standing armies, he says, require vast amounts of supplies. These are furnished by the work of the people, who thus find employment. All the industries concerned are therefore helped and maintained, etc.

Whence comes these people's daily pay? From the government. And where does the government get the money from? From taxes, paid in part by *those same people*. By that much they are therefore worse off in making military supplies than if they had been making anything else.

A *standing* army is a vent-hole, down which goes the wealth of the nation, and from which nothing comes back. If the makers of military supplies had been making shirts, they would have been furnishing a necessity, enabling the wearers of those shirts to go on with their work; which work is an addition to the sum of national work. But the soldier of the standing army does not make that addition, that return; he is a non-productive consumer.

The argument is of course trite enough; the surprising thing is that it should have to be fetched out of the museum.

M. Brunetière's other contention is that war evolves high virtues, courage and so on.

Possibly; but what is the proportion between the time spent by any nation's armies in war compared with that which they spend peacefully lolling in barracks trying to kill the afternoons? What noble virtues are the fruit of barrack life? If you can think of one or two, contrast

them with what would have evolved by the same men peacefully and productively working at ordinary employment.

And finally, when the virtues evolved by actual war have been reckoned up, balance them against the volume of elemental savagery let loose upon every battle-field. STUDENT

Transitions

THE artists too, think we are on the eve of a new era, that the coming universal inspiration will touch them too with its wings. With them too is the chaos that precedes new order. According to Charles Morice, in the *Mercur de France*, the touches of all past schools can be seen side by side in the work of today. "The early masters and those of the decadence have met in a transition epoch and, as it were, walk side by side with the masters of the age of Pericles, those of the Renaissance, those of the age of Louis XIV, and so on." To a number of artists he has sent certain questions of which the first is: "Do you feel that today art tends to take new directions?" Most of them reply in the affirmative; some of them very strongly, indicating the directions which they think it will take. René Piot sums up the tendencies of the expected movement as "a reaction from pre-existing forms, but an offspring of them at the same time." (Quoted from *The Literary Digest*.)

It is the same in all other fields of human thought and work—a waiting, an expectancy, the coming to an end of old things, the signs of the birth of new. Theosophy, which has so far only *begun* to tell its message, will, when its time comes, *illuminate* all these fields completely. It can do this because it is the stored wisdom of man's whole past, never let die from epoch to epoch, never withdrawn *from* men, but, epoch after epoch, withdrawn *from by* men. Now it is again beginning to call men's attention to their own past which with its light they can recover. And the greatness of that past few even suspect. STUDENT

Theosophy as Historian

PHILADELPHIA has at last done herself the honor of setting up a bust of Thomas Paine in Independence Hall. We say *at last*, because—according to *The Ledger*—the bust was presented in 1876, but, owing to religious prejudices, was held back all these years. If it can ever be said that one man was the cause of a great event in human history, Paine was the cause of our American independence, even of our birth as a nation. *Commonsense* and *The American Crisis* were the last accessions of heat which brought the whole to boiling point, the sparks which fired the long gathering pile. And that of course is really the only sense in which we *can* say that one man caused a vast and pregnant event.

The character of Paine, and the real motives which actuated him, have never yet been understood. In his relations to this country he had a mission, and he knew it. How he knew it and exactly what he knew have not yet been told. There are some men, often quite unknown or inconspicuous, who *guide* to a degree the currents of history. Others, however prominent, *go with* the stream they may seem to lead. Upon these the attention of the historians is mostly fixed. Paine was among the number of the first. His character will not be understood till history is written with a light that Theosophy alone can throw. STUDENT

The Strike Problem

A STUDY of the "strike" problem in Great Britain might lead to some real knowledge. During the last five years, as compared with the preceding five, they have been steadily falling off in number. In the five years ending in 1893 the disputes leading to a strike were on the average 568 per annum; the average for the preceding five was 835. The average number of work people affected was 184,000 as against 254,000. The average duration of the disputes was 3,125,000 days against 8,927,000 days.

This is a very remarkable falling off. It may mean increased reasonableness of both sides and readiness to submit to arbitration before going to extremities. It may mean increased prosperity; or that the workmen think strikes useless. Whatever the cause it would be well worth the while of social students to ascertain it. STUDENT

Archeology Paleontology Ethnology

The Erechtheum

THE Erechtheum, one of the two principal buildings on the Acropolis stands on the northern edge of that citadel, opposite to the Parthenon, which is on the south. It is in marked contrast to the Parthenon, for, instead of the massive and regular Doric style, it has the more graceful Ionic form, and is much smaller. It consisted of a central shrine, running east and west, with two porticoes, one on the north and the other on the south, at the west end of the shrine. The southern portico is supported by Caryatides. The Erechtheum was two temples in one, part being dedicated to Athena Polias and part to Athena Pandrosus. The name comes from a tradition that Erechtheus was buried on this site.

STUDENT

Antiquity of the Arch

IN an article on Babylonia, in a newspaper, it is said: "To the student of architecture it may be surprising to learn that the arch, until recently supposed to have been unknown to the ancients, was frequently employed by the pre-Babylonians of more than 6000 years ago."

The said supposition seems to be nothing more than a belated survival of out-of-date archeological superstitions, according to which, human history is but a brief period, beginning with a comparatively recent barbarism and ending with our present exalted state. That view of things has been sufficiently stultified by later discoveries. In the light shed by these discoveries, we are free to surmise that, even if certain peoples were ignorant of the arch, nevertheless earlier peoples may have known of it; for

human history moves down as well as up. But we may go further and ask ourselves whether those people who did not use the arch eschewed it from ignorance or from design. The ancient Egyptians did not use the arch. Dare we say that the idea had never occurred to them? What is there so very recondite about an arch—one of the most familiar devices in nature? One would sooner say the Egyptians scorned the arch.

Architecture also will have to revise its dates and tables to keep pace with modern research.

STUDENT

Ancient Sumerian Drains

ONE of the facts ascertained at the recent excavations of Bismya, the ancient Sumerian city, was that these pre-Babylonians, of over 6000 years ago, had drains (and, inferentially, also brains). And what is more they knew how to drain successfully in a country, the character of which would have puzzled a modern sanitary engineer. With a surface that was perfectly level and had not the slightest fall towards the sea, and a soil consisting of unknown depths of loose sand crusted over by a layer of sun-baked clay, drainage, as we understand it, would seem, to say the least, difficult. How then did these Sumerians

manage it? Exploration has proved, by actual discovery of the structures, that they sank a porous cylindrical shaft of brick deep into the sand, packing it around the outside with potsherds and loose sand, and poured their waste water down this to be absorbed.

At Bismya they found instances where this drainage shaft reached 14 meters in depth. From the bottom of the pit was built up a cylindrical terra cotta shaft, made up of tubular sections. These pipes were pierced at intervals with holes two centimeters in diameter, and on the top was a hemispherical cap with an entry hole. There were also horizontal gutters leading down to these drains; they have been found on the ruins. The Babylonians of a later period drained their burial places in a similar way, thus preserving them and their less perishable contents.

STUDENT

Facts and Fancies about Easter Island

WHEN Easter Island was visited by a Harvard expedition recently, only 60 native inhabitants were found remaining. Fifteen years ago, when Paymaster Wm. J. Thomson went there with the Mohican, there were 150. The gigantic Lemuro-Atlantean images, for

which the island is so celebrated, are very numerous and lie scattered all about, dethroned from their stone platforms. How they became scattered, and why "all image building and erecting appears to have had a very sudden interruption," tradition does not say, though confused and improbable accounts are given by the natives. The scientists, imagining these images to have been made in comparatively recent times by a race but little more advanced than its present survivors, are

THE ERECHTHEUM WITH THE CARYATIDES TO THE RIGHT, ACROPOLIS, ATHENS

obliged to infer that these huge monoliths, weighing from 10 to 40 tons, and being from 10 to 70 feet high, were quarried and carved with stone knives(!), and dragged for immense distances "with no other mechanism than crude hempen ropes and wedges made of stone greased with grasses"(!!) The archeological formula seems to be that, the achievement remaining constant, the skill of the workman is inversely proportional to his degradation. It beats the Egyptians hollow.

Hieroglyphics have been found on pieces of driftwood washed ashore, and an account says that the last expedition tried to induce an old native to translate them; but he refused, because the missionaries had forbidden him and he was afraid to imperil his soul. Finally however he consented to dodge the ban by translating a photograph of the hieroglyphics.

STUDENT

Oldest Chaldean Inscription

A FRENCH archeologist has recently discovered, in the course of excavations in Mesopotamia, some Chaldean sculptures which are thought to be among the oldest yet found; the date assigned being considerably more than 4000 B. C. They represent a virgin and a divine child, a sufficiently familiar and universal symbol, and battle scenes.

The Trend of Twentieth Century Science

The Chaos and Cosmos of Facts

IT is very interesting to observe scientific men grouping themselves on one side or the other of the line of bias, the line between material and spiritual conceptions of the universe. A striking instance of the former, to which we have already referred, was the principal astronomical address at the meetings of the British Association in South Africa, where the speaker suggested that we should "get rid of" the idea of the celestial bodies, the stars and nebulae, being parts of one whole, arranged according to some vast law, and substitute the idea of the arrangement being according to chance.

Sir William Ramsay comes on the other side. He has just offered a mechanical explanation of Burke's "radiobes." But at the end of his remarks he says: "But no one will rejoice more than I if it"—his explanation—"should ultimately prove to be inadequate." His mind *likes* the idea that the pouring of energy—in this case from radium—into certain forms of matter—here gelatine—may result in forms of life. The less living ever waiting to become the more living, ready the moment that conditions offer—is his conception of the universe.

The greater discoveries in science now impending will be the work of such men as this, not of the other type. The two kinds of men go wholly differently to the vast lumber room of facts. To the one come by day and night intuitions of law and of laws; and they search the storehouse already illuminated and prepared, knowing what to look for and where to look. The others go blind and clueless. Long lost ideas from the far past, when there were seers in science, are pressing upward into the modern air, seeking minds to harbor them. This is the illumination by which the greater discoveries of the future will be made, discoveries leading to wholly new (for our epoch) conceptions of the universe and of life.

STUDENT

The Secret of Vegetable Juice

A MEDICAL writer, attempting to throw light on the causes of the value of fresh vegetable juices to the consumptive, explains it by a quotation from Fernie's book *Meals Medicinal*. The author of this book points out that the constitution of vegetable foods is "altogether of a building-up character, as distinguished from animal life, which involves excretions of the broken-down products as parts of its being."

The differences between animal and vegetable cells are not yet fully known. But we do know that an animal cell breaks down in its work, and requires rebuilding, much faster than the vegetable. The products of the breaking down are not excreted at once into the blood, but remain awhile in the cell. They only enter the blood when they have reached the stage of uric acid, urea, and similar crystals. To eat the cell, to eat animal food, is to eat these extractives, all of which are irritants, stimulants, no more food than is a cut with a whip to a horse. They are followed by a reaction; and they themselves have to be excreted by the eater.

A corresponding set of bodies exist in the vegetable cell, but in far minuter quantity, and some of them seem to be entirely beneficial in their action. In the case of most vegetable cells they may be disregarded altogether.

The real secret of Dr. Russell's treatment seems to be that in his doses of juice, the living matter—not killed by cooking—of a vast number of cells is contained, so large a number that were the patient to obtain the equivalent by eating the vegetables themselves he might have to consume pounds. Moreover as the patient needs the matter living so as to add its life to his own, he would have to eat all that mass of vegetable *raw*. Some consumptives would hardly survive even one such meal! M. D.

The Pull of the Sun

ACCORDING to Camille Flammarion, the sun exercises a direct lifting power on plants and trees. To this power he refers the general movement of leaves towards the light; and the tendency of branches to grow rather on the sunned than the shady sides of trunks. He thinks there is a real attractive influence, capable, given enough time, of doing a large amount of work. He instances the case of a chestnut-

tree in the grounds of the Juvisy Observatory which the wind had overturned against a wall, tearing a number of its roots from the ground. The roots took a new hold, and year after year the tree gradually righted itself, finally becoming quite upright.

A ray of light is known to have a repulsive force, pushing away from the source of the light whatever it falls upon. The phenomenon of the tree suggests that in the case of certain kinds of matter the ray may exert a pull as well as a push. And the pull must have some quite appreciable proportionate relation to the contrary-acting pull of gravity. It is at least as plausible an idea as those commonly held respecting the growth and turning of leaves towards the sun, which indeed could hardly be applied at all to Flammarion's tree.

STUDENT

A Curious Electrical Experiment

HERE is a little experiment in electricity easily tried by anyone. Professor Sommer of Giesen noticed that when he rubbed the bulb of an electric lamp with his hand, or against any part of his body it became luminous. He remarked that the experiment did not succeed with all bulbs, and especially not with such as had been some time in use.

"When, after having rubbed the lamp on some part of the body, another part is touched—the cheek, for instance,—the same luminosity is produced, even without further rubbing, by the simple contact, lighting up part of the face. If the breath strikes a lamp that has been rubbed on some part of the body, a well-marked light is also produced. . . . The luminosity may also produce photographic effects."

Possibly it would not be the case at all times, nor with all people. The phenomenon seems to be of the same nature as those which occur on the passage of a high tension current through a vacuum tube. But in this case it is not a current passing *through*, but a static charge *outside* the vacuum.

STUDENT

Radio-Active Facts

THE Italian chemist Tommasina has found that both animals and fresh vegetation are radio active. There is an instrument by which these radiations can be accurately measured, and it appears that from the moment of their leaving the tree fruits begin to lose this force. When quite dead and dry they have almost but not quite none of it. As it is eminently communicable by contact, the desirability of eating them as quickly as possible after gathering them is clear.

Sixty years ago Reichenbach found that some people, kept a considerable time without food, in total darkness, were able to see these radiations. But he nearly got into a lunatic asylum for saying so.

To any young scientist desirous of getting a speedy reputation we would suggest the following method: Go back half a century or so and find some discovery universally derided by the science of that day, derided and labelled as superstition and quackery. Work at that. The chances are that it is true, and only needs translating into modern scientific terminology.

STUDENT

Go to the Glow-Worm

AN ordinary electric lamp bulb placed in water will soon boil it; and long before that, it has become too hot to hold. We do not need that heat, would in fact rather be without it. It is the light we are after. Yet 97 per cent of the electric energy coming along the wire to the bulb is utilised in making the heat we do not want and are glad to get rid of. And we know as yet no way to prevent this extraordinary waste.

Somebody has recommended us to go to the ant to learn some useful quality—industry we believe. But something very useful remains to be learned even from the humble glow-worm. He turns a current of energy into his little lamp and knows how to arrange connections and so on so as to use it all in light. No one has been able to detect the smallest rise of temperature at that spot in his body where the light is burning. In the learning of his secret lies an incalculable addition to the world's wealth. Will some one now interrogate the glow-worm and give us a cold light?

When Will We Awaken and Act?

SEVERAL years ago Mark Twain published a lengthy article in the *North American Review* in regard to the conditions known to exist on the East Side of New York. Such a picture as he portrayed, of human degradation and disease, almost caused one's heart to stop beating. It seemed as though all the ministers in the land, all the workers for charity who read this account, would have organized immediately into one great body, to begin the work of rescuing lost souls and sacrificed lives. The thought of a girl, who would one day grow up and be a mother, being born and reared under the circumstances related must have kept the readers of this article awake at night. How could they rest until some practical beginning of reform had been made?

In spite of the vivid picture that was then painted, the conditions have evidently remained unchanged. Here is another article in a recent New York paper, stating that, "The——Grand Jury, instigated by the unusual number of cases of moral degradation among young school girls, on the lower East Side, is investigating, and bringing to the light of public attention, a most appalling state of affairs."

O, ye thinkers, ponder well over this suggestion: "The Board of Education should employ means to enlighten mothers of the evils which threaten their young daughters." Do you realize that there are mothers who know so little of the lives of their daughters, that assaults are committed and they are in ignorance, waiting for enlightenment from some Board of Education?

This brings up another question, Where are the school-teachers, when crimes take place, as is stated, in the very buildings where they are teaching—and they none the wiser?

One might possibly say that the mothers of these girls were reared under similar conditions and so their moral sensibilities are dulled and they do not regard certain crimes with the same horror with which we think of them. The majority, too, know nothing of the importance of "home influence."

But is it possible the Board of Education selects its teachers from this class? And if not, where are their watchful eyes, that the "records show a great increase in the number of these crimes committed in school buildings during the past five years"? This shows very plainly that the superficial, half-hearted methods of reform heretofore employed, have only scratched the surface of the soil, and never gone to the root of the matter.

Cannot these conditions be likened unto a loathsome cancer, that at first is confined to one spot, and by degrees sends its poison into every pore of the body? Is it possible that men and women believe their own

children are not affected by them? Just so long as they sit idly by, making no effort to correct these evils, every home in the land, every man, woman, and child in this country—still more, every young girl—is in more danger than if an epidemic of cholera were raging in New York and no experienced hands were fighting the disease.

There is slender wisdom in sending money and missionaries to spread the gospel of Christianity to foreign countries, when within a mile or less of the richest congregations and the largest churches in this country, the conditions of women and children are unbelievably degrading and where morality is less considered than in any known savage race in the world. But if parents and guardians only realized it, these pitiful conditions are only the results of open and evident causes of which they somehow remain unaware. When will they awaken? E. C. H.

What Is Our Duty to the Race?

THAT there are two aspects to the race-suicide problem goes without saying, but rarely has the reverse view, so to speak, been more convincingly stated than by a well-known woman philanthropist of the President's own State. Her words, because of her many years of unselfish and practical effort in behalf of the unfortunate and the poor, have no uncertain weight. She said recently:

"I had a case called to my attention only this afternoon. A poor woman came to my office and asked to see me. She was dressed in the most shabby garments and looked as though she had not had a meal for a week. Clinging to her tattered skirts were four children while in her arms were two others. She told me that she was the mother of seventeen children. Most of them are still too young to be of any assistance to her in earning a livelihood. A short time ago her husband died and left her with all the children on her hands. Yet she seemed to be proud of them and thought that she was deserving of a medal or some other token of appreciation from the President.

"I have not the least doubt that the race-suicide talk has resulted in the bringing into the world of thousands of children, many of whom will be a drag upon their parents and upon themselves all through life."

Yet even this does not give more than a hint of the folly of those who talk as if quantity were the one thing needful while quality didn't matter. There was once a woman named Jukes. We mention her because there is no doubt that she actually existed, as every statistician on charities, criminology or birth and death rates can attest. She was addicted to liquor and of grossly immoral life, yet with enough love of the race in her heart to become the mother of numerous chil-

dren. These became, according to individual taste, imbeciles, courtezans, drunkards and thieves. They also became parents. To sum up the case in a sentence—according to the detailed records which were made and are obtainable—this woman Jukes contributed to the race, through her children, grandchildren, etc., several hundred living units of whom the vast majority, sooner or later, joined the ranks of the idiotic, the insane, the thief, drunkard, murderer, courtezan, and the incurably diseased. They were something of a financial burden to the state, incidentally, to which fact we probably owe the minute records of this family which exist.

This is, of course, an extreme case; but then, Mrs. Jukes may have had extremely conscientious notions as to her duty to the race. Yet is there not, from this point of view, food for reflection in Katherine Tingley's plea: "Fewer children and better ones—fewer marriages and wiser ones?"

STUDENT

THE Russian government was not slow to follow the excellent example set by one of their most patriotic women, the Baroness Budberg, who established a school of horticulture for women on her estate and for years maintained it at her own expense. Now there is a regular course established under the government at a school near

Moscow, where dairy work, care of cattle, poultry and bees, spinning and weaving, laundry work, the care of the sick, and cooking are most thoroughly taught. Graduates wear a uniform and are able to command good salaries.

The classes in Russia may discover along these lines something new and beautiful growing up between them—a natural and harmonious relationship where together they become interested in developing the resources of their country. The peasants will gratefully acknowledge that an aristocracy with both kind hearts and wide culture can advise and guide them to the great advantage of all concerned; while landowners may discover a new delight in thus putting themselves at the service of their people, directing them on the way to prosperity and a higher happiness and earning their eternal gratitude.

E. L. W.

THE craze for bargains reached a climax in Pittsburg some time since. Men's shirts and overalls were advertised to be sold for ten cents each with the result that a regular stampede occurred. Eight women were seriously injured before the police succeeded in driving out the three thousand bargain hunters. The interior of the store was wrecked—but the shirts and overalls were sold! The same lack of discretion and the determination to get something without paying for it in full has wrecked many a home. Let us hope that this may prove a warning to storekeepers who strive to profit by the cupidity and weakness of such women as attend these sales, if the warning perchance should be unheeded by the latter. It plainly indicates the need for strenuous reform in private character as well as in business life. H.

The Textile Work of Swedish Women

OF particular interest to women are the beautiful and artistic modern textile fabrics of Sweden, for they have evolved from the time-honored home-industries of Swedish women. For centuries in the homes of Sweden women have "plied the loom," weaving and embellishing all the textiles needed for wear, for household use and for adornment, each county, nay, each township even, working after its own manner and with its own set of designs.

It is wonderful to note, from the treasured heirlooms of families, how little the designs of one district encroach upon those of another. This peculiar tenacity of purpose which is a characteristic of the women of this northern land, has made them slower in relinquishing the home-crafts

than the women of other countries, and so, in a measure, they have maintained the use of the beautiful hand-made stuffs, despite the world-wide employment of machines. Thus in Sweden, even today, there is a very large body of women, familiar with the use of the spinning-wheel, hand-loom and embroidery-frame, whose artistic sense has been nourished with the traditional forms, colors and composition of their native-land.

Now that the crafts are again receiving some meed of the honor

due them, the century-old work of the women of Sweden, by its merit and excellence, is claiming its long deserved attention. The obstinacy with which for so long each section maintained its individuality, while limiting the variety of design, secured a permanence of effort, which is at length bearing fruit. The ancient arts of weaving and embroidering have been taught, with the old persistence, to the daughters of the present generation, and from the wealth of antique designs, collected from every part of Sweden, a distinctly national type of textiles has been evolved, that admits of infinite variety while maintaining a national character.

The women of Sweden have not been slow in recognizing the value of their work from the modern view-point of art, and, to carry it still further on its evolution and development, societies of national importance have been organized. Through these, skilled workers all over Sweden receive encouragement and also the aid of books, pamphlets and new designs. From time to time, exhibitions of handiwork are held even in remote rural districts so that all may experience the broadening effect of outside influence.

This effort to further and perfect the ancient crafts is more than commendable, and the dignity and value of the results attest the benefit of united organized effort among women.

ON THE GRAND CANAL—VENICE

OUR YOUNG FOLK

The Raja Yoga Question Box

MANY women who have been great scholars and artists are examples to us of perseverance and faithfulness to duty.

1 Who was Margaret Fuller Ossoli?

ANSWER—Margaret Fuller was a famous New England woman. Her father was a learned man and helped her to become a great scholar. She was a very busy active young girl for, besides studying philosophy and history and many languages, she had home duties which she faithfully performed. Margaret Fuller was a teacher, a lecturer and a writer. She always interested those around her in learning and self-improvement. It is said that she always inspired people to do their best and to have a high purpose. Margaret Fuller was a friend of Emerson. She was married in Italy to the Marquis d' Ossoli. While she lived in Rome the city was

besieged and Margaret Fuller Ossoli tenderly nursed the sick and wounded soldiers.

2 Who was Charlotte Cushman?

ANSWER—Charlotte Cushman was a celebrated American actress and reader. She lived in Boston and studied hard to become a great singer. One day she found she could sing no more. She was not discouraged but began to study the drama. Great success came to her, and for a long time she was able to provide for her mother and her younger brothers and sisters with what she earned. One of her sisters became an actress also; they often acted in plays together. Charlotte Cushman believed in discipline and industry. She was beloved and honored for her noble character and her great talent. Many people are living who well remember hearing Charlotte Cushman recite the great dramas and also act in them.

ONE BY ONE

ADELAIDE A. PROCTOR

ONE by one the sands are flowing,
One by one the moments fall;
Some are coming, some are going;
Do not strive to grasp them all.

One by one thy duties wait thee---
Let the whole strength go to each,
Let no future dreams elude thee,
Learn thou first what these can teach.

One by one (bright gifts from heaven)
Joys are sent thee here below;
Take them readily when given---
Ready, too, to let them go.

One by one thy griefs shall meet thee
Do not fear an armed band;
One will fade as others greet thee---
Shadows passing through the land.

Do not look at life's long sorrow;
See how small each moment's pain
God will help thee for tomorrow,
So each day begin again.

Every hour that fleets so slowly
Has its task to do or bear;
Luminous the crown, and holy,
When each gem is set with care.

Do not linger with regretting,
Or for passing hours despond;
Nor, thy daily trial forgetting,
Look too eagerly beyond.

Hours are golden links, God's tokens,
Reaching heaven; but, one by one,
Take them, lest the chain be broken
Ere the pilgrimage be done.

sons they have learned in beautiful Lomaland.

One of these friends of yours wrote: "I wish that every one of you knew that the true education is neither that which trains you in many branches of study so that you know many things and are interested in learning many more, nor that which trains you to do and be just what pleases other people even though what pleases them is to have you become very skilful and learned. No, the true education is that which *prepares you for life*, which gives you the training so deep in your nature that the heart-light can pour into your mind and show you your duty and how to do it, and can also brighten up that brain of yours so that you can learn anything you need to learn and learn it well."

Another of the letters read: "Perhaps you have been petted and spoiled; perhaps everyone has been trying so hard to make you happy by giving you all that they thought might help you to enjoy yourself, that they have not seen your need to know something of life's deep meaning.

A Letter to Young Girls

DEAR GIRLS: One day when the women of Lomaland had a meeting in one of the beautiful studios, they spoke of you—the young girls in the world who will some day be the mothers and teachers, and who are now planting the seeds that will blossom into womanly service. One of these Lomaland women said: Let each of us write a short letter to the girls, then let one of us make one big letter out of what we have written and ask the editor of the *NEW CENTURY PATH* to publish it so that it may be read by young girls in every country, and carry, with a message of love and friendship, the good news of how in Lomaland women and girls are learning many great truths about the nobility of true service.

The letters were written. I wish you had seen the Lomaland women as they were writing them. I was writing one myself but I could not help taking a peep at their faces as they sat there, intent on writing something to you that would help you to feel the love that is growing in their hearts for the women and girls everywhere, and all eager to help you to learn some of the les-

Sometimes older people believe that it is time enough for a woman to learn about life's deep meaning when she is old and sad, but the Lomaland women have learned that it is possible for a girl to learn to be wise before she grows either old or sad, and they have learned also that young girls can be a living force for good everywhere if they begin while young to think of life's deep meaning, and of the great and beautiful work there is for girls to do. The Lomaland women have learned that if you will think great thoughts about life instead of selfish ones, your bodies will grow strong and forceful and you can do this noble work as girls and women."

Another of your friends wrote: "Vanity is the biggest stumbling-block in the way of young girls; push it out of your way, and be simple and girlish without caring to be looked at and admired and spoken of. This desire for notice is not a pure quality of growing womanhood; it leads to discontent and envy and jealousy. Be orderly if you wish to save time for great things. Cultivate honor in little things. Shrink from ignoble thoughts about anything or anybody."

These are only three of the letters, dear girls. If you remember what these Lomaland friends have written to you, and try to learn the lessons they have learned, you will also learn some of the beautiful truths about the noble service that can be rendered by young girls while they are growing into women. ONE OF YOUR LOMALAND FRIENDS

Facts Worth Knowing

AMONG the Zuni Indians of America fire is called the "grandmother of men."

IN Sweden only two men in a thousand cannot read and write; in Norway and Denmark only three; in England, thirteen, and in Russia seventy-eight.

IRELAND is exceedingly rich in minerals—iron, copper, lead, tin, gold and silver. But there is scarcely any mining done in the entire island. The chief industries, in addition to weaving, are spinning and knitting, embroidering, lace making and crochet-work.

BOTANY was a favorite study among the Greeks, Romans, and Arabians. Yet no great progress was made by these early naturalists; they did not describe more than fourteen hundred species. The first herbarium arranged methodically and based on observation was published in 1530 by Otto Brunfels, a German. The first botanical garden in Europe was opened in 1536 on the banks of the River Po in Italy.

IN New England there is a venerable tree which is quite as important in the eastern forests as is the redwood among the trees of California. It is known as the "old growth pine," and is declared to be more than a thousand years old. It is a giant tree, sometimes growing to one hundred and fifty feet, with no limbs up to a height of fifty or eighty feet from the ground. One tract where these trees grow is near Amherst in Massachusetts, and those still standing are in a healthy condition, but this primeval pine has been permitted almost to disappear.

THE CHILDREN'S HOUR

SEARCHING FOR STRAWBERRIES

S EARCHING for strawberries ready to eat,
 Finding them crimson, large and sweet,
 What do you think I found at my feet,
 Deep in the green hillside?

Four brown sparrows, the cunning things,
 Feathered on breast and back and wings,
 Proud of the dignity plumage brings,
 Opening their four mouths wide.

Stooping lower to scan my prize,
 Watching their motions with curious eyes,
 Dropping my berries in glad surprise,
 A plaintive sound I heard.

And looking up at the mournful call,
 I spied on a branch near the old stoac wall,
 Tumbling and twittering, ready to fall,
 The poor little mother bird.

With grief and terror her heart was wrung,
 And while to slender bough she clung,
 She felt that the lives of her birdlings hang
 On a more slender thread.

Ah! birdie, I said, if you only knew,
 My heart was tender and warm and true!
 But the thought that I loved her birdlings too
 Never entered her small brown head.

Lomaland Photo and Eng. Dept.

RAJA YOGA CHILDREN GOING TO THE BEACH AT POINT LOMA, CALIFORNIA

and noise near my bed-room windows, which led me to suppose that the linnets were preparing to build a nest. I discovered it quite by accident, for the weather was still so cool that I rarely opened the windows on that side.

I found they had made a very choice selection for the tiny home, one that a king might enjoy. It was in a jessamine vine, one of those sweet scented white jessamines that make you think of stars, so white do they gleam amid their green leaves. Well, here amidst the beauty and fragrance of the flowers, they built a little nest, underneath the thick foliage. It was placed just where it might rock in the breezes, but at the same time be protected from the curious eyes of cats or human beings.

About this time the weather became warmer and I began to open the window that was very near to the little home. Every morning I watched with much interest the small mother sitting there, and felt sorry she seemed so startled at the noise. I was just as careful as though a sleeping child were there and was as quiet as possible. To my surprise and regret, a few days ago I saw the little nest was deserted and the four tiny eggs were left alone. I have watched and waited for the return of the small mother, but she has not come back.

Do you really believe that this little bird who spent so many weeks preparing a downy nest for her little ones, and who was sitting and waiting so patiently, suddenly left them without any good reason? No, indeed, although she had a nest soft and nice, in the most beautiful and fragrant place, rocked by soft breezes and warmed by the sun, she felt it might not be safe for her coming birdies. In spite of its beauty, it might not be the best place, for her listening ear caught sounds that showed some danger might be near. And this, I am certain, is why she preferred to wait until another time to hatch out these little birdlings, rather than run the risk of their being destroyed.

Perhaps by this time the wise little mother bird has found another spot where she can rear her little ones quite safely until they can use their own wings and take care of themselves. She was as wise as a human mother, was she not?

THE Lapps and Finns of the north build houses for themselves of great blocks of ice which stick fast together. These houses keep the little fur-dressed family warm and "comfy" all the long winter of six months. The floor of frozen earth is covered with skins and furs, and in this snug little ice palace life goes on quite merrily and busily for the little Lapps and Finns for they have their regular duties and play hours just as you have.

D EAR CHILDREN: Many weeks ago there was a great chattering

A Walk to the Beach

H ERE we are, all off for a long tramp to the beach. We are a merry crowd, I can tell you, and nearly every time we go we take a new comrade along with us and show him the beauties of the hillside and the canyon and the shore. Sometimes this new comrade is a boy or girl who has just come to the school, and who must learn about nature in Lomaland; and sometimes, children, he is one of the little folks who has grown big enough to take the long walk with the older boys and girls. It is a happy day for a little Raja Yoga when he can join the line of march down to the ocean for the first time. E.

D EAR CHILDREN: Here is a delightful little story about Queen Alexandra and the tiny elephant Jumbo at present with the Italian Circus in England. Princess Victoria, Queen Alexandra's daughter, chose this year to celebrate her birthday on July 9th by a garden party to all her nieces and nephews and about fifty other children. And Queen Alexandra arranged an entertainment in the grounds of Buckingham Palace for them. The entertainers were the forest pigmies, two performing ponies, a conjurer, and "Jumbo Junior" the baby elephant. He behaved beautifully and followed his trainer as sedately as usual until he passed her Majesty's chair, when she gave him a sweet, and he immediately showed a great attachment to her; so cakes and bananas were sent for and Jumbo feasted. At length his trainer persuaded him to mount his little tub and prepare to play on his mouth-organ, but just as he was going to begin, his eye wandered off to the Queen and down he got and trotted off to her side and nothing would induce him to leave her again! When the performance was over and she rose from her seat and walked away, Jumbo Junior trotted proudly beside her. I think Jumbo felt the kindness in the Queen's heart and responded to it in the only way he knew. COUSIN BEATRICE

M IGNON and Richelieu are two bull puppies whose mother died when they were only a week old. They were adopted by a cat who has been a very kind foster-mother to them. When they go out on the street the puppies walk one on each side of Pussy in order to protect her from any ignorant dog who might tease her. One day Richelieu gave one of these rude dogs a shaking because he insulted her. Mother Puss has a kitten and the three babies lie down to sleep side by side, while Puss walks around them to guard them. She has a smile in her eyes as if she were saying to herself, "How many cats have such a family as I have!" You might think that these two puppies would grow up to be like cats, but they show no sign of such a thing, but are every inch dogs. E.

The Theosophical Forum in Isis Theatre

S a n D i e g o C a l i f o r n i a

Raja Yoga Children Conduct the Regular Sunday Evening Meeting at Isis Theatre

THE meeting of the Universal Brotherhood and Theosophical Society at Isis Theatre on last Sunday evening was conducted, as on the previous week, by the Raja Yoga children from Point Loma. San Diego and her visitors are very appreciative of these weekly meetings, which are generally conducted by the older Students, and whenever it is announced that the Raja Yoga children are to take part, the Theatre is filled to its capacity, so finished and artistic are the performances given by them. The stage decorations of flowers and green foliage were in keeping with the occasion, and harmonious in their general effect.

The program was a most interesting and varied one, giving the audience an opportunity to see the practical results of the Raja Yoga training, not only along musical and literary lines, but also in the dignified bearing and lack of self-consciousness that so characterizes the Raja Yoga children. It is this Raja Yoga "naturalness" that is so much noticed and commented on, and that makes their efforts so easy and thorough.

The first number was by the Raja Yoga Quintet, composed of two violins, viola, cello and piano. The selections were "Chanson sans paroles" (Tschaikowsky) and "Moment Musical" (Schubert.) These were executed with skilful technique and an appreciative interpretation. Following this was a paper on "San Diego," by one of the "Tiny Tots," little Frederic McAlpin. With childish simplicity he read his paper clearly and earnestly, each word being heard in all parts of the house.

Weber's "Invitation to the Dance" for two pianos was the selection given by four of the Raja Yoga girls, representing three nationalities, American, English and Cuban. After this came an admirable recitation of Mrs. Browning's poem, "A Musical Instrument," by Cora Lee Hanson.

The singing of the Special Class of Raja Yoga boys and girls is always of especial interest and pleasure to the audience, and on this occasion their selections were exceptionally well rendered. The boys in their khaki uniforms, the girls in Greek dresses with garlands of smilax and roses, the fresh young voices singing true and clear, indeed made a picture that was pregnant with hope and force. A violin solo, "Romance" (Svendson) by Master Hubert Dunn, one of the older Raja Yoga boys, was delivered in a manner that showed mastery of theme and instrument by the performer.

Several numbers were given by some of the older Students from Point Loma who assisted in the program. There were two songs, "But the Lord is Mindful of His Own" (Mendelssohn) and "Bird Raptures" (Cowen) by Mrs. Samuel Bonn. A piano solo, "Rondo" from *Sonata Op. 53* (Beethoven) by Miss Julia Hecht of the Isis Conservatory of Music was much enjoyed by her listeners. Mrs. C. M. Hiney read a paper entitled "The Mother's Prayer." She said in part:

"In every age and clime one prayer has risen from the hearts of the mothers—it is always the best she can conceive, the greatest earthly good, the most lasting joy of heaven that she can imagine, that the mother craves for her child. "Save my child's life. But if you cannot save his body alive, save his soul." If the mother has known joy and peace and prosperity, she pleads for continuance of these for her child, if she has known pain and poverty and disease she pleads that he may be spared from these. Mothers have been willing, eager to gain benefits for their children at great personal cost and self-sacrifice. They have so yearned to bless their offspring, so fervently prayed for them the highest good they knew that it would seem that these prayers, so earnest, so long continued, in many cases so unselfish, might by this time have regenerated the whole human race and have made of the outward life we know a thing free from pain, and beautiful and joyous.

"Very often these prayers are an ignorant though agonized protest against effects which must inevitably follow, given the causes which produce them. How many mothers are praying for their drunken and dissolute sons, though they gave these sons drunken and dissolute fathers? How many mothers are praying for good health for their children after a total

disregard on their own part of all the habits of mind and body that alone make good health possible? How many are praying for their idle and frivolous daughters when in their own lives there has been nothing to inspire a higher ideal in these young people, nothing done to instil love of industry or a sense of personal responsibility? Special pleading prevails in a good many cases. "O Lord save my son, my daughter, only this I ask!" Human beings most often ignore the essential law of unity, and mothers are no exception to the rule. When, on the other hand, the prayer has been offered in the true spirit of "Not my will but thine be done," however unconscious the mother may be of the working of the Law, she has appealed to the divine in her own nature and in her child, and having invoked the higher creative and compassionate powers of the soul, has liberated a force that blesses even while it chastens. Prayers of this sort are a mighty invocation, they are always answered.

"If the mothers of to-day would learn the broad, wise views of life, and the truths about the nature of human beings which will enable them to learn to be the true guardians of their children, guiding them steadily towards the highest good, they must look to Theosophy and its Teachers.

"The mother who has done this, and has thus gained the light of the Wisdom-Religion upon her views of life, sees in her child a soul that has come back once again to take up earth life in order to learn more fully the lessons of that life and to stamp the higher impress of the soul upon it. She knows that the new-born child bears in himself many characteristics and tendencies acquired in other lives and not yet purified of their lower aspects; she knows because of the basis offered by the tie of physical heredity that these characteristics and tendencies will in some measure resemble those of the parents, and will in all probability present the same difficulties which they have encountered in dealing with their own natures. This mother knows that the physical tendencies of the parents will in all likelihood appear in their children. But over all and in all she sees the possibility of the strong comradeship of soul that may exist among those of close kin and that may be a developing force making of every year of the child's life one of triumph for that soul, one of victory over all debasing tendencies, a blessed year of united effort in the building of character after the soul's divine model. What then is the Theosophical mother's prayer?

"It is this: For every child that is born the recognition as a divine soul, and as a divine soul residing in a body, the training that shall so invoke the higher nature that *this shall rule him throughout his life*; for every child the strong-hearted guardianship of the wise to guide and sustain him moment by moment until the day when, as a conscious being, he can take up the thread of life, and pass onward invincible in his armor of purity and high purpose.

"The Theosophical mother knows full well that as she thus appeals, at the same time rising to her own purest and highest endeavor, the Good Law will come to her aid. The Raja Yoga School has already given the response to this prayer that had risen from the hearts of many mothers in the world, and many children have now this soul to soul recognition and this royal training.

"The great hope that has dawned for these mothers, the glad new time that speaks in the happy voices of their Raja Yoga children, has thrilled their hearts with a prayer to all of you: *Guard well the sacredness of life* that those yet unborn may on the foundation of your unselfish efforts for humanity's children, build strong and beautiful temples in which the soul may dwell."

Theosophical Meetings for Sunday Nights

Public Theosophical meetings are conducted every Sunday night in San Diego at 7:30, at the Isis Theatre, by the students of Lomaland.

Theosophical subjects pertaining to all departments of thought and bearing on all conditions of life are attractively and thoughtfully presented.

An interesting feature is the excellent music rendered by some of the students of the Isis Conservatory of Music of Lomaland. Theosophical literature may always be purchased at these meetings.

Art Music Literature and the Drama

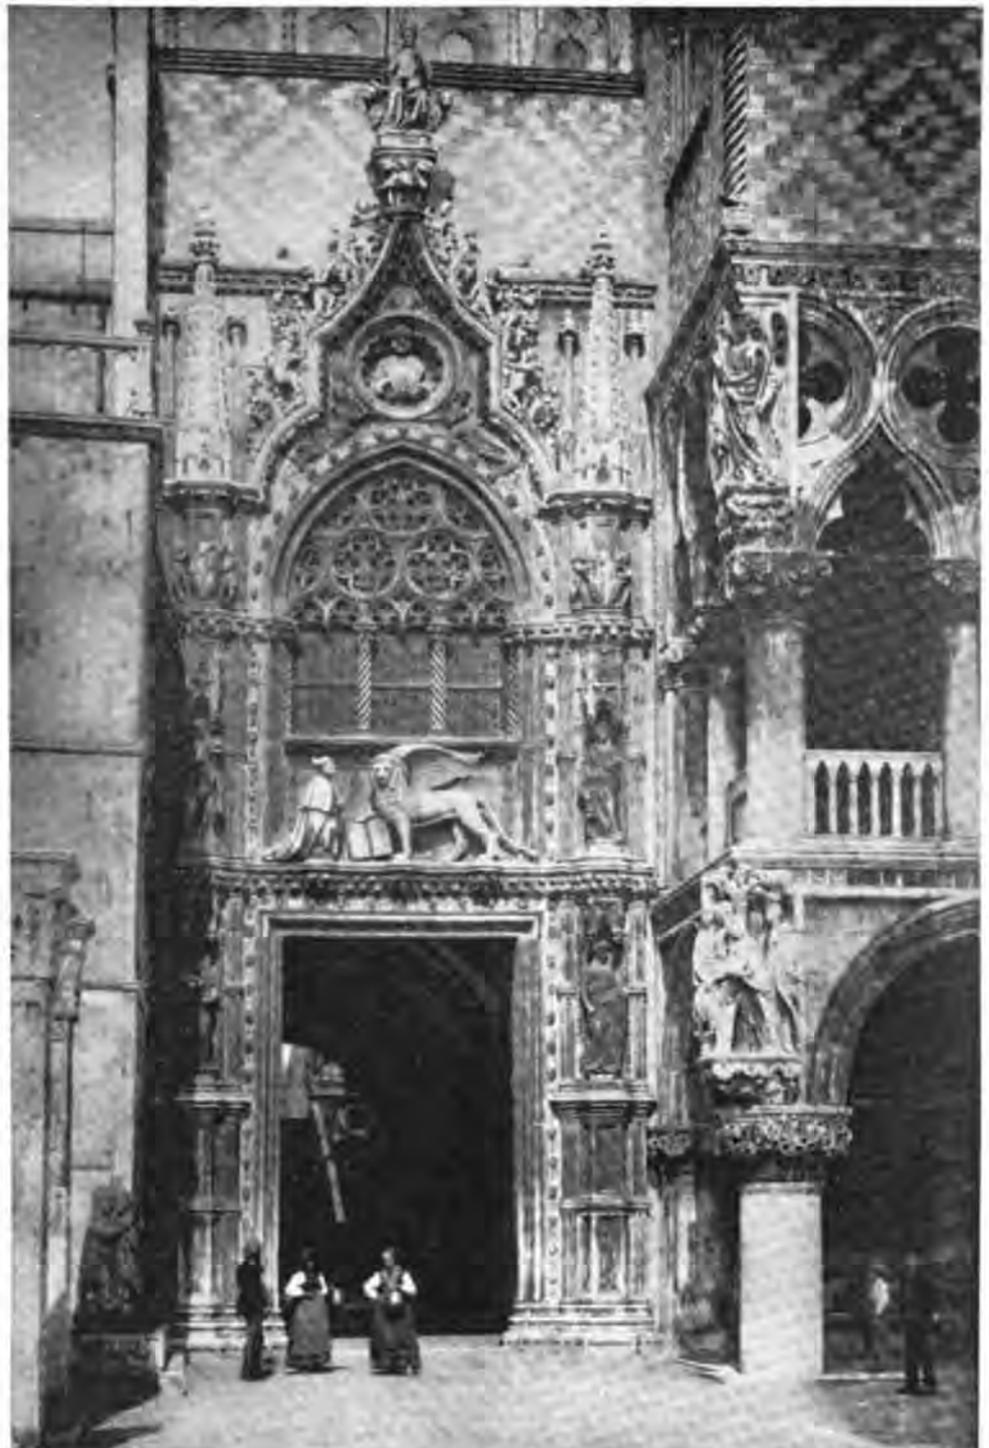

Carta Gate and Corner of the Ducal Palace, Venice

There is a glorious City in the Sea,
The sea is in the broad, the narrow, streets,
Ebbing and flowing; and the salt sea-weed
Clings to the marble of her palaces. . . —Rogers

THE Doge's Palace, Venice, is the central feature of the loveliest group of buildings which yet remain intact in the world. In its glory the Acropolis of Athens must have far exceeded the Venetian magnificence, and for sublimity and grandeur the cluster of temples at Philæ and the colossal groups at Thebes, were supreme; but at present no other spot exists where there is such a well-preserved assemblage of original, picturesque, and altogether delightful structures as in the strange and romantic Queen of the Adriatic. The Doge's Palace was commenced in 1354 and the original design had to be modified during the construction, which has somewhat detracted from its beauty. The upper wall was intended to lie back of the arcades, but to make the rooms larger it was brought forward to rest upon them. The exquisite colored marbles of the walls give a great distinction to the building and the sculpture is of a high class: "The Judgment of Solomon," and "Adam and Eve," by the two Bons are well known. The "Judgment" group is shown in our cut at the corner above the large round pillar.

Venice to-day shines in the after glow of its glorious past, but is by no means a dead city. It has prospered greatly under the new régime of United Italy and has a large foreign trade. It is a very important port and is the center of gold and silver, silk, cotton and glass manufacture. The great number of tourists who go there to study the crowded glories of its artistic past also help in its prosperity, but of course its political importance has been merged into the general policy of the Italian Kingdom.

Venice has been especially hallowed to the English-speaking peoples by the genius of Shakespeare. There is a romantic semi-Oriental glow about the very name and we may rejoice that so many of the artistic treasures of the city have been preserved for our profit. It cannot, alas, be many centuries before it will sink beneath the lagoons, for its foundations are not built upon the rock. Change is the common lot and must not be regretted unduly; perhaps, by the time the city in the sea has become merely a memory mankind will have evolved in some more favored spot conditions which will command a finer and more ideal city to rise. CARTA GATE AND CORNER OF DUCAL PALACE, VENICE, ITALY

A Wasted Treasure—Priceless Sketches of the Great Turner

ATTENTION has lately been called to the surprising fact that about seventeen thousand of the priceless sketches of Turner, the great landscape painter, which, with unexampled generosity, he left to the British nation, are still buried in the obscurity of tin boxes, mildewing and inaccessible to the public. Of all landscape painters Turner was perhaps the most splendidly endowed with imagination—a true seer in spite of his eccentricities—and every line he drew has power to awaken something deeply spiritual in the hearts of those who are fitted to respond. To the materialist in art he does not appeal, for his methods are strange; he despised what is commonly called "realism," but he displayed a realism more profound than photographic fidelity, for he penetrated behind the mask of things and revealed the essential nature—the living force. Look at the lines of his tree branches, no previous painters approach them in living force. His waves are wet; his mountains lift their heads above the clouds; and his sun dazzles the eye.

But, although he was the high priest, the interpreter of Nature, it was the soul of humanity that Turner felt. In all his work the intuitive mind feels his sympathy with the throbbing heart and the griefs of men.

He never separated man from Nature. In insight he resembled the Japanese artists. Like these he seized the essential; he despised the topographical; in art he "lived in the eternal." Towards the end of his career his pictures became dreams of delicate color, air and sunlight; and though he, in going to extremes, at last failed to realize the utmost aim, his failures, in an attempt where none could succeed, are more precious than the thousand triumphs of mediocrity. He was a poet, and poetry is not foolishness; it is the deeper insight. We hope that these priceless sketches will soon be distributed to schools of art and colleges, if they cannot be exhibited together as he wished, for want of space in the London National Gallery. Time passes, methods change, and the mental horizon in art, no less than in literature and science, broadens with the march of the years. The future will consign much that the artist to-day holds precious to the gentle ministry of oblivion. But there is that in the paintings of Turner which is greater than what is ordinarily termed "method," nobler than any merely mental concept. STUDENT

The Cycle of Brotherhood

ALL Nature works in cycles; everything has its seasons, its periods, its tides with their ebb and flow. And man as a part of Nature, is subject to her greater and lesser cycles as well as having cycles of his own. But there is this difference that exists between man and outer nature, that he has the power to adjust himself to the cycles, and as Shakespeare puts it, to take the current when it serves.

Like as the fisherman, seeking to bring his boat to shore, waits for the big wave that will carry him safely, and then puts forth his efforts, and the boat rides safely in on the crest of the wave, so for man in all the affairs of life, there is a moment when to act and when to wait. I have seen a heavy pendulum weighing three hundred pounds set swinging, moving through an arc of several feet, simply by means of the tiny impulses communicated to it through a slender cotton thread. It was time, time, the little impulse given at the proper time, that enabled this to be done.

There is something about the teachings of Theosophy that one does not find elsewhere, and this, of the Law of Cycles, is one of the most helpful and encouraging. Modern science knows about many cycles, of the years, the seasons and days, the great sidereal year of the Zodiac—though it is certainly a question whether modern science would

have reached its present knowledge of the last mentioned, if it had not been for the knowledge which had come down to us from the ancients—then there is the cycle of the heart-beat, and of the breath. But the great ancients went further, so much further that modern science has a long way yet to travel before it reaches those sublime heights. Plain hints of this are given in H. P. Blavatsky's writings, and corroborated by the wonderful and so little understood literature of the most ancient times.

Regarding the subject before us, that of Cycles, the ancient teaching, once again given out by H. P. Blavatsky in *The Secret Doctrine*, is that the law of Cycles or of Periodicity is absolutely universal in its sway, governing the life of a universe as well as of the smallest infusorium. But this law has a still wider sweep than that of the outer life. It does not only apply to outward material existence, but to all the planes of being, the mental and moral as well, and also to the plane of the desires and emotions.

We all know how much depends upon the observance of times and seasons in the obtaining of our food and maintaining physical life, and without fully knowing the reason of so doing, we apply it also to our mental and other work. It is generally held that the best results in study, or in the following of any pursuit, come from regularity, and from properly timed efforts. But in spite of all that we do, how much more might we not do, and in so many other directions, if we only knew more and understood better this law of cyclic effort. By the tiny impulses given through a slender cotton thread we may move a heavy suspended mass, and by the timely and rightly directed efforts of thought and will, what is there we cannot accomplish?

The world life, the life of humanity, has its times and seasons; times for sowing the seed of new truths, and giving new impulse to the spir-

itual life of the race. The great Teachers of the world do not come haphazard, or unrelated to one another. At the beginning of every age comes a great Teacher to strike the keynote of Truth and point out the pathway of life.

In one of the World Scriptures, the *Bhagavad Gita*, Krishna says: "I produce myself among creatures, O son of Bharata, whenever there is a decline of virtue and an insurrection of vice and injustice in the world; and thus I incarnate from age to age for the preservation of the just, the destruction of the wicked, and the establishment of righteousness."

If we read history with this in view we shall find that the lives and destinies of races and nations are governed by cycles, and that in every

century during its last twenty-five years, a new impulse is given towards the higher life. There can be no doubt of the tremendous importance of the closing years of the last century, or of the beginning of this one in which we now are. Of this time it can truly be said "The old order changeth and giveth place to new"; a flood-tide has come in the affairs of men; the great pendulum of events which had swung into the very depths of materialism has turned on the upward arc. We are in fact at one of the turning points of the world's life, one of the great cycles of human existence. One of the turning points had come when humanity unaided must have been

Lomaland Photo and Eng. Dept.

A LOMALAND DRIVEWAY, POINT LOMA, CALIFORNIA

overwhelmed in ruin and disaster. If we look beneath the surface of things as they were fifty or even twenty-five years ago there is no mistaking the signs, or the blindness of the people to the cancer of selfishness that was eating out humanity's heart.

Looking at these things and comparing the present time and the dawn of hope that has arisen, with the dull despair on the one hand and the feverish grasping after objects of desire on the other, that were settling down upon the people towards the close of the last century; and again, looking back at the past struggles of humanity, can any intelligent person fail to see that a helping hand is indeed stretched out to protect and guide it? Humanity has never been deserted, and at the turn of the Cycle came H. P. Blavatsky, then William Q. Judge, then Katherine Tingley. Their message and work are not yet understood in the world, save by the few, but the influence of Theosophy is already to be seen in every department of the world's thought and activity.

In the rush of the world's life as it is today, men cannot stand by indifferent and careless as to the result. They must throw the weight of their influence, their energy, their interest, into one scale or the other. Universal Brotherhood, and the Solidarity of the human race, are facts; and have ever been facts in Nature; but there is an accentuation of these, or we might say, of this fact, for the two are one, such as has not been known in all history. It is as though another door had been opened and as if new influences were streaming out making the ties of Brotherhood more potent. Thus no one can stand aside or remain indifferent; he who attempts to do so does but add his forces to those of the enemies of mankind. The Cycle upon which we are entering is the Cycle of Brotherhood, and Brotherhood is its key-note. STUDENT

BID STERN DUTY LEAD!

RICHARD CHEVENIX TRENCH

O RIGHTEOUS doom, that they who make
Pleasure their only end,
Ordering the whole life for its sake,
Miss that whereto they lead.

While they who bid stern duty lead,
Content to follow, they,
Of duty only taking heed,
Find pleasure by the way.—Selected

THEOSOPHICAL FORUM

Conducted by J. H. FUSSELL

Question Is not the theory that Brotherhood is a fact in nature, directly opposed to the well established scientific doctrine of the "survival of the fittest?"

Answer It is demonstrated by our Theosophical philosophy that the doctrine of "the survival of the fittest" and that of Brotherhood in nature, are both truths, and no truths can be opposed to each other. There may be seeming opposition, but on careful investigation it will be found to be only seeming.

If truths worked in opposition to each other instead of working as we know they do, in the strictest unity of purpose, the whole universe would be a chaos.

Material science, though correct in stating that only the fittest survive in every department of nature, falsely teach that this result is brought about alone by physical causes, not recognizing the fact that such causes are only secondary and that the deeper causes are spiritual, that matter is acted upon by spiritual force intelligently applied.

The Secret Doctrine teaches that this law of the survival of the fittest works in the very formation of universes and worlds, that every nucleus of cosmic matter launched into being, begins its existence under the most hostile circumstances, that many forms perish, their masses disintegrating through stronger masses, and that those which take a wrong course are doomed to annihilation, as forms, sooner or later.

The same law that works in the worlds above us governs evolution also on this planet, in all its kingdoms, and although the struggle for life necessitates annihilation of the weaker forms to the advantage of the stronger, which may appear unbrotherly, yet nothing is ever really destroyed. There is only a change of physical form, a transfer of the life energy from one form to another, and by this and its other many other varied means, the Law ever works for the general good and the uplifting of all. And though the weak have outwardly to give way before the strong, not only is there no spiritual force lost, but the material particles of the vanishing form are all utilized by nature in her economy as a destroyer and builder.

But that which chiefly concerns us at the present moment is the working of law among us, members of the present humanity, and the bearing it has upon our lives and conduct. The struggle for existence will go on, but it will become less strenuous and painful in proportion to our efforts towards a Universal Brotherhood. The practice of Brotherhood will not prevent the weaker from giving place to the stronger but it will tend to strengthen the weak so that they will become strong; and it will arouse in the strong that compassion which will help the weak.

Evil, in the long run, is always on the weaker side and will eventually be swallowed up in good. It will be overcome by good. This is and ever will be the ultimate expression of this law of the "survival of the fittest."

Physical law ordains that during the night darkness shall reign, but that does not prevent us from supplying ourselves with light, and our efforts in that direction are in no way opposed to the law that governs light and darkness. And so too our working to help those weaker than ourselves, and extending to them the hand of Brotherhood, is not and cannot be in opposition to the law of the survival of the fittest, but simply tends to fit more and more who shall survive.

The law of Brotherhood works in perfect harmony with all divine law. This is one of the distinct teachings in our Theosophical philosophy. We have only to practice Brotherhood in our daily lives, to learn that harmony with all nature's laws is the result. M. J. B.

Answer 2 In the broader outlook that Theosophy gives, the law of "the survival of the fittest," as maintained by modern materialistic science, is indeed a mockery. To express it in the colloquial phrase, "the weak go to the wall," adding also, "every man for himself and the devil take the hindmost," would, I venture to assert, unless we quibble over the reference to his Satanic majesty, and do not take it in a merely figurative sense, be much more scientific. For what, from the standpoint of modern science, does this law really mean? It may be expressed briefly, if perchance crudely, thus:—In any community or family or associated group of individuals of any species, there will always, presumably, be some stronger than others, and—at least in a primitive state, so it is supposed—the dominant factor being self-preservation, the gratification of selfish desires, self-interest, the tendency will always be for these stronger ones to live longer, often at the expense of the weaker, and sometimes through the destruction of them. The weaklings may die early or late, due partly to the measure of their strength or their lack of it, and partly to the scarcity or abundance of food, but generally speaking they do die and give place to the stronger. And these stronger are said to *survive!!!*

To survive! What do we mean? To live a little longer, a paltry few years. Suppose they live a score of years longer, a hundred, or by a stretch of the imagination, a thousand years. Is this to survive? What do the few years, the thousand years count in the eons of time? And then the individual dies. You may say perhaps that he has transmitted the qualities which made him the stronger, which made him the fittest, he has transmitted these to his offspring; the species survives and receives the benefit, growing stronger and better, the average life-term of the individual may increase, but of course the individual lives at best only a few years.

And then we find that one species has to give way to another, it ceases to have supremacy in its own realm and degenerates may be, *survives* a little longer, and then disappears, leaving perhaps some fossilized bone to cause wonder in some geologic age to come. Is that, are we not justified in asking, worthy of being called a "survival", and where does the fitness come in?

But now let us look at the matter from the standpoint of Theosophy, for we hold that the "survival of the fittest" is a law in nature, partly indeed in the sense in which science interprets it, but also and chiefly in a very different and much more significant way.

First what is man? He possesses an outer form, a physical body, but is he that body? He possesses an emotional and passional nature; he possesses a mental nature; but is he either one of these? From the standpoint of the outer form being the man, and considering the survival of that physical form, it is of little consequence—if we have no wider outlook than modern science can give us, whether it survives or exists for a few hours or days or a thousand years. It passes and is gone. The same reasoning holds good regarding the other parts of the nature of man. They are not the man, but only his instruments. As instruments they are important to his survival, but considered as the man they are mere bubbles on the ocean of being, and we may as well argue as to the survival and permanency of bubbles, and enter into learned discussions as to the relative value of different saponaceous mixtures in determining the life of such.

It surely requires no argument, only a little observation, unprejudiced and unbiased to see that this is so, to see that that which survives is the man himself who uses these instruments, and who builds form after form to accomplish the purposes of his evolution. The soul, that which is the real man, is the true survivor; for he survives death, and returns again and again to earth. But modern science has missed this entirely, and more too, for from each life the soul distils as it were the aroma of all the good deeds and thoughts and adds it to its permanent store. And as the student of Theosophy knows, there is always going on a conflict between the higher and the lower natures of man. It is a contest for the survival of the fittest; it is the struggle for existence; and although the ultimate victory is sure, it cannot be gained without a struggle, nor can the true nature of the soul manifest itself without the conquest and subjugation of the animal, lower self.

Modern science has read but a chapter in the book of evolution; it has discovered but a few detached pages and has but imperfectly deciphered them, but the keynote is missing to all its problems. For the complete story we must turn to Theosophy, and for the keynote, to the soul. And from it all we shall learn that Brotherhood is a fact. STUDENT

English Notes

(By Our London Correspondent)

Sept. 26th, 1905

WITHIN a day of each other have passed away two men whose influence upon the life and thought of England has been very considerable. I refer to Dr. George MacDonald and Dr. Thomas J. Barnardo. The author of *Imaginary Conversations*, had he been alive, would have found some difficulty in arranging a conversation between them, especially on a religious subject—so contradictory was their mental attitude. Yet there was one point at which they were united; namely, their love and service of the child.

Dr. Barnardo was a medical student in 1866 when he began his work of helping homeless children in London. He was moved to this by discovering a number of lads sleeping in the gutters of an iron-roofed shed near Petticoat Lane. He told the story at Lord Shaftesbury's dinner-table, and there and then the whole party of guests hired cabs and travelled eastwards. They came across about seventy lads sleeping under similar conditions. The next year Barnardo started a Home for Waifs at Stepney Causeway with eighteen children. Up to the present time 60,000 children have entered the institutions which were under his control and the total sum received for their support is upwards of three million sterling.

It is difficult to realize that a man so practically helpful, learnt so little from the children of whom he became the foster-father. His life-long beliefs were those of Exeter Hall. He was an Evangelical Christian. On the other hand, George MacDonald was one of the pioneers of

the "larger hope" movement. He spread the ideas of Frederick Denison Maurice among the dissenters of England. In fiction and in verse, on the platform and in the pulpit, he cultivated an intimacy with the Divine which to a man of Barnardo's mould would appear impious. Those lines of his, adapted from a tombstone inscription:

Here lie I, David Elginbrod.
Ha'e mercy on my soul, Lord God,
Aa I wad dae, were I Lord God,
An' ye were David Elginbrod

have gone round the world. One wonders what a man like Barnardo thought of them, however?

To MacDonald the child was that vision of delight which Wordsworth has dwelt upon in such splendid verse. He sympathized with the *child itself*, not merely with its sufferings and its bodily needs. He looked up to the child as an ideal—a Christ-taught fact which the Evangelical school has utterly forgotten. Because of this reverence he was able to write books for children and about children which will not be forgotten.

Which of these men has done the greater service to childhood, is a very open question. At

any rate, they both strove to leave the world better than they found it. And their works do follow them. They shall reap of the fruit of their labours in a day when,

Mind and heart according well,
Shall make one music as before—
But waster!

And the music will be heard, not in a distant Heaven, but on this old earth of ours—some day!

Athletics in Consciousness

IT is a very one-sided and partial athleticism that we cultivate today. It deals only with the body. The whole sphere of mind, will and emotions, we leave out of account.

If our bodies were as little under control as our minds we should have but a few hours to live. Intending to grasp one thing, we should grasp something else. Intending to go to one place, we should go to another. Proposing to go to bed, we should find ourselves standing on our heads, or rushing wildly down the street.

That is exactly the behavior of the mind. When we propose that it shall think of one thing, it thinks of another, and as soon as it has touched that other, it rushes wildly away in a wholly new direction.

It is the same with the emotions. The emotional instrument plays what tunes it will, whether pleasant or unpleasant to us. We want happiness, and find our sphere of feeling black with clouds. We want to be on good terms with our acquaintances, and find that causeless dislikes and prejudices are being generated like maggots.

We try to use the will, and find it absent, asleep, or so anæmic as to be fit only for a hospital.

And on every hand are persons with all these defects, who have muscles like trolley-cables and who can breathe as deeply as an ox—thinking that by these acquirements they have a better hold on life. Obviously, they regard the body as the only element in their total make-up with which life is concerned; and even among its activities the gross contractions of muscles the only one to be considered or developed.

No small part of our bad health is due to unstable mind and emotions. The mind rattles about, so to speak, among the brain-cells, like a loose wheel in the mechanism of a clock. Real, fixed thought, if we could achieve it only for a few minutes, would be as beneficial to them as exercise to a muscle. But the treatment they get from their restless occupant from morning till night halves their length of life and incapacitates them from their best work.

Not less havoc to the whole body is wrought by the changeful and discordant jangle of emotions we permit, the moods, dislikes, longings, prejudices, fancies, causeless exhilarations and depressions, a whole gamut of nothings in every hour.

Why not let our athletic exercises cover some of this ground, correct some of these preposterous debilities? Why should will remain an almost unknown factor in our being?

STUDENT

A Real Arbitration Treaty

EVERY one of the Arbitration Treaties that have been signed during the last three or four years by any of the pairs of Powers, has contained a clause removing from their operation "matters of dispute affecting the independence, integrity, or vital interests" of either party.

The Arbitration clause of the separation treaty between Norway and Sweden "goes one better" than this. It provides that the question whether a matter of dispute *does* affect the independence, etc., of either party shall itself be a matter of arbitration. Thus the clause cannot be juggled with and made to cover trifles. Indeed without such a proviso or guard, these treaties are not calculated to stand much strain. Any trifle can easily be magnified by nations anxious to fight, into a point affecting honor, independence, integrity, vital interests or anything else. The two sister peoples of Scandinavia may be congratulated on a distinct step to the good.

C.

Mammoth Cities

NEW Yorkers are congratulating themselves upon the growth of their city. Within its greater boundaries are living four millions of people, an addition of 830,000 in the last five years. London, taking a radius of 15 miles from Charing Cross, contains six and a half millions. But if, starting from City Hall, New York, you take the same radius, you will include five millions. And as London took ten years to add a million, it is easy to calculate how soon New York will overtake her.

Should not the cities rather think with regret than pride upon their size? Surely we have learned enough about the evils, moral and physical, inseparable from close-packed city life to save us at least from self-congratulation on the score of size or populousness! STUDENT

A Delicate Problem

A CURIOUS problem has arisen in connection with the Priblof Islands, two little spots of land lying west of the Alaskan mainland, which became United States property as part of the Alaskan cession of 1867 from Russia. They contain about 300 inhabitants, devout adherents of the Greek church. Their one occupation is the business of seal-catching. Our government has continued the policy of the Russian government, treated the right to take seal-furs as a monopoly, and allows no one except the natives to land on the islands except by express permission. The monopoly is leased to the Alaska Commercial Company who have a contract with our government to pay the natives 40 cents per seal. For a long time this was very profitable to the Company and to the natives, although the latter have no other means or possibility of livelihood.

But of late years the seals are much fewer and some distress has accordingly arisen. To meet this, Congress has been appropriating \$19,000 yearly to go to the support of the little band of natives.

In 1891 it came to the knowledge of our government that emissaries of the Greek Church had been calling on the islanders and collecting money from them, to be taken out of the islands. About \$3600 had thus been levied. A good deal of trouble arose over this, but at last the levy had to be permitted, and the money duly went from the islands to San Francisco, to be used there in some ecclesiastical purpose.

The appropriations for the natives have to continue, and nothing prevents them from handing over more or less of it to Church officials. The problem is whether, since government is aware of the use to which a part of the voted funds will be put, funds coming from the pockets of American citizens, it is not really and knowingly voting money to the support of a particular Church, and thus violating the Constitution. All that the Treasury could say, in 1895, in its instructions to the Agent in charge of the islands, was this:

The order heretofore made by the department prohibiting the collection of money from the natives for transmission to places outside of the Territory has been revoked. But it will be your duty to see that no coercive means are employed by any person to secure contributions of money from the natives, and to advise them that they are at liberty to make such contributions as they choose, but the same must be in all cases entirely voluntary on their part.

C.

Australian Echoes

TWO recent books on the northern Tribes of Central Australia, both written by specialists in their subject, give us a decidedly more pleasing picture of these people than is usual. Their brutalities have been greatly overdrawn; on the whole, "they are decidedly kind to each other;" there is "no such thing as allowing an aged and infirm person to starve;" their treatment of their wives, and their methods of warfare, have been painted much too red; "the members of contiguous tribes, where they are in contact, live for the most part in a state of mutual friendship;" and the so-called wife-captures are mostly pre-arranged elopements.

These tribes universally believe in reincarnation. Every living member is the reincarnation of a dead ancestor. They firmly believe that motherhood is quite possible without a male parent!! One tribe has the extraordinary belief that women, as incarnated, have no spiritual part(!); there *are* spiritual women, but these are not incarnated. In this there seem to be mixed echoes of several ancient beliefs.

On attaining a certain age the males undergo an initiation, the import of which is carefully concealed from the women—and, we should suspect, from the inquiring stranger. As time goes on, the matters dealt with in this ceremony come to occupy more and more of the man's thoughts; his mind is expected to concern itself with preparations for his next incarnation; his final years are in fact supposed to be spiritualised.

All this twisted belief is more probably the remains of something much higher, than the products of primitive barbarism. According to Theosophy, the people of Australia are retrograde remnants, not beginners. The Continent itself was part of Lemuria.

There seems to be something of the Aryan in the gradual withdrawal of the males from active participation in external tribal matters after their attainment of the customary age. Though many savage and half-savage tribes on various continents believe in reincarnation there are not many who preserve it in such clearness and certainty as these Australians. STUDENT

Some Views on XXth Century Problems

"Woman's Sphere"

EX-PRESIDENT Grover Cleveland has brought a storm upon his head by maintaining that woman should not have the suffrage. He does not lack courage, for he speaks his message in a women's journal. Have not women, he says, "in some way allowed the idea to gain a place in their minds that if the suffrage were accorded to them, it would be the pure, the honest, the intelligent, and the patriotic of the sex who would avail themselves of it? If they are drifting on the smooth surface of such a pleasing conceit as this, it behooves them to take soundings and locate landmarks. They can perhaps thus bring themselves to a realization of the fact that among women, as is unfortunately the case now among men, it would not be the best and most responsible that would most diligently use their voting powers, and that, even if every woman in the land should exercise the suffrage, the votes of the thoughtful and conscientious would almost certainly be largely outweighed by those of the disreputable, the ignorant, the thoughtless, the purchased and the coerced."

But suppose this were not so, would it even then become the wisdom of women to vote? We think not. If at the present day, either sex apparently succeeds in duplicating or understudying the rôle of the other, it is because we are passing through a transition, and the achievement will not hold. Is nature's line only physical? If we carry all the arguments ever urged against women's appearance on the political field and in the polling booth, to an abstract, if we get down to the feeling or intuition at the root of them all, does it not come to this—that the spiritual rôle of womanhood is not overt action, but the subtler and higher activity which consists in *the creation of an atmosphere in which actions are born*? Her training of children is a symbol of a larger fact; the child is the action, guided and suffused by the atmosphere which she has made about it. Her spiritual action and *raison d'être* is neither higher nor lower than man's; but the other half of the whole.

STUDENT

Standing Armies

A STANDING army seems to be midway between the worst and best methods of national defence, and to correspond to the midway period in the history of nations, the period between their best youth and their decay.

When the pulse of patriotism beat at its highest, every man stood ready to fight. But he did not stay in his war-paint or armor. When there was no fighting, he discharged the duties of a citizen according to the lights of his time.

Then, through several stages of transition, comes the standing army period. More or fewer men are told off to do nothing but wait for war and engage in it when it comes. The others begin to lose, and in advanced cases, have lost, the instinct to offer their lives in defence of their country.

Lastly, and also by way of stages, comes the time when in all the nation there are not enough who are willing even for pay to defend their national existence. It is the day of the hire of mercenaries, and the end of the nation is not far off.

There is much criticism of the policy of compelling men to spend some fraction of the year in military training. There would be less, or even none perhaps, if there were no *standing* army. All would feel the pressure of responsibility for national defence, and it may be that the pressure of opinion would make legal compulsion unnecessary. The training might be voluntary and would be a matter of honor.

It may be that war, and the tremendous financial pressure of preparedness for war by standing armies, may come to an end by way of return to the older method of general voluntary national readiness, every man to whom it is possible consenting to give a fraction of his time periodically to the necessary training. Surely such a condition would not only flow from a higher patriotism but would conduce to it. And the mere absence of standing armies would certainly conduce negatively to peace. There is much in suggestion. STUDENT

Prayer as Medicine

"AS an alienist," says Professor William James, of Harvard, "and one whose whole life has been concerned with the sufferings of the mind, I would state that of all hygienic measures to counteract disturbed sleep, depressed spirits, and all the miserable sequels of a distressed mind, I would undoubtedly give the first place to the simple habit of prayer."

But he does not, by prayer, mean asking for things. Nearly all those mental sufferings which the habit of prayer is to cure, come from desiring something unattained or unattainable. Prayer in the sense of asking for this something is really a mental concentration on the desire; which accordingly grows; and the querent rises from his knees either more perturbed than before; or self-hypnotised into the surety that his petition is to be granted.

By prayer, Professor James means "communion, not as a mendicant or repeater of words more adapted to the tongue of a sage, but as a humble individual who submerges or asserts his individuality as an integral part of a greater whole." In other words *Thy will be done, not mine*. "Such a habit does more to clean the spirit and strengthen the soul to overcome mere incidental emotionalism than any other therapeutic agent known to me."

But it implies belief in a mighty purpose working itself out in the universe as a whole and in the life of the individual; not necessarily belief that the purpose cannot be stayed, for the free-willed acts of men do constantly stay it or the world would not be in the plight it is; not passive resignation in the miserable sense ordinarily attaching to that word; but a heart-made acceptance of unavoidable as expressions of that purpose, and a heart-whole intention to cooperate with the purpose as fast as it becomes known. The mere surrender of the intention to resist and grumble is only negative; the positive is the formation of the intention to cooperate.

The rewards are many; peace, the fact of the *communion*, the stirring of that divine consciousness which is to the heart what the thinking consciousness is to the brain, glimpses of the unspeakable goal to which the individual and all individuals are tending, knowledge of self and of others, ennoblement of character. The hours of sleep which follow are protected, cleared; physical refreshment is perfected; and in the silence that is deeper than dreams, the soul grows.

STUDENT

Our Physical Co-Tenants

TABULATING things, sometimes leads to useful results. So a thus usefully occupied gentleman has been inquiring into the relation of much walking to literary production, and he finds that there is a very real one. In fact he thinks "that the flabby flexors and extensors of the locomotor media of our modern poets are largely responsible for the invertebrate verse of present production." The poets don't walk enough to do great work. He gives a number of instances in support of his position; that is he enumerates a number of strikingly great writers who were strikingly great walkers—although he does not venture upon the proposition that . . . and . . . and . . . might really do something in literature if only they would get up from their desks and walk.

There is a good deal in what he says. If you have a child in the same room with you when you want to think you give it something to do. A good part of our physical thinking apparatus is very childish, and it keeps interjecting foolish and irrelevant remarks when we are at work in a higher department. To put it to walking is as it were to fling it a bone with which it can occupy itself. But the walking is not only something for it to do, but something in the doing of which it will gain health. We are not suppressing its activity, but turning its energy into useful channels. We must not walk it to fatigue, or it will interrupt us with its grumbles; we must not walk it in crowded streets, or it may chatter to us about what it sees.

But of course all the bones, walking, cigarettes and what else, are makeshifts. Perfect thinking, which few know how to do, would be a turning of all the energies of every plane on to the wheels of thought for the time needed. We ought not to have to placate the unruly servants of the house. In return for making them help us to think, we could, when we take them out into the open air for exercise, add to their lower our higher consciousness of the beauty of nature and the sun and moon. We could touch with spirituality their joy in physical life. But alas! how many of them have one, or of us the other? STUDENT

Ancient Egyptian City Beneath Carthage

WHEN the vengeful Romans utterly demolished Carthage, razing it to the ground and ploughing over the earth, they did not know that French scientists would come two thousand years later and dig out Egyptian mummies from a still older city lying beneath the ruins of the Punic one. Yet the French Government's explorations in Tunis have revealed the location of several distinct cities on the ancient site of Carthage. There was an older city below the Punic one, and there was a later city above it.

Hundreds of sarcophagi with mummies have been taken out from the site, and there is no doubt that there was here an Egyptian city before the Phœnician colony was planted. For, although the Phœnicians did embalm their dead and lay them in cases brought from Egypt, these mummies and cases that are now being unearthed are unlike the Phœnician ones heretofore found. They are clearly Egyptian; masks of Hathor and other purely Egyptian articles accompany them. STUDENT

Discoveries in Pergamum

THE site of ancient Pergamus was excavated by the German archeologists, Humann and Bohn (!) some twenty years ago, and many relics of its splendid Grecian art brought to light. The work was continued in 1900, and these later excavations have yielded more treasures of the same character.

Pergamus (more properly Pergamum) near the west coast of Asia Minor, is a very ancient city. According to tradition it was founded by Arcadian colonists, led by Telephus, son of Heracles. But it was under Lysimachus, the successor of Alexander the Great, that it came to prominence; and its splendor culminated under Eumenes II in the Second century B. C. Its civilization seems to have always remained Greek and to have withstood the orientalizing influence which affected neighboring cities.

A hall of columns, of the time of Eumenes II, with thousands of figures

in white marble, which ornamented the walls, has been discovered; as also a bust of Hermes by Alcámenes, inscribed: "Learn that this is Hermes, by the great Alcámenes, standing at the gates of Pergamum." STUDENT

Stonehenge

MANY people still go to Stonehenge to see the sun rise on the 21st of June, the longest day of the year, when the sun, as it rises above the horizon, casts the shadow of the stones in a way that is not due to chance, but speaks of a careful alignment by Druid priests, whose methods may still be traced by the observant. But still greater attention is likely to be drawn to those stones from the result of recent inquiries which give substantial grounds for believing that the megalithic structures at Stonehenge point to the existence of two temples, at very different dates, on practically the same site. The worked sarsens with their mortises and lintels point to the rededication and reconstruction on a more magnificent plan and scale of the older and original edifice. Also there is evidence of the employment of two different years—one, that long recognised as connected with the solstices; the other a May and November year, the year of agriculture, a year which would be of *greater importance to the community as it advanced in culture and enlightenment.** Such a year still serves some useful purpose, and is employed in Scotland and other parts of the British Isles for the collection of rents and for agricultural purposes generally. (*Italics ours.—ED.)

The Ancients and Their Haitches

COCKNEY language is by no means an exclusively modern development,—so we learn; and with regret, for we did think there was one thing which the ancients have not copied. A writer in a London exchange points out that in Catullus, Ode 84, a Roman citizen of 60 B. C. says "chommoda" for commoda, "hinsidias" for insidias, and the "Hionian waves." We shall be digging up fossil "grapenuts" next.

✻ The Trend of Twentieth Century Science ✻

A Three-eyed Man

IN some remarks upon the eye, Professor Ray Lankester points out a fact or two, which, when the Theosophical teachings on human evolution are better understood, will be found more and more significant. He is dealing with the eye of the ascidian—or sea-squirt—tadpole. As the creature is transparent, the fact that its eye is *within its brain*, instead of on the surface, is no drawback to its vision. It is a vertebrate and its eye has the peculiarity of the eyes of all vertebrates, that is, starts within and from the brain. In the case of this little animal it not only starts there but stays there. In the case of other vertebrates, for example man, who have not the good fortune to be transparent, that little mass of brain matter which proposes to become an eye, gradually pushes towards the surface, which dips in or cups in to meet it. The bottom of the surface cup forms the lens and cornea, and the brain bud the retina—the really seeing part. Professor Lankester comments thus:

We are thus led to the conclusion . . . that the original vertebrate must have been a transparent animal, and had an eye or a pair of eyes in its brain, like an ascidian tadpole. As the tissues of this ancestral vertebrate grew denser and more opaque, the eye-bearing part of the brain was forced to grow outwards towards the surface in order that it might still be in a position to receive the sun's rays.

It happens that man has three eyes, one which has *remained* in the centre of his brain—an eye now called the Pineal Gland—and two which have come forward to the surface. (It is curious, by the way, that some ancient sculptures and pictures represent man with three eyes! How came the artists by the idea?)

The histories of man from his appearance on the globe, given by Theosophy and by science, are not identical. According to the former, man—or rather his body—*was* once transparent, but was not any more a reptile than he is now. And the third or pineal eye not only functioned in response to what we know as light, but to those far higher vibrations of which science is only just beginning to suspect the existence, of the lowest of which she has quite lately obtained proof. Increasing grossness of *consciousness* begat grossness of body; the third eye failed at last to respond even to such rays as can—like *e. g.* the X-rays—penetrate the now dense brain vestures. The other two eyes had to come forward to get the sunlight.

That far-off transparent man left no fossils of himself. Later, when degeneration into grosser materiality had gone a long way, he did.

Professor Lankester's speculation is a little step toward the verification of the history of man given us by H. P. Blavatsky. But he has yet to get the true relation of man to the vertebrate animals. The sacred tree of the old Hindu legend had its roots *upward*. STUDENT

Storm, Cyclone, Hurricane, and Tornado

A METEOROLOGIST has been calling our attention to the loose way in which we use the terms cyclone, hurricane and tornado. High-pressure and low-pressure aerial areas follow each other from the west to the east with a three-day rhythm. In a high-pressure area the air is getting denser near the earth. To equalize matters, less dense air from a higher level, from up in the cold, rushes down into this dense area and cools it. At the same time the dense air flows away along the earth's surface to some place where the pressure is less. If the motion is rapid—due to considerable difference of pressure—there is a storm line between the two points. The average rate of a storm, Mr. Moore tells us, is between 37 miles an hour, for winter, and 22 miles, for summer.

At any point where pressure is getting less, this less dense air will be rising, and air from a denser region will be coming in to fill the gap. In that way we get the warm wet air from the Atlantic and Gulf of Mexico.

When air is ascending to a higher level, or descending from a higher level, its motion is spiral. The cyclone is a spirally revolving disk of air perhaps a thousand miles in diameter, and of itself doing little damage. The hurricane is a small cyclone, with a diameter perhaps one-third as great. But the spiral currents making for its centre are necessarily much faster. But the tornado has but a diameter of a few yards. It is a spiral

of an enormous rapidity of rotation developing at the south-eastern corner of a cyclone and pursues a destructive path of its own, westward. "It is possible," says Mr. Moore, "that some day a Kepler or a Newton may discover such fundamental principles underlying weather changes as will make it possible to foretell the character of coming seasons." But as yet such principles are unknown. STUDENT

Pigmented Skin

A WRITER in a French scientific magazine attempts to explain the presence of the black pigment in the skin of the negro. It has generally been referred to the necessity for protection against the solar rays. To this he replies very truly that black does not reflect the heat rays, but absorbs them and should therefore make the negro more rather than less uncomfortable. The skin is not needed against heat; the body possesses another apparatus by which it protects itself against rise of temperature from exposure to any ordinary amount of solar heat. The black pigment is, he thinks, therefore an evolution for the protection of the negro against the injurious *actinic* and *luminous* rays. He points out that the effects on white skins of intense sunlight may be prevented by blackening the skin with lampblack; and that we use dark glasses to protect our eyes from the intense cold glare of light from glaciers.

But yet his argument will hardly do. If the black pigment is an evolution for the purpose he says, why is not the Egyptian, for example, not of the same color as the negro with whom he has dwelt under the same sun for ages? And why are not negroes less black on parts of the body which they cover than elsewhere? Equal solar exposure should produce equal blackening; unequal solar exposure unequal blackening. But neither is the case. A more radical reason must be found. Theosophy teaches, today's science notwithstanding, "of three entirely distinct primeval races whose evolution, formation, and development went *pari passu* and on parallel lines with the evolution, formation, and development of three geological strata; namely, the Black, the Red-Yellow, and the Brown-White. The Root Races"—Lemurian, Atlantean, and Aryan-Caucasian—"are subsequent evolutions of these." So we must go a long way back for cause. STUDENT

The Skeleton in the Cupboard

SO far, in all her imaginings about the ether, science has stopped short with giving it a constitution. According to Mendeleef it is the lightest of all the elements, the least dense of gases. By densifying into itself it forms all the other elements. According to Professor Osborne Reynolds it consists of an immeasurable number of minute round particles, fitted closely together. Molecules of matter are points in this sea of billiard balls where the gearing, the closeness of the fit, is disturbed. According to Lord Kelvin it is also a sea of particles, not geared together, but moving amongst each other with absolute freedom. When a short chain of these particles closes into a ring, and the ring proceeds to spin, we have a molecule. According to Dr. Larmor the ether is a fluid; electric corpuscles are points of strain in the fluid; a number of these make an atom; and a molecule is a little solar system of atoms moving about each other.

All these hypotheses agree to a certain extent in regarding the ether as primarily a uniform sea of some kind. In and from this sea arise elements, points of misfit, whirling rings, or spots of strain. What made them? Only one cause is even imaginable—*will*. The universe can never be accounted for till science ventures to say that word. Is it unscientific, speculative, metaphysical, outside the domain of provable fact? But the work of will is not only a proved fact, but the first fact we know. We are conscious of this fact in our own bodies every minute, the work of will, the work of the subjective on the objective. Why is science so squeamish about this fact? Rather than face it she will even deny the existence of will altogether—just as if a man were so anxious to escape acknowledgment of a favor that he denied the very existence of his benefactor! So it is agreed that will in cosmos as the prime motor, is to be the skeleton in the cupboard, never to be mentioned on pain of impeachment for heresy! STUDENT

The Sahara

THE Sahara Desert is as large as the whole United States and nearly as large as Europe. Consequently it is rather absurd to talk about it as if it were a square mile or two of sandy desert, when one might effectually lose a few average-sized countries in it, and never find them again. We know a few of the things that are in the Sahara, but what else there may be which is not yet discovered, we can only conjecture. We need to cultivate

a saving sense of proportion in considering maps.

Not more than one-ninth, says one authority, is covered by the endless sands which popular tradition formerly assigned to the whole area of the Sahara. Over one-half is said to be plateaux and mountains, and much consists of steppe-land. We know from recent accounts of travel that there are blooming valleys hidden away among those mountains. We also know that nothing but the magic touch of water is needed to turn the wilderness into a paradise; and that, if water does already exist anywhere, there fertility must also exist. The broad channels of the water courses, now often dry, point back to a time when rivers like the Nile bore their irrigating waters down from the mountains. What remains of ancient glory, what sites (perhaps) of places believed to be fabulous, must lie there!

Some idea of the size of the desert is gained from the fact that the trip across from north to south takes the camel caravans three months.

COME, with thy sweeping cloud and starry vest,
 Mother of counsel, and the joy which lies
 In feelings deep, and inward sympathies,
 Soothing, like founts of health, the wearied breast.
 Lo! o'er the distant hills the day-star's crest
 Sinks redly burning; and the winds arise,
 Moving with shadowy gusts and feeble sighs
 Amid the reeds which veil the bittern's nest.
 Day hath its melody and light --- the sense
 Of mirth which sports round fancy's fairy mine;
 But the full power, which loftier aids dispense,
 To speed the soul where scenes unearthly shine ---
 Silence and peace and stern magnificence
 And awe and throned solemnity --- are thine! --- Selected

remarkable.”—From R. Gordon Cumming's “Five Years of a Hunter's Life in the Far Interior of South Africa.”

Origin of the Dahlia.

THE dahlia, now renowned as a show flower in horticultural exhibitions, had no such aristocratic pretensions when it first immigrated into Great Britain. In fact it was imported from Mexico in 1789 by Dr. Dahl, a Swedish botanist, for the purpose of supplanting, as a food, that very ordinary and unpretentious vegetable—the common or garden potato! In the south of France it is still eaten as a tuber, but the acrid flavor prevented its success in that capacity in other countries; and so it has given up the useful in favor of the beautiful.

When Is a Lizard not a Lizard?

Lizards, dressed and dried, stretched on pieces of bamboo, are imported into the United States in pairs. They were stated to be used as Chinese medicine, and have hitherto been classified as such for import duty. But recently the assessors have decided that, since the lizards are cooked with herbs and administered in a broth, they are not medicine, but “non-enumerated unmanufactured articles,” and hence a new rate of duty has been levied on them. This reminds one of the Pharoah imported as “salt fish.”

pink, red, and crimson, some of them with brown lips to the bell, flourished in the richer hollows of their native glen, or bloomed with equal loveliness along the arid cliffs and fissures of the overhanging rocks.

Almost equaling the heaths in beauty, and surpassing them in the additional attraction of their scented leaves, a whole host of geraniums filled the balmy breeze with their delicious perfume. Small groups of the lofty, conscious-looking iris rear their graceful heads along the edges of the streams. . . .

Several varieties of the light and airy fern, or bracken. . . . Besides these a thousand other gay flowers deck the hills and plains wherever the eye can fall. Endless varieties of the ixea, the hæmanthus, the amaryllis, the marigold, and a number of everlasting flowers, are scattered around with a lavish hand; also the splendid protea, whose sweets never fail to attract swarms of the insect tribes, on which several bright kinds of fly-catchers, their plumage glancing in the noonday sun, are constantly preying. Farther down these water-courses, in the dense shady ravines, the jungle is ornamented with long tangled festoons of different creepers, among which the wild jessamine ranks foremost, hanging in fragrant garlands among the shaggy lichens and bunches of bright orange-colored mistletoe, for which the forests of Africa, in the vicinity of her seacoast, are

sphere of woman's work in that day when her heart, her mind and her will are devoted to the highest interests of the race? W. D. Howells, in a recent magazine article, speaks of the gracious and wise future time when the peace envoys of two warring nations shall be the best and brightest of their women. This surmise will become a fact when women awakened to their power and, trusting that they will have a backing of power and courage and discretion, step forth into the highest service of love. Great indeed shall be the auspices under which women will one day enter public life, and great indeed shall be their influence.

MARJORIE TYBERG

The Basis of Success

UNDER the general term of "Fads and Fancies," the subject of the education of children is being seriously discussed by many parents in our largest cities.

Parents are complaining that children have too many studies in school, that they learn nothing thoroughly, but get mere smatterings in varied and fanciful "ologies" and "isms"; that they are receiving instruction in music, drawing, raffia work, etc., and all quite to no useful result. Of course the argument centers around the threadbare contention that the three R's are all that may be needed to prepare a child for the practical work of life, for of course, also, life has no really practical work outside the question of earning a livelihood.

This discord between home and school is detrimental to the child's best interests. Before real progress can begin, there must be true harmony established between parents and teachers. They must agree upon what are the real needs of the child, and then work together conscientiously in the same direction.

Parents naturally want to secure success and happiness for their children in after life. The question is, do life's success and happiness depend solely upon how well or ill we learn our three R's, or upon whether we study music, drawing, or any other thing, at school?

When we look out over the world, upon its failures, its misery, its wars and strife everywhere; when we examine the matter of unhappiness in the family circle, can we say that it has come to be because we haven't learnt our three R's thoroughly enough?

Then, too, have the studies of music, drawing, or any other of the refining arts; the study of basketry or even of butterflies and frogs, been the cause of our present day failures and unhappiness?

Surely not; we had discontent and to spare long before. The cause is lack of knowledge of the deeper meaning of life and its purpose, which is not the mere earning of a living but the rounding out of character until is achieved that balance which will forever be the sure foundation for all success and happiness. This must begin with the early training of a child. Its nature must be understood and wisely trained, so that there may be brought into permanent power, the good and true; thus would be assured to all humanity permanent happiness, and thus alone. But few, indeed, are "worthy and well-qualified," so few that, were the heart not optimistic in its own right, the future would look dark. But the heart looks upward and ahead and sees—the Light. A RAJA YOGA TEACHER

The Woman in Business Life

A WOMAN who has been a drummer for five years, travelling from place to place with a case of samples, reports that during that time she has not received a single insult or affront from customers or drummers of the opposite sex. She acknowledges that something more is expected of a woman than of a man in any capacity and states that she set herself firmly to follow certain rules of action (not loitering, etc.), in order to protect herself and her employer's interests. She states, moreover, that the power to shield herself from affront or familiarity resides in every woman and that, this mantle of self-respect assumed, a woman is safe anywhere.

These conclusions will undoubtedly be confirmed by all women who have had business experience and been successful in that line of work. Women who thoroughly respect themselves need no other panoply when they step outside their homes into the business and industrial world; their womanliness will never be lessened and their hands will be free to do the best work. This self-respect must be the genuine article, however, an inwrought strength and decision of character manifest at all times which gives the possessor a keen perception of right and wrong, a power over all conditions, whether she be on dangerous ground or threatened with ensnaring meshes, and which creates an atmosphere about her person in which the evil thought and insulting action cannot live. The woman drummer quoted was most wise in establishing certain standards of conduct from which she did not deviate. Even little things which seem, and perchance are, harmless in themselves may prove loopholes through which affronts and wrongs will creep, an old

Lomaland Photo and Eng. Dept.

FINNISH PEASANT WOMEN FIGHTING A FIELD FIRE

truth, having been demonstrated in the Eden days. If Eve had not loitered with the serpent the blame for the evil in the world would not have been laid at her door.

Some women who enter the business field attempt to establish and maintain their position by exercising their feminine charms, so to speak, and accentuating their sex. Such women are not single minded in purpose. If they have one eye out for their employer's interests they certainly have another for inviting matrimonial chances and the flattery and tributes which their vain natures demand. Although they may seem to be successful at first such standards will ultimately prove as fatal to their business success as it is disintegrating to their character. Men may be fascinated in some degree and along certain lines by such women but they will never entrust them with valuable contracts or important business.

So long as the belief is prevalent that the virtues have been unequally divided and that woman, in general, has more than man, so long will more be expected of her and in business life she must prove her place by her ability as well as by her tact and purity, to an extent that her brother is not called upon to do. But, clad in this mantle of strong self-respect and animated by a high purpose, any woman may pass along erect and free, with unstained garments and clean hands. And every one who firmly maintains her business relations on these lines not only makes it vastly easier for those who follow her, but gives also a mighty impetus to the progress and self-development of her sex as a whole. OUR YOUNG FOLK

A SERVICE OF SONG

EMILY DICKINSON

SOME keep the Sabbath going to church;
I keep it staying at home,
With a boboliak for a chorister
And an orchard for a dome.

Some keep the Sabbath in surplice;
I just wear my wings,
And instead of tolling the bell for church,
Our little sexton sings.

God preaches---a noted clergyman---
And the sermon is never long;
So instead of getting to heaven at last,
I'm going all along!

Nature Flashlight

SAILING through a sea of light! This sounds like a fairy tale, but sailors who have been on voyages on the tropical seas know that one may sail hundreds of miles at night over a sea glimmering with phosphorescent light. So bright indeed is this light very often that the sailors can read by it, and can see the shadows cast by the masts and sails as the ship moves over the luminous sea. This beautiful sight has been seen not only on the Indian Ocean, but on the Atlantic Ocean, where a sea as black as the night itself has been seen to break into gleams of light whenever the water was ruffled by a breeze.

This phosphorescent light comes from shoals of tiny creatures which live in the water. In the daytime they look like yellow scum on the surface of the sea, but at night they display this brilliant light. Deep down in the sea all would be dark were it not for other marine creatures which can emit light. Many of the animals who live in these depths have no eyes, but others have not only eyes but have also the power to flash their light upon things they wish to see. These flashlights under the sea are mostly green in color though some are like a brilliant white searchlight, and a few belonging to some sea animals very much like plants have a purple light. One of these light bearers has the power to change his light from blue to green. Two miles below the surface of the ocean live these strange luminous creatures.

Nature's flashlights are not all found in the sea however, as most of you know. There are insects which are light-bearers. American boys and girls are familiar with the little firefly or "lightning-bug" of the Eastern and Middle States. This little insect flits about in the tall weeds at dusk, flashing its yellow light every few seconds. Some red and yellow flowers belonging to the liverwort family are luminous at night, just as if they had caught a bit of the light from the sun and held it in their blossoms through the night.

The glow-worm has a soft green light which seems to be held in a transparent layer in the lower part of the body, while a deep opaque layer lies behind it like a reflector.

The Mexican firefly carries two lanterns, one in its chest and one in the lower part of the body. Some of the larger sea animals have the power to use their light in quite the manner of the condensing and reflecting lanterns of our modern light-houses.

Science is unable to account fully for this curious faculty of illumination which many of the plants and animals possess. Some have called it the conversion of vital power into radiant energy, but as some creatures still continue to give forth this strange light after death, and as decaying wood often glows with the same light, it is difficult to determine what is the real cause.

If these creatures of the lower kingdoms of Nature are thus able to make light about them in such wonderful ways, does it not seem fair to expect something even greater from human beings? Do you not think, for example, that boys and girls could learn to use the great heart light within them, causing it to gleam in the darkness of selfishness in the world and by strong, self-reliant, helpful lives keep a great light shining ever for the good of all that lives?

Lomaland Photo and Eng. Dept.

LOOKING WESTWARD OVER THE BLUE PACIFIC

Facts Worth Knowing

TEN years ago China had no newspapers. To-day she has almost a hundred.

A BUREAU of Standards has recently been established in Washington. It furnishes information on any scientific point coming under the head of weights and measures. Purchasers of scientific instruments, incandescent lamps or hydraulic machinery can learn if these conform to the standard recognized in other parts of the world, by applying to this department for the information. In the Bureau of Standards it is now possible to measure temperature to a millionth of a degree.

A SCIENTIFIC expedition is to be sent out to explore the Northern Pacific Ocean in order to make more satisfactory magnetic charts than can be made from observations from the coasts and islands. The expedition will include magnetic observers, naturalists and surveyors, and will pursue a spiral course across the ocean. The length of this spiral course will be at least seventy thousand miles, and three years will be needed to complete the work outlined by the department of international research in terrestrial magnetism of the Carnegie Institution.

MANY farmers in France and Germany attach electric motors to their ploughs and cultivators and reaping-machines. A great saving of labor is the result. Tenants of small farms club together to purchase a motor and lighten their work by using it in turn. And recently it has been found that the ground can be rid of pestiferous insects and worms by applying electricity through an electrode buried in the earth. The heavy labor that has been necessary, in order to make the soil yield a harvest, is thus becoming lessened. The farmer of the future will use his brain more, and in this way lighten the work of his hands.

How many boys and girls know how to show the respect due to the flag of their nation by raising it only at the proper time and in the proper manner? The flag on any building but a fort that is besieged should never be displayed between sunset and sunrise. When the flag is to be placed at half-mast it should first be hoisted to the top of the staff and lowered from that position. The national ensign is the most sacred emblem of the nation, too sacred to be used except in the most reverent and highly decorous way; it is for this reason that even in honoring brave soldiers and men of exalted rank who are dead, the flag is not kept long in mourning. In the case of the national memorial ceremonies each year in the United States in honor of the thousands who lost their lives during the Civil War, the flag is displayed at half-mast until noon, and then after a dirge has been played in honor of the dead soldiers, and the national salute of twenty-one guns has been fired, the flag is hoisted again to the top of the staff to float there until sunset.

COUSIN EDYTHA

THE CHILDREN'S HOUR

BABY-LAND

HOW many miles to Baby-Land?
 Anyone can tell;
 Up one flight,
 To your right,
 Please to ring the bell.

What can you see in Baby-Land?
 Little folks in white,
 Downy heads,
 Cradle beds,
 Faces pure and bright.

What do they do in Baby-Land?
 Dream and work and play;
 Laugh and crow,
 Shout and grow;
 Jolly times have they.

What do they say in Baby-Land?
 Why, the oddest things;
 Might as well
 Try to tell
 What a birdie sings.—*Selected*

✻ ✻ ✻ A MORNING RIDE ✻ ✻ ✻

The Heart-Song

GODFREY and his little sister Marjorie were visiting their aunt who lived at the sea-side in the far away island of Trinidad, B. W. I., and one day when they were looking at some shells she held a large one to Godfrey's ear and told him to listen to the beautiful song of the sea which the heart of the shell was singing. She explained to him that his heart also sang a beautiful song when he was good and happy. Little Marjorie did not appear to be paying very much attention, but she had evidently understood a great deal and was soon seen toddling away to the shell-stand, and holding one of the shells up to her ear with a deep mysterious look in her dear little face. We grown-ups cannot know what message might have passed from the heart of the shell to the heart of wee Marjorie.

After the children returned home, Godfrey was one day playing with the cat, which was purring very contentedly, when he suddenly ran to his mother and said, "Kitty must be very good today, I think, for his heart is singing a beautiful song." So Godfrey learned that pussies and shells and little boys and girls all have something in common, although each expresses it in quite a different way.

These lucky little children have a water garden under the shade of an almond-tree. In it their mother has planted a beautiful white lily with green leaves, and a pink lily which has brown leaves. The children like nothing better than to sit on the edge of the concrete basin which holds the water and watch the beautiful lily buds gradually unfold. Sometimes cunning little frogs come and sit upon the big lily leaves at the opposite side of the basin and, swelling out their wonderful pouch-like throats, they sing songs to each other. Godfrey and Marjorie cannot understand these songs, but they like to listen and the little frogs seem to know that the children are friendly and so they are not at all afraid. Above their heads are the branches of the big almond-tree and the sunbeams seem to smile as they shine down through the green and yellow and crimson leaves upon the two happy little children who know about the Heart-song.

Cousin Beatrice

ONE of the greatest pleasures for children is a play at the theatre. What they see and hear there makes a strong impression on their minds. Long, long after they have seen a play, they remember all about it, and they often enjoy hours of fun at home when they try to imitate the actors.

Because children love so much to go to the theatre, it is a great pity that they have not the chance to see better plays. Most of the plays of nowadays are not at all suitable for them, or for anybody.

The stage is a school, where boys and girls learn many things. Now, it may be either a good school or a bad school, according to what it teaches. So, if the right kind of plays were given, the stage would be one of

the greatest schools in the world for children. Some children don't like to go to school to learn reading and writing, and spelling and arithmetic, and things like that, but there is no child that does not like to see a play. Then just think, what beautiful lessons of life could be taught to children in such a place, where they all like to come.

What is it that children should learn in the theatre-school? Well, first of all, I think they should learn how to grow; then they would become warriors for the right, and know how to build up the Life Beautiful. When they go away from the play-house,

their minds should be filled with beautiful pictures. These pictures would make them think beautiful thoughts, that would help to wake up the higher nature; and the sweet beauty that lies hiding away in them, would come out and shine. Then of course the whole world would be brighter.

Everything that is done on the stage should touch the heart. When little children's hearts are touched, the soul is wide awake. Something inside, like a great Love Fairy, drives all rudeness and hate away, and makes them gentle and true.

I am sure that all must agree with me, that the plays on the stage now, do not give children even a glimpse of the Life Beautiful. They are mostly scenes of excitement, full of rough quarrels, low speech, and degrading acts.

But there have been plays that have brought real joy to children; they were given by the little folk of Lomaland. Some day they will play more, and fill the world with light and beauty. R. Y. TEACHER

DEAR CHILDREN: Away in Africa, there is a forest so thick and so dark, that the sunbeams can scarcely steal through the leaves.

In this forest, there live the strangest little people, called pigmies, or little earth-men.

The men and women are no larger than little children. They are dark-skinned people, with bright eyes, and hair that curls tightly all over their heads.

They live in little houses, that look like mounds of leaves, and support themselves by hunting. The men sharpen their spear-heads by rubbing them across their noses. This makes their noses grow very broad.

It is only about fifteen years, since the white people have known of these pigmies. They had been found by explorers, but people thought the stories about them were but fairy tales.

Not long ago, a great hunter brought six of these little people to England. There they have attracted a great deal of attention.

Princess Victoria, on her birthday, gave a garden party to her nieces and nephews. To entertain them, she arranged to have these pigmies, a baby elephant, and two performing ponies, in the grounds of the palace.

Everyone was interested in the pigmies, who carried their tiny bows and arrows. They did not mind being looked at, and were as interested in the performance of the animals as the other people were.

Since these pigmies have come to England they have been treated very kindly. They believe the great white man can do anything. When they return to Africa, they will have many stories to tell to their people.

In their native forest, they do not know what it is to laugh and be joyous, but they are very loving and grateful to anyone who is good to them. May be, when the children, who have learned Raja Yoga grow up, they may go to these strange little people and teach them love and brotherhood.

But we can help them now, by thinking loving thoughts, for thoughts have wings, like birds, that can carry them even to the depth of that great forest where the sunlight seldom gleams. AUNT JEAN

A Delightful and Instructive Evening With the Raja Yoga Children at Isis Theatre

THE Raja Yoga children from Point Loma conducted the Universal Brotherhood meeting again last Sunday evening, and again Isis Theatre was filled to the doors. In fact there seems to be a growing interest on the part of San Diego people in the remarkable results attained by the Raja Yoga system, as demonstrated week after week at these public meetings. Last Sunday night's meeting, like those of the two preceding weeks, was conducted almost wholly by the boys and girls of the Raja Yoga school.

A profusion of blossoms and foliage gave to the stage a delightful touch of nature that seemed an appropriate setting for the freshness and spontaneity which characterized the rendition of the program. The numbers were varied and well arranged, and included, besides vocal and instrumental music, a recitation and three short papers. The program opened with organ music, after which was a string trio, *allegro op. 9* (Beethoven). Ruth Westerlund gave a very effective recitation. The special class which so delighted the audience a week ago was again present, and rendered three songs most charmingly: "Calm and Storm," "Evening and Morning," and "Shepherd Lullaby."

Master Rex Dunn read a paper entitled: "Is Humanity Asleep?" "In our times," he said, "most people regard the world's progress as an advance only in the improved commercial relations, in manufactures and industries; in the invention of new labor-saving machines, new articles of comfort and usefulness; and most of all, anything that will be the cause of more pleasure and comfort, making life easier and less troublesome. Certainly, some of these things hold their place, and do make a certain progress, but that progress is only along the lines of materialism, making one's life more empty and purposeless."

"How many hundreds of people go through life without ever coming in touch with the higher and finer qualities of their natures, even down to self-respect? It is easier to number those who are living the life guided by their divine natures, for there are but few besides the students and children of Lomaland. The desire for that life is in the hearts of many, but the knowledge is not theirs. The lack of true education shows itself more and more every day in the world's life."

"Many children have within them many latent faculties which never have the opportunity to show themselves. They are paralyzed or weighed down by surrounding conditions, and by unhealthy and weak bodies. To have strong and healthy bodies we must have pure and wholesome thoughts, and for the higher, the divine nature to unfold and express itself, the mind must be clean and the body healthy."

"Humanity has not yet awakened to the fact that men are souls, and that man cannot live for himself alone; but the fact that there is a Raja Yoga school where all there are striving to live the 'life beautiful,' proves that there is a better day dawning for poor humanity. And as Theosophy is the parent of the soul system, to it humanity must turn to open the door to wisdom, the magic ladder that man can climb if he will."

Master Montague Machell gave a cello solo (Gottermann Romance), which was much enjoyed by all present.

Master Thorley von Holst read a paper on: "The Sabbath." In part he said: "The Sabbath Day is an institution which the Christian Church has adopted, partly from the Jews and partly from our old Teutonic ancestors. The word Sabbath is a very ancient Chaldean word, meaning a period of rest. There were Sabbatical years, as well as Sabbatical days."

"The ancients knew that, after a period of work and worldly occupations, it was right to devote a period to sacred rest, so that the mind could have an opportunity to dwell in the peace and silence, and to regain its balance for another period of work."

"We may remember that Jesus Christ found the custom of the Sabbath Day existing among the Jews; and that he told them that it was

right to do deeds of mercy on the Sabbath Day, as the Sabbath was made for man and not man for the Sabbath."

"The modern man still has the idea of devoting one day in every seven to spiritual occupations and religious exercises; but he departs so far from the original idea of a Sabbath, that the custom is now largely a dead letter. Most people in civilized countries today spend the six week-days so badly that they cannot spend the Sabbath properly. They have worked so hard at their business that they are glad to devote the seventh day to pleasure or to idleness."

"Many people, of course, go to church, but, except in a very few cases, they do not reach a very high state of holy calm and peace there, though they may sincerely strive for it."

"The life of most people in the world is made up of nothing but work and pleasure, and hence they would not know how to use a Sabbath. Man has so neglected the culture of the higher part of his nature, that he does not see the use of setting aside a day for it. He would not know how to employ such a day. When he is not working or enjoying himself, he goes to sleep."

"In view of the way the Raja Yoga children are taught to respect the Sabbath, you may more readily understand why our Leader, Katherine Tingley, at all Sunday assemblies suggests no applause. Yet she does encourage hearty applause of the young students at the Homestead and elsewhere, on week-day times."

"The Sabbath was not founded by Moses, as many are taught. It is a most ancient and universal custom, based on a profound knowledge of the laws of nature and the science of life. The seventh day was sacred to the Sun, the emblem of the central fount of life and of the soul. On that day we ought to dismiss from our minds the cares of the week and hold communion with the God within us—or with our 'Father in secret,' as Jesus said."

"We Raja Yoga boys and girls are striving to bring back into this troubled, hurrying world the grand old idea of rest and repose which is so lacking everywhere. People nowadays do not know how to rest. If they rest the body, then the mind goes on worrying, or else they over eat themselves, or drink, or smoke or sleep. They have lost the power of self-mastery and cannot maintain the attitude of peace and quiet dignity."

Miss Julia Hecht also read a paper entitled "Music as an Educational Factor."

In part she said: "Katherine Tingley has said, 'Music is one of the basic principles of life. It is the harmony of life; and if we attune ourselves physically, mentally and spiritually, we have the key that unlocks the door of the mysteries of life.' How few are there in the world today who realize that music should be studied in this deeper sense of its true relation to life, and that music is not only a vital educational factor in life, but part of life itself! Music studied according to present-day methods fails to fulfil its high educative mission, because the present system of education is limited to the details of mere intellectual study—to the outward acquirement by the brain-mind and hand of technical achievements. Theosophy teaches that true education is that which awakes the soul to a nobler use of its faculties, and in this education music is the most important factor."

"Has the brilliant technician who has no moral stamina been truly educated, or the self-centered egotist who is interested only in his own performances, and whose principal aim is for personal display rather than to be a divine spring of help to others?"

Do the colleges and universities which stand only for culture and technique, awaken the soul to a realization of its divine power to vibrate in unison with the deepest and richest chords in life's harmony? I think not, for Theosophy has not yet touched them. These methods do not afford a high and definite aim for the attainment of the things of immortality, nor do they awaken the student to a realization of the rich treasures which lie hidden in the recesses of his own heart."—*San Diego News*

Art Music Literature and the Drama

On the Grand Canal—The Rezzonico and Balbi Palaces, Venice

The path lies o'er the sea,
Invisible; * * *
By many a pile in more than Eastern pride,
The fronts of some, tho' Time had shattered them,
Still glowing with the richest hues of art,
As tho' the wealth within them had run o'er.—Rogers

EVERY corner of Venice is illuminated by art; even in the darkest and narrowest canals the richest details can be found, but in the Grand Canal the most splendid monuments of perfect taste are seen. This winding sheet of water has been the scene of the most fairy-like and unique pageants, and even now, although the great gilded Bucentaur, the Doge's galley, has ceased to glide among the revellers, and the almost Oriental opulence of the past has fled, a fête of gondolas, held by moonlight, and glittering with richest colors gleaming from innumerable lanterns, echoing with light music of mandolins and guitars accompanying the tuneful Italian voices, is an event never to be forgotten. At such an hour the past returns as in a dream. But even by day, under the soft Venetian skies (very different from certain crude, sensational daubs which grievously defame their tenderness), when the rich but harmonious colors of the princely dwellings are reflected in the cool green water, there is a magic and a charm. "The city," said Byron, "resembles a dream; her history is a romance."

The illustration shows a portion of the Grand Canal, with the Balbi Palace on the right, and on the left the Rezzonico Palace (1732) now called the Browning Palace. Here the poet lived for many years and upon his death the Venetian Municipality placed a marble tablet upon the outer wall with the following inscription:

A ROBERTO BROWNING,

*Morto in questo Palazzo
Venezia pose*

"Open my heart and you will see
Graved inside of it 'Italy.'"

THE REZZONICO AND BALBI PALACES, GRAND CANAL, VENICE

IT is said that the tendency among diplomats today to supplant French with English is a sign of changes that are coming. Time was when Latin was the international language of record and possibly the formal documents resulting from the Portsmouth conference will finally take form in that tongue. However that may be, except for the fact that M. Witte did not speak English fluently, the whole negotiations at Portsmouth undoubtedly would have been conducted in that language. All educated Russians speak French, but this language Orientalists find it difficult to master, while for a thousand reasons English is widely taught in both China and Japan. English is also becoming the chief language of science in many of the smaller European countries. Are not these facts signs?

The Oriental Sense of Beauty—Its Criterion Not That of the Occident

"THE Chinese have no sense of beauty," a missionary once explained to me, writes Francis H. Nichols in his book, *In Hidden Shensi*.

The kung kwan where we stayed the last night before reaching Sian was near the Baths of Lintoun. In the side of a hill was a hot sulphur-spring. A stone-cave built over it enclosed a pool about forty feet square. The yellow water had been bubbling up into its rock-hewn bowl while empires on our side of the world had come and gone. An inscription over the entrance to the cave told of its having been repaired by an emperor of China who reigned two thousand years

ago. By a system of underground pipes the steaming water was carried about a thousand yards to a hollow on the hillside, where it formed an artificial lake. Its margin was shaded by shrubbery and plants of varieties rare in Shensi. Narrow piers on piles extended from the shore to a series of pavilions in the center of the lake. A narrow walk connected the pavilions and wound in and out among them. With an exquisite attention to detail, the walks were enclosed by a low balustrade composed of serpentine railings that alternated in succession of red and blue above the yellow water. In designing the pavilions care had evidently been taken that no two of the tiled roofs should be of the same color. Above the lake labyrinthine paths led up the side of the hill to a little shrine at the top.

When I first saw the lake the sun was dropping into the plain away off in the direction of Sian. As the last light of day fell across the glazed pavilion-roofs, they glistened and flashed for a few minutes and then their colors began to blend. Purple and green and red, all melted into gold, while the mist of yellow steam breathed softly into the bushes on the shore. I watched that play of God-made sunlight and man-made color until the rising mist met the falling twilight and darkness came. It was then that I remembered that the "Chinese have no sense of beauty."

If that hillside with its lake and pavilions had been part of the gardens of a man who had founded a trust or who had consolidated a railroad-system, it is safe to say that we should have heard all about them long ago. We should have been accurately informed as to how much they had cost, and we should know where their landscape-gardener "got the idea" which he followed in their design. But Lintoun has not the advantage of being conspicuous. The glinting roofs

play with the sunlight that falls on a grey, forgotten land, whose "heathen" people have always scorned the stare of the crowd and who have never worked for praise. To the men and women of the Shensi villages around Lintoun it is enough that the cave is on the hillside, and that the yellow mist is forever rising under the shadow of the purple pavilions. They love it all, as their fathers did before them. They may not know what moderns mean by a "sense of beauty," but the day may come when the West will go to that yellow race in their old grey land and will say, "We are children. Teach us what beauty is."

What promise shall not be fulfilled in that future time when the East and West shall clasp hands in the service of Higher Art; in ministry to "The Beautiful" which is also "The Good and The True"? STUDENT

Universal Brotherhood Organization

Central Office Point Loma California

Why Does the Universal Brotherhood Organization Oppose the Practice of Hypnotism?

Extracts from the Writings of W. Q. Judge on the Question

PATH, February, 1894:

"Body, soul and astral man properly in relation give us a sane man; hypnotized, the relation is broken and we have a person who is not for the time wholly sane."

"The process of hypnotizing is as yet unknown in respect to what does happen to the molecules. We claim that those molecules are pressed from periphery to centre, instead of being expanded from the inside to the surface. This contraction is one of the symptoms of death, and therefore hypnotizing is a long step toward physical and moral death."

"In the wake of the hypnotizer will be found a host of hysteriacs and that it all should be regulated by law is unquestionable."

"I go still further and say that many persons are already in a half-hypnotized state, easily influenced by the unprincipled or the immoral; that the power to hypnotize and to be sensitive to it are both progressive states of our racial evolution; that it can and will be used for selfish, wicked, and degrading purposes unless the race, and especially the occidental portion of it, understands and practices true ethics based on the brotherhood of man."

"Ethics of the purest are found in the words of Jesus, but are universally negated by Church, State, and individual. The Theosophical doctrines of man and nature give a true and necessary basis and enforcement to eth-

ics, devoid of favoritism or illogical schemes of eternal damnation. And only through these doctrines can the dangers of hypnotism be averted, since legislation, while affixing penalties, will not alter or curtail private acts of selfishness and greed."

"Except here and there they, [the modern schools], . . . see no cause for alarm, . . . they cannot perceive . . . any possible devilish use of hypnotic powers. The Theosophist, however, intimates a danger . . . in the lack of morality and ethics in the use of them both now and in the future."

Path, May, 1890:

"While we thoroughly agree . . . as to the need for placing safeguards around this budding science (hypnotism), it is from a conviction that crime can be aided and hidden by the use of such a practice, and is today thus aided and hidden."

"We do not care to commit hypnotism solely to the doctors, but we would wish to place restrictions upon even these gentlemen, and to limit the number of them who may be allowed to use it."

Colored N-Rays

ONE of the chief organs of the English medical profession, the *Lancet*, recently published a long letter from Dr. Hooker giving the results of his three years of work on the N-rays. They are, he says, in no case colorless, but have tints varying with the character of their owner. These are his results:

Rays emanating from a very passionate man have a deep red hue. One whose keynote in life is to be good and to do good, throws off pink rays; an ambitious man emits orange rays; a deep thinker throws off deep blue; a lover of art and refined surroundings, yellow; an anxious, depressed person, gray; one who leads a low debased life, muddy brown rays; a devotional, good meaning person, light blue; progressive minded, light green, and physically or mentally ill person, dark green rays.

Lomaland Photo and Eng. Dept.

THE RAJA YOGA ACADEMY, THE ARYAN MEMORIAL TEMPLE, AND STUDENTS' GROUP HOUSE NUMBER ONE, POINT LOMA, CALIFORNIA

Finally he says that rays of the characteristic color continue to be given off from objects that have been—even years previously—in contact with a human being.

However "new" the above may sound to the general reader, students of Theosophy will but see a primordial attempt (unconscious *mayhap* to the writer quoted) at a justification of certain facts in human life taught many years ago by H. P. Blavatsky—facts which have since been unfortunately crassly misunderstood in the fantastic expositions of more than one body of cranks.

Who has not met with the uncanny expounders of "auras" and "forces?" Facts in themselves real and positive may be so absurdly expounded and misunderstood as to make their general acceptance nearly synonymous with mental or moral obliquity. Teachings like the above were, among the ancients, only imparted in the strict seclusion of the temple mysteries to candidates who had successfully passed the severest and most uncompromising moral and mental training. They are dangerous to handle in ignorance, hence the reason. STUDENT

BROTHERHOOD

LONGFELLOW

Y^E whose hearts are fresh and simple,
 Who have faith in God and nature,
 Believe ye that in all ages
 Every human heart is human,
 That in even savage bosoms
 There are longings, yearnings, strivings,
 For the good they comprehend not,
 That the feeble hands and helpless
 Groping blindly in the darkness,
 Touch God's right hand in that darkness,
 And are lifted up and strengthened.

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question In a letter from an earnest enquirer the question is asked, "Why are we, and why were we ever so selfish"? What answer would you make?

Answer The question is the same as that as to the origin of evil, and to answer it satisfactorily would require much more space than we have at our disposal here. And so to anyone who wishes to go into the matter fully we would recommend our Theosophical literature, especially the writings of Madame H. P. Blavatsky.

But without going to the ultimates of the problem, even a little study of Theosophy throws a great light on the nature of man with all its tendencies, good and bad. One of the most important teachings, which Theosophy is again making known to the world, is that of the dual nature of man; and it is here that such a light is thrown upon the whole problem of evolution. For man is not simply the product of evolution as ordinarily understood; in him two lines of evolution meet—one from below, giving him a nature in common with the animals and linking him with all the kingdoms of nature below him; the other from above, the soul-nature, divine. Man is in fact more than an animal, or it is still better to say that although he *has* an animal nature, he *is not* that, but is in reality the higher nature, which we call the soul.

The tendency of the lower nature is towards selfishness, self-gratification, and hence there has been an age-long conflict between it and the higher. Because man has permitted the lower nature to rule, and has identified himself with it, he has become selfish and forgotten his true and nobler, better nature. And so it might be said that the reason why we are so selfish is that we ourselves have failed to remain masters in our own house and have become enslaved by our own servants, letting them persuade us that they are ourselves.

But aside from any reason *why* we are so selfish or *how* we became so, the more important fact remains that we do now find ourselves selfish, and the first step is gained when we recognize this fact. It rests with us then to overcome this selfishness, and we have every incentive to do so, for we know from experience that happiness never comes from self-indulgence or any form of selfishness, but from its opposite.

How shall we overcome our selfish tendencies? Surely by cultivating the opposite qualities, of unselfishness and brotherhood, by helpfulness and goodwill.

STUDENT

Question How is it that some people have such an antipathy to the very idea of Reincarnation? Is there no other way to progress except through it?

Answer The main reason is probably to be found in the general line of thought, due to the heredity and education of the past thousand and more years. Because of this the teaching of Reincarnation has been forgotten, and the teaching that takes its place regarding the future life of man is so contrary in its principles as to change the whole outlook on life. If the latter is accepted and held to, if the idea of eternal rest, golden harps, and streets paved with emeralds and sapphires, is the highest ideal of an after life, it is no wonder that the teaching of Reincarnation comes with somewhat of a shock.

If one is satisfied with the orthodox teaching of a miraculous change after death for those who believe, or are elected to grace, and that they are permitted to enter heaven because of the imputed righteousness of another, the prospect offered by Reincarnation would no doubt be distasteful. For Reincarnation means effort, repeated again and again, it

means activity, struggle, and more than anything else it means OPPORTUNITY and PROGRESS. It carries with it, too, the necessity for self-reliance; one cannot be saved by imputed righteousness nor by the sacrifice of another, but only by his own life.

The idea of Reincarnation calls forth all the noblest qualities in man and woman, for coupled with it is the teaching of the divinity of the soul, and so it becomes possible to live our life in accordance with the highest laws of being, and to progress ever nearer and nearer towards perfection.

Another reason why Reincarnation is objected to by some, is that there is no escaping the consequences of sin, by means of a deathbed or any other repentance and forgiveness. For the twin doctrine of Reincarnation is that of Karma, absolute law, by which a man reaps exactly what he sows. Here again it appeals to the noblest qualities in man, though there are some unfortunate beings who do not desire to pay their debts, and who would escape the result of all their wrong actions.

As to the other part of the question, I cannot see that anyone would want any other way. Certainly, if it is the law, as it is, it must be best. And if one tries to live in harmony with the law, realizing that the law always works towards the highest ends, repeated rebirths will be gateways leading to perfect freedom.

STUDENT

Question It is stated in Theosophical literature that at the end of every century, during the last twenty-five years of the century, a special effort is made by the Helpers of the race to arouse men to a nobler and higher life, and to give out again a deeper knowledge of the truth. I cannot understand why this should be specially done at the end of the century, and not at other times. For instance is not the present time just as good for that purpose, or, say, ten years from now?

Answer We have only to look at the processes and methods of nature to realize that she works ever in cycles and according to times and seasons. And man individually and collectively is not exempt from these. All this can be readily traced out on the physical plane; but this is only one of the planes of nature, for there are in nature as in man many planes of life and activity. In fact the ancient teaching of Theosophy is that man is in all aspects a mirror and counterpart in miniature of Nature as a whole. And the teaching further is that the tides of life have sway on the inner planes of being as on the outer physical plane.

Many of the cycles affecting the outer physical world we are well acquainted with, such as the cycles of the year and its seasons, upon the observance of which we depend so largely for the maintenance of physical existence; the cycle of the moon that affects so many diseases and the growth of plants and periods of gestation; the cycle of day and night, the importance of which needs no mention; the eleven year cycle of the sun spots, which it has been recently discovered marks most important cyclic changes on the earth, due in part no doubt to magnetic and electric changes, and in part perhaps to other causes.

It is very curious to watch the waves on the seashore and to note how they augment and then diminish in size and power,—every third wave being greater, and the greatest of all coming every ninth. Many other cycles could be mentioned, from the human heart-beat to the sidereal year of over twenty-five thousand years, and cycles comprising hundreds of thousands of years, marking vast changes in the evolution of humanity and of the earth on which we live. For a study of this most interesting subject and the teachings of Theosophy in regard to it, the student is referred to our literature.

The one hundred year cycle referred to in the question is one that is not generally known, but is of vast importance in human history, and many evidences of it are plainly traceable by the student of history in the light of Theosophy. The last quarter of every century is, as it were, a time for seed sowing and for reawakening with a new impulse the spiritual nature of man. And just as we must pay attention to the seasons if we would get good harvests, so do the Helpers of humanity regard the spiritual seasons of the world's life, and there is as much a seed-time and a harvest-time in this as in the realms of outer nature. And surely it is to be expected that the Wise Helpers of the race work with and use the forces of Nature, and that they use the times and seasons for the accomplishment of their beneficent purposes.

STUDENT

SELF-TRUST is the essence of heroism. It is the state of the soul at war, and its ultimate objects are the last defiance of falsehood and wrong, and the power to bear all that can be inflicted by evil agents.—Emerson

France's Coat of Arms

A WELL-KNOWN heraldic painter has been employed by the French government to design a coat-of-arms or crest for the adornment of the French consulates abroad. His design was exhibited for the first time above the entrance to the Ministry of the Interior at the recent visit to Paris of King Alfonso. This is the description: "On a blue ground the lictor's fasces and the axe, placed upon two branches of oak and laurel, symbolical of strength and peace, in gold, joined together by a ribbon bearing the words 'Liberté, Egalité, Fraternité.' Beneath them the Star of the Legion of Honor." So France has not forgotten her old motto. A.

A Sublime Swindle

OF the many outrageous swindles which followed in the wake of the notorious "South Sea Bubble" scheme, perhaps the most amusing, as an instance of the successful exploitation of gullibility, was that of the "Company for the carrying on of an undertaking of great advantage; but nobody to know what it is." The company was capitalized at £500,000, in 5000 shares of £100 each, deposit £2 per share. The promised dividend was 100 per cent. On the morning after the announcement the mysterious promoter opened an office, sold a thousand shares in six hours and decamped with the £2000. E.

If we are indeed here to perfect and complete our own natures, and grow larger, stronger, and more sympathetic against some nobler career in the future, we had all best bestir ourselves to the uttermost while we have the time.—R. L. Stevenson

Linguistic Difficulties

THE Korean language—a Turanian tongue—is surely the most difficult in the world. Chinese is nowhere. There are over 2000 endings for the verb to *be*. The simplest phrases have many forms according to the person to whom they are addressed, and it is a horrible breach of etiquette to use the wrong one. The language cannot therefore be learned by remembering what is said to you, for when you come to express the same idea to another you will have to vary the expression according to whether you address a woman, a child, a grandee, and so on. The official and literary language is however Chinese. H.

EVERY life is a profession of faith, and exercises an inevitable and silent propaganda. As far as lies in its power it tends to transform the universe and humanity into its own image. Thus we have all a cure of souls. Every man is a centre of perpetual radiation, like a luminous body; he is, as it were, a

beacon which entices a ship upon the rocks if it does not guide it into port. Every man is a priest, even involuntarily; his conduct is an unspoken sermon, which is forever preaching to others;—but there are priests of Baal, of Moloch, and of all the false gods. Such is the high importance of example. Thence comes the terrible responsibility which weighs upon us all.—Amiel

THE best part of every great work is always inexplicable: it is good because it is good: and innocently gracious, opening as the green of the earth, or falling as the dew of heaven.—Ruskin—*Elements of Drawing*

Importance of the Study of the Classics

THE movement in favor of so-called "utilitarian" education has tended to somewhat discourage the enthusiasm for classical studies; but now there is a reactionary movement, as educators begin to see that science, book-keeping, etc., develop only one side of the nature, and that that side may be developed to harmful excess. The *Literæ Humaniores* were not so called at random; those medieval scholars who gave that name to classical studies knew well the refining, broadening effect they have on the mind and whole character. Nor can we, in this age, claim to have so far progressed beyond the level of our medieval ancestors as to render such a description of the classical studies no longer applicable. We can still benefit from a contact with the minds of Homer, Æschylus, or Virgil. Apart, too, from the character of

Greek and Roman literature as such, ancient classics have a value simply because they are ancient. In other words, whatever lifts our minds for a season from our own times to other times which have become ideal and romantic from their antiquity—this elevates and recreates our minds. Pages could be written on the advantages of classical studies: how they enrich the mind with a goodly store of imagery, similes, illustrations, etc., which constitute a universal language of culture;

Theosophical View of the Question

how they elucidate one's own language, its grammar and idioms; and so forth. But there is one special point that must be made here, since it pertains exclusively to the Theosophical view of the question. In the light of Theosophy, the classical myths, legends, and historical narratives, all acquire an enormous significance and value.

The mythology ceases to be a collection of absurd fables and superstitious fancies; for, the Theosophist, with his rejuvenated sense of humor, no longer takes figurative language literally, or believes the ancients fools because they used a different symbolism from what we do. Theosophists can see in the story of Perseus and the Gorgon, or of Hercules and the Hydra, dramatic representations of some of the most pregnant events in the life-history of a human soul; and realize that the symbology was at once a veil for the profane and a key for the enlightened. This classical mythology gives us a clue to what the ancients learned in those Schools of the Mysteries of which we read. Taken in conjunction with the similar myths found among all peoples, they are recognized as survivals of the picture-language of the ancient Wisdom-Religion, formerly general in its diffusion over the earth. Thus what

So-called Le- gends Are His- torical Facts

must ever remain for the ordinary scholar obscure and strange, is for the Theosophical student lucid and consistent. Again the so-called "semi-historical" legends, such as the siege of Troy and the voyage of the Argonauts and the war of the Titans, are seen to refer to real historical facts; facts, however, much greater than those to which the legends seem to refer; for those legends are told in an epitomized form, well-known to students of Oriental and ancient literature, in virtue of which a hero means a race, and the other details are similarly abbreviated. We know that the war of the Titans is a description of that momentous event which is similarly described in the *Old Testament*, the *Sagas*, the *Mahabharata*, etc., etc.—the struggle between the Sons of Light and the Sons of Darkness when old Atlantis went down beneath the waves.

Even those classical stories which are generally accepted as historical acquire a new value and charm when viewed from the more generous and reverential viewpoint of Theosophy. The heroes of Marathon, and the incorruptible philosophers and statesmen, were not mere "heathen" struggling against the weight of superstition to emulate Christian virtues, but men to whom their faith was a reality inspiring them to those deeds.

Disparaging Comments of Modern Editors

The children at the Raja Yoga School in Lomaland, no longer content to try to swallow the vintaged preparations of ancient history served up to them in the school-books, are beginning to write their own accounts of the stories, relying upon the facts recorded by classic historians, and carefully eliminating the disparaging comments of modern editors. Their own knowledge of practical Theosophy enables them to replace this comment by intelligent and illuminating comment of their own. It may not be long therefore before we have something to offer the children of the world that shall be at once more accurate and truthful, more elevating, and less discreditable to modern intelligence, than so much of what is found in the present history books. STUDENT

Thought and Routine

DR. BRISTOL of Washington, recently commenting on the proposal of the American Federation of Labor to exclude Chinese, Japanese, and Koreans from the labor arena of this country, points out that there are thirteen more people to the square mile in France than in America, twenty more in England, and thirty-five more in Belgium. Consequently before we can be as thickly populated as France all the people of Europe must come here; before we can be as thickly populated as Great Britain all the human race will have to come.

The difficulty of course is distribution; the immigrant makes for the city, not the country. A recent writer thinks he has found a sort of

Some Views on XXth Century Problems

Outworn Argument

THE fight between a material and a spiritual conception of the universe is so nearly ended that it is curious to see, in *The Contemporary Review*, a long article quite on the old controversial lines. Mr. Mallock shows, quite unanswerably, that if the present arrangement and constitution of matter are the product and effect of its arrangement a moment before, and that of a moment before, till we get back to the "primordial" nebula behind which our intellects cannot go: the same must be true of consciousness. That subjective something which in infinite time became my consciousness, my mind, my feeling, must have been there present just as that objective something which in the same lapse of time became my brain cell.

It is ingenious enough. About a hundred years ago Paley's "Evidences" appeared, wherein an attempt was made to prove the existence of God. It had an immense vogue, and may be yet a belated text-book in some universities. But everybody admits that its arguments are out of date. Go back through the Middle Ages and you will find them strewn with works designed to prove this and that. They start from premises which nobody would now sufficiently bother about to deny or accept, and which, if he did, he would find meaningless; advance through arguments which to us would not seem to follow; and reach conclusions of no weight or applicability to anything. Back still further, in ancient India, we can find even stranger arguments, stranger ways of refuting materialistic opponents who advance unintelligible propositions; and so on.

In time Mr. Mallock's arguments, and the positions they refute, will be equally out of date and meaningless. But perhaps not for the same reason as in the past. From him backwards, the attempts are to prove the existence and permanence of the spiritual in man and nature. The attempts are made by intellect, and to intellect appeal. And in their various forms they are at least thousands of years old. They have, for a time yet, to be made in order to clear the intellect out of the way of a higher faculty. In the full sense they cannot be constructive, cannot prove in the sense of bringing realization, any more than the clearing of an obstruction is the flowing of the water through it. If intellect, as many believe and some know, is connected to the visible world by the five senses, and to the spiritual light everywhere by another—"sense": and if that sense should grow keener, or the spiritual light grow brighter or more imperious in its pressure—then the intellect will have to accept the situation. The vice-president becomes a mere private individual when the president arrives.

And that this evolution is going on with extraordinary speed no one can doubt who studies the times *behind* instead of *in* the newspapers.

STUDENT

Unclean Novels

AN English critic gives facts and figures to show that the production and popularity of erotic novels are steadily increasing. The public taste grows by what it feeds on, and the stories have to be ranker and ranker. The critic names half a dozen recent novels which have sold well, and notes that the second book of each writer is worse than the first; whilst in each case the third comes very near to naked descriptions of "certain acts that a limited number of medical works alone are supposed to deal with." "It is no unusual thing today to hear women of a certain set asking one another what books they have read and can recommend that are 'really *haut-gout*,' a phrase meaning, when used by them with reference to novels, books that verge as closely as possible upon the immoral."

These people are suffering from cancer of the mind, and their sympathies are with the cancer! If a little more real psychology was known, a little more of the states that follow death, they would know that the simile was exact. They would know that as the spiritual essence of the living body frees itself at death from disease, so will the spiritual essence of the mind free itself at death from mental disease. And in the thinking out of the implications of that truth, referred to in many an ancient philosophy, but long forgotten, they would act accordingly—if

not too late. Perhaps it is a merciful law of nature that those for whom it is actually too late, cannot understand.

A press censorship is no remedy. We can only popularize a knowledge of Theosophy and look to the training of the children. They at least can learn, can have evoked, in their consciousness, a knowledge of their dual nature. They can easily be led to understand that in every case where the lower is permitted to rule the higher, the germ of a disease of the mind has been admitted. This surely is part of the essence of religious teaching, and until it is learned it is useless to go further. STUDENT

The Ideal of a Hospital

THE *London Lancet*, one of the two most important English medical journals, asserts that "the hospital is the outpost of our national defense against degeneracy, and the boon which is conferred by hospital ministrations upon every modern community is practically immeasurable if hospitals be rightly used." How is a hospital a bulwark against degeneracy? It might be, and much more; and it will be, when the Universal Brotherhood lays its hand upon this part of our social work. Does the *Lancet* think that degeneracy can be met by medicines and surgical operations? But the possibilities of a hospital for good are almost infinite; its entry, by every patient, might be a veritable initiation for him into the atmosphere of brotherhood, a touch that he could never lose. Those who assisted some years ago at the "Brotherhood Suppers" given to thousands of the very poor in the great cities of Europe and America, who noted the softening and elevating spirit they engendered and the reception of the simple teachings on life for which they afforded the opportunity, and who can feel the possibilities of the extensions of this work, will know what we mean when we speak of the future Universal Brotherhood hospitals as centres of light. As to the students—medicine was once one of the *sacred* sciences, and has to become so again. H. P. Blavatsky laid the foundations of this as of other reforms. C.

A Paternal Government

THE State of Kansas now gives away 500,000 trees annually to its farmers. The effect of this policy on the wealth and well-being of the State are already very marked. "I can remember," says Representative Beeson, "when the blizzards from the north in the winter, would kill cattle by the thousands and the hot winds from the south would burn up crops and pasture in summer. Now the trees break the blizzards in winter and the hot winds in summer. The saving to the farmers in cattle alone runs into thousands of dollars." And he added that since the growth of the trees to their full size no failure of the crops has been known.

According to Herbert Spencer's ideas, the State government is exceeding its duties. But one is apt to judge of a pudding by the eating, even if the cook can be proved to have made it unscientifically. The people of the State are willing to be taxed for the benefit of their farmers, for they share the benefit. It is a method of general coöperation. The growth of trees is often very slow and, while human nature is as it is, a large proportion of men will decline to undertake labor and spend money for what will only benefit their descendants. The government constitutes the permanent entity. We may depute a committee to do anything for us. Are its powers necessarily limited the moment you choose to call it a government? STUDENT

Beverages and Character

THE favorite beverages of nations should be some clue to their character. An English dean once denounced tea-drinking on the ground that it provoked thought and therefore led to revolutions! In tea-drinking, that people leads the world, drinking an average of six pounds per head per annum. But as America drinks twelve pounds of coffee, we are bound to infer that the dean had never tasted that bean. But what of wine? France leads there, drinking 1.56 litres per person per annum. And has beer any relation to placidity of temperament? The German is ahead in that, with 1.38 litres. Russia's one hundred millions drink each their five and a half litres of vodka. Any one with a taste for figures can estimate how many battle-ships could float in that great ocean of spirits. C.

Archeology Paleontology Ethnology

Early Christian Symbolism in the Catacombs

A DESCRIPTION, in a contemporary, of the catacombs of Saint Callixtus throws an interesting light on the early history of Christianity. There are sixty sets of catacombs, of which those of St. Callixtus are only one. Yet these last comprise a labyrinth of many miles of passages whose extent is scarcely known and in which parties have been lost and never heard of again. In each set of catacombs there are about 100,000 graves, making a total of six million people buried. Some say they were Roman excavations for sand and tufa, and others that they were made specially for Christian burial places, the sand-pits being utilized merely as entrances.

The art represented on the walls shows a more joyous form of Christianity than that prevalent in later times. Christ is a beautiful youth, bounding down from his native hills with a lamb on his shoulder. He is however usually represented by a symbol, such as the Fish, the Vine, the Latin Cross, or the interlaced X and P, which are also the first two letters of Christos. The writer who describes these catacombs says:

The Cross, in varying forms, was gradually introduced, but there was great prejudice against it, the Pagans even regarding it as an object of intense horror. It was however used as a joyous emblem in these early days, the symbol of life and triumph. In later years, in the change from the cross to the crucifix, the original intention of the symbol was lost. From being a token of joy it became a thing of tears and agony.

One notes here an ignorance of the all-important distinction between the ansated cross and the cross without its crowning circle. The former combines the four arms with a unifying circle, and signifies *mastery* over the four elements or four modes of life-force. The latter signifies subjection to matter. The Pagans might well have had a horror of this dark emblem, introduced along with that terribly gloomy and cruel influence that seems to have supervened upon the original mystic gospel of Christ.

Orpheus taming wild beasts with his lyre also occurs as a favorite symbol of Christ.

The Fish, by ordinary scholars explained by saying that the Greek word for a fish, *ichthus*, is an anagram of the words *Jesous Christos theou uiuos soter*, is a familiar symbol in the ancient mysteries. The anagram will not explain how the Fish got into the Zodiac, though doubtless anyone with five minutes to spare could make up another anagram which would.

Sometimes Christ has on his shoulders a kid instead of a lamb, a circumstance which inspired the following lines from Matthew Arnold:

"He saves the sheep, the goats He doth not save,"
So spake the fierce Tertullian; but she sigh'd—
The infant Church! Of love she felt the tide
Stream on her from her Lord's yet recent grave.
And then she smiled; and in the catacombs,
On those walls subterranean, where she hid
Her head 'mid ignominy, death, and tombs,
With eyes suffused, but heart inspired true,
She her Good Shepherd's hasty image drew,
And on His shoulders not a lamb, a kid.

The goat was an important symbol with the Gnostics and other early

Christian mystics, as were also the serpent and other animals. Christianity was originally (and still is) a profound mystical teaching; but Jesus' esoteric doctrines seem to have been obscured by waves of degrading and materializing influence, which emasculated Christianity and converted it for a time into the highly neurotic and demoralizing religion of which we read in the days of the Roman Emperors and of Hypatia.

Some day we shall know what Christianity really was and what frauds have been practised on it. STUDENT

The Roman Amphitheatre at Nimes

AT Nimes there are many remains of Roman architecture, among which is the amphitheatre here depicted. This is the best preserved of all Roman buildings of its kind. During the Middle Ages its site was occupied by a quarter having a church of its own; but in 1809 it was cleared, and since then has been kept in repair. It is

built of large uncemented blocks, and is elliptical in shape, the external dimensions being 437½ by 332½ feet, and the arena being 327 by 222. The height is 70 feet, comprising a grand story of 60 arches, an upper story of 60 arches, and an attic with consoles pierced with holes for supporting the *velarium* or awning. There are four main gates, one at each cardinal point, and 124 doorways led from the tiers of the amphitheatre to the inner galleries. This building is at least 100 years older than the Colosseum at Rome.

An amphitheatre is a theatre with seats all round, such as is adapted to the witnessing of fights—a circus in fact; in a theatre, where hearing

Lomaland Photo and Eng. Dept.

A VIEW OF THE ARENA AND AMPHITHEATRE OF NIMES, FRANCE

is a necessity, the seats are in a semicircle in front of the stage.

The origin of the amphitheatre, according to Pliny, was a certain building erected by the deputy of Julius Cæsar, to popularize Cæsar with the masses, in which there were two theatres, which, after having been used for dramatic representations, could be swung around, with the spectators in them, so as to make an amphitheatre for gladiatorial shows. Soon afterwards Cæsar built a regular amphitheatre of wood, and later stone began to be used. The amphitheatre was always elliptical. The arena had the same shape, and was surrounded by a high smooth wall for the protection of the spectators; the beasts and gladiators came in from rooms below the seats. The lowest row of seats were the most honorable and the most commodious, and here sat the Emperor or chief magistrate and the *grandees*. Above this row were other rows for the smaller people, with numerous exits leading to sheltered corridors. Many Roman amphitheatres exist, one authority having described fifty-two. E.

Historic Bombs Unearthed

AT St. Martin de Re, in France, some excavators unearthed trenches in which lay skeletons which were presumably those of the citizens who fell fighting there in defending the town against the English in 1627. Among the skeletons was found a spherical iron bomb containing a moist black powder, which was found to consist of about a third of nitre, a third of carbon, and a fifth of sulphur, the remainder being iron oxide derived from the rusting of the iron shell.

The Trend of Twentieth Century Science

The Futile Nebular Theory

MORE and more is it being perceived that the famous nebular theory of cosmic evolution rested only upon blanks of thought. We only tolerated it by not thinking it out. We were taught that there was once only a homogeneous incoherent nebula or cloud filling space. From the diffused uniform came the multitudinously un-uniform heterogeneous matter of today. Could it ever have been uniform, ever have been one whit less complex than now? Were not our minds cheating us in pretending that it could have been?

Either the nebula filled all space, or it did not. If it did, then it was infinite and had no centre to aggregate around. If there were centres, then it was not uniform and the hypothesis is at an end before it began. But if it did not fill all space, then the space around contained nothing; or it contained ether. If it was empty, no ether, then the mass could not have begun to cool, for the ether is necessary to carry the rays of heat. But if ether, then the beginning of things was at least a duality—ether and the nebula. So we have to have a sphere of nebula, with a centre; and a sea of ether in which it floats. But even with the ether, a uniform nebula will not do at all.

It began to cool, from the outside toward the centre. In the outermost ring the minute particles went together to make atoms of some such light element as hydrogen. But if the ring was uniform, what made the particles collect about centres? *The ring was not uniform*, but contained latent centres which attracted the particles in their neighborhood—which otherwise could have had no possible reason for moving. In other words, to explain hydrogen, we have already supposed hydrogen. To explain its atoms we have supposed the atoms to exist already as centres.

When this outermost ring got cooler, the atoms became denser. Instead of consisting of hydrogen, the ring now contained say oxygen—which is sixteen times denser. But there is the same problem. What caused a certain sixteen hydrogen atoms to rush together? What was the centre which drew them? Again, we have to suppose the oxygen pre-existing as centres in that pretendedly uniform nebula.

But while the outermost ring was now making oxygen, the next inward was doing what the first had done—making hydrogen. We are blinking at another gap in thought. There were no rings. The decline of temperature was gradual. We have to assume the rings in order to account for hydrogen and oxygen. In other words we have to assume that the ring pre-existed, otherwise the temperature could not have jumped, but must have slid, and in that case we should have had not only those two elements or any definite number, but an infinite number.

In fine it is clear that to make the nebula accountable for anything, we had to assume that that thing was already there in some form. We had to put into it what we wanted to take out of it. The primordial nebula was as complex, as heterogeneous, as is the universe today. The theory explained nothing; it only seemed to explain till you looked carefully at it. STUDENT

A Stupendous Problem

IT was mentioned in these columns a few months ago that the spiral nebulae have been found lately to have two centres each from which the curved streams of light proceed. H. P. Blavatsky in her works speaks of the duality of all forces and shows that manifestation is the outcome of such polarised action. The electric current is a familiar example.

We find now that not only are the spiral nebulae—supposed to be worlds in preliminary stages of formation—dual, but their placing in the sky indicates some still greater law of duality. We do not find them, as we might expect, scattered broadcast over the heavens, but grouped with some indication of order. They are singularly few in and near the great circle of the Milky Way but increase in numbers as their distance from it increases, being closely crowded about ninety degrees from it both ways, that is to say at about the poles of the Galactic circle.

Astronomers believe that the solar system is located within the great disk-shaped cluster of stars, the Milky Way. If we are also in an immense ring of nebulae lying at right angles to the plane of the galaxy in

a spot near the intersection of the supposed ring of nebulae and the disk of stars the resulting appearance of stars and nebulae would be such as we really see. The great "Magellanic Cloud" in the Southern Hemisphere seems to be a link between the two systems, for in it are myriads of stars, of star-clusters, and of nebulae.

Time will prove the truth of the idea suggested above that the nebulae form a ring, but anyway the distinct polarisation of stars and nebulae is in perfect harmony with the teachings of H. P. Blavatsky as it indicates the dual forces at work throughout the universe. STUDENT

The Purple Veil

DR. GILL has contributed to the Smithsonian *Collections* an interesting study of what is known to New England fishermen as the "purple veil." This is a great transparent sheet of mucous matter, sometimes seen floating on the surface of the water. It may reach 20 or 30 feet in length and 3 or 4 in width. The purple color is due to a vast number of colored specks scattered throughout the sheet. Each of these spots is an egg; there may be a million or more; and the whole is the contribution of one single fish, the Angler. Doubtless the "veil" is a tempting object of food to other fish and perhaps birds, or there would soon not be a cubic inch of sea left.

The adult fish presents a remarkable instance of mimicry. Not only does it exactly resemble the rough seaweedy surface of the rocks upon which it lies close-pressed; but the mimicry extends to its very eyes. These, projecting from the head very prominently, are so shaped and colored as to imitate the aspect of *the deserted shell of an acorn barnacle!* "We have here in this fish," says Mr. Saville Kent, "the most perfect possible embodiment of a rocky boulder, with its associated animal and vegetable growths. . . . No strategy need be exerted by the voracious fish to attract his prey; he has only to lie close and quiet, letting his tendrils sway to and fro in the passing current like the weeds about him," and the shoals will swim into his very mouth. STUDENT

A New Calendar

REFORMING the calendar seems rather a large order, but a contributor to a contemporary scientific journal is willing to attempt it. He proposes that every month and year, like the week, should begin with Sunday, and end with Saturday. Each month is to have four weeks except the quarter months, March, June, September and December; these are to have five and so there will be 13 weeks to the quarter as heretofore. Of course there will only be 52 weeks or 364 days to the year—about a day and a quarter short. In six years this would give an error of seven and a half days. To correct this, have a leap-year every sixth year and signalise it by giving January 5 weeks instead of 4. The half days still over would be let to accumulate for 84 years—till they had amounted to a week, which would then be dealt with.

But the astronomical year is not 365 days and a quarter, or six hours, but 365 days five hours and nearly 49 minutes. This error in its turn would need correction. It would amount to a week, within about two hours, every 924 years, and could then be corrected.

The advantage—if it is one—of this method would be that we should know the days of every year on which any day of the week fell or could fall. The change seems fairly simple; but though the writer refers to it as the XXth Century Calendar, proposes an international conference to consider it, and suggests that it might begin on whatever month, following the conference, happened to open with a Sunday—we hardly expect to see it in use much before the day of the universal metric system. STUDENT

Hay-fever

It used to be thought that hay-fever and its accompanying catarrh were due to the actual germination of pollen grains on the nasal mucus membrane. But recent researches have shown that the albumen of the pollen granule, or one of its albumens, is actively poisonous. Why do not the homeopaths make an attenuation according to their methods and administer it medicinally? In this country the offending pollens are mainly those of ragweed and goldenrod. But there are others. STUDENT

The Winsome Lizard

ONE of the most winsome of our animal friends in Lomaland is the common or garden California lizard. There are various members of the lizard family to be seen in California, but the ordinary kind is about 5 or 6 inches long. Which of the numerous subdivisions of his extensive family he belongs to, I am not prepared to say; but, like the rose, he is just as sweet under any other name. He is called *Reptilia* on account of certain distant relatives who crawl (*repto, repere, repti, reptus*) on their belly, though he himself has limbs long enough to lift his belly off the ground when he runs fast,—a circumstance to which he is indebted for his other name, Lizard (Latin *lacerta*, akin to *lacertus* "an arm.")

The word reptile usually conveys a slimy, crawly, malignant impression; but the lizard—there is nothing of this about him. He is dry and clean and loves the sunshine and open air. And there is something eminently friendly and attractive about the little creature, as he sits gazing at you with his bright shrewd eyes, and moving his head about. He does not take needless alarms like other animals, but sits still and waits to see whether there really is any danger before he moves; and when he does move, he merely twitches himself out of the way for a moment.

When one contemplates the lizard, he feels something of what the ancient Egyptians must have meant by what we call their "animal worship." They felt that each animal embodied some influence and was typical of some latent power in man. And the lizard exhales an air of archaic wisdom and calmness. He will lean his arms on one's doorstep of an evening and gaze tranquilly into the room as if he were some benign household god, and had some connection with one's thoughts and aspirations; as if there were something congenial to him in the mental atmosphere of a writer for the *NEW CENTURY PATH*. "Who's that talking about my ancestors?" he seems to say.

For is he not descended from ancestors as big as mountains, whose tread shook the earth? Their mighty bones are with us yet. The lizard also preserves the rudiments of a third eye on the top of his head; and in one species, found in New Zealand (the ancient Lemuria) this is especially prominent. Scientists affirm that in the lizard's ancestors that eye was not blind and skinned over as now. H. P. Blavatsky points out that, just as the reptilia have degenerated, *so has man*. Thus our lizard is a reminder of our own past and of our future possibilities.

About this animal, and even more about his kinsman the horned toad,

Lomaland Photo and Eng. Dept.

A PRIMEVAL GIANT OF THE FOREST, PHILIPPINE ISLANDS

there is certainly an archaic prehistoric air; and every lineament of his wise little head suggests something above the ordinary commonplace. One is glad to have him for an occasional companion. STUDENT

The Stingless Bee

STINGLESS bees! What an age this is! All the advantages without the disadvantages. We have fruits without pippins, and fire without smoke, and very likely there may be roses without thorns; all in flat contradiction to the proverbial morality which adorns the pages of our writing-books. Soon we shall be having turnless worms. "How harder than a serpent's child it is to have a stingless bee," as Shakespeare would have said, had he lived today.

This Burbankized bee is a native of the Caucasus Mountains, and is known as the Caucasian bee. We are not told whether it belongs to the Aryan or the Semitic branch of the Caucasian race. The department of agriculture secured a few queens, raised bee colonies, and distributed queens to experiment stations throughout the United States.

The apiarists of the department at Washington handle the bees with as much ease and indifference as if they were flies; lifting out the trays, brushing off the bees with the naked hand, blowing on them to separate them, and so forth, without gloves or mask. It is not that the bees cannot sting, but that they will not. They have

learned to master their fears and know their friends from their enemies. But they will always make a valiant defense of their hive against other bees. They are R. Y. B.'s, and use their weapons in defense only.

The common or roadside bee of the United States is said to have been imported from Europe in the Seventeenth century, and is described as being "irritable, a small producer, and a poor fighter." But the Italian bee, imported some years ago, is better tempered and more industrious. Report also mentions the Cyprian bee as being the most vicious but also very industrious, and the Carniola bee from the Alps, which is of a gentle disposition.

With all these diverse national traits, it can be understood that the Virgilian bee may have been different from any kind we know; and so any apparent anomalies in Virgil's descriptions may be accounted for. We might now improve on Dr. Watts' well-known hymn, and sing:

How doth the mild Caucasian bee
Improve each shining hour, etc.

and, for a second verse,

How doth the 17th century bee
Delight to bark and bite,
And gather honey all the day,
And eat it all the night.

UNDER THE GREENWOOD TREE

SHAKESPEARE

UNDER the greenwood tree
Who loves to lie with me,
And tune his merry note
Unto the sweet bird's throat---
Come hither, come hither, come hither!
Here shall he see
No enemy
But winter and rough weather.

Who doth ambition shun
And loves to live i' the sun,
Seeking the food he eats
And pleased with what he gets---
Come hither, come hither, come hither!
Here shall he see
No enemy
But winter and rough weather.

My Mother Isis protects me.
I come. I bring the serene life.

—From the Egyptian Book of the Dead

MUCH has been written and said to interest women in the betterment of household conditions, to awaken them to the advantages of scientific training in the various household arts, and inspire them with high ideals of the "home beautiful." The desirability of chairs of household economics in every co-educational, as well as woman's, college is admitted, where special degrees shall be given for proficiency in the various domestic arts. In all this discoursing housekeeping is continually referred to as a fine art and compared to painting and sculpture. This idea of considering the subject almost entirely from the esthetic side, with a little emphasis on scientific cookery and sanitation, has always seemed to the writer a point of view that is fatal to the end desired, which is, plainly: the saving of the present stupendous waste of energy and effort, and the laying of a good foundation, by women, for successful work in the domestic sphere. Housekeeping is not an art, neither is it an incident of marriage. It is an industry and the most important of all industries because it provides food, health and comfort for humanity, thus supplying the very nerve and sinew of civilization. If this standpoint is logical, would it not be a more flawless doctrine, and just as much a definite phase of the ideal, to consider housekeeping in its essentials as we would the other great industries?

What is behind the dividend-paying railroad, the great corporation, the busy, humming mill? An intelligent, resourceful, sagacious manager, usually a man, applying business principles. A person of the opposite sex, manifesting the same characteristics and applying the same principles at their highest and best, must be behind the successful home. This does not mean the commercializing of the home; far from it. The esthetic ideals may still remain in view, kept uppermost if you will; but without a basis of practical, common sense, efficient administration, they will be found an insufficient equipment for the high vocation and service to which the majority of women are dedicated.

What are the principles current in the business world that would have a corrective influence if applied to home duties? First, surely, economy, not a false notion of doing without things at a great sacrifice, but a real economy of time and material as well as money. If the economic value of their own time could be recognized by housekeepers and the male members of their own families, one of the greatest victories for women would be achieved.

It is an old complaint that "man's work is from sun to sun, while wo-

Home Duties from the Business Standpoint

man's work is never done." A systematic organization of work and hours would obviate, to a considerable degree at least, this deplorable and unjust condition which keeps woman in a continual state of procrastination. Absence of responsibility has certainly been one great preventive of woman's experience in this vital economy. Every housekeeper feels that she is her own mistress; that her time is her own, and that she can do as she pleases

with the money and materials at her command. Things not convenient today can be postponed until tomorrow; the door can be shut and locked and the sacred privacy which women so often insist upon having, kept inviolate from intruders, whether these be duties, or just people. There is no one to whom the housekeeper is responsible for the results of the passing hours, no one to whom she must render an equivalent of greatest efficiency, and give a strict accounting of material.

How many housekeepers know at the end of a year whether the establishment over which they preside has been run at a profit or a loss, whether the results attained have justified the expenditures, the adequate return being not only in material commodities but in the possession and enjoyment of the higher values of life? I know of one housekeeper who wrote the *History of a Pair of Chickens*, deriving much of interest and value from the experience. How many housekeepers would consider the matter farther than the most appetizing way of serving them? How many housekeepers even know the cost, in dollars and cents, of maintaining for a year the establishment over which they preside? The funds placed at their disposal by husbands or fathers are drawn on when needed and no system of accounting maintained, no monthly nor quarterly balancing of debit and credit. Such methods lead to loose ideas of financing and imperfect knowledge of values.

There is also in the household a great demand for the higher business qualities of justice, fair play, trustworthiness. In the daily relations of the housekeeper with the children, servants and tradespeople, tact must play a prominent part, together with a discriminating knowledge of human nature, if the best interests of all are to be subserved. The principal reason the domestic service problem has become so difficult is because the mistresses of the homes of the land have not grasped the business principles of organization and management as related to men and women. My sisters, although we are the heads of our little kingdoms, there is a Higher Law than ours to which we must be responsible for our stewardship, and it is this responsibility which we need to feel more

deeply. It is not enough for us to make our homes attractive and beautiful, serve appetizing meals, and teach our children good manners. Without the sound, intelligent, efficient, organized, executive centre or basis from which life, power, and balance come, our homes will be as empty shells, destitute of the substance that nourishes and sustains.

How can women develop these practical business principles so foreign to the education and training which they generally receive? A few women may have had practical experience in business before assuming the direction of a household; still fewer may have this business instinct in-born, but to the majority these matters are an unknown quantity. Yet any woman can gain a knowledge of them and a mastery over them who rouses herself to do it and refuses to have her horizon bounded by the circumstantial and ephemeral. Great intellect and deep erudition are not the price of their acquirement, simply unflagging diligence and unswerving purpose. The opportunities in every household for experience, the great teacher, are manifold, and mistakes can be made the best of stepping-stones to ultimate success. While practical experience in business life would be invaluable to every housekeeper, the foundation for these vital principles, like every other branch of useful knowledge, can best be laid in youth—and nowhere better than in the home. The girls who are fortunate enough to get the right start in life, which the Raja Yoga training gives, with its systematic arrangement of hours for study, work and play, its disciplining in concentration, in thoroughness, in promptness and efficiency, will have the power when they reach womanhood to grasp the salient points of all conditions and to seize and use opportunities, while their knowledge of their own natures will lead them to read others aright. This firm foundation of practical intelligence, to which is added the deep love and appreciation of the esthetic values of life, alone can make the households of the land what we so often boast of them as being, "the strength of the nation." LUCY W. BRADLEY

Lomaland Photo and Eng. Dept.
A YOUNG WOMAN OF IRELAND, SHOWING THE IRISH CLOAK

IT is said that a new occupation is open to girls who have left school, and do not intend to enter on a business or professional career. It is called "being a daughter."

There are many little services that can be done in households by tactful and obliging young girls. A "daughter" busies herself writing notes and invitations, telephoning, shopping, arranging rooms for guests and assisting at entertainments, reading aloud and acting as companion to invalids or old people for an hour or two. She passes from one household to another, dividing her time as her employers require. Some, it is said, have earned as much as \$18 a week in this way.

Work like this done cheerily and capably would be a boon in many lonely homes where a resident companion cannot be afforded. It might be a real sharing of the home relation and spirit, if kept free from the temptation to tyrannize on the part of the employer, and the temptation to think of salary first and duty afterwards, on the part of the young helper herself. And these temptations, looking at human nature as it is and not as it might be, are often more real than imaginary. STUDENT

M. RUBENS, manager of a large dressmakers' association and a Parisian, has recently declared that the palm for taste in dress must go to the women of California. Needless to state, his remark has aroused some feeling and considerable discussion among Eastern women—at least, so they say.

The Women of Ireland

But if hearts that feel, and eyes that smile,
Are the dearest gifts that Heaven supplies,
We need never leave our own green isle
For sensitive hearts, and for sun-bright eyes. — Moore

IN Ireland, perhaps more than in any other country, can be discerned traces of the dual legacy bequeathed to mankind by the submersion of Atlantis ages ago. For the old magic, good and bad, still lingers there, especially in the south and west. The Irish word *Sidbe*—denoting the fairies or gods, including those of Light and Day and those of Darkness and Night—is identical both in form and meaning with the Sanscrit *Siddhi*, the psychic faculties, the inner powers in man, of which, as H. P. Blavatsky tells us, there are also two kinds: one group embracing the lower, coarse psychic and mental energies, and the other exacting the highest training of spiritual powers. The Irish legends—the wars between the De Dananns and Formorians, etc.—interspersed though these are with blinds as to places, names and dates—seem to portray the aftermath of wars between the white and black magicians of Atlantean times. Centuries upon centuries filled with the records of brutality, extravagance, love of display, gambling, drinking, fighting and other petty and squalid events, proclaiming the manifold sway of the lower *Sidbe* in the Irish nature, have nevertheless failed to eradicate the beneficent influence of the higher, upon very many of the women of Ireland, who, in all ages down to the present, have preserved in their natures so much that is pure, beautiful and entirely gracious.

Thus it has come to pass that the women of Ireland are bringing to the upbuilding of the new race in America valuable qualities which will blossom more fully when the light that Theosophy gives shall have reached the hearts of the people. And in Ireland, too, the advance now being achieved by its women in every department of activity, holds the promise of brighter days, when the people will choose the light rather than the darkness.

There are, of course, all kinds of characteristics, good, bad, and indifferent, prevalent among Irishwomen; just as there are in any other country or race. Yet the endowments of a good Irishwoman, be she humble, shawled peasant, or lady of high degree, are well known, and can be to some extent defined. Sympathy, imagination, purity, love of the beautiful and the heroic, vivacity, ready wit, *gaieté de cœur*, good comradeship, motherliness of disposition, philanthropy, and unfailing good nature in the hardest trials of life, combined not infrequently with a sturdy common sense, are traits pre-eminent among them, and are such as the world stands much in need of. Many are the practical Theosophists among the women of Ireland, swift to relieve the suffering, and possessing an intuitive knowledge of the dignity and mystery of life. Fond of athletics, it must have some meaning out of the far past that so many of Erin's daughters are the happy owners of an incomparable beauty and grace. Probably in a land where there is so much inner beauty and harmony, nature insists upon its outward expression, although there may be misfits occasionally.

A stream of loving thoughts flows ever to Ireland from America, for a closer kinship exists between the two nations than the world dreams of, a kinship of which H. P. Blavatsky spoke in a very special sense and which shall yet assert itself as a saving force. AN IRISH MEMBER

OUR YOUNG FOLK

FRAGMENT

EMERSON

LET me go where'er I will
I hear a sky-born music still:
It sounds from all things old,
It sounds from all things young,
From all that's fair, from all that's foul,
Peals out a cheerful song.

It is not only in the rose,
It is not only in the bird,
Not only where the rainbow glows,
Nor in the song of woman heard,
But in the darkest, meanest things
There always, always something sings.

'Tis not in the high stars alone,
Nor in the cups of budding flowers,
Nor in the redbreast's mellow tone
Nor in the bow that smiles in showers,
But in the mud and scam of things
There always, always something sings.

A Heroic Deed

DEAR BOYS AND GIRLS: I suppose you have all heard of the wreck of the troop-ship, *Birkenhead*, which happened off the coast of Africa, in the year 1852, while on her way to the East, full of troops, with their wives and children. And you know, it being quite impossible to save any of the troops—or, indeed, even all the women and children—how the officers formed the men into line, on deck, where they stood motionless, weeping in their hats, while they watched their dear ones being carried away in the boats. When the ship gave the last plunge, they all saluted their officers, and went calmly and heroically down to death.

So impressed was the grand old Kaiser William I of Prussia, by this story that he ordered it to be read aloud to every regiment on parade, so that German soldiers might learn what discipline, obedience, and true heroism meant.

I do not suppose, however, that you have heard of a still more inspiring act of heroism, which was performed at the same time. Alexander Cremine Russell, a boy officer, of the 74th Highlanders, was ordered by the Captain to take charge of one of the boats, which was so full that there was not room in it for one more. He was a quiet, unassuming boy of seventeen. Who can tell what thoughts rushed through his mind, as he watched the quickly sinking ship, and waved his hand in sad farewell to his brother officers and their men?

The ship sank; he closed his eyes to keep out the terrible sight, but a despairing cry aroused him, and the appealing eyes of a drowning sailor met his, while a hand grasped the side of the boat. Alexander's heart bled for the man, but he was helpless; he dare not risk sinking the boat with its precious cargo by taking in even one more, and the hand was gently pushed away.

Suddenly a woman who held a child closely to her screamed aloud, "Save him! Save him! it is my husband."

Quickly Alexander's eyes ran over the boat. No, there was no room, even for one more. They fell upon the woman and her child, then saying simply, "God bless you all," he rose and jumped into the sea, helped the drowning man into his place, then turned to meet his fate. Some of the women cried, "God bless you, sir," while the others bowed their heads and prayed. When they looked again, he had gone from their sight forever.

Recently, a marble tablet has been erected to his memory at his old school, the famous Scottish Trinity College at Glenalwynd. Well did he deserve the tribute it bears: *Dulce et decorum est pro patria mori* (Sweet and seemly is it to die for one's fatherland). COUSIN BEATRICE

PICKING WILD FLOWERS AT LOMALAND, CALIFORNIA

Young Girls and Their Comrades

ALMOST every girl has a cluster of so-called "friends," but how many of these friends prove to be real comrades, who are not only interesting and agreeable as companions, but true helpers in the upbuilding of a noble and beautiful character?

Recently a young girl said, "It is so hard to do right when you are with others," meaning others who are doing wrong. But isn't this a golden opportunity for a girl to show her true warrior spirit and genuine heart love for her comrades, by setting them an example of right action, and helping them to grow strong and find their true selves?

One girl determined to do her duty can by her example, influence hundreds of others to do so.

How fortunate are the Raja Yoga girls at Lomaland, for they not only study, play, and are happy together, but they are constantly helping and teaching one another in the spirit of truest comradeship. They have not a sentimental idea of friendship, and their "feelings are not hurt" when they are reminded of mistakes made. They are grateful for all the help which their comrades as well as their teachers give them, and they are all *striving together* to do right every moment, and bravely go on trying to do better every day.

All girls, however, no matter where they are, can do so much more than they realize, to help others to be true and strong. The way to begin is for each to be true and strong herself.

COUSIN JULIA

Facts Worth Knowing

WATER agates are among the curiosities found on the Pacific Coast. They are small, smooth, round stones each of which contains a bubble of water and air. A few double water agates have been found, each containing two cavities and two bubbles unconnected in any way. It is stated that ages were required for the formation of these peculiar stones, and that they were formed inside small clam shells which gradually decayed leaving them to be worn smooth by the action of the water.

SOMETIMES there are so few Indians remaining in a tribe that the tribe loses its identity. A pathetic little ceremony was held recently in New York State when the remnants of the Oneidas, once a powerful nation, gathered about their sacred stone or Onia from which their tribal name was taken, and after singing their national songs, surrendered this venerated relic to the care of the white man. An Indian chief made an address which was really the farewell of the Oneida Indians as a tribe.

Raja Yoga School---Another Entertainment Showing Its Results

Isis Theatre Again Crowded by an Interested Audience---Music and Addresses

THERE is evidently a growing interest among the people of San Diego in the work of the Raja Yoga School at Point Loma, as evidenced by the size of the audiences and the interest evinced at the Universal Brotherhood meetings at Isis Theatre on Sunday evenings. The Raja Yoga children had charge of the meeting again last Sunday evening, and again the Theatre was filled to the doors with an audience that could not refrain from giving expression to its admiration and delight at the really remarkable performances of these children.

The Raja Yoga string quartette rendered two numbers: "Largo," from Beethoven, Second pianoforte Sonate (arranged by a Raja Yoga boy); Minuet and Trio from Haydn, C Major Quartette. Two wee little tots of girls sang a song in a most charming and artistic manner.

Master Montague Machell read a paper entitled: "A Raja Yoga Day School on Point Loma." In part he said:

"The meaning of a new school established in any part of the world for any purpose depends entirely upon the motives of those establishing it and their power to carry out their plans.

"Remembering this let us ask ourselves, those of us who know anything of the work accomplished by Raja Yoga, what will a Raja Yoga Day School mean to San Diego and the world?

"The advantages of this educational system are numerous. Visitors to Point Loma never fail in their appreciation of the superb location and surroundings. The important effect of environment on character is marked. One readily can see the advantage that a day school in this beautiful land of sunshine, would have over the schools located in or on the outskirts of a crowded city. Another advantage that pupils of any Raja Yoga School have, is that of superior teachers. This superiority is being recognized in many parts of the world. Yet, visitors to the Raja Yoga Schools, besides seeing the children's superior knowledge of all the subjects in hand, are conscious of something else, an inner connecting link between child and teacher. This is where Raja Yoga teachers have the advantage over ordinary teachers.

"Their lives and environments are so pure, their knowledge of human nature gained through being in this atmosphere of Theosophical teachings, so true, their love for little children so great, that they are able to make their earnest efforts to help the pupils all count. Nothing that they do is without purpose. Every step taken is another stone added to the Temple of Purity, which they are helping the child build within itself.

"The citizens of San Diego should certainly take great interest in this new school. For their city is destined to become a great center of learning, and it is these schools and their pupils that are to win renown. We surely need not question this. Where in the world are there such schools, established under such conditions? Where in the world is the training so thorough, the system so all-round and commonsense? Where are there teachers who are permitted such scope and freedom to become living examples of honor and high purpose? Raja Yoga teachers have not the dollar and cent nightmare to hold them down. They give their lives to the children's work, look only for reward in the advancement of these children. There is certainly nothing parallel to this system in the world to-day."

A piano trio by three little girls was followed by a wee little Cuban girl reading a short paper entitled: "What a Little Girl Can Do for Cuba." Her pronunciation of English was faultless, though four years ago she could not speak a word of the language. A special class of Raja Yoga children sang three songs most charmingly: "Ye Moments," "On Music's Wings" and "Spirit of Song."

Little Kate Hanson read a paper on "Cultivating the Divine Nature in Children." In part she said: "The Raja Yoga system of education

seeks to bring out the higher faculties of the child nature—giving perfect balance of body, mind and soul. To secure this balance the higher divine nature must be cultivated as well as the body and mind. Too often the moral nature of children is not guarded, consequently it remains weak and undeveloped—making room for vice and folly.

"The need of thousands of children, whose parents and teachers do not realize their responsibilities, deeply touches the hearts of the Raja Yoga children, and causes them to realize how much their help will be needed in the world. They have learnt that human nature has two sides to it, and that the higher nature *must* be cultivated and given a chance to grow when we are young.

"We only need to go into the homes and schools, and watch the training given to children, to account for the terrible conditions that blot out the beauty and joy of life.

"We children are quite capable of seeing that the vices, follies and selfish ambitions that darken people's lives had their origin in early years, at a time when teachers and guardians could have easily helped the children in their efforts to develop sweeter and nobler habits of life.

"By trying to do our best always, and thinking of each other with consideration and love, we find that joy and knowledge comes naturally. When the heart feeling has opportunity to grow strong, the mind opens out of itself—then comes the strong desire to lose no opportunity to help, ourselves, and not leave all to our teachers. The divine nature then fills the heart, growing as naturally as do the flowers. Then we know that happiness can only come when we work so that others may share it with us."

The closing paper of the evening was by Miss Ethelind Wood, her subject being: "Theosophy and its Counterfeits." In part she said:

"The Theosophical Society as founded by Helena P. Blavatsky, 30 years ago, was based on a most broad and generous platform. The founder desired to give everybody a chance to take part in this noble work for man's advancement, and would exclude nobody who expressed a desire for a pure life from an opportunity of benefiting by the great teachings which she was promulgating.

"Hence there came into the Society a number of people whose hearts were not sufficiently pure, but who cherished *secret* ambitions to use the Society and its teachings to further their *own plans*; and many people of *unbalanced temperaments* who could not accommodate themselves to the steady work and common sense required of all *genuine* Theosophists.

"Theosophy is always unselfish. It makes for the interests of humanity as a whole. Therefore anything that favors the rich over the poor, or the poor over the rich; the cultured over the ignorant, or the ignorant over the cultured; the east over the west, or the west over the east; Buddhism over Christianity, or Christianity over Buddhism;—none of these is Theosophy. If any cult favors the select few; if it teaches that self-interest comes first and foremost; if it teaches that humanity must be left to work out its own destiny; if it justifies war, if it teaches brutality and immorality, if it preaches food fads or occult fads, or any other sort of fads; if it makes appeal to your love of power or mysterious learning or vanity,—then it is not Theosophy.

"Those who are tired of theories that come to nothing and faiths that yield no results, and philosophies that do not show us how to live, will avoid all counterfeits of Theosophy. Such counterfeits are only so many more voices added to the din of multitudinous creeds and cults. They will only confuse our brains and will not lead us into the light of life. People who desire something real will be found in the ranks of true Theosophical workers, where results are shown and theories are at a discount. Those who seek the truth must try to look beyond personalities at principles and judge people by what they are and what they do, rather than by what they profess.

"If one's motives are sincere, one's intuition clear, one's heart true, we shall always be able to detect the false note in the voice of the hypocrite and recognize the true ring of the genuine gold."—*San Diego News*

Art Music Literature and the Drama

Ancient Painters—The Limitations of Traditional Methods

THE painters of this century are awaking to the need of a broader view of art training. They have suffered, along with the rest of the world, from the limitations of popular education, and have thought it sufficient merely to learn to paint and draw, neglecting much that painters of the earlier days thought necessary to the making of an artist. I am not now alluding simply to the mass of students impatient for fame or merely eager for the grosser rewards of quick success, but also to the earnest and true student and lover of the best in art.

The painters of the Renaissance were craftsmen; they were not painters only. They were students of sculpture and architecture, some were skilled workers in metal—goldsmiths or engravers perhaps—or, learning some practical craft, they acquired that knowledge of construction which lies at the root of design. Painting and architecture were then more closely allied so that the painter had always in mind the great ideal of construction, that which makes the designer a true decorator, as contrasted with the false decorator, who is merely an ornament.

There is a world of difference between the two. I doubt if the false decorator, who applies ornament without understanding "the fitness of things," ever existed in Greece or in ancient Egypt, although there are signs of the work of such in the degenerate days of Egypt's decline.

But this close alliance of painting and architecture, and the familiarity of painters with the principles and practise of architecture, gave to the painter an almost unconscious desire to create in each work a well-balanced composition. It also gave a certain dignity and breadth to their conceptions that is strangely lacking in most of our modern pictures. Yet when we look back at their work and note their limitations and their conventionalities, we are apt to forget that they were pioneers in their day and had emancipated themselves from the still greater limitations and more rigid conventionalities that had fettered the art of their immediate predecessors. It is often difficult to understand why some of these earlier painters should be so highly honored, unless we are acquainted with the condition of art during the age preceding that in which they lived.

Even in our own time we may see the works of men, who were denounced as impostors and charlatans for the boldness of their innovations in artistic method, pass from the position of startling novelties into that of accepted standards, and thence into the region of the "old-fashioned," even before their authors have passed away. We should bear

this in mind when studying the works of the Old Masters and make full allowance, not only for their limitations but still more for our own ignorance of the conditions from which they freed themselves and all who followed them. Thus only can we do them justice. Thus only can we make their works really helpful to ourselves. R. MACHELL

✻ ✻ PORTRAIT OF REMBRANDT ✻ ✻

TOO feeble fall the impressions of nature on us to make us artists. Every touch should thrill. Every man should be so much an artist, that he could report in conversation what had befallen him.—Emerson

to be worthy. Monet, with all his experimental work and with all the inadequacies that the future will discover in his method as well as motive, has rendered the present generation grateful for one thing, if for no other—his courage in refusing to follow the time-honored custom of painting within an arbitrary scale of lights and shades, for he early aimed at accomplishing one of the most difficult tasks known to the painter, that of truly representing sunlight. STUDENT

THE harp was a favorite instrument among the ancient Egyptians. Paintings and even fragments of harps themselves have been found in ancient temples and tombs and it is said no modern maker has invented specimens more beautiful than some of these must have been in their day. In a tomb hewn in the solid rock of Thebes was found a kind of harp that after being buried three thousand years, yet gave out musical tones when the strings, still intact, were touched.

The Work of a Pioneer

A correspondent gives the following picture of the methods of the French painter, Claude Monet:

Painting entirely out of doors, for the most part in France, though working at times in Holland, England and Italy, enduring the blazing heat of the noonday sun in August, standing up to his thighs in snowdrifts on bleak winter afternoons, tearing dozens of sketches up for every one that his fastidious taste accepts as worthy, risking health and life itself in study of the fleeting phenomena of sky and earth—this man for more than a generation has toiled laboriously at a profession which is popularly, though wrongly, supposed to be delightfully easy. Nothing has ever been too hard for him. Most landscape painters, however industrious, shrink from attempts to depict the garishness of noonday light, indescribably beautiful but—until Monet came—all but unpaintable. The easier task, essayed by the English artist Constable and the men of the Barbizon school, is to paint in the morning and early evening when tones are lower and masses more simple. But Monet, with untiring industry and conscientiousness and with the regard for truth of form and construction which has made modern French art preëminent, has clung to his lifelong task without relaxation, almost without diversion.

The hints contained have more than a merely personal interest, suggesting, as they do, the only means by which anyone may attain that success which is worth while; absolute subservience of personal comfort to the aim and end, granting that aim and end

to be worthy. Monet, with all his experimental work and with all the inadequacies that the future will discover in his method as well as motive, has rendered the present generation grateful for one thing, if for no other—his courage in refusing to follow the time-honored custom of painting within an arbitrary scale of lights and shades, for he early aimed at accomplishing one of the most difficult tasks known to the painter, that of truly representing sunlight. RESURRECTION

From *The Hermit*, by JAMES BRATTIE

"TIS night, and the landscape is lovely no more.
I moura --- but, ye woodlands, I moura not for you;
For morn is approaching, your charms to restore,
Perfumed with fresh fragrance, and glittering with dew.
Not yet for the ravage of winter I moura ---
Kind Nature the embryo blossom will save;
But when shall spring visit the mouldering urn?
Oh, when shall day dawn on the sight of the grave?
'Twas thus, by the glare of false science betrayed,
That leads to bewilder, and dazzles to blind,
My thoughts wot to roam from shade onward to shade,
Destruction before me, and sorrow behind ---
"Oh, pity, great Father of Light," then I cried,
"Thy creature who fain would not wander from Thee!
Lo! humbled in dust, I relinquish my pride;
From doubt and from darkness Thou only canst free."
"And darkness and doubt are now flying away;
No longer I roam in conjecture forlorn,
So breaks on the traveler, faint and astray,
The bright and the balmy effulgence of morn.
See Truth, Love, and Mercy, in triumph descending,
And Nature all glowing in Eden's first bloom!
On the cold cheek of Death smiles and roses are bleeding,
And Beauty immortal awakes from the tomb."

The Problem of Education

AMONG the problems that confront thoughtful parents, anxious for their children's welfare, undoubtedly one of the most difficult and urgent is how to help them to acquire that poise, that mental and moral equilibrium that will enable them to withstand successfully the many varied temptations of modern life and, in addition, make of them genuine benefactors of mankind. On every hand do we not see a general unsteadiness and weakness of will, combined with a soul-destroying selfishness which is the root of all trouble? This strange lack of balance and moral poise—strange, because we know our divine possibilities should make us different—is so much a characteristic of today, with no generally known method of combating its destructiveness, that parents are often in despair when thinking of their children's future, whether honor and benefit to others will be written upon the scroll of their endeavors, or dishonor and selfishness.

But where can parents turn to remedy this deficiency with its harvest of vice and misery, for neither the current systems of education, nor of religious training have proved adequate. But in Theosophy the remedy is to be found, and in it, with its teachings of the nature of man and the soul, and the right relation, one to another, of all the parts of his complex being, lies the solution to the problem. For Theosophy gives the key, how the divine nature may become manifest and the lower nature be placed under full control. Theosophy supplies that sound ethical basis, not a theory but a science, the absence of which has caused so much foolishness and misery, and worse; for must we not admit that all our educational systems are dominated by the element of fear, and by a desire to conform to custom, rather than to Truth? And how much has the treatment of children been made to conform to our conception of life which we have limited to one short period between that which we call birth and that which we name death; and though we have surrounded the latter and the life after death with so much mystery and fear, our conception of this after state is so vague that it has but little or no effect upon our present action.

Again, another tendency of modern education—is it not to stifle the voice of conscience, and to comply with the demands of the selfish world, rather than to teach self-control, and the true dignity and nobility of manhood which will lift one above the allurements that the world offers?

These are errors with which we are all very well acquainted, and a

study of Theosophy does not only bring home to us the necessity for a correction of them, by revealing to us the true purpose of life, which we have been so sadly missing, but it shows *how* we may correct them. Experience should have taught us long ago that nature's laws cannot be trifled with, but through the one-life theory which mankind has held for so long it has failed to see that the result may sometimes be held back for several incarnations, and so has been unable to connect present misfortune and sorrow with the seeds sown far back in the past, nor has it realized that it is sowing seeds the harvest of which will inevitably be reaped in the future, and which cannot be escaped from.

The basis of Theosophical education is the postulate that all are souls, immortal and divine, heirs of a mighty past, reapers of the wisdom of the ages; that the nature of man is dual, and that associated with the higher, soul nature is the lower, "animal" nature, with its desires and appetites demanding incessant gratification. Education, then, from the Theosophical standpoint, consists in drawing out, encouraging, and developing the higher nature that it may be in command throughout life, and the lower be fully controlled. And this applies to the mental powers as well, for man's highest development does not come from putting the mind first, but by using it as an instrument. The whole is summed up in the word Raja Yoga, and the practice of the Heart Doctrine.

But instead of all this which is so easy, because it is in line with the highest purposes of Nature, what do we find? Lack of balance, abnormal desire, keen intellect, but the deeper side of the nature starved, the soul forgotten, and all this we transmit to the children and send them out upon the sea of life like rudderless barques. And we find *fear*, and we educate the children in—*fear*! The only solution to this vast problem, that of the education of the children, the greatest problem that confronts humanity today, for if it were solved all the sorrows and the burdens of life would be lifted—the only solution is Theosophy.

We need courage then, we need to cast fear to the winds, and give whole-hearted assistance to the returning souls from out of the far past, entrusted to our care for a time. Let us remove the stumbling blocks from their path, not regarding them as empty receptacles into which a mixed mass of information should be crammed, but, as Theosophy teaches, souls stored with the wisdom of the ages, sacredly to be unveiled.

The great success of Katherine Tingley's system of education, the Raja Yoga system, at Point Loma, and in other parts of the world where she has established these schools, is because of this knowledge, and the wisdom to apply it, and because the teachers have set before them to be, first of all, that which they teach, and to be living examples of unselfishness; for this is the first requisite in real teaching, and the only real basis on which the soul can manifest.

To teach children to be compassionate, unselfish, sympathetic, courteous, lovers of truth, defenders of the innocent and oppressed, to love the good, and the beautiful and the true; to teach them they are divine, is to give them a moral power which is proof against all the allurements of modern life, and make of them benefactors of mankind. E. W.

With Whatsoever Measure Ye Mete

ACURIOUSLY intense indignation visits some people on their finding that misjudgments and spiteful misrepresentations have sprung up around their words and acts. They fail to reflect that in nearly every case these annoyances are the exact reaction of a habit of their own. It is not that the exact things they loosely or spitefully say of others are in turn said of them. It is that the habit of mind which dwells on persons and personalities—a habit *never* connected with kindness of judgment—acts inductively upon similarly habited persons and draws the stream of their talk hitherward.

Every mind is a magnet to every other, tending to draw from the others its like and being itself similarly acted on. He who lives by the sword shall die by the sword. He who talks with a dagger or a hatpin shall be talked of with the same weapons. In the ordinary ways of life, malicious things are only said of those who themselves say them. The chief exception to this rule is unfortunately a rare one, applying to those who by their moral elevation, their proclamation and exemplification of an ideal, cause discomfort to the baser sort by awakening their consciences or threatening their positions.

But these are few; most of us get back from life similar coin to that in which we pay, why then should we complain, we reap what we sow. And if we are troubled by the pricks of the hatpins, let us first learn the strength that comes of disregarding them, and secondly correct ourselves. In any case, if we were not so particular to have the good opinion of others we should care equivalently less for their ill opinion. STUDENT

NEGATIVE VIRTUE

ROBERT BROWNING

THAT low man seeks a little thing to do,
Sees it and does it;
This high man, with a great thing to pursue,
Dies, ere he knows it.
That low man goes on adding one to one,
His hundred's soon hit;
This high man, aiming at a million,
Misses an unit.

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question What answer would Theosophists give to the question asked of Christ by the rich young man: "What must I do to inherit eternal life?"

Answer This passage is interesting for various reasons. It shows a substantial agreement, but with certain minor differences, in the gospels of Matthew, Mark, and Luke. It gives Christ's reply to an important question; and it makes the fact clear that Christ's teaching was in harmony with the Ancient Wisdom Religion, known as Theosophy.

The close verbal agreement in most cases which Mark and Luke exhibit in this narrative seems to indicate that Luke followed Mark, but not in quite the same words; or that both Mark and Luke used the same source, now, probably lost. The peculiar variations in Matthew, such as, "Why askest thou me concerning the good," seem to indicate that this gospel here is made from a different source, and we think of "the good," as discussed by Plato.

From the words of Matthew it appears that the young man had asked Christ something concerning "the good," as well as, "What good thing shall I do that I may have eternal life?" For Christ answers, "Why do you ask me concerning the good? One there is who is good: but if thou wouldest enter into life, keep the commandments." In other words, Christ sums up all speculative discourse by saying, "The Good is One, is Unity, or Eternal Being itself." But, as to the more practical question of entering on "the Path"—"What good thing must be done to have eternal life," the ancient wisdom always gives the same answer, "Live in harmony with Divine Law." Christ mentions some of those commandments that refer to human relationships, and then the gospel of Matthew, alone, significantly adds, "Thou shalt love thy neighbour as thyself." The rich young man replies that he has kept all these, and wishes to know what there is in addition. Christ says very significantly, "If thou wouldest be perfect, go sell that thou hast, and give to the poor, and thou shalt have treasure in heaven: and come, follow me."

It is hardly necessary to point out how utterly at variance all this discourse about eternal life is with modern teachings as to the "plan of salvation." There is here not the slightest hint of "only believe," as the *sine qua non* of eternal life. And yet it is impossible to conceive a question that could have brought out a more full and direct answer about eternal life than this question of the rich ruler. If modern orthodoxy be true why did Christ miss such a splendid opportunity of stating the "plan of salvation by faith alone?" Then, the whole of the Sermon on the Mount, and the spirit of Christ's teaching from first to last is in perfect harmony with what he teaches here. And that being so, we must see what a great gulf is fixed between the pure teachings of Christ, and Churchianity. To a Theosophist the whole story is so harmonious with the teachings given by H. P. Blavatsky in the *Voice of the Silence*, and elsewhere, that we can very well claim it as part of the "Ancient Wisdom" teaching. The young ruler is a type of one who lives by the "eye doctrine," one who places much faith in ritual, and in the outward keeping of the law. Apparently the ruler was not to blame so far as he went. He said he had kept the Commandments, and Jesus finds no fault with him in that respect, but says, "you lack one thing yet," you have missed the Spirit of the Law, you have missed the Heart Doctrine. And Theosophy teaches us that the "Heart Doctrine is the great sifter;" and it is so because it means Love, Unselfishness, Selflessness. It is so difficult to "love ourselves last," or to "love our neighbor as ourselves;" yet that, and that alone, is the fulfilling of the Law.

"Sell what thou hast; give to the poor; follow me; and thou shalt

have treasure in heaven." In this case riches were a handicap in reaching the goal; and in the great race we must cast aside every weight. In other cases Jesus gives different advice—"Go home to your family and friends, and tell them what great benefits you have received," or, "go and keep silence." But underneath all there is the same spirit and each person must follow *his own* duty; and all duties must be done in the spirit of love, forgetting self, and filled with the spirit of unity and brotherhood.

It is said the rich ruler went away sorrowful, by which I think it is implied that he *did* mean to try to follow the advice given. It is also said that Jesus "loved him."

STUDENT

Question It is so often stated, in fact I see it in nearly all your publications, that the Universal Brotherhood and Theosophical Society is non-political; but should it not take a stand against corrupt politics, and in behalf of clean government?

Answer Most assuredly, and it does take such a stand, and in greater degree and in a more effective way than any other Organization or body of people. For it takes a stand *against* every thing that is corrupt in life, and *for* everything that is clean and pure and good. But for all this it is not political, it does not support one political party against another; but at the same time its action is much wider and more basic for, wherever its influence reaches, there is in the individual life an incentive towards reform, so that the individual, to whatever party he may belong, cannot help but carry that influence and thus be an active power against corruption. But with political questions and changing policies, the Organization has nothing to do, and on this question it is interesting to note what H. P. Blavatsky wrote in answer to a similar question in *The Key to Theosophy*:

Enquirer—The Theosophical Society is not, then, a political organization?

Theosophist—Certainly not. It is international in the highest sense in that its members comprise men and women of all races, creeds, and forms of thought, who work together for one object, the improvement of humanity; but as a society it takes absolutely no part in any national or party politics.

Enquirer—Why is this?

Theosophist—Just for the reasons I have mentioned. Moreover, political action must necessarily vary with the circumstances of the time and with the idiosyncracies of the individuals. While from the very nature of their position as Theosophists the members of the Society are agreed on the principles of Theosophy, or they would not belong to the Society at all, it does not thereby follow that they agree on every other subject. As a Society they can only act together in matters which are common to all—that is, in Theosophy itself; as individuals, each is left perfectly free to follow out his or her particular line of political thought and action, so long as this does not conflict with Theosophical principles or hurt the Theosophical Society.

Enquirer—But surely the T. S. does not stand aloof altogether from the social questions which are now so fast coming to the front?

Theosophist—The very principles of the T. S. are a proof that it does not—or, rather, that most of its members do not—so stand aloof. If humanity can only be developed mentally and spiritually by the enforcement, first of all, of the soundest and most scientific physiological laws, it is the bounden duty of all who strive for this development to do their utmost to see that those laws shall be generally carried out. All Theosophists are only too sadly aware that, in Occidental countries especially, the social condition of large masses of the people renders it impossible for either their bodies or their spirits to be properly trained, so that the development of both is thereby arrested. As this training and development is one of the express objects of Theosophy, the T. S. is in thorough sympathy and harmony with all true efforts in this direction.

Enquirer—But what do you mean by "true efforts"? Each social reformer has his own panacea, and each believes his to be the one and only thing which can improve and save humanity?

Theosophist—Perfectly true, and this is the real reason why so little satisfactory social work is accomplished. In most of these panaceas there is no really guiding principle, and there is certainly no one principle which connects them all. Valuable time and energy are thus wasted; for men, instead of cooperating, strive one against the other, often, it is to be feared, for the sake of fame and reward rather than for the great cause which they profess to have at heart, and which should be supreme in their lives.

STUDENT

FOR the origin of all reform is in that mysterious fountain of the moral sentiment in man, which, amidst the natural, ever contains the supernatural for men. That is new and creative. That is alive. That alone can make a man other than he is. Here or nowhere resides unbounded energy, unbounded power.—"Lecture on the Times"—Emerson

European Notes

(By Our Special Correspondent)

Oct 1, 1905

EVERY one admits that it is a good thing to see ourselves as others see us. Will the Spanish people accept the application of this maxim to themselves by one who fully recognises the hopeful potentialities of the Spanish character, and who has, at the same time, the keenest sympathy with them in the many difficulties by which they as a nation are at present surrounded?

It is hard for any of us to break away from old habits; especially when life has no definite purpose which commands their abandonment. Perhaps if Spain could realise her own power for good in the world as clearly as some of her friends do, she would at one effort stop a practise which disgusts civilized humanity, and creates a feeling of contempt for the people which is not warranted by a knowledge of their true character.

I refer to that horrible, unworthy, unmanly "sport" of bull-fighting! Reading a recent issue of the *Heraldo de Madrid* its leading article inspired one with hope. It dealt with the backwardness of Spanish agriculture, and pointed out how much could be done to alter this state of things by studying and adopting the methods of other countries. The intelligence and wisdom of this article were admirable. A vision of Spain as she might be, without any great difficulty, did her people but bend their minds to the task of self-deliverance, portrayed itself.

Then, on turning over the page, I encountered three or four columns devoted to the bull-fights of the previous day—the day of rest and peace! There was an illustration also, a wretched animal on its knees about to receive its death blow. An immense crowd watching this contemptible, this ignoble spectacle! When will Spain see herself as others see her—a nation suffering through long indulgence in this brutal "pastime?" There is more than this to be seen, but that one fact obscures it.

Lomaland Photo and Eng. Dept.

A MOUNTAIN STREAM OF FINLAND

A great resolve on the part of her representative men to fight against this abomination might help Spain to take once more a leading part among the nations. Will not the King recognize the nobility of his calling by organizing a crusade against cruelty to animals? Then the path of his people will assuredly become brighter and brighter.

Vivisection and Sunday Reading

A PAPER with a large Sunday circulation prints in a late number an account of some of the latest vivisection outrages. That is not the way the paper puts it, however, but it rather describes the

doings of this vivisectionist at one of the largest Universities in the country as if it were something highly commendable. Apparently the writer of the article in question is thoroughly in sympathy with the doings of this practitioner, who, in the name of science, tortured a lot of helpless animals. A most detailed account is given of the way in which the poor animals were cut apart and spliced together again in the most unnatural manner possible. One instance is where the heart of a dog was placed beating in its throat, and another, where a leg was cut off to be spliced back again in its place. Why? Profuse illustrations describe the processes in all their horrible cruelty. Can it really be that the readers of that paper

wish to be given such morbid things to read, and that on a Sunday, the day which Christian people have devoted to a special attempt at goodness?

The practice of vivisection shows, however, how pitiful intellect is without heart. Be it ever so clever, ever so powerful, the former produces but unnatural human beings when left to itself, without the ennobling influence of love and sympathy with all life, which alone can unite us with that which is divine.

Vivisection may lead to results; but one of them, usually entirely disregarded, is the degradation of the nature of the operator—who is often a doctor!

Investors, Speculators, & Real Estate Dealers

San Diego is the Open Door to the Orient: Investors now will be Capitalists later.

- CAN'T YOU SEE THE HAND OF DESTINY?
- 2700 miles saved in encircling the globe via this port
 - Three Transcontinental Railroads heading for this Harbor
 - The Commerce of the Southwest and of the Pacific is being concentrated at the Bay of San Diego
 - Look out for Big Developments; the Market is active now
