The Oriental of Tomorrow

Ten years ago, the writer states, no one would have dared to predict the astonishing development along all lines of the wonderful little island Empire. In 1893 its foreign trade was about \$93,500,000; in 1903 it was \$303,500,000. In 1893 the deposits in Tokyo banks reached a smaller figure than \$18,500,000, but in 1903 they had attained to \$66,500,000; in Osaka banks they were in 1893 \$5,000,000, and in 1903 they had grown to \$38,500,000.

The same authority is of opinion that identical surprises are in store as regards Korea and Manchuria. Both of these countries are probably

THE *Deutsche Export Revue* of September 1, contains an interesting article on the progress of Japan and the Orient, based on the report sent home by the Swiss Consul-General in Yokohama.

as susceptible of progress and development as Japan has been, and still is; and the same may be said of northern China, with its rich mineral resources, chief among which is coal.

The rise of Japan is, of course, intrinsically due to the remarkable adaptability and souplesse of the Japanese national character. The same may be said of China and the Chinese. It is a current saying among all who know the Chinaman well, that he is more than the equal of any competitor who may oppose him. For steady, plodding, hard work; for sobriety and moderation as a class; for deftness and delicacy of touch; for fidelity and honesty—for all these sterling qualities the Chinaman has no rival on earth. As to quiet, dogged honesty, the true Chinaman, unspoiled by over-close contact with the white man, will keep to his contract even if it break him. This is perfectly well known to European and American business men, who are generally unanimous in saying that the Chinese merchant is beyond criticism as far as his business methods go.

It is the present Chinese governmental system which is fully responsible for the malodorous name ascribed to the many equivocal methods of the sons of the Flowery Kingdom. Under a firm, stable and equitable government, China would bid fair to take a position among the nations which would make her a power not merely in the Orient, but the world over as well. In short, the Chinaman needs good leadership; when he gets it, we of the impeccable West will stand amazed.

The Chinese is the very best kind of a colonist. "He only desires to be let alone." He overcomes all linguistic difficulties. "He is a splendid worker, retail merchant, hand-worker, or servant; and he is naturally honest. The large commercial cities, Colombo, Singapore, Siam, Penang, Saigon, Haifong, Hongkong, Shanghai, Kiau-chau, are striking examples of what the peace-loving Chinese can accomplish."—*(Daily Consular Report No. 2087 of the Department of Commerce and Labor of U. S.)*

What the Chinese Can Accomplish

It is a remarkable fact that in positions of responsibility throughout the Orient, east of 90° longitude east from Greenwich, the Chinaman is found to be the incumbent, and rare are the exceptions. For accuracy in figures and quickness of computation he is unexcelled; for business integrity, both as employé or employer he stands above fault; for punctuality and hard work he is far ahead of any competitor.

In the banks, counting-houses, hotels and large commercial houses of Indo-China, of the Islands of the Oriental seas, and in the treaty ports and in Japan, the familiar figure of the shaven crown, with queue and parti-colored garments is everywhere.

Here in the East trade would be impossible but for the Chinese. Even in Japan the Chinese have made themselves indispensable. What is true of the English, French and German spheres of influence in the East is just as true of the regions presided over by Russia. The life of Port Arthur, Dalny, Nicolajewsk, Vladivostok, Charbin, Chaborowsk and Blagovestchensk depends upon the activity of the Chinese inhabitants. . . . The efforts of the great Powers to secure a place for their agents in the East is easy to understand. Progress and prosperity will go along faster under the ægis of the West than they ever would were the initiative efforts left to the East. China's opposition to strangers, to new trade reforms, to railroads, is confined to China proper. Where the Chinaman is a stranger, an immigrant, a colonist, he is far more pliable and adaptable than any other. Thus the fundamentals upon which a foreign trade may be built up are in the East. Everybody is getting ready to be on hand.—*(From U. S. Daily Consular Report No. 2087, October 21, '04)*

Under the Aegis of the West

Korea and Manchuria, with all their natural resources and mineral wealth, will be opened up at the end of this war, let it end as it may. Japan victorious will be the leading nation in the East, and the balance of power will be at Tokyo and not at Pekin—for a time, at least.

The Koreans and the Japanese are twin brothers, and the Chinese and the Japanese are cousins. Japan has attained in thirty-five years an extraordinary stage of national progress and international influence. What has the next quarter of the century in store for the East? What will be the Oriental of tomorrow? G. DE P.

Can Man Modify the Climate?

THE intimate connection between man and his planet was certainly believed by the whole of the ancient world and continually crops out as we study the books bequeathed to us by our wise ancestors.

Plutarch has an interesting passage where he refers to the downpour of rain that was commonly observed to follow a great battle. This of course has been noted in modern times and has been explained as the effect of the guns disturbing the atmosphere and by concussion precipitating the watery vapor always more or less present overhead. But the ancient battlefields were (comparatively) quiet, so this explanation does not seem to cover the whole of the ground.

May it not be that the massing of vast multitudes of men in a small space, where for many hours they are subject to the most vivid and violent emotions of which man is capable, may generate electric conditions which disturb the atmospheric equilibrium just as effectively as explosives? According to the ancient sages man is continually generating subtle influences which produce visible effects in nature. Even the Hebrew writers echo the same teaching, although somewhat obscured by their habit of referring all natural phenomena to the deliberate action of a personal god.

"He turneth rivers into a wilderness,
And watersprings into a thirsty ground;
A fruitful land into a salt desert,
For the wickedness of them that dwell therein."—*Psalms CVII, 33 and 34.*

Can we not imagine that valuable as may be the undoubted good results of irrigation and tree planting, man's daily activities and work for universal purposes may also effect climatic changes and induce the moisture-laden clouds that so frequently pass over our heads to discharge their burdens? If the passionate and stormy elements in human life are reflected and reproduced in cataclysms in nature, why should not the daily sacrifice of active unselfish labors call down some beneficent response from the sky by the operation of nature's laws? Of one thing we feel sure. There is a subtle and intimate connection between man and his planet, for

"Nothing on the earth is single
All things, by a law divine
With each other's being mingle."

Terminable Marriages

AN English daily paper has been conducting a correspondence on the marriage question, and every kind of view has been aired. At last appears the novelist George Meredith, with the proposition that marriage should be for a term of years only—he suggests ten. Young people, he says, marry with no knowledge of life or of each other, and in many cases find themselves utterly and unchangeably out of tune.

This is true. But ten years is much longer than is necessary to discover radical incompatibility. Why not five? And if marriages are to lapse automatically at the end of some years, and the partners are free to effect new ties, *wherein does this differ in principle from the horrors of what is called "free love"?* Not only is the difference in principle nothing, but it would not be long before the difference was also nothing in practice. Civilization, self-inoculated with this cancer, would have ceased to exist in two generations.

The real preventive remedy for mis-marriages is education. Not that education which comes from books, but that which confers dignity of character: honor, respect for duty, self-restraint, and a sense of the inner meaning of life. This is the education that the children receive at Point Loma and which they show in their bearing from morning to night. And until the world wakes up to the need of it, till it is known and adopted in every civilized country, will the "marriage problem" remain unanswered. Then and not till then will it be found to have solved itself. For it is simply the result of leaving children in entire ignorance of their divine nature and at the mercy of every transient whim. The very literature placed in their hands is often their worst enemy, awakening impulses that instantly and from thenceforward keep them back from the path of their right growth.

STUDENT

Rowdiness and "Hazing"

IN deprecating rowdiness and "hazing," one runs a certain risk of being accused of unmanliness and of a wish to depreciate the excellence of youthful spirits. But such manifestations are a perversion of manliness and youthful ardor; and, so far from disparaging these qualities, one would fain see them directed into proper channels.

Useless waste of energy in one direction means weakness in some other direction, and the whole indicates lack of balance. It is the combination of over-application to mental work and self-indulgent habits which is re-

sponsible for these outbreaks. The strength and manliness so much needed in daily life are not called into play, and so have to find an outlet.

In an account of an annual "rush" at a college, we read that one youth was kicked in the stomach and will probably die, and five were left lying on the ground; also that girls wanted to engage in the fight and had to be prevented. Similar accounts come from another college, and this disgraceful practice is still indulged in various degrees in a few educational institutions.

Commission Rule in Cities

ACCORDING to *The Fort Worth Record*, the city of Galveston is now ruled by a commission appointed by the Governor, something similar to the commission which rules the District of Columbia.

The satisfactory part of this is, undoubtedly, that the commission is appointed instead of elected, and appointed by a man who selects it strictly according to merit. On the other hand, any rule by many heads will, sooner or later, tend to difficulties. Either there will be disagreements, resulting at best in a compromise, sacrificing that which would be best on the altar of harmony, or else there will be a complacent adoption of every suggestion every member of the commission brings forward. Committee work means divided responsibility, and that is never conducive to best results.

A commission's greatest use is that of being an advisory board. Look at our great commercial and manufacturing concerns. In every case those have flourished best which have had a strong and capable man at the head—just one man.

Can we not draw a lesson from this and realize that what our cities need most is that the man at the head be strong and wise and good and true. If he is the right man in the right place, then he can be relied upon to see that those under him will also fulfill their duties. When shall we learn this, and when shall we begin to realize that upon us as citizens rests the responsibility of picking out that one man, looking for sterling worth and manliness as the paramount qualifications? Then, and not till then will we have really well-governed cities.

Sterilized Sermons

WE knew—or thought we knew—that the breath of people poisoned the air of a room, but it has remained for a certain professor to reduce this alleged knowledge to such a form that now we can say that it is a scientific fact. As an irreverent newspaper says, he has proved that "an orator actually spouts bacteria which fill the room where he is speaking."

The professor first examined bacteriologically the saliva of people to find out what bacteria were in it. He found *streptococcus brevis* to the number of ten million to the cubic centimeter. Having invented a color test for this organism, he set dishes about a room, had people speak in the room, and, sure enough, there was the *streptococcus*. It takes the professor a great many words to say this, but the above is the gist of his experiments. The result is that not only is our knowledge now reduced to scientific form, but we can also replace the old precautions by properly conducted scientific ones. We can have sterilized sermons which will be free from physical impurities at any rate, however much they may need doctoring in other ways.

But seriously, is not the bacteria-hunting craze going rather far? Can we for a single moment escape bacteria? They are in our clothes, our food, our lungs, our hair; on coins, furniture, food. Surely, except where disease is actually in progress, we who are healthy need do no more than see that we breathe fresh air, are clean, get plenty of sunlight, and govern our habits. But if we try to shield ourselves from all the bacteria that may emanate from other people, we shall certainly have time for nothing else. It is well occasionally to reflect on the proverb that he who fears no disease will get none. Fear is a very fine culture medium, and fearlessness is excelled as an antiseptic.

E.

THIS week's cover page of the NEW CENTURY PATH contains the face, well-known and beloved by many, of William Quan Judge, the second leader of the Theosophical Movement throughout the world, who succeeded Helena Petrovna Blavatsky at her death, May 8th, 1891.

Mr. Judge was born in Dublin on April 13th, 1851, and died in New York City on March 21st, 1896. He died a true World's Worker.

Some Views on XXth Century Problems

A Short Way With Nature

IN a book of some pretensions, recently published abroad, there is another of the propositions to redeem our race by "eliminating the unfit." The author would have us begin with small and tentative measures. Children born in the poorhouses with signs of serious disease should be painlessly killed. Going on from that, we eliminate the "unfit" physically, morally, or mentally, by similar process, and thus clean up humanity. A noted physician made the same proposition recently with respect to alcoholics and morphinomaniacs.

The simplicity of the process is charming. Only kill enough people, and in another generation you have civilization represented by a nobly-proportioned, healthy, balanced, and morally flawless race.

The absurdity and madness of it grows with every instant's contemplation. *It is mostly the people you leave alive who are answerable for the condition of the people you kill.* When the tender growth-years of thirty thousand children are blasted in the whirl of pitiless factories, who is responsible for the stream of physical, mental and moral cripples that ceaselessly adds itself to the social river? And if some of these should actually presume to imitate their "betters," and marry, who is to blame for their offspring?

And so on. One instance is enough. Before we begin the killing let us estimate how much of the sin, the deformities, the diseases, for which we should do the killing, is due to the selfishness, the utter disregard of all human interests but their own, of those who would remain complacently alive. There is no act of selfishness ever done or thought, whether of omission or commission, but make life a little harder all over a widening area. And as it passes on its evil way it gives here and there the last touch into overt criminality or disease to some unit on the very desperate brink.

In truth this process, to which, once begun, there is no limit, would presently ultimate in a "race of callous fiends," and then in racial extinction through internecine conflict.

Think of its results as achieving their theoretical best, and then contrast them with the results of another process which we can conceive. Conceive a race that not only cared for its waifs, its sick, its mentally and morally frail, but cared also so to live that there were none of such; that did not push the weakest to the wall; did not make money-grasping its chief occupation; did not permit the immolation of women and children in factories; did not demand any luxuries, conveniences, or "necessities" that were obtained at the cost of human life or health; a race whose units had each and all the feeling of being co-members of a race, and in which this feeling took precedence of that other that makes for each individual his own interests a sacred shrine whereat he continuously worships—contrast the two civilizations that would respectively result from the two processes, and then say whether the proposition could come from the brain of one in whom moral degeneracy had not begun.

STUDENT

Civilization and Insanity

ACCORDING to the local lunacy experts, Chicago has a higher proportion of the insane than any other city (where the figures are known) in the world. One person in 150 is insane, and one in 5 predisposed to it. Chicago should study its habits, and find out in which of them it exceeds all other cities. Statistics might be found to convey an exceedingly broad hint. The subtle emanations of slaughterhouses might perhaps be worthy of a little consideration.

The same experts conclude that, as things go on now, half the civilized world will be insane, or partially so, in another five hundred years. But long ere that, the civilized world will have learned what produces insanity. Part of the lesson may be learned perhaps from the "uncivilized"—but *sane*—world.

The real cause is the search for happiness in directions where it cannot be found. The craving for sensations of every kind only grows by what it feeds on. The people of large cities live in a state of mental fever unknown to eastern nations and to country-dwellers. STUDENT

Dogma and Freedom

THE presence of the great Biblical scholar, Harnack, at Boston, and his addresses there, have caused an inevitable comparison between his work and that of Loisy in France. But they are as it were on different planes. Harnack is the historian; he writes the history of dogma; dissects away accretions; and finally exposes the nucleus of teaching from Christ about which the accretions have gathered. If very little remains when he has done, it is not his fault. It is because the great bulk of Christ's teaching was lost, and, up to now, has not been found. Perhaps, under other names, and in (to us) strange forms, much of it may be even now accessible. But in that case the names and the forms are, thus far, efficient and deterrent masks.

Loisy is also the historian; but he rather shows how, from the methods of human working, the accretions *must* have come, than how they *did*. For example: some parts of the Old Testament, made into Church dogmas, he shows to be Revelation as to their essential, but clothed as it were in baby-clothes on their way through the minds to whom they were spiritually imparted. But he holds that the Church has some genuine dogmatizing power, though she has overstrained it. She is to some extent entitled to say of some incomprehensible or (scientifically) untrue statement: "This is nevertheless to be accepted." In other words he has not pursued his own method to its limit. Harnack has; and Renan did.

In general terms, both aim at a nucleus; Harnack an historical one, Loisy a spiritual. Loisy holds that his spiritual nucleus needs amplification by *some* dogma; Harnack that his historical nucleus must be supplemented or complemented by individual spiritual intuition acting as interpreter. And he looks forward to the time when no special ministry of religion will be needed; there will be no teachers of spiritual matters, for each man's spiritual nature will be his own guide.

But will there not always be degrees of spiritual enlightenment; and will it not be both natural and desirable that those who have less and want more should seek it of those who *have* more, and that the latter should desire to give it? This natural process will have nothing whatever to do with the imposition of dogmas. It is indeed the exact opposite. Dogmas, in their very nature, in their profession, are statements whose import transcends human experience and conception. Real spiritual teaching is an explanation, by a teacher, of experiences which the pupil has and does not comprehend; or will have. It is simply a shortening of the pupil's path, a light in an otherwise dark place, *an interpretation to be verified*, and never a shackle upon perfect mental freedom. That, at any rate, is the ideal of true Teachers of *Theosophy*.

STUDENT

Japan Attacks the Opium Habit

THE Japanese are making a fine and successful attempt to stop the use of opium in Formosa. There can be no fresh cases of opium-smoking, for only those may now obtain it who had the habit well established at the time of the new regulations. Thus there is no cruelty. The victim must procure a license, stating his dose and the quality of the drug he uses. From these he may not then deviate. The trade is in the hands of the government, and sellers are licensed and their prices fixed. When the regulations were promulgated, official lecturers visited the villages and explained the evils of the use of opium. Books were distributed, and the same subject is part of the public schools' course. When shall we imitate in the matter of morphine, cocaine, and even alcohol?

STUDENT

Vivisection Not Permitted

ONE of the largest hospitals in London—King's College—is changing its location, and the authorities and staff (among whom are some of the most eminent physicians in Europe) have taken the opportunity to express their opinion "that research work involving the use of living animals should not be permitted."

One of the Council, Dr. Buzzard, adds:

"Vivisection has never been practised at King's College Hospital, and we only announce that at the new hospital there will be no experiments on living animals in order to anticipate any question on the subject." C.

Relics of the Mogul Empire in Hindustan

A REPORT from Simla states that the Government of India is about to restore some black marble elephants with riders which formerly stood on each side of the entrance to the Delhi Gate of the Delhi Fort, but have since become reduced to mere fragments. For this purpose an artist has prepared a model, first in wax and then in plaster, in which he has successfully reproduced the spirit of the originals. These originals were taken from Chitor, the Rajput stronghold, by Shah Jehan, the Mogul conqueror who founded Delhi in the Seventeenth century.

STUDENT

The Sphinx a Solar Myth

A NEWSPAPER report states that the Egyptian Sphinx is a mystery no more; its nature and object have been discovered by scholars. *Omne ignotum pro magnifico*, and now that we know what the Sphinx is, it matters little what it is; the point is that it is no longer a mystery.

Naturally this discovery does not redound to the credit of the ancient Egyptians. It reduces them to the level of commonplace sun-worshippers, so that they and all their religion and architecture can now be conveniently docketed "solar myth,"—an immense simplification. The Sphinx is "after all nothing more than" an image of Ra Harmachis, God of Morning, destroyer of darkness. This has been found out from hieroglyphics on the walls of the temple at the base.

The ancient Egyptians, in common with the ancient Americans, and all ancient races, have recognized the sun as a *symbol* of eternal Light and Divine Wisdom and Power. They have called the Supreme Deity by the names of the sun, and used solar symbols in his worship. Matter, the dark and contractive power of Nature, has similarly been signified by night and darkness. But modern "scholars," transferring the puerility of their own heads to the shoulders of the ancients, affect to believe that all antiquity has been engaged in worshipping the actual sun and the actual night.

This discovery that the Sphinx is a statue of the God of Light and Wisdom, which to modern scholars seems so disparaging, is to real scholars a proof that the Egyptians had the ancient Wisdom Religion and were masters of its symbolism.

The report goes on to say that the Sphinx was once crowned with an asp-headed crown of gold and covered all over with enamel in divers and rich colors, so that it must have been a most sublime spectacle. Vandals at various epochs have since defaced the statue. The head and body are hewn out of the solid rock, but masonry was added to perfect the outline, and the enameled plates laid over all.

With such descriptions of the images and temples, we may form a faint conception of the sublimity of the ceremonial and worship; especially if we remember our own paltry edifices and degraded symbols. If the above report represents what scholars say of the Egyptian relics, what would some future antiquary be likely to say about ourselves should the scythe of Time chance to spare a fragment of one of our churches with its little altar, chalice and cross?

In using the words "the mystery of the Sphinx," no distinction has been made between this particular statue and sphinxes in general. Sphinxes are very numerous, both in Egypt and Assyria; and, as a symbol, they represent the mystery of the divine nature of man,—which will remain ever a mystery until man is perfected.

STUDENT

Living Cliff-Dwellers

ACCORDING to reports, a community of living cliff-dwellers has been found in Chihuahua, Mexico, in an unexplored region of the Sierra Madre. Two American prospectors became lost in those mountains, and after returning to the city of Chihuahua they reported their discovery. They say the town is built like those of the Pueblo Indians of New Mexico, but the rooms are more difficult of access, being reached by a ladder of the maguey plant. The walls of the rooms are smooth, and in some cases covered with hieroglyphics,

which it is hoped to decipher. The pottery used is described as different from that of any other living race, but similar to that of the Toltecs.

Ancient China

IT is stated that an American professor has been granted permission to explore the mountain regions of Northern China in search of a white race which he hopes to find there; but another report says it is merely to study the aborigines of China, apart from any theory of a white race.

H. P. Blavatsky alludes to a degenerate, semi-animal, hairy mountain tribe in China, the descendants of the later Lemurians. This is one thing; another is that H. P. Blavatsky, quoting from a high authority, says that the inland or true Chinaman—not the hybrid mixture between the Fourth and Fifth Races now occupying the throne, but the aborigines, who belong wholly to the highest and last branch of the Fourth Race—reached their highest civilization when the Fifth Race had hardly appeared in Asia.

Take a map of China, and remember that the Chinese Empire is larger than the United States and densely populated, and it becomes evident how little we know about that country, especially the interior. Remember, too, that, in Egyptian history, the further we go back the more advanced becomes the culture.

Bearing these things in mind, we shall realize that, while degenerate races may be found which will seem to support the favorite theory of human evolution, the evidences are accumulating in support of the teachings outlined by H. P. Blavatsky.

H. T. E.

Buried Empires of Central Asia

AMONG the many vast tracts of the earth's surface now covered by barren sands which conceal the ruins of mighty civilizations is the Desert of Gobi and the adjacent barren regions more or less included under that name. While archeologists probe these sands for "connecting links" to all the gaps in their modest genealogical chart of the human race, students of Theosophy will await the evidences which must surely forthcome of the existence of great and advanced civilizations on these spots—evidence which will force the antiquaries to enlarge their theories and which will create more gaps in their knowledge instead of filling any up.

The outlines of human history, and of the tenets of the ancient universal Wisdom-Religion, given by H. P. Blavatsky, are at once recognized by the intelligent student as belonging to a system both self-consistent and elevated; whereas the theories of academic learning are fragmentary, inconsistent and derogatory to the human race.

Dr. M. A. Stein's explorations in Chinese Turkestan, though not pertaining exactly to the Desert of Gobi, are concerned with what may be regarded as the western extremity of the Central Asian desert. These have been mentioned before in the *NEW CENTURY PATH*, but a brief reminder of their results will not be out of place.

He said that the sculptures, frescoes, objects of industrial art, etc., dug out of the temples and houses in the moving sand, gave us some idea of a great civilization connecting ancient China and India with the classic West. The desert has advanced until some of the sites excavated are 100 miles from cultivated land. The natives regard these ruins with veneration and will not disturb them. Dr. Stein thought that the ancient occupants had a culture derived from India and were Buddhists. The preservative nature of the dry sand has kept intact the timbers of the buildings and even a host of inscriptions written in ink upon small wooden tablets. The characters on these tablets are in a known Indian script which, though rare, is decipherable. Sanskrit, Chinese and Tibetan characters have been found, but as yet no unknown script.

Gardens, with dead leaves still under the trees, which were orchard trees; houses, with pitchforks, mousetraps, boots, shoemakers' lasts, etc.; silken fabrics clinging to the images in the temples; and colossal statues in stucco, are among the things found preserved amid the surroundings of awful desolation.

STUDENT

✻ The Trend of Twentieth Century Science ✻

The Brain as a Prehistoric Remain

PROFESSOR W. I. THOMAS, writing in *The Forum*, expresses his opinion that the brain of man has now reached its ultimate of development. But the word *now* means the beginning of historic time. And *man* includes civilized and savage.

In other words, the Professor's statement is that the savage man's brain is essentially as good as the civilized man's, though it is used for other purposes; and that "we have no reason to believe either that the brain or the average intelligence of our race has improved or deteriorated within historical time." "In the beginning . . . a type of brain developed which has remained relatively fixed in all times and among all races." Of that "beginning" there are no traces, and the steps of transition between the human brain and that of the highest of the animals, are visible as hypothesis instead of fact.

Professor Thomas uses his showing that the human brain *has* not advanced since the "beginning," to reason that it *will* not advance. It may occupy itself with other matters, just as the brain of the man of science, thinking out a problem or an instrument, occupies itself with other matters than the brain of the savage thinking out a new trap or reasoning about the trail of an enemy. The senses of the savage are usually better than ours, his memory equal to ours, his power of abstraction merely less used, and his power of self-restraint merely differently used from ours.

If these things be true, have we any warrant for supposing any further advance (that is, further with respect to the "beginning") is possible? The Professor thinks not. Nature has done her utmost. She endangered the health of several organs to make the brain. And it is so delicate as to be easily put out of order. Witness the prevalence of idiocy and insanity. Its weight is what it always was, and, broadly speaking, it is the same everywhere now.

But there is one consideration of which Professor Thomas takes no account. We know that debauchery, passions and inordinate desires, while not lessening the size of the brain, blunt its delicacy as an instrument and may utterly ruin it. They waste force that should go into the brain cells and develop their structure. Take the other side of the same fact, and we can easily see that as human life rises nearer and nearer to the ideal, more and more of the life-force (the building and creative force) will be redeemed and put to its proper work. And thus a brain may be built, which, while perhaps little larger than the brain of today, may in delicacy of action, in speed, and in perfection of response to finer and finer forces, arrive at a point we cannot now conceive of, and raise the intelligence of man to a level we should call godlike.

Lastly: if the savage brain needs but a few years' education to make it as good an instrument as that of the civilized man, does this not show that it belongs to the type of "resting organs," resting from use in civilizations like our own, but long forgotten; and prepared to resume its old activity when the time shall come? Is it not in fact as definite and suggestive a prehistoric remain and witness as the temples of Mexico and the water courses of Babylon?

STUDENT

A Genuine Benefactor of Medicine

PROFESSOR NIELS FINSEN, discoverer of the curative value of red light in smallpox, and of blue light in lupus, will doubtless, as a man of science, have his memory preserved and honored in the world of science for these discoveries. But the larger world should honor him for another reason. He lived poor and died poor. He never patented his discoveries, never concealed for the advantage of his own pocket any details of their application, but placed them promptly and wholly at the service of mankind. His own income consisted of an allowance honorably and generously made him by the Danish Government.

PHYSICIAN

The Study of Wells

THE United States Geological Survey has recently perfected plans for the systematic collection and preservation of well records and samples. An annual publication will be issued, supplied to all persons who ask for it, containing a brief account of all wells bored

during the year. Much valuable knowledge may be expected from this effort, not only relating to the geology of the United States, but even to the structure of the earth itself.

STUDENT

The Trough of Civilization

A GEOLOGIST, writing to *Knowledge*, calls attention to a very usual error in dealing with human origin. Because Palæolithic man was anterior to Neolithic man, it is assumed that he was nearer savagery. The theory that man has come up from the monkey, or from the monkey's ancestors, being thus far hardly in dispute, it follows that the further back our researches and finds go, the ruder must the traces be, the more thoroughly must they evidence the barbarism. If they do *not*—well, they *must*, all the same. Says Mr. Larkby:

Nothing in truth could be more misleading. If Palæolithic implements are regarded as a class, they show, especially with regard to later types, a remarkable proficiency in the working of flint. . . . It is not a little significant to point out that, viewed as a class, Neolithic implements are actually ruder than Palæolithic. . . . I am aware that the museums do not illustrate this condition of things; but it is an old grievance of the man in the field that on this point the museums are misleading.

Moreover palæolithic man, unlike the cannibal neolithic, was often a fine artist.

According to the view of human history given by H. P. Blavatsky, the palæolithic people constituted the barbaric fringe of civilization occupying the sunken Atlantean continent. Hence the traces of art which we find among their remains. The continent sank before the Quaternary period, and the fringe degenerated yet further. But the neolithic people were mainly from Central Asia, precursors of the Celtic wave, and constituted the preface to our own Aryan race. One was the last ripple of an outgoing tide; the other the first of an incoming. STUDENT

The "Green Flash"

CURIOSLY enough, correspondents of several journals have been writing to ask the meaning of the "green ray," or "green flash," seen at sunset. From the fact that no one seems to have noticed the same phenomenon at sunrise, we infer that the habit of early rising is not general.

When the sun is on the horizon, his rays on entering our atmosphere are refracted or bent, the red least so, the blues and violet most. The spectrum is therefore spread out as if it were passed through a prism.

The colors disappear below the horizon in their order, red, orange and yellow successively vanishing, and leaving green, the blues and violet. But at the same time, the higher blue and the violet have been mostly absorbed by the atmosphere—sometimes all the blue. In this case, the final flash will be pure green. Otherwise it is greenish-blue, and this may be followed by a pure blue. There is probably never a violet moment.

At sunrise, if there is a clear, sharp horizon line, these phenomena occur in reverse order. But they will be missed if the attention is not closely fixed on the exact spot where the sun will show himself. And at sunset they are often missed because the eye is dazzled from gazing at the sun for a few minutes before he sinks. It is recommended to keep one's back to the west till the last moment, watching by means of reflection on a bit of glass the moment when to turn around.

STUDENT

The Earth's Temperature

IS the temperature of the earth rising? According to all the orthodox theories it ought to be falling; but it appears that in defiance of the theories it is not.

The new opinion is based on the melting of glaciers. In *La Nature* a number of photographs of shrinking glaciers are given. They are South American. The shrinkage is very rapid, measurable in one year. The writer of the article which the photographs illustrate, maintains that the process is not confined to South America, but that throughout the second half of the Nineteenth century it has been going on in Spitzbergen, Iceland, Central Asia, the Rockies and Alaska.

It is painful to see old and respectable theories, jogging along into this Twentieth century, suddenly called back to the barriers to show their passes. So many of these old fellows are being detained, and even forced into the museums that are kept there—fit places for them!

Nest of Leaf-Cutting Bee

THE original of the pictured rose leaf on this page grew in the Homestead garden at Point Loma. The smoothly cut round holes in one leaflet and the unfinished cutting of a segment from another are the work of *Megachile sapellonis*, a leaf-cutting bee. This bee has a preference for rose leaves. It uses the pieces in the building of nests for its young. In the first place it cuts a tunnel in a log or stump with great care, shaping and marking the places for cells, cleans it out, and then builds its cells in accordance with the plan.

It makes them out of bits of rose leaves that it cuts in curves with great neatness and precision, using twenty or more of the pieces for each cell. It arranges these in rows and sticks them together with a kind of gum. When a cell is completed the bee gathers pollen from flowers and with it half fills the cell to furnish food for the young bee. The egg is deposited on the pollen and a round bit of rose leaf is glued over the opening of the cell. Then the bee goes to work at another, and so on, till the number of cells is complete and the future bee family well provided for.

STUDENT

A Nature Letter

OUR gardens at Point Loma are a constant and beautiful book. They have messages for each of us, and for all of us, written in a language of which all can understand what is best suited to themselves. Some read one thing, some another, but each is aware that there are other pages yet to be read, other chapters yet to be written. For, as the wise man said, "Of the making of books there is no end." And truly the scribes of the gods are ever at work, now recording, now erasing, and anon planning a new unfoldment of the story.

It is a privilege to work in the gardens of Lomaland, helping Nature in her great work of transmutation. Here on this hill is a world. This is a South Sea Island pine. Here are palms from the tropics. In one avenue there are over one hundred in continuous lines. Eucalyptus, the gum tree of Australia, is largely in evidence. In this basin, where the fountain plays by the East entrance to the Homestead, are pink blossoms of great beauty—the Egyptian lotus. Vigorous green leaves are these of the life-plant which traveled here all the way from Bermuda. It is propagated by seeds, by runners, and yet again by perfect plants which bud from the leaves—oozing, as it were, from the pores of the parent leaf at every indentation.

This scented bush is the wild yerba santa, the Holy shrub whose ancestors came from old Spain in the days of the missions. Some would call this yellow flower *eschscholtzia*, but here it is called the California poppy. This, as also the fuchsia which comes from Peru, bears in Europe the name of the German who there brought it into prominence. The dahlia, in turn, perpetuates a Swedish name. Snowdrops, which recall the tales of Grimm and Hans Andersen, have been seen here also in their season. They, too, have a history, for they were brought from London, from the children of the great city to this garden, six thousand miles away. The handsome young copper leaves of the castor-oil tree, topping a cluster of green, are prominent, for much is made of this old favorite.

About the beginning of April, 1904, a European comrade planted

some castor seeds. That was at the commencement of the dry season, when nature begins to withdraw into herself after the burst of harmony with which she meets the rains. Some of these seeds were watered a little; they are now, at the end of five months, strong plants. Others were watered well; they are now shrubs of two to three feet in height. One was planted where it had unlimited supply of rich, moist soil. It is now a thick-stemmed tree of ten feet in height!

Those greedy water stealers, the Eucalyptus trees, must often be destroyed because they grow great by taking the moisture from humbler members of the garden. Their roots are everywhere, subtly stealing underground to rob a comrade many yards away.

There is something appropriate in the honeysuckle which clambers in sweet confusion over the rabbit fences.

The California pepper, which bears some resemblance to a drooping, silvery willow, is growing into avenues of restful green, in contrast to the red and the gray of the bare earth. For

grass, green grass, is here a luxury, consuming water in unlimited quantity.

Looking out over the fields there are orchards of peaches, plums, figs, oranges, lemons, pears, grapes, and a host of delicious fruits in sight. That orchard beyond the main road, by the bungalows, is the mulberry orchard, whence the silkworms derive their sustenance. The green roofs of the bungalows harmonize so well with the leaves that they are quite inconspicuous, in this respect unlike the little white city in the plain beyond. This city of white canvas houses—they call them tents—circling round a many-windowed music pavilion beyond the Roman gate, is a great resort for tourists who come to the Hill for rest and health and recreation.

Many other trees and plants and flowers there are of interest, for truly Lomaland is cosmopolitan in all its ways.

Dates there are from the Islands of Atlantis—the Canaries; broad-leaved bananas from Abyssinia; Australian salt-bushes, blue gums and palms; other palms whose home was once in Asia; bamboo, that giant grass which few refrain from describing as a tree, so tall will it grow; northern pines and southern palms; olives, aloes, cactus, representatives of the four quarters of the globe are here assembled. Everything seems so natural here, so much a matter of course that one is tempted to forget how in a few short years Katherine Tingley has made the wilderness to blossom like the rose.

"Back East," as the phrase runs with these Western men, Point Loma was mentioned as a land of beauty and order to one who knew the place in the days before it had found itself.

"Poor old Point Loma!" was the comment. "Could such a place ever become fertile?" Here one

is tempted to say: "Could such a place ever have been a desert?" Such is the magic of working with Nature, hand in hand, under the guidance of one who lives in broad sympathy with the sky and the sea and the flowers, and all that is beautiful.

Does one not sometimes in moments of silence feel dimly that sense of companionship with Nature, that sympathy with the Heart of Life, that harmony of Sunlight which shines into the depths of every kingdom of our Divine heritage?

There is no monopoly of these things in Lomaland, but would that they could be made more real to the patient, waiting world! They are to be found in close touch with Nature at first hand and are for all. H.

THE SEA

by CAMPBELL

OLD Ocean was
 Infinity of ages ere we breathed
 Existence—and he will be beautiful
 When all the living world that sees him now
 Shall roll unconscious dust around the sun.
 Quelling from age to age the vital throb
 In human hearts, Death shall not subjugate
 The pulse that dwells in his stupendous breast,
 Or interdict his minstrelsy to sound
 In thundering concert with the quiring winds;
 But long as Man to parent Nature owes
 Inactive homage, and in times beyond
 The power of thought to reach, bard after bard
 Shall sing thy glory, beatific Sea.

A great city is that which has the greatest men and women.—Walt Whitman

NOT many days ago some one said to an educated Chicago woman who 'does her own work': 'How is it that you manage with all your duties to keep so bright, so fresh, so well abreast of all that is going on in the intellectual world, your judgment always so well poised concerning it all? I cannot understand it.'

"'You do not consider,' was the reply, 'how much time I have to think. My housework, once the habit of it is acquired, requires very little mentality. It is simply good exercise, quite as good, hygienically considered, as tennis or golf, and it gives me many hours for quiet thought. On the whole, I sometimes think my morning hours as profitably spent, even intellectually, as though I were playing 'bridge' or rummaging over a bargain counter.'"—*Exchange*

It is not a fact that housework may be perfectly done without thought, or that it is "simply good exercise," requiring "very little mentality." The fact is, the splendid little woman who wrote the above has probably gone through the various processes of housework so many times, and so perfectly each time, that none of them now requires any special effort. She has probably paid such close attention to her duties that concentration has become easy instead of difficult. One has only to recall a single experience with a thoughtless maid or heedless cook to know that housework does require mentality and concentration as well, and that it is very much more than "simply good exercise."

But the fact also remains that some of our best-poised women are rightfully grateful to the gods for giving them a long or short tuition in housework. They became well poised, not by virtue of peeling onions or carving roasts, however, but because they were doing their duty in the right way and with a right attitude of mind *because it was their duty*. That is the criterion and the test. We will take many strides ahead, as individual women and as a race, when we cease to run after this or that

✻ Blessed be Home Duty ✻

IN THE INTERNATIONAL HEADQUARTERS,—A LOMALAND HOME

particular and specific line of work, thinking that something outside of ourselves can bring us poise and power. That is today an almost universal disease, and one of the least curable owing to the fact that so many consider it an evidence of mental health. It matters not what the work may be so long as it is our duty and the duty of the hour, so long as it is thoroughly, conscientiously, and cheerily done. It is the attitude of mind that fits a woman to cope with any emergency, whether her work has been to preside over the kitchen or over a board of college trustees. When Joan of Arc was asked, "How were you trained for warfare?" she replied, "I tended sheep and helped my mother with the housework." "But your education?" was the next sneering question. "I know not if it were education," she replied, "I only know that it was my duty!" When the Great Task came she was found worthy and well qualified because the lesser task had been perfectly done. Why should we not learn—without even consulting the nearest Guru or the farthest neighbor—this simple lesson? The woman who meets today's duty, if not with gratitude at least with equanimity, and does it as it ought to be done, need feel no terror of tomorrow. Time, place and opportunity will be co-workers with her, and the good Law will care for the rest.

How simple, how very near, are the great, fundamental truths of human life! They are so simple that, like Naaman of old, we pass them by, searching for something greater and more mysterious and away off in the distance.

There are times when the mind forgets to assert itself and the Soul comes forth to counsel the Life in the silences. It is then that the woman steps,—though perchance for only a moment,—into light. Then the environment of the homeliest life revealeth itself as woof and warp of that purple-gold garment the Soul would wear for its weaving. Then do home duties stand forth in their true significance,—as gateways through which the strong, the gentle and the true serenely pass. E.W.

Our Young Folk

America and Japan

MANY now living remember the time when Japanese could leave their country only under penalty of death, and when a foreigner visited Japan only at the risk of his life. Today Japan stands as one of the great harmonizing powers of the earth. She has assimilated all that is best in European culture and has quietly refused to be contaminated by that which is worst; and more marvelous still, this has been due to the energy and leadership of one who came to the throne when a mere lad. It seems incredible, outside of a book, that a youth still in his teens should lead a whole kingdom out of darkness and into light.

It was a short war by which the Shogun dynasty, which had ruled Japan for seven centuries, was overthrown. With Mutsuhito, the present Mikado, the dynasty which had ruled the country for centuries merely in name, came to rule in fact. Mutsuhito lifted Japan out of feudalism and inspired his people with that higher patriotism which today is a lesson to the nations of the world.

If the picture of Japan on our maps looks like a tiny isle in some fairy book, the history of the nation reads like a fairy tale. Is it not inspiring to think that it was an American, Commodore Perry, who by his courtesy, his diplomacy and his level-headed determination, opened up Japan to the world in this century? Is it not also inspiring to think that the very men who are leading the Japanese nation today, the warriors and statesmen in whom the Emperor deservedly places the greatest confidence, received a large part of their education in American universities? And yet that is not because of the opportunities they had, but because they knew how to avail themselves of them. Thousands of American young men graduate from our universities and do nothing to help the nation, for their motives are not unselfish and their lives, too often, are not pure.

The Japanese are an example to us in their discrimination, surely. They can tell wisdom when they see it, and know how to make its lessons a part of their heart life. They can also tell purity from vice and know how to leave the latter alone.

The Need of Higher Citizenship

By one of the young Cuban lads who is a student in the Raja Yoga Academy

HOW many strive to be true citizens, yet fail to be such? And why we fail is what each of us honestly needs to answer.

We are too apt to make excuses and shrink from the judgment of our conscience, but if we are honest and brave enough to think it out we shall find the cause of our failure is this: that our principles are not always before us. Somehow or other we forget them, and often selfish ambition rules our thoughts and actions.

Such being the case, we shall always fail in our duty as loyal citizens. There are already too many men who, through fraud and against the laws

SOME say that the age of chivalry is past. The age of chivalry is never past, so long as there is a wrong left unredressed on earth, or a man or woman left to say, "I will redress that wrong, or spend my life in the attempt." The age of chivalry is never past, so long as we have faith enough to say, "God will help me to redress that wrong; or, if not me, He will help those that come after me, for His eternal will is to overcome evil with good."—Charles Kingsley

of righteousness, have gained political positions from which they can press down all other men.

With such men in power to influence the weak, and such examples of dishonesty and unmanliness, we cannot make the progress that we should. Therefore, knowing that such citizenship is not what it ought to be, and that it is keeping the nation back, we should strive, each and every one of us, to lift citizenship to a higher standard of perfection.

To do this we need not be known all over the land; the duty of every citizen being not to acquire fame but to obey, not merely the laws of the nation, but the laws that govern noble and true men. Above all things we should control ourselves, conquer ourselves.

We have many examples of men whose great qualities were developed through their untiring efforts to help humanity. These are the beacon lights of the nations.

We should not say there is nothing for us to do. We rely upon a few to keep up the nation, and do not fully realize what a burden it is. We all, as citizens, should feel it a duty to help carry the burden ourselves.

We are too apt, when the few we rely on sink under their burden, to blame them for their weakness. The blame is on us, because we let our share fall upon some one's else shoulders. The men of the Twentieth century must improve their morals. The work of reform has been begun but recruits are lacking.

Let all those who are able, come forward with willing hands and help rescue their countrymen. There is plenty to do at our very doors if we but willingly bend ourselves to the work.

We, freedom-loving citizens of the Great Republic, citizens of a free nation in its youth, have a greater responsibility than we have yet realized. We have the power to make this land of our ancestors a light unto the nations of the world, to be looked up to as the champion and defender of the rights of all living things.

Facts Worth Knowing

THE Japanese currency system is decimal, the *yen* having the nominal value of our dollar.

"How many of you know that spiders are fond of music? They are," a close observer writes; and he also adds that he once knew a garden snake to be attracted by piano playing.

RECENTLY the following brief letter was sent by a Japanese warrior to his brother, who is now living in America:

It was written in the very midst of battles and gives us a good idea of why the Japanese have been so successful: "I write, my dear brother, on the eve of battle. We are in the exposed front rank and this may be the last greeting I shall send you, but if I fall tomorrow for Japan, I am glad, for I know that I give my life that human brotherhood may triumph."

THE CHILDREN'S HOUR

The Raja Yoga Question Box

DEEP in the heart of the true patriot is ever the vision of a glorious future. When this gleam is in the heart the brave, though suffering, grow wise.

1 Who was José Martí?

ANSWER—José Martí was a poet and an orator. His heart was on fire with love for Cuba. He traveled in Central America and the United States. Everywhere he plead the cause of Cuba. Martí joined Gomez and Maceo, and became a leader in the Cuban army. He was killed at Don Rios in 1895.

2 Who is Maximo Gomez?

ANSWER—General Gomez is called the "grand old man" of Cuba. He was

a leader of the Cubans in the Ten Years War. With Maceo and Martí and others he began the war of 1895. He has lived to see his country free.

3 Who was General Maceo?

ANSWER—General Antonio Maceo was born in Santiago de Cuba in 1848. He was a leader much loved by the Cubans. Maceo fought many battles and held the great armies of Spain at bay. His bravery and power as a leader made him the terror of the Spanish soldier. In 1896, through treachery, Maceo was captured and killed. Antonio Maceo was a noble-hearted patriot. He treated even his cruel enemies with kindness when they fell into his hands.

The Cloudlets

A THOUSAND cloudlets rippling across the eastern sky were tinted with delicate pink. They were so beautiful and so joyous! They did not talk as we do, but they had a language, a beautiful, silent thought-language, I am sure. A wise old cloud saw them and said, "Do not think your beauty is your own. You are beautiful, as I am, because of the coming of the Sun-king. He clothes us in his glory to herald his approach to the children of earth. Your beauty, like mine, will fade when he has passed away."

"But we are so beautiful!" returned some of the cloudlets, with pride.

"The real beauty is the joyous feeling in our hearts," was the gentle and wise reply.

"We like best the beauty we have now," said another cloudlet who was growing more and more lovely every moment.

By that time the sun had risen and the rippling cloudlets paled. But the wise old cloud thrilled with gladness. He felt joy that the bright Sun-king was moving on his majestic path, bestowing light

A LOMALAND LOTUS BUD

and life on all things; and he could not grow sad, knowing that soon would come the glory of sunset and then, after that, the beauty of dawn once more. But the selfish little cloudlets grew sullen, for their delicate loveliness was fading away.

"Better be happy," said the wise old cloud. "You will fall to the earth if you are not happier than that!"

But the cloudlets grew more and more sullen, and at last they began to cry, and then they fell, drop by drop, to the earth. They were then more unhappy than ever. How they longed to be up in the sky again, near the Sun-king and close to the wise old cloud! Suddenly one began to think about being unselfish and great, like the Sun-king, and out of the feeling of love in its little heart came these words, "Find the joy of giving."

"But what have we to give?" said one who heard it.

And another one said, "Our moisture—we can give water to the thirsty flowers."

So they did, and it came to pass that by and by the Sun-king lifted them from the flowers in the form of vapor and the breeze wafted them upwards to the eastern sky, and in the morning they were once more clothed in the loveliness and the glory of the dawn. But they were wise this time! They knew then that their beauty came from the Sun-king and that they could not keep it just for themselves. They felt a great gladness and joy. They loved to be beautiful and it was right they should, for they had become unselfish.

ANNIE P. DICK

THEY tell us that Japan is the land of babies; that nowhere else in the world are there so many babies in proportion to the number of grown-ups; and that nowhere else in the world are the babies so uniformly good.

The Humming-Birds of Lomaland

DEAR CHILDREN: Some folks think that men and women and boys and girls are the only beings who can talk to each other intelligently; but you and I know better.

One day I had the lawn sprinkler going. It made a beautiful spray through which the sunbeams gleamed and glistened in a way that turned every little drop of water into a sparkling diamond.

If there is anything that the little humming-birds love above everything else, it is to play in such a spray. On this day one little humming-bird discovered this water and, after darting back and forth through it a number of times, he suddenly flew to the very top of the Homestead where he lighted and began calling in a very loud, shrill voice—loud and shrill for a humming-bird, I mean.

He called and called and called until I thought that he certainly must be calling every humming-bird on Point Loma to come and join in the fun. And that was exactly what he was doing. Soon they began to come and they kept coming until there was quite a flock of them. I counted eighteen, but there may have been more.

When they had all come, the little fellow on top of the Homestead flew down and joined the merry picnic; for it was truly a picnic, the merriest, jolliest, wildest, most delightful picnic ever known. I don't believe the liveliest of the fairies ever had such a gloriously gay time as did those little birds in that beautiful sun-kissed spray.

They darted to and fro, up and down, around and across, all the time apparently just

screaming with merriment—now alighting a moment on a twig, then almost immediately dashing madly back and forth again in the spray.

I wondered if they weren't playing a most exciting game of some kind. Be that as it may, they were so absorbed in their fun that they paid no more attention to me than as though I had been one of the rose bushes. Perhaps they knew how dearly I loved them.

It was indeed a most beautiful sight to see those many "bits of burnished brightness" dashing to and fro in this excited manner, now their little bodies gleaming in the sunlight like so many emeralds and now their little throats flashing like so many exquisitely beautiful rubies.

ONE OF YOUR FRIENDS

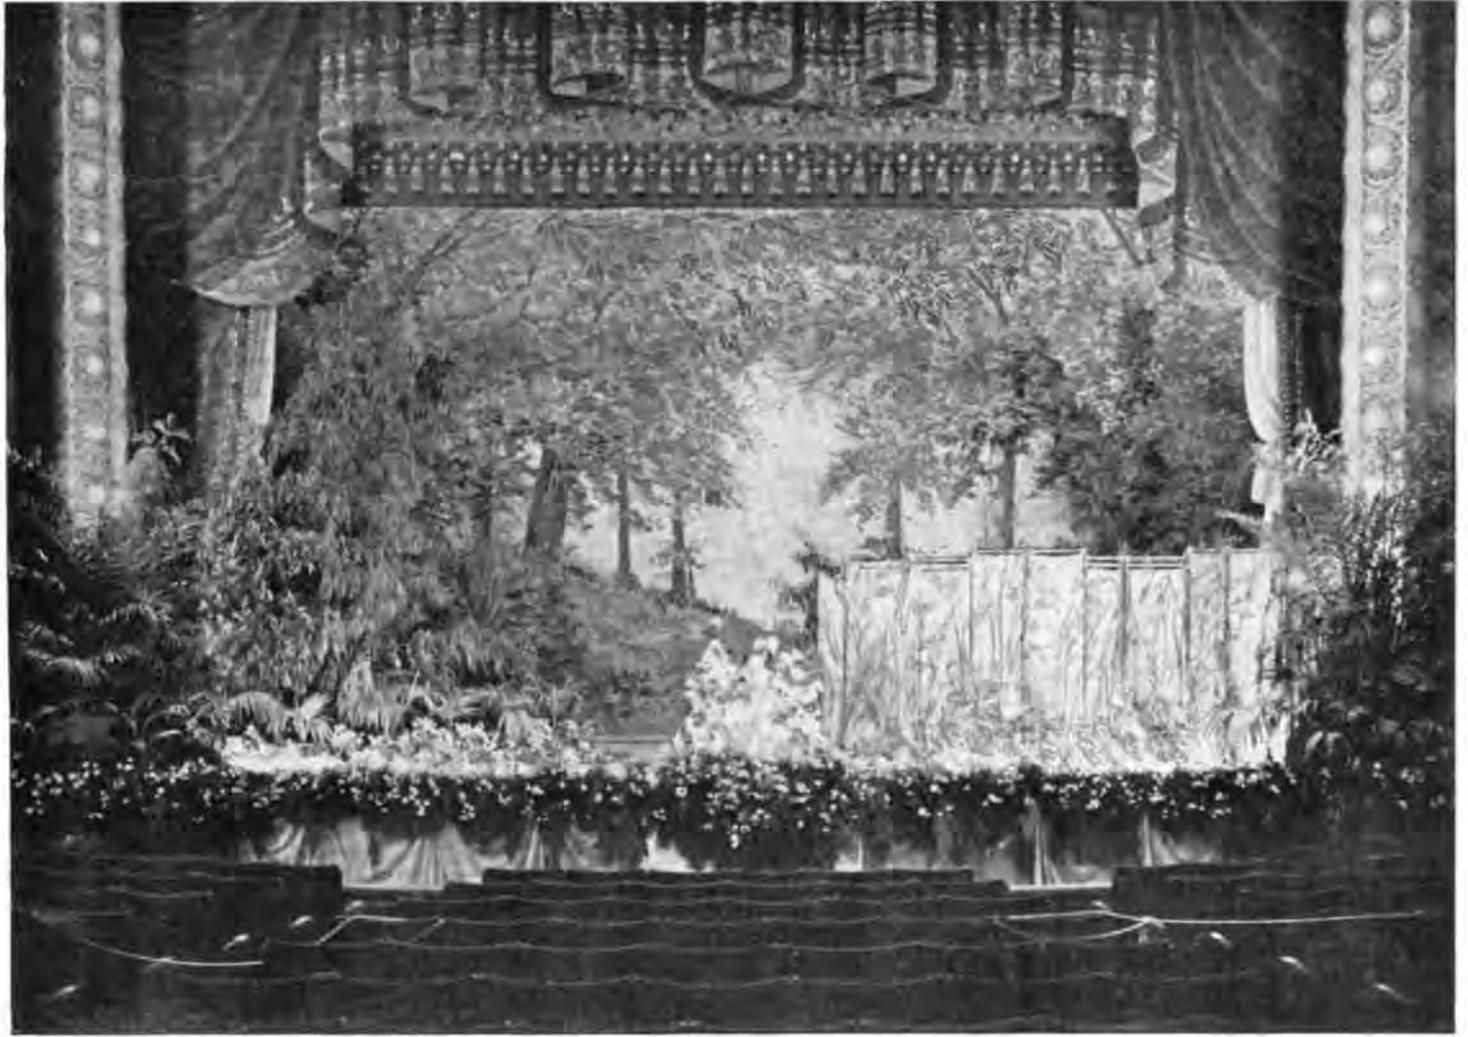

DEAR CHILDREN—The other night a little girl saved the big limited train on the Chicago, Great Western Railroad from a disastrous wreck. Eight loaded freight cars had been run on the main track when the child discovered them. She was only five years old, but she knew something was wrong and she toddled more than a mile and told the agent. It was then too late to telegraph to the train, so he secured a switching engine and moved the cars—just in the nick of time. E. H.

BROTHER AND SISTERS FROM Cuba, now students in the Raja Yoga School, Point Loma.

Isis
Theatre
San
Diego
California

LOMALAND STUDENTS AT ISIS THEATRE

AN evening of unusual profit and pleasure was enjoyed by those who were present at the Sunday evening meeting of The Universal Brotherhood and Theosophical Society at Isis Theatre. The music, artistically rendered by students of the Isis Conservatory of Music, included the following numbers: Overture, "Merry Wives of Windsor" (Nicolai); Concert, "Romance" (Schmeidler); "Ave Verum Corpus" (Mozart); "Rondo Capriccioso" (Mendelssohn).

The first paper of the evening was read by Iverson Harris, Jr., one of the Raja Yoga boys, his subject being "George Washington." He emphasized the fact that this great character was a most excellent model, in both public and private life, for American youth to follow.

The principal topic for the evening was "Prehistoric America," and was treated of in three intensely interesting papers, which received the closest attention and cordial applause of the large audience which filled the Theatre.

The first was by Mrs. W. T. Hanson, who quoted Katherine Tingley's statement made at Bombay, 1896, that "Egypt was older than India, and America older than either." In support of this statement the speaker quoted from the writings of H. P. Blavatsky and others, and also adduced many proofs, linguistic, ethnological and archeological in support of this claim.

She said: "The remains of vast cities in Central America, belonging to a forgotten past, the remains in Ohio and other places, the hieroglyphic carvings in an unknown language found in Arizona; all these are evidences of a mighty and most distant past. They point to a past that had been buried in oblivion before any present nation began to be. Every year is making the cumulative proof stronger and stronger; and no doubt much more will be added in the near future. And it should give scientific men food for thought when they discover that they themselves find growing up under their hands, such wonderful corroborations of H. P. Blavatsky and of the affirmation of Katherine Tingley, that America is older than either India or Egypt."

Mrs. I. H. Butler continued the subject along similar lines. Among other interesting points touched on she said: "Every new discovery

made in American archeology goes to confirm the fact that America is older than Egypt. We know that there are pyramids all over Central America, like those in Egypt; and the archeologists who interpreted the hieroglyphics on the ruins of Yucatan were enabled to do so by their previous knowledge of Egyptian hieroglyphics. These people, whoever they were, that built the colossal temples and monuments at Uxmal and Palenque, in Yucatan, had the very same notions as to architecture as the ancient Egyptians, and their symbols and records show that their religious, philosophical and scientific ideas were the same."

W. Ross White, who read the concluding paper, said in part: "As we go southward into Mexico, Yucatan and Bolivia, the more evident become the traces of a vast and long vanished set of civilizations. Pyramids, temples and cities are met with in extraordinary number. Charnay, at Teotihuacan measured one building 2000 feet wide on each side, and fifteen pyramids each nearly as large on the base as Cheops. 'This continent,' says Charnay, 'is the land of mysteries; we here enter an infinity whose limits we cannot estimate. . . . I shall soon have to quit work in this place. The long avenue on which it stands is lined with ruins of public buildings and palaces, forming continuous lines, as in the streets of modern cities.

"Some of these cities have enormous stone gateways, stones thirty feet long, fifteen feet high and six thick. The capital of the Chimus of northern Peru covered twenty square miles. Tombs, temples and palaces arise on every hand. . . . Immense pyramidal structures, some of them half a mile in circuit; vast areas shut in by massive walls, each containing its water tank, its shops, municipal edifices, and the dwellings of its inhabitants; . . . prisons, furnaces for smelting metals, and almost every concomitant of civilization, existed in the ancient Chimu capital."

"Eight years ago in Bombay Katherine Tingley asserted that ancient Egypt owed her civilization to still more ancient America. Time will corroborate.

"Meanwhile we have seen something of prehistoric America, east and west and south, which makes the statement seem at least not impossible."

Art Music Literature and the Drama

The Power of Musical Sound—Old Truths Rediscovered

At the Royal College of Science in Dublin interesting experiments have been made showing the influence of musical sound upon falling water. Ordinarily a jet of falling water consists of two parts, one, a clear column and a second portion which is not clear. The latter, when photographed with the aid of the electric spark, is seen to be composed of a succession of drops, falling one after another too rapidly to be separately perceived by the eye. These drops, in shape, size and interval one from another, are ordinarily irregular, but if a tuning-fork, vibrating, be placed in contact with the stand from which the jet of water starts, the drops will fall with exquisite precision, a drop being cast off with each vibration. Remarkable and even marvellous effects can be thus produced.

Is it then so difficult for the brain mind to grasp that ancient conception by which the Universe was guided out of chaos and into order by musical sound? Is it difficult for us to find reasons not purely sentimental for the fact that in the ancient schools of true Theosophy the study of music was always obligatory? Pythagoras was not the first—nor the last—to make music a part of the ideal school curriculum. Side by side, however, with the picture of the days when music was understood, comes involuntarily the picture of the tortures heaped upon those who, in the Dark Ages, strove to bring back to men some of their ancient knowledge. History does not record a picture of just this experiment, but depend upon it, had it been made in the Thirteenth or Fourteenth century in medieval Europe, it would probably have been accompanied by the corollary picture of a trial for heresy, the torture, or the more merciful stake.

We are wiser today, thanks to the few Great Ones who have dared crucifixion for humanity's sake. We know that a force not yet recognized by science has built the Universe and that the harmonies of sound and color are but number heard and seen. If music has this power over water, or rather the outer garment of water, that which we can see and weigh and touch—what must be its power over forces and things invisible and intangible?

We know that character is refined by music. We do not know why or how; but who shall say that this is not because, as in the case of the jet of water, musical sound leads order to replace disorder, brings sequence that is logical in place of sequence that is illogical? Who shall say that, if the soul itself blossoms into fuller beauty by the help of right music, flowers may not so bloom? Indeed, who shall say that the beauty, the symmetry, the utter loveliness of the perfect flower is not due to the music at Nature's heart, its sound too delicate for our ears and so unheard? Who shall say that misshapen, stunted or malformed flowers do not come because somewhere Nature's pure melody has been broken, its sequence of sound disturbed?

Yet how unfortunate that humanity had to wait to learn these things by the brain-mind's labyrinthine path! The wisest of the ancients knew this and infinitely more than this, but not as we know it, in mentally-woven fragments, but infallibly, absolutely, by the heart's own guidance and light. It may seem a simple thing to demonstrate, as is today demonstrated in the Raja Yoga system, that music is as important as any other factor in the education of the child; but the results are far from

simple, for the step so taken is founded upon laws older than time, which men in their own blindness have failed to see and in their wickedness have forgotten.

STUDENT

It would seem that the limit must by this time be reached. The luxurious in drama has grown to such proportions that a return to simplicity seems inevitable, if there is anything in natural law. When we consider the expense of the modern spectacular production, is it a wonder that we long for the poor and simple boards of Shakespeare's time, or for the trodden earth of an old Greek theatre? A generation ago five thousand dollars was a great sum to spend upon a single production. Today, fifty thousand dollars is nothing exceptional. The pay-

roll of the average large theatrical company is an astonishing spectacle to the uninitiated. A salary list of even five thousand dollars a week is moderate, and altogether the weekly expenses of many of our immense spectacular productions have to be written with five figures. Then, too, the theatres themselves! When one thinks of the recent catastrophe in a Chicago theatre, one recalls the Epicurean cry: "Give me luxuries, I can easily spare necessities!"

The latest is a device by which the temperature can be regulated specially to accommodate the convenience of each individual patron, by means of a contrivance terminating under each chair. It is not surprising that managers go to extremes, for with many of our so-called dramatic representations there would be nothing left at all were the spectacular setting dispensed with. They resemble nothing so much as overdressed, gaudily draped manikins, mere devices on which to hang gold lace and electrical effects.

Take away the accessories, the tinsel, the crystal and the glare, and what is there left? What a contrast to the classical drama, and what wonder that we long to see it revived, unspoiled by gaudy accessories, unspoiled by a "star" cast with its half a dozen jealous understudies.

STUDENT

The Higher Drama: the Need of Joy and Beauty

MINNIE MADDERN FISKE recently wrote the following anent the dramas of Ibsen. As a champion of the intellectual in drama, her words have special weight, and it is therefore a sign not insignificant that she should have concluded her defense with a recognition of that which the Ibsen drama so much needs, sunlight and real heart joy:

"Why Ibsen?" This question, elaborated and particularized, is often asked. Ibsen's most devoted admirers deplore the fact that his subjects are almost invariably gloomy and that he seldom moves in happy channels—unless we except his scintillant and biting wit and satire. The actor who studies Ibsen, however, must take delight in him. With all his gloom and his depressing satire on life, Ibsen projects the truth and that he fascinates audiences, as he lays hold of actors, is evident from the success of his plays when they are represented with appreciation. Again, Ibsen is a pleasing foil to the average modern play—the average "society" play and current "comedy," for these have nothing in them that appeals to intelligence or that suggests thought. As a rule, they are pretty things, with nothing behind them or beneath their superficialities. As they lack in matter that means something, so Ibsen is crammed with that sort of matter. Perhaps Ibsen is a pioneer for better things.

It is true that his imitators now seem to think that it is their duty to out-Ibsen Ibsen in the depressing subjects they treat with more or less superficiality, but he may for the future inspire masters of drama who will write as significantly of the beauties and nobilities of life as he writes now of its aberrant and miserable features.

I cannot conceive the spirit of music as aught but Love.—Wagner

KIYOMORI TEMPLE, JAPAN

PSALM OF THE WEST

Fragment

by SIDNEY LANIER

AND the sun stretched beams to the worlds
as the shining strings
Of the large hid harp that sounds when
an all-lover sings;
And the sky's blue traction prevailed o'er
the earth's in might,
And the passion of light grew mad with the
glory of height.
And the uttering of song was like to the
giving of light;
And he learned that hearing and seeing wrought
nothing alone,
And that music on earth much light upon
Heaven had thrown,
And he melted in silvery sunshine with silvery
tone;
And the spirals of music e'er higher and
higher he wound
Till the luminous ciactures of melody up
from the ground
Arose as the shaft of a tapering tower of
sound.

Three Great Ideas

AMONG many ideas brought forward through the Theosophical Movement there are three which should never be lost sight of.

Not speech, but thought, really rules the world; so, if these three ideas are good, let them be rescued again and again from oblivion.

The first idea is, that there is a great Cause—in the sense of an enterprise—called the Cause of Sublime Perfection and Human Brotherhood. This rests upon the essential unity of the whole human family, and is a possibility because sublimity in perfectness and actual realization of brotherhood on every plane of being are one and the same thing.

The second idea is, that man is a being who may be raised up to perfection, to the stature of the Godhead, because he himself is God incarnate. This noble doctrine was in the mind of Jesus, when he said that we must be perfect even as is the Father in heaven. This is the idea of human perfectibility. It will destroy the awful theory of inherent original sin which has held and ground down the Western Christian nations for centuries.

The third idea is the illustration, the proof, the high result of the others. It is, that the great Helpers of Humanity—those who have reached up to what perfection this period of evolution and this solar system will allow—are living, veritable facts, and not abstractions cold and distant. They are, as H. P. Blavatsky so often said, *living men*. These Helpers, as living facts and high ideals, will fill the soul with hope, will themselves help all who wish to raise the human race.

Let us not forget these three great ideas.

W. Q. JUDGE

FRIENDS IN COUNSEL

DEAR COMRADES: In order to clarify my ideas in reference to the newly established Raja Yoga Academy, I acted upon the oft-repeated advice of W. Q. Judge and consulted a dictionary. I found that the first academy was held in a grove near Athens which had been named after the hero Academus. It was here that Plato and his followers taught their pupils under the shade of the ilex and olive, while bees murmured among the asphodels and lilies, and white clouds floated overhead. What a very different picture does the word academy call up in the modern mind! A dingy classroom, a joyless assembly of youths memorizing dry facts or forcing their immature minds into mental gymnastics for which they are as yet unfitted. The work of Plato may be compared to that of a gardener who supplies his seedlings with water for them to absorb according to their needs and capacity; whereas the schoolmaster of modern times may be likened to a carpenter hammering nails into a plank.

Here in Lomaland the old academy is revived and immeasurably developed. Here the true philosophy of life is taught, and while the pupil learns of the unity of existence, his knowledge will find expression in his life by practice of right action. The Raja Yoga system will not produce learned recluses nor spiritual dreamers, nor muscular animals

There Is No RELIGION Higher Than T R U T H

merely, with little head or heart to govern them.

A perfect balance of the spirit, soul and body is aimed at and the finished product (if an eternally evolving being can ever be said to be "finished") will be men of the world in the highest sense of the term; men who can run a factory, or manage a business, reclaim a desert or move in the highest circles of his kind

with dignity and discretion. They may not talk much about brotherhood or deliver orations on the Divinity of Man, but their every action will be prompted by compassion, and their whole lives will shew forth the light of their higher nature operating in the smallest affairs of life.

I have sometimes noticed a tendency among weak-kneed workers that after they have spoken with enthusiasm of the children and their future, they go on to say that they who are older must wait till another incarnation before they shall be of much use, and that they shall take a fresh start when they get new bodies! "Our Karma," they say, "will of course (?) be such as to entitle us to the benefits of Raja Yoga training and environment and we shall go on and make real progress then. Meanwhile we may take things easily."

That notion *should be knocked down flat whenever it puts up its ugly head*. It is a false humility and a device of the lower nature to lead us to postpone our efforts for self-conquest. The real heroes are not those who wait for more favorable surroundings and put off the inevitable struggle, but those who are daily and hourly striving their hardest.

There are some, to their honor be it said, who occupy feeble and worn out bodies who use their imperfect instruments to their full limit, and these are they who at their next rebirth will find themselves the darlings of Fate. To these will come the great opportunities of the coming years, for the gods help those who help themselves. But those who passively sit down and speculate about their chances in their next life, are just the kind of people to find themselves stranded in some shallow when the great tides of life roll in to readjust human affairs. "At each instant strive for that instant," and "the more one dares the more he shall obtain." The Leader often remarks to one or another of the students that they are getting younger. Why should not this be really true? Why should the injunction that "the pupil must regain the child-state he has lost" remain forever as a beautiful thought upon a printed page? Why should not the flower rebecome the bud here and now in these old bodies, and we ourselves become like little children born anew, and ready to begin our lives over again in a new way? P. L.

THE Soul of man is immortal, and its future is the future of a thing whose growth and splendor has no limit.

The principle which gives life dwells in us, and without us, is undying and eternally beneficent, is not heard or seen or sensed, but is perceived by the man who desires perception.

Each man is his own absolute lawgiver, the dispenser of glory or gloom to himself; the decreer of his life, his reward, his punishment.

These truths, which are as great as is life itself, are as simple as the simplest mind of man. Feed the hungry with them." C.

IN THE RAPID RUSHING RIVER OF TIME

LONGFELLOW

THUS the seer, with vision clear,
 Sees forms appear and disappear
 In the perpetual round of strange
 Mysterious change
 From birth to death, from death to birth,
 From earth to heaven, from heaven to earth,
 Till glimpses more sublime
 Of things unseen before
 Unto his wondering eyes reveal
 The universe, as an immeasurable wheel
 Turning for evermore
 In the rapid rushing river of time.

Universal Brotherhood the Basis of Morals

THE one great law of Universal Brotherhood is the law of duty, and the performance of duty is the basis of all moral action. Duty has been defined as "That which is due from us to humanity." And Ethics, in the last analysis, is an ever expanding circle of duty. First, to our real self, the Soul, that we may more and more gain the mastery over the lower nature and make of it a fit Temple for the living God within; next, to the Home, that it may be a center from which shall emanate an influence that will shape the thought of every member of the family circle and turn them toward Justice, and Righteousness, and Truth; then to the community, not by merely giving a half-hearted assent to good and wholesome regulations, but by an active, practical, helpful cooperation in all movements for the public good.

Our duty to the State and Nation may be described in the same words, except that as a citizen of the country of our birth or adoption, we may be called to make the supreme sacrifice of giving our life for its preservation and the honor of its flag. Such sacrifice is a heroic example of duty performed; for when, in thickest of the battle, comrades are falling all around, it is a moral courage that keeps men in their appointed place: a sense of duty stronger than fear that fires the heart and nerves the arm.

The moral character is the result of the performance of duty. Every effort toward mastery of the lower self is that much fertilizer for the moral growth of the individual. As we strive and fail—as we all must do—but strive again and again, we open the channels through which the Divine Soul, the real I, can make its presence felt, and the voice of conscience sounds clear and certain in our hearts, which, if obeyed, will lead us at last to all truth.

We must labor faithfully in every station of life in which our lot is cast, but the difference between Brotherhood and Selfishness is that, in brotherhood we work for ourselves as a part of humanity, and included in it; and in selfishness we work for ourselves as separate units of humanity.

We are bound together so that the action of each affects all, and the connection is stronger and more subtle on the higher planes of being. Thoughts are things, potent for good or ill, and travel more swiftly than light. Others are affected by our thoughts and desires, as they vibrate along the invisible threads which bind together all mankind.

Laws of life are laws of harmony, and, when broken, are their own avengers, bringing about readjustment with exact justice. The whole human family is indissolubly linked together, and none can help or injure himself without doing the same to others, and Universal Brotherhood is a determined and forceful movement on the part of those who see the need and know the law to infuse these truths into our individual, social, political, and national life.

The moral, or ethical law, is but an expression of Brotherhood, or helpfulness to all creatures, and this law is not subject to the caprice of Kings or Priests, neither is it based upon any special revelation, but is

the "Stone which the builders rejected, which has become the head of the corner."

All the great Souls who have appeared from time to time, and whose names are found in the world's history: Krishna, Lao Tse, Zoroaster, Confucius, Buddha, Jesus, and many other great teachers, like H. P. Blavatsky, W. Q. Judge, and our present leader, Katherine Tingley, have always and everywhere promulgated the self-same law of morals. Each has striven to revive in man a knowledge of the Great Law which had been forgotten, and to guide him to a recognition of his spiritual nature, which alone brings to him a sense of duty.

Many so-called religious sects have claimed that the revelation of these great truths came only to their own particular prophet or founder, and were unknown before such revelation; but both nature and history contradict such a pretty conceit, for the Moral Law is the law of Universal Brotherhood, and is, and has been, ever the same, and the ethical concept of man's duty does not vary from age to age. To apply the moral law in our daily lives is man's most difficult task, but the power and will to so apply it is his only means of salvation. If individuals are to be saved they must, by a deliberate and well considered choice, save themselves. We must willingly give up the things upon which our hearts are set whenever they become obstacles in our labors for the general welfare. This renunciation applies, not only to bodily appetites and passions, but also to objects of ambition and vanity, and the seeking for place and power. It means the will to work for others at all times without thought of how we may be affected.

It requires a life devoted to helpfulness, not only in deeds, but in thoughts and words as well, and an entire forgetfulness of self when the good of others is involved, not caring whether our actions meet with praise or blame.

This Ethical, or Moral Law, requires our utmost energy and perseverance in the performance of our duty to humanity, a great patience, the power to forgive persecutors and slanderers, and an unbounded compassion and willingness to be helpful to all creatures.

These lofty attainments of self-control and self-abnegation can only be reached by those who have learned that the Spiritual is the *real*, and that man is a Soul.

Thus does Universal Brotherhood lead to the performance of duty, and its performance is the essence of all moral growth. The law of love is our priceless heritage, and yet we do not recognize our treasure. Every great teacher of religion has taught the same doctrine. Every great Soul who has come into the world that he might again strike the key-note of compassion has spoken the same language of love.

E. T. B.

A Soul's Triumph

AS one of the many evidences that "the world does move," may be cited the idea enunciated by so high an authority as Plato; and by many nations of that time held as orthodox; that those who were physically defective should be more or less cordially invited to die at the first opportunity. We now regard this idea, at least theoretically, as a relic and sign of barbarism. We prefer to make the competitive struggle where physical weakness counts for less, unless it is utterly disabling. And even then the mind sometimes rises triumphantly above its limitations and renders the defective body—which in olden times might have been contemptuously thrown into the river, or otherwise disposed of—a means of blessing to humanity by the very fact of its seeming uselessness.

The cases of Helen Keller, and her recent Wisconsin prototype, are familiar to all, but we recently learned of a case scarcely less remarkable in its way. Two or three months after her marriage a woman was stricken with articular rheumatism of such severity that she was practically petrified in a sitting position, and was constantly in much pain. Her husband was a wage-earner to whom every incumbrance was serious. She has been in that condition for *twenty-three years*; utterly helpless. And yet it is said by intimate friends of the family that neither she nor her husband have ever, in that time, uttered one complaining or fretful word. They are the radiating source of peace, patience and happiness to the neighborhood. Surely such a life is a triumphant one; at least we would consider ourselves most highly favored if we enjoyed the privilege of acquaintance with it.

Such lives are conclusive disproofs of any materialistic theory of life whatever; no matter how intellectually framed nor how learnedly worded. The Soul rises triumphant o'er all.

STUDENT

FOES

If thou hast gone so far that thou hast foes,
I praise thee, for not yet are all men good.
Though thou dost bury it in silence, yet
Be not ashamed of foes. Who cannot bear
To have a foe does not deserve a friend.
They must be foes to thee, who would be slaves!
They must be foes to thee, who fear the truth!
They must be foes, who dare pervert the right!
Foes, who from ways of honor turn aside!
They must be foes to thee, who have no friends,
But only partners in their evil deeds.
They must be foes to thee, who have no foes,
Since—to win pardon for itself—the world
Too easily condones. They must be foes,
Who deem thee not a friend. Bravely endure
The hatred of the base! 'Tis weak and void.
If thou art steadfast, like a warm, pure ray
Of fire celestial, thou dost warm the good,
And good men will ally themselves to thee.
But be thou ever truest friend to foes.
Turn not away from them in word and look;
Dwell not in silence and aloofness stern;
For this would bring upon thee heavy blame!
Those men are worthy of the highest praise
Who win the foolish ones to wisdom's ways,
And lo—there beg for these unfortunates
Their father and their mother, from the grave!
There beg for them their wives, their children beg!
Their own averted glances do beseech!
The God in thine own heart beseeches thee:
"Turn not away from brothers, O my child!"

—From the German of Leopold Schefer

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question

I have read the answer regarding the intuition, in the issue of October 9th, and wish to ask a further question as to its source. Is the intuition the result of the experiences of previous lives, a kind of recollection, as it were, or has it its source elsewhere?

Answer

There can be no doubt that the experiences of life have to do with the development of the intuition, in so far as they help to purify the whole nature, upon which the action of this faculty depends, but is not the source of the intuition deeper than this? Strictly speaking, could experience ever take us beyond what we have already passed through; could it take us into new fields of action and be a guide there? Experience gives a basis, a foundation, for present action; it relates us to the past, and from the fact that we have come through that past, surmounted it, however full of failures it may have seemed to be, and have not been engulfed by it, should give both courage and confidence to meet the future. But the future has always a new element in it; it is never a repetition of the past, and we must look for something beyond experience to enable us to meet this new factor.

The source of man's deeper knowledge is the soul, divine in its origin and linking him to the divine in nature, and however man may apparently have covered up this, his real self, yet it does not desert him so long as he has a single aspiration upward, or can think a single kind thought, or is capable of a single kind deed.

It is in the soul that resides this faculty of direct knowledge which we call the intuition, and is a faculty of the soul by virtue of its identity with the Universal Soul, the soul of nature. It is from this that even the ordinary man draws his knowledge that enables him to meet new conditions, and the new factors which make those new conditions different from any which he may have previously met. In the case of the ordinary man it is more or less an unconscious response he makes to this inner direction; he thinks the decision has been made by himself as a result of his own reasoning faculties.

But where the whole nature has been purified, so that this power of the intuition can act more freely, it becomes evident that it is distinct from the ordinary process of reasoning, and is to a degree recognized for what it really is, a direct knowing. Then going a step further, we come to recognize also its source, that it is from the center of our real being, the soul. From this standpoint it is clear, therefore, how necessary it is for the nature to be purified to enable the intuition to act. STUDENT

Question

I have read in Theosophical literature that the cause of rebirth is the desire to live. If this be so, then how should those be reborn who are weary of life? There are many such who have no desire to repeat their experiences.

Answer

Is it weariness of life itself; is it not rather weariness only of the particular phase of life, brought about by disappointment or unfulfilled desire? And if the opportunity were afforded of a different phase of life in which our hopes and aspirations might be fulfilled, would we not immediately take it and would not the whole aspect of life change, so that we should desire again to live? If we did not have the desire to live, and moreover the *will* to live, I doubt if we should remain in life another minute. The fact that we do live is really evidence that we desire life, only we may perhaps desire another form of life than that which we are now experiencing.

But the fallacy in the expression "weary of life" is clear if we consider what life is, and what it is that lives. It is the soul that lives, and it is only when we identify ourselves with the soul, *i. e.*, with our real selves, that in very truth we live. In order to become our real selves, and so to know what life really is, we must not look for a life in which our thousand and one desires may be gratified, or even that one overpowering desire may be fulfilled—unless indeed that desire is to know the soul, and to become one with its purposes—but on the contrary we must control our desires, so that at last they come to be in harmony with the true purposes of life, and then there will be no desire to escape from life, but there will be a recognition of the opportunity that life affords, and the determination to live it rightly and well.

In regard to this subject of the desire to live, W. Q. Judge has said:

Desire of any sort, satisfied or not, deludes the Ego, and it is thereby drawn into the magnetic attractions (from which through ignorance it cannot escape) which must and will operate in time to cause rebirth. The desire operates the instant it is entertained, and, sinking into the inner recesses of being, is a cause for rebirth. The mere fact that it is forgotten, or that all earthly life in time becomes distasteful does not do away with its force in those parts of our nature which, while we are ignorant, remain hidden from us. For with each desire—and there are millions of them—there is a thought, and it is these thoughts which make the bonds which draw us back to earth. And with each person this goes on for many years, for but few children are wise enough [or have been taught] to control their desires. This immense mass of desires and thoughts is to be taken into account. [And among them may be, nay almost certainly are, desires for life and to continue to live; and it cannot be considered that these are of no effect or force, even though others arise which seem to be contrary to them.] The question seems to ignore them [*i. e.*, this immense mass] altogether. If in mature years one begins to see the futility and uselessness of desire for life, or any other desire, it means that experience has been gained, but not by any means that the forces engendered during preceding years have been exhausted.

Furthermore, there is behind each one the whole sum of other lives with all their desires, much of which must be yet unexhausted. These are each a cause for rebirth. And it is not merely the desire to live that causes rebirth.

That is a prime cause, and one that being seated in general human nature is more subtle and powerful than any other, for it relates to life itself, no matter where. And I take it that if the person who says life here seems worthless, were offered life on some other planet in most harmonious, beautiful, and gratifying circumstances, he would find the deeply seated *wish for life* suddenly blazing up, causing him immediately to accept the offer. STUDENT

THE true will is a concentrated force working steadily yet gently, dominating both soul and person, having its source in the spirit and highest elements of the soul. It is never used for the gratification of self, is inspired by the highest of motives, is never interposed to violate a law, but works in harmony with the unseen as well as the seen.

As the true will is the manifestation of the spirit through the soul, it must be at one with the divine, inasmuch as the spirit is the divine in man. It is the God in man, a portion of the all-pervading. Asserting itself through the soul, the true will is brought forth and in truth we say, "It is the will of God."

We may make our finite wills at one with the divine by elevating our aim, using it for good or in the search for God, in striving to find how to use it in harmony with the laws of God. By proper use in the right direction the human will becomes purified, elevated, and being exerted only in conformity with our highest ideal, eventually becomes at one with the highest in man. WILLIAM Q. JUDGE

Fragments---A Few Words about Helena Petrovna Blavatsky and Her European Habitation

HELENA PETROVNA BLAVATSKY, the Foundress of the Theosophical Society, which included a nucleus of a Universal Brotherhood, was a cosmopolitan in the truest sense of the word. She loved all countries, and all peoples; and during the time of her Leadership of the Theosophical Society, she lived in many places.

The pictures on this page give glimpses of her European home, at 19 Avenue Road, Regent Park, London, where now exists the European Headquarters of the Universal Brotherhood and Theosophical Society, which is a branch of the great International Theosophical Center at Point Loma, California. Around H. P. B.'s old home are clustered most sacred and tender memories, in connection with her unselfish life.

One of her most devoted pupils, writing of her in 1893, said:

"It is sometimes said that all that H. P. Blavatsky wrote or spoke, constitutes a 'New Revelation.' Laying aside all other matters, Helena Petrovna Blavatsky was accused with equal virulence (1) of having invented all the doctrines she taught; then (2) of having copied it from Paracelsus, Eliphas Lévi, and other writers.

"These are two opposite statements, and as she herself writes in one of her Theosophical publications, she made a nosegay of colored flowers, and all that was her own was the string which tied them together.

"In other words, every doctrine or law which she taught can be found stated in the records of the nations, but it is her hand which has provided the key to their discovery. The main and most important points in the Theosophy she taught and practised are certainly not 'new' in the sense that they originated with her, but she clothed them in modern dress and made them comprehensible for students of Occidental philosophy, and especially so by those who had not the means or the time for such study and to whom the knowledge brought peace and rest in the uncertainties of religious and philosophic doubt. (Italics are mine.—Editor)

..... The law of Karma so much insisted on by Helena Petrovna Blavatsky, is insisted on by all the Oriental philosophers alike.

"The three-fold constitution of man of the New Testament is to be found in the Vedas and elsewhere, while the various schools give a four-fold, a five-fold, and even a seven-fold when you have the hint to find it. The law of periodicity, of rise and fall, or reincarnation in another dress, of cyclic progression, is universally agreed on. The insistence on it as applied to man, and the thus widening his view of life and responsibility, that is Helena Petrovna Blavatsky's."

In plain words, Helena Petrovna Blavatsky had the wisdom to rescue the essential truths of all religions from obscurity, and to place them as clearly defined propositions as keys to the mysterious secrets of human life.

The name of Helena Petrovna Blavatsky has often been used by self-styled Theosophists to impose on the credulity of the people. Within the last few years her name has been found attached to circulars and self-styled Theosophical societies, where the very teachings were a contradiction to the truths that H. P. Blavatsky *did* teach. Occasionally would be inserted just enough of her writings to mislead.

In Europe today there are members of a certain *soi-disant* Theosophical body, in no way connected with the Universal Brotherhood and Theosophical Society, who are now offering "courses in Theosophy"

for pounds, shillings and pence, kronor, etc.; and there is in a near-by city a course of lectures given in which H. P. Blavatsky and Theosophy are blended in with the sale of "medicines" at the end of the lectures. Shade of Blavatsky! What a rebuke to such as these was the straight and clean path she made when she established the Theosophical Society and placed William Q. Judge as her Successor. Wherever one hears William Q. Judge denounced in connection with the Theosophical Movement, there one may be sure to find delusion. And the same delusion will be found in those who do decry the Successor of William Q. Judge, Katherine Tingley. H. P. Blavatsky's efforts in this direction were a SUPERB ENLIGHTENMENT.

In *The Mysteries of the Heart Doctrine*, may be found one of her devoted students writing of her as follows:

"H. P. Blavatsky did her utmost to teach her pupils to attune themselves to the universal divine Law. . . .

"In her her faithful students recognized Friend, wisest of Counsellors, more than Mother.

"In other words, she taught the innate divinity of man, that he was heir to all the powers in the Universe, and must be his own savior through his own soul, needing no intercessor or intermediary between himself and the Divine. And she wielded the power that belongs to one who has attained what she desired all others should also attain."

"These were the teachings of that 'strange woman,'—strange because she loved her neighbor better than herself. Can we wonder that in this materialistic age these thoughts fell like a bomb-shell among the false teachings of some religious systems that were psychologizing the world?

"Yet she gave to the world only an iota out of her vast store of philosophy and science and spiritual wisdom. 'He who speaks the truth is turned out of nine cities;' he who teaches it is crucified according to the methods of the time. The methods of our time are slander, hate and treachery, and these she experienced in the fullest measure. They never ceased; and the very fact of these persecutions pushed her on to do more; on her part also, she never ceased the labors that stimulated them."

"In writing, teaching, diffusing the great truths she had brought to the Western World, she spent the days and nights of many years; and her task yielded neither honor, money nor popularity. . . . She was in her day probably as unpopular as Christ was in his. She did not claim

to have originated these teachings, but with the inner light she had garnered the wisdom of the Ancients; and with that inner urge and pity for humanity in its ignorance, with unbounded love and compassion she gave out some of the Divine Wisdom." H. P. Blavatsky speaks in the following:

"Were the churches themselves not carried away in the flood of negation and materialism which has engulfed society, they would recognize the quickly growing germ of the Christ spirit in the hearts of thousands whom they now brand as infidels and madmen. They would

recognize there the same spirit of love, of self-sacrifice, of immense pity for the ignorance, the folly, the suffering of the World, which appeared in its purity in the heart of Jesus, as it has appeared in the hearts of other Holy Reformers in other ages; and which is the light of all true religion and the lamp by which all the Theosophists of all times have endeavored to guide their steps along the narrow path that leads to salvation, . . . the path which is trodden by every incarnation of Christos, or the spirit of Truth." The Spirit of the Age

WE have noted several addresses, given of late, mostly before religious bodies, on "The Spirit of the Age," and kindred topics. In none of them were the listeners spoken to as if they belonged to the "age" that received so much criticism. The addresses were good, in some cases very good; but all characterized by this mistaken impersonality. The hearers were invited to consider "the spirit of the age" as if they stood apart from it, were visitors from another planet, or in no way shared the follies and sins to which attention was called.

Such discourses are always received with great satisfaction and applause, and in that way show their little real value. For there is an un-

spoken implication:—I who criticize and you who listen, we are free from the errors we thus deplore.

Absolutely nothing is thus affected save that a sense of self-righteousness, of freedom from the failings of the general community, is aroused—surely not a valuable bit of work. "It is an age of boundless passion for wealth," says one speaker. The hearers agree; they think of the Trusts, of multi-millionaires. Is the slightest consciousness aroused in any hearer that he himself contributes to this general "boundless passion,"

It Is An 'Age of Luxury

and that the millionaire is simply a man who has succeeded? "It is an age of luxury," and they all think of the Fifth Avenue palace drawing-room. Will any one curtail a single want? Yet the man or woman who desires one more unnecessary item, one added luxury, effects a contribution to the luxury-loving "spirit of the age." For it is not the luxury purchased, in its absolute value that does this, but the dynamic force of the desire that compelled the purchase.

Another speaker justly remarked that "it is not an age of profound thought, but merely of intellectual activity." To how many of his hearers did it come home that they themselves were guilty of letting their days go by without one thought worthy of the name, without even an attempt to get one from the pages of a book?

In every case the speakers sat down with a larger halo of popularity than when they began. Would that have been the case if they had brought their criticisms home to the consciences of individuals instead of launching them upon the winds? Would they not have been a little less popular, less likely to be among the lists of speakers at the next conference, monthly meeting or what-not?

Plain Living and High Thinking

But the speaker would usually do well, not only to press his idea home to the consciences of his hearers, but to take it to himself. In reading the speeches, one cannot get rid of a certain flavor of insincerity. The strenuous life of mind and soul, the days of plain living and high thinking, are not indicated. These speakers are too representative of that which they criticize, to be of any service. They stand apart for the purpose of criticism, not of action. Nothing they say is of the slightest moment in stemming the tide whose flow they try to deplore.

It was not in this way that Wesley, Peter the Hermit, Bernard of Clairvaux, and many another fire-maker worked. It was not the way of Christ or of Paul. Nor, in our own time, was it that of H. P. Blavatsky when to make a vehicle for the new and quickly coming "spirit of the age," she worked by day and night to found her Theosophical Society. All these lit fires and left them blazing. They were not content to move their hearers into gentle murmurs of admiration as they adjourned from morning sessions to lunch. They hit home, and for that reason, awaking men's consciences, more often than not awoke their lower natures to bitter hostility. The divine Power probably never went forth yet from any man without evoking hostility. It comes not to bring peace, but a sword.

H. C.

"Magnetic" Twaddle

AN article on "Personal Magnetism," by a D. D., gives occasion for a few pointed remarks on this kind of subject, from a Theosophical (and therefore wholesome common-sense) point of view. In the article one finds the usual sort of stuff. There is a man of extraordinary physique, nerves of steel, magnetic personality and so on. He says "the secret of magnetism is to make the heart a highway for every brother man." It is "love" that makes magnetism. "Magnetic people are commonly good hearty eaters; they are aware that there must be fuel under the boiler." Much advice is given that would be good if followed from a better motive; and some that is bad anyway, such as "sitting dead still, . . . avoiding jerking movements, which cause the magnetism to leak at the joints," and so on.

Now healthy, normal, happy people feel at once that this kind of thing, however plausible and convincing some of it may sound, is morbid. And the reason is not far to seek. It is all personal and selfish; where unselfishness is recommended it is only as a means towards the main end which is for personal power. And observe the way in which truths are distorted! It is true that the selfish calculating mind is the great foe of man, and that the way to liberation is by cultivating the heart. But we cannot cultivate the heart by thinking about it; that merely intensifies

the egotism. The way to cultivate the heart and get rid of the burden of selfish absorption is to *get to work*. The Soul or true Self expresses itself through duties rightly done, and the magnetism will take care of itself.

There is really something so contemptible about this philosophy of filling up the wretched body with magnetism and carefully stopping all the leaks, that one does not know whether to laugh or to cry. These magnetic people ought to be shut up together to enjoy each other's company and develop each other's personality. E.

In an Inland City of China

IT is a curious thing that European ideas of China are still so inchoate and vague. The Westerner knows, or thinks he knows, a great deal about the Chinese, from what he sees of him in the treaty ports of China and in those foreign countries to which thousands of the poorer and more illiterate Chinamen go. But of China proper, of the great mass of the inland Chinese, and what the Chinaman is at home, European knowledge is limited to the reports of missionaries and to the biased views of "travelers." As a matter of fact both these classes of opinions are superficial and incomplete.

The recent report of a German consul throws a very surprising and interesting light on what sort of a being the true inland Chinaman is. The city of Ching-tu, in the province of Sze-Chuen, lies in the triangle formed by the intersection of the Kiu-Long-Shan Mts. with the range of the Snowy Mountains. Ching-tu is some 1900 miles from the coast, and has a population of half a million. It is the seat of a general government, and of the superior provincial authorities of Sze-Chuen. The streets of Ching-tu are broad, clean, regularly rectangular, and form a remarkable net of thoroughfares. The German consul above quoted states that the "manifold splendor of the shops and guilds and private houses, the well-clothed people, betraying more of the condition of prosperity than of employment, give to the city the appearance of a refined cosmopolitan center. Foreign wares and articles of luxury are to be obtained in large quantities in the stores of this city deep in the very heart of the country and separated from the outside world, in a province that is reached only by means of difficult land and water ways. The conditions thus described prove that neither distance nor rapids on the rivers nor mountain passes nor likin stations in China present difficulties for commerce that cannot be overcome. For here we find in the thickly populated valley of Tchengtou (Ching-tu) large numbers of people ready to become consumers of European wares."

The above writer states positively that even far in the interior in certain sections, "the condition of the people today is immeasurably higher than those in foreign countries are in the habit of thinking." G.

Deforestation and the Rainfall

THE Kohala district on the island of Hawaii furnishes a very direct illustration of the effect produced on the rainfall by the destruction of forests. Kohala is at the northwestern end of the island, where there is a high mountainous ridge. This ridge and the upper part of the long, gradual slope were formerly well covered with woods, and in the southeastern end of the district they are still growing. In the northwest, however, these forests have been largely destroyed.

In the extreme northwest of the island not a tree is left standing, nor a blade of grass, nor is there ever seen a drop of rain.

Formerly, while there was plenty of forest land, there was also rain enough, but the rain has disappeared with the woods, keeping exact ratio with them.

The country is cut by a number of gulches, about three quarters of a mile apart, and of these only those from the wooded district ever show any water. One of these brooks, and all others to the east of it, run full all the year round. The one in the next gulch is dry a part of the year; that in the next shows water only on rare occasions, while the one west of that and but a little over two miles from the one which always runs full, hardly ever shows a single drop of water. This would in itself be remarkable enough and it is still more so from the fact that in former days these were all running streams, and that the now entirely dry gulch starts exactly from that place on the ridge where the forest has altogether disappeared. Attempts have been made by some land owners to reforest the district, but only with partial success. E. T. S.

Church and State in Italy

A PROMINENT Italian ecclesiastical organ, the *Italia Evangelica*, has been remarking on the striking change of attitude adopted of late years by that portion of the aristocracy of Rome which hitherto has been conspicuous for its attachment to the Vatican. This class of the Roman aristocracy is known under the name of "Blacks," in sharp distinction to the "Whites," or the liberal aristocracy. The latter stands firm with the Italian government.

It appears that the "Blacks" have decided that it is wiser to adhere to the governmental ranks than to stand doggedly as heretofore by the Vatican. In lieu of seizing any and every opportunity to show their attachment to the Roman See, the "Blacks" are now noticeable by their absence. Where formerly the priesthood and the guard were attractive and considered as the only honorable careers for the scions of this branch of the Roman aristocracy, the young men are now turning elsewhere; and families most closely associated with the Vatican through hereditary offices are now seeking intermarriage with the "Whites," or liberal nobility, and are sending their sons to the national fleet and army.

The wordless enmity which has so long existed between the Vatican and the Italian government, due almost wholly to the attitude of the former, is still, in all probability, as strong as ever; but the change of front assumed by the "Blacks" removes one of the most vexatious problems the government has had to face since the realization of a United Italy in 1870 under Victor Emanuel. G.

Curious Funerary Customs in the Solomon Islands

TO a contemporary for September two observers contribute an interesting note on funerary customs in the Solomon Islands. These are the largest but the least known of any in the Pacific ocean, full of volcanic traces and apparently rising somewhat rapidly. The origin of their dark and diminutive population no one knows.

They often subject their dead to a curious mutilation. Cutting off the head, they enclose the skull in an object made to resemble a fish. It would seem that they regard the head as the seat of life, perhaps of thought, and they enclose it in a fish that it may be safely carried across the waters to the beyond. The fish is a very ancient symbol of life preserved, but it is curious to meet it in these isolated islands.

They also bury rings with their dead, and pieces of shells of other shapes with human figures, probably intended for portraits, cut upon them. Between these portraits, and mere linear shapes with no human resemblance, are all gradations. Have we here an indication of *one* of the origins of written language? STUDENT

The Migration to the Cities

ONE of the most prominent questions of the day in Europe, as we gather from the papers, is the steady and irresistible migration of the people from the country to the towns and cities. This is generally recognized as an evil, partly on account of the congestion brought about in the cities, partly from the lack of farmers, and partly from the deterioration in physique and simplicity of character. Various means are suggested to check this movement. But it is evident that the tendency is irresistible, being a result of many causes inherent in the very life and character of the people, and in short an inevitable stage in the progress of humanity through the cycles of its destiny.

It is therefore useless to try and restore the old order; we must try and prepare for the new. What this will be like it is difficult to forecast; there are so many things that need adjusting first. The desire for an exciting life and for quick returns takes the rising generation from the farms to the cities; and the condition of supply and demand of produce, added to vested interests in land tenure and in railways, prevents the gentleman farmer from succeeding.

To utilize Nature and the soil properly it would seem that some kind of communal action is necessary, and the community must have ideals higher than that of mere profit. Let us watch the growth of the Brotherhood work in Lomaland and we may gain some notion of what the future relation of man to the soil and to the cities should be. E.

H. P. Blavatsky and W. Q. Judge---November 17th, 1875

The frontispiece picture this week is that of William Quan Judge, successor to H. P. Blavatsky, who founded the World's Theosophical Society in New York City on November 17th, 1875. The Point Loma Students celebrated this anniversary in the most fitting and interesting way. Their action found a parallel in similar feeling and celebrations by the members of the Universal Brotherhood Organizations throughout the world.

Some Views on XXth Century Problems

Occultism and Charlatanism

NOT as often as might be, but still fairly often, some one is arraigned before the police magistrates for obtaining money from public credulity in matters "occult." The credulity appears to be increasing, as was prophesied many years ago by H. P. Blavatsky. And of course the impostors who flourish on it increase correspondingly. They have but to assert themselves to have "mystic powers," to be representatives of an "Order of Magi," or to be qualified to admit the aspirant to a "Temple,"—and straightway the money begins to come in. Money always occupies a prominent place in the relations of these hierophants and their pupils.

The law reaches them with considerable difficulty, mostly by a side issue. A man was recently prosecuted in New York for practising medicine without a qualification. The issue was taken on this count because it was easier than the real one, which was that he asserted himself as a "High Priest of the Order of the Magi," an Order with "Temples" in Harlem, Los Angeles, Boston and elsewhere—and took money for teaching rubbish corresponding with the fraud of his claims and the credulity of his disciples. A rival set of "Temples" we recall as having had its headquarters several years ago in Syracuse.

Sometimes these uncanny persons are really self-deluded, and entitled to pity. They have become victims of the craze for "occult powers," and, having duly held their breath and pumped it this way and that through their nostrils, gazed at a spot on the wall, taken morphine, or what-not, have become permanently self-hypnotized into acceptance of their own dreams or belief in their own powers and status in "the occult fraternity." But even *their* insanity never takes the form of rejecting fees.

There is another class of fee-takers who do not even profess to show the way up to their own mystic position and the means to their own acquirements. This class claims your absolute and humble allegiance; its members are recipients of a peculiar revelation to which no one else can lay claim. Or they are the reincarnations of Biblical personages—even of Jesus Christ. There are at least three of the latter now before the public, and one or two Elijahs.

The adherence of the followers of all such people is a symptom of the rapidly spreading belief or intuition that there is an inner world in man and nature to which access is possible; that there are powers in man which have hitherto lain latent and unused; and that the world is about to have a new light or message.

But it ought surely to be suspected that such a light would not come through some one who makes the delivery of it monetarily lucrative to himself! And that the way to the inner world could not be shown by men who turn about on the path every few yards to take money from those who follow!

There is another consideration. The very postulation of a higher world or plane of being implies that the path to it is *upward*, a *moral* ascent. Can it be known to, or preached by, men who only appeal to the *selfish* elements in human nature?

The Common- sense of It

And as to the "mystic powers." Let the aspirant think over one or two things before opening his pocketbook. The "teachers" will either teach him to distort his bodily mechanism in some way, the respiratory apparatus usually, sometimes the procreative; and this brings not *powers* but *penalties* (in the latter case very formidable ones): or they teach some form of self-hypnotization by *mental* distortion, affirmations, dwellings on small groups of ideas, or what not; and in every conceivable case this is a limitation and crystallization of the mind, not an expansion: or they teach concentration. And the pupil knows as much about that as any one else. There is no royal road, either by crystals or mirrors, which merely hypnotize again. To learn concentration you must concentrate. And the book you are reading, or the task you are doing, are as well as anything else. The favorite "spot

on the wall" is no better than a word on a page, and not nearly as well as an *idea* on a page.

There is no need to strain after growth. Growth is natural, normal. Raise the body to the best health you can; keep cheerful, controlled in mood and appetite; use the mind fully and concentratedly; keep the sense of beauty alive and fed by music, nature and art; seek the performance of every duty in the highest spirit; trust nature and the higher law to roll up to your door those duties in the doing of which you will find the cure of all the flaws of character;—do all this, finding in the heart the love of it all and that love of humanity which leads to unstinted service; and growth will be swift and balanced, surpassing all the promises of the freaks and charlatans.

STUDENT

Our Cramped Natures

THE "full contraction" system of treating writers' cramp, pianists' cramp and similar troubles, has perhaps a wider application than was in its inventor's mind. Writers, pianists, and the like, in their specialized occupations, use certain muscles only, calling upon them for a very great number of repeated *partial* contractive movements—that is, movements not covering the whole arc or circle possible to the fingers, wrist or forearm.

Now if a muscle (or joint) is to stay healthy, it must be occasionally squeezed clean of all its stagnant, venous blood and lymph. This can only be done—unless by *massage*—by its utmost contraction for a few times, followed by its utmost relaxation and the corresponding contraction of its opposer. In the rest that follows those two movements, fresh blood pours in.

In the case of writers and pianists, the muscles are half used and the products of use accumulate, poisoning them and perhaps organizing into lower forms of tissue.

The remedy and prevention is therefore the utmost movement of every joint in all directions natural to it, eight or nine times, slowly, several times a day.

The analogy holds with regard to the threefold nature, physical, mental and spiritual. Neither of the three will be healthy unless all are in constant full use, each on its highest lines. "A sound mind in a sound body" needs the addition, "and the light of the soul upon both." Physical exercises are good, but alone they never yet gave a man the full and *enduring* health he might have. The utmost use of mind, daily, is good and indeed necessary for its health. But unless it also gets daily into the light of that which is higher than itself, it will stiffen instead of ripen with age; and its sweep of outlook will be narrow and superficial. "Man, know thyself," was a *spiritual* injunction. Must not *self-consciousness* be necessarily beyond mere mind-consciousness? And is not self, freed of its limits, the same as soul?

STUDENT

An Educa- tional Mistake

IN a recent address before the St. Louis educational college, occasion was taken to point out one of the chief errors of our modern school system. Are not the deepest foundations of egotism and individualism laid during the course of school and college training? Rivalry is here made the chief stimulus to exertion.

The aim of the pupil is not so much to do the thing well, as to do it better than his neighbor. The sense of separateness of interests and being reaches its utmost possibility of growth; and, thus, out of tune with the profoundest of all truths—human unity—the young man enters the world.

If anyone doubts the evil of this, let him contrast the system, in imagination, with another—with one in which the pupils are never arranged in their relation to each other, but to the work.

The "first place" is filled by as many as make themselves competent to enter it. They do not measure themselves jealously against each other but against the task. The meaner ambition has no play or encouragement, and the pupils leave school and college at least not *smaller-souled* than they entered it.

The Seven Days of the Week

ONE of the lost mysteries of antiquity is certainly that connected with the division of the week into seven days; a mystery which has been preserved, in defiance of the scoffs of sceptics and the perversions of others, until the day when its meaning shall be found again. Strange power of custom and unconscious intuition, which suffers not the truth to die though it understands it not!

The sceptics can prove that the septenary division of the week is "pagan," that is, ancient and universal; and that the word "Sabbath" can be traced through the Hebrews, back to the Semitic Babylonians, and even beyond them to the Accadians. But, though this may prove that the Christian religion has no genuine sanction for a sacred seventh day, it does not prove that the ancient belief was meaningless. There is a certain real significance about the seventh day, and the days do correspond to the seven planets and hence to other septenates. This fragment of ancient wisdom the Christians have adopted, and, tacking on to it the old word Sabbath, have made a dogma. But Jesus actually ridicules the idea of the later Hebrew Sabbath; and, as for the older Hebrews, with them the word means (as H. P. Blavatsky insists in many parts of her writings) a "period of rest" of any duration, up to myriads of years, and often equivalent to "Nirvana."

One scholar says that Sabbath is an Accadian word, meaning "rest of the heart;" and that the Babylonians, and after them the Hebrews, used it in the general sense of a period of rest; but that the later Hebrews used it in connection with the "pagan" idea of the seventh or sacred day of the Sun.

Some New Finds in Argentine

IF orthodox archeology has once made up its mind that an ancient people must have been "primitive," then it will take a great deal of evidence to the contrary effect to alter that mind.

Accounts of the St. Louis Exposition describe the exhibit of Señor A. Zavalata in the Argentine pavilion. This consists of 4565 specimens of pottery and carved metal and stone, illustrating the life and customs of the inhabitants of South American lands in prehistoric times. The accounts persist in calling these people primitive and in expressing wonder how and why such primitive folk came to make and to need so many and such beautiful utensils. Is not the wonder rather how such cultured people have come to be called primitive?

Cremation was among some of the customs of this interesting people to which we are slowly returning in these latter days. Their urns were made with rare skill and great artistic taste. Their culture is strikingly shown by the articles of table decoration and utility, including the pitchers, cups, bowls and plates which the moderns still find convenient. It is probable that the decorations of these included many colors, but as is usual with relics of such antiquity, it is the rich browns and reds which have best survived the wear of time and climate. Their sculptors worked in a hard black clay, and formed figures showing both beauty of line and originality of conception.

The collection also contains numerous articles of ornamental jewelry, made in copper, silver and gold. The hairpins used by the ladies of those days had the heads so formed as to prevent the pins from falling out, a device which has been the subject of study during the past twenty years and the occasion of patents being issued.

Roman Cremation Urns in London

DURING some excavation work in London recently, an interesting archeological find was made by the workmen. The site was Mansell St., Aldgate, which contains some of the oldest houses in London. About ten feet below the ground were found two huge earthenware vessels, of the shape of watermelons, but five times as large, and having sealed lids. During removal, one of these broke, revealing an inner vessel, which, breaking in its turn, disclosed calcined human bones. Clearly it was a Roman cremation urn, and the site was probably that of a Roman villa. The other urn remained intact and could be better examined. The outer vessel is of clay, and the inner of a much

thinner ware. The outer one is perfectly round and has handles on each side of the mouth; and the inner has a movable cover and is of the shape of an ordinary jar. Probably these are over 1200 years old, and are additional proof that the problem of disposing of the dead was solved; even as we are trying to solve it.

Vanishing Tribes of Central Australia

THIS interesting subject is treated in a recent voluminous work by Baldwin Spencer and F. J. Gillen as a sequel to their former work on *Native Tribes of Central Australia*, and for its preparation the authors spent a year in the field under the financial courtesy of Mr. David Syme of Melbourne. Attention is called to the fact that as the black man dies out, so does the white man's interest in him develop, and this would be especially true of Australia, which has ever been considered as preserving to this day the surviving fauna and flora of extremely ancient times. Together with New Zealand and other islands of Polynesia, Australia marks the location of the ancient continent of Lemuria, from which ethnologists have traced the migrations of many of the earlier races of men who spread out, tree-like, over the newly formed continents when their country vanished beneath the waves.

The chapters in which the authors deal with the social organization of the tribe are interesting and exhaustive, although in the detailed explanation of relationships rather perplexing. As would be expected, what organization there is, though definite, is of the most primitive kind. There is no recognized chief, but on ceremonial occasions certain of the elder men act a leading and superintending part. It may not be a crime to be a young man in Central Australia, but it is certainly not too comfortable. The old men, we are told, take absolutely no notice of the younger men, "preserving their own counsels in the most quiet and dignified manner possible." These leading men are the head men of their respective totemic groups, and forming a sort of secret cabinet council they deal not only with ceremonies, but deal out punishment for offenses against tribal customs.

Although the Central Australian is firmly convinced that his alcheringa (dream-time) ancestors were endowed with superior powers, the authors find no instance in which any of these ancestors is regarded in the light of a "deity."

The Central Australian natives—and this is true of the tribes extending from Lake Eyre, in the south, to the far north, and eastwards across the Gulf of Carpentaria—have no idea whatever of the existence of any Supreme Being who is pleased if they follow a certain line of what we may call moral conduct, and displeased if they do not do so. They have not the vaguest idea of a personal individual other than an actual living member of the tribe, who approves or disapproves of their conduct so far as anything like what we call morality is concerned. Any such idea as that of a future life of happiness or the reverse, as a reward for meritorious, or as a punishment for blameworthy, conduct is quite foreign to them. Every individual, whatever be his or her manner of life, is supposed, when dead, to return, sooner or later to the spot at which he or she lived in the alcheringa, and may at a subsequent time undergo reincarnation. We know of no tribe in which there is a belief of any kind in a Supreme Being who rewards or punishes the individual according to his moral behavior, using the word moral in its native sense.

An Old Rock Wall in Texas

THE town of Rockwall, Texas, takes its name from a curious formation which many contend is the work of prehistoric people, although geologists have held that it is a volcanic dyke. The *Galveston News* says:

That the wall extends along three sides of the town, but generally at some distance from it, although to the south it is to be found within 200 or 300 yards of the corporation line. No one seems to know how long it is, but traces of it have been discovered across the river in Dallas county. It is composed of stones which are three or four inches in width, two or three inches thick and from six to eighteen inches in length. They are piled on top of one another, just like brick, and with the same regularity.

All of it is underground. At some places it comes to within ten feet of the surface of the earth. In others one will have to dig down to twice that depth before its top is touched. In the localities where it is nearest the surface plowshares have turned over many of the stones and some of the fields are plentifully besprinkled with them. Wells have been dug down by the side of the wall for a distance of fully fifty feet, but it extends down beyond that depth.

The stones are of a light yellow color and evidently have mica in them. There are some streaks, too, which closely resemble white marble. The substance is very hard, and when exposed to the elements does not deteriorate. This is attested by pieces which have been exposed for more than a generation. Another curious thing about it is that there is no other stone in the county which is just like it.

Nature

Studies

The Seedless Apple

THIS is the era of seedless fruit, and the old orthodox fruit with its usual quota of seeds is no longer in demand. Seedless fruit in itself is however nothing new, for the banana has been seedless as far back as our knowledge reaches. This has seemed natural, for no one has ever seen a different banana, while the ordinary orange, grape, etc., have had seeds in plenty and to spare. In eating the fruit they are troublesome, and principally for that reason our horticulturists have of late made great efforts to produce fruit free from seeds.

The latest product in this line is the seedless apple now brought out in Colorado. This apple tree does not blossom like other apple trees, and therefore does not attract the codling-moth, and as a consequence the apples are free from worms.

It is curious to contemplate how nature will have to change her methods to suit these new forms of fruit trees. The trees will have to be propagated in quite a different way, and nature will again have to adopt some kind of method of partition. But one thing is sure, and that is that she will be equal to all requirements and will not be baffled by a little thing like a seedless apple.

STUDENT

Do Snakes Fascinate Their Victims?

MANY a time have a certain school of naturalists ridiculed the idea of the power of fascination, presumably because they are loth to believe in anything that will not dovetail into their materialistic views of Nature, but the "superstition" dies hard. Recently, Mr. Graham Peck has endorsed this popular belief. He describes the process as he saw it performed by a gopher-snake.

The snake kept darting out his tongue with extreme rapidity, while the victim, a ground-squirrel, watched it as if spellbound. The snake crept slowly nearer meanwhile, and when within a few inches of his prey sprang upon him and enveloped him in his coils. The spell seemed broken when the leap was made and the squirrel recovered his wits when all too late.

Science has at last been convinced of the reality of hypnotism as practised by human beings, and the natural magic of the wild creatures will be admitted later on.

STUDENT

The Calculating Horse

PARTICULARS continue to appear about the performances of the "calculating horse," Hans, of Herr von Osten, of which the following will serve as a sample. Dr. Heinroth, of the Berlin Zoological Garden, says:

In my presence von Osten asked the horse to add such sums as $6 + 2$ and $4 + 3$. The horse indicated the correct answers by stamping with his right fore-hoof. . . . I asked, "What are the multiples of 12?" The answer came almost immediately. Such sums as $72 \div 14$ are correctly given. The actual words (in German) "What is the difference between 43 and 6?" were read, and the answer immediately pawed. . . . Hans is able to convert common fractions into decimal fractions. He

can also tell time by the clock. . . . He picked out a badly worn German 50 pfennig piece from several coins. From a number of pieces of colored cloth laid upon the ground he will select any color he is ordered to choose.

Dr. Heinroth further states that he has questioned the horse in his stall in the absence of the owner, and received answers just as precise.

According to current comment, opinion wavers between a belief in trickery by secret signs given by the owner, and a belief that the horse can really calculate. But, even if we were able to believe that the horse can calculate, how can we credit him with a knowledge of the German language, and a general education in the mysteries of spoken thought and the understanding of oral questions? The horse would clearly have to be, not merely a calculator, but an educated third-grade horse, familiar with a countless number of ideas and mental processes such as a child assimilates between infancy and childhood.

This is rather too much to believe; and the other theory, that of signs

given by the owner, is disposed of by the last remark of Dr. Heinroth. But what if the owner (or investigator) gives unintentional *mental* signs which the animal is able to perceive? It is surely much easier to believe that an animal might, by what is called thought-transference, perceive the questioner's intention. E.

Perennial Life

THE autumn time has come, and Life has largely withdrawn from outward visible manifestation, especially in the plant world. Where recently all was clothed in verdure and bloom, we see grey and brown, withered leaves and bareness. That which was once so full of life wears the aspect of death.

But when the springtime

comes we shall see, on every hand, arising from the seeming dead, new and vigorous manifestations of Life. The brown earth will once more robe itself in green. Trees and shrubs will wear again a wealth of foliage and bloom, and from hidden root and bulb and seed will arise in gorgeous array the never-dying Life, singing again its songs of joy in every leaf and blade and bloom.

And all this is a type of Life's eternal ways—activity and rest, rest and activity, ever-renewing Life springing from apparent death; a lesson written in living characters year in and year out before our very eyes. And yet how blind and deaf we are to its import! The phoenix ever arises from the ashes of death into more glorious life, and for this we should rejoice. The worn-out form must be laid aside that a newer and better may take its place. Change is but a sign of life. Eternal change is necessary to eternal progress. And what is there in this to lament? We need only to keep step in the great onward march to know the nearness of all we love and feel the bounding joy of Undying Life.

Let us be ever willing to abandon whatever has run its cycle, and to identify ourselves with what is just beginning its course. Let us not haunt the graveyard of dead memories, but search out the dawning promise of the future. Thus shall eternal youth be ours. STUDENT

Woman, to judge man rightly, do not scan
Each separate act,—pass judgment on the Man!—Schiller

The Wife of Schiller

WHEN we read of the life of a great man, poet, writer, musician, artist, soldier, statesman or financier, and admire his wonderful work, how rarely do our thoughts turn toward the quiet companion at his side; the one who has shared his trials, in the struggles against adverse conditions which genius generally encounters in its outward flights, and who has been, perhaps, his real inspiration, with her womanly sympathy and intuition. Many cases are recorded and unrecorded where the husband has held the judgment and criticism of his wife as truer, more impartial, than that of any other.

The unselfish record of a woman's heart is unfolded on the scroll of time more frequently than the world realizes, the woman-heart suppressing its own genius, which may have been greater than that of the one at her side.

History does not give many details of the life and character of Charlotte Von Lengefeld, the wife of the poet, Friederich Schiller. Indeed, more is said about the poet's friendship with others before and after his marriage.

It seemed for a brief period that Schiller hardly knew which he preferred of the two Lengefeld sisters, both equally attractive; but fortunately he married the younger, more practical and clear-headed Charlotte. Germany at that period was infected with a peculiar sentimentalism, where passion and friendship were mixed in such a jargon of free love, that it made rather a bewildering condition of things, socially and morally.

"The weakness of the sentimental period, in spite of the common talk of virtue, friendship and brotherhood, was in reality its intense egoism."

But after Schiller's marriage to Charlotte he became devoted to the acquirement of knowledge, an earnest student of history, classics, etc., and he developed to a wonderful degree, both mentally and in strength of purpose.

Charlotte Von Lengefeld is described as having been fond of the arts, music and sketching especially, and it was no doubt her artistic nature that made her the sympathetic, appreciative companion. Indeed, it was her influence, to a great extent, that held the friendship cemented between

Goethe and Schiller, as each of the two great poets, for many years, while mutually attracted, were yet sensitively jealous of each other. Goethe had a great regard for Schiller's wife, and she, realizing the great benefit to Schiller derived from Goethe's friendship, fostered and sustained this relation between the two to the best of her ability.

The picture of Charlotte Von Lengefeld is very pleasing and almost beautiful. The fine oval face, with its large dreamy eyes, piquant nose, sweet mouth, surrounded by masses of dark, wavy hair, forms a most attractive picture. Hers was a sympathetic, not an egotistical, character. She was one who, while possessing gifts of her own which, individualized, might have made her shine as a light, yet suppressed these, happy in doing so, for the purpose of sustaining the genius of the one near her whom she loved. *Such is woman.*

So we read the character of Charlotte Von Lengefeld, the wife of Schiller, with whom he lived happily to the end. His married life was full of contentment and peace that is not often the lot of gifted mortals. Does that not record the effort of the faithful woman-heart in the home? E. C. S.

CHARLOTTE VON LENGEFELD

A Unique Incident

THE New York Supreme Court recently reported a unique incident, that of a woman lawyer acting as counsel for her husband. Mrs. Florence Potter is the attorney in question and her connection with this case—which concerned certain water concessions in Mexico—went much further back than the suit in court.

Mrs. Potter, after her graduation from Cornell University, began the study of law and continued it after her marriage to Mr. Potter, a civil engineer. A few years ago she went to Mexico to re-

cover from a serious illness, and while there learned of a series of waterfalls near the capitol. She connected this information with the fact that the business men of Toluca, where she was staying, were complaining about the cost of light and power, owing to the short supply of coal. The idea of utilizing the Falls came to her. She visited them and on her return to Toluca asked the Governor for an option on the water right of the Falls. It was due to her influence that her husband later took up the government concession and it is with regard to this that the recent suit was brought.

Theory vs. Fact

THE dislike of Indian children for the Reservation schools in certain sections is commented upon, year after year, by our newspaper correspondents, as the school season opens.

One observer writes: "So reluctant are some Indian mothers to give up their children, as they think, that the Indian agent withholds rations and annuity money until the children are placed in school. Even then parents often seclude them until hunger brings the matter to an issue and the mother succumbs."

Perhaps we may discover the reason why in the following description:

"If the child has never before been in school, and especially if it is a boy, there is a heart-breaking ceremony.

"His mother has dressed him in his finest buckskin suit and beaded moccasins. His long black hair hangs in two glossy braids down his back. He is the son of a warrior and wears the garb of one, and he stands silent and disdainful in the presence of the school superintendent.

"The latter believes that the quickest way to make a white boy of him is to strip him of everything that suggests the Indian. He brings forth a pair of scissors and the mother and son begin weeping.

"The long braids are seized and cut close to the scalp. The boy bursts into a paroxysm of grief and reaches for his mother's arms. Then his buckskin suit and moccasins are removed, and in place of them he wears a shirt, a coat, a hat, stockings and a pair of coarse shoes; and his misery is complete."

There is nothing to be said in favor of tepee sanitation or tepee household and educational conditions generally, and it is perhaps not strange that the unthinking argue "degeneracy" when the Indian child prefers his "home" to the well-lighted and sanitary building where he gets three good meals a day; clean clothing, plenty of baths and kind treatment.

But there is something else to be considered and the above description gives one reason for this dislike and distrust. The Indian, forced back upon himself by hardship and injustice, clings to old customs and tribal traditions with a loyalty of which the civilized man is scarcely capable. The solution will come when our Indian agents know more of human nature. Indian traditions are not meaningless. They are degraded, doubtless, yet still reminders of the time when the Indian race did stand close to the sun. That is why there is a sacred and pathetic significance in their clinging to what seems to us trivial and even objectionable. Until we realize this and bend our own devices to its recognition, our brotherliness will be mixed and mitigated with something quite the reverse, to the Indian mind. One cannot make a wild grape-vine produce hyacinths, though, by pruning it according to its own nature and by giving it the food its life demands, the wise gardener may make it produce better grapes and become a more useful vine. One cannot grow roses upon the wild almond tree, but common-sense treatment has produced from that very stock one of our most delicious and valuable fruits.

When will we be as rational in our treatment of human beings as are our gardeners in their handling of shrubs and plants? STUDENT

TODAY'S paper contains the account of an eighteen-year old girl who is being held to the grand jury of one state for trying to extort money from a well-known publishing house. She threatened to blow up the publishing house unless the manager of it sent her five hundred dollars! The police believe that her acts are to be attributed solely to the reading of sensational literature. Is there not a lesson in this and is it not time that some of the sentimentalism that is yet indulged in, over young womanhood in the abstract, should adjust itself to facts? H.

A Japanese Nurse

IN Roosevelt Hospital, New York, a Japanese girl, Miss Tama Ide, is studying to be a trained nurse. She came to America a year ago, and when the war broke out her heart became fired with a great desire to help her countrymen, and she decided to become a trained nurse. She was finally admitted to the hospital and as soon as her course of study is completed will go back to her beloved Japan. To quote from her own quaintly-worded letter of application:

"Our Empress and the ladies of the noble families are greatly interested in the work of the Red Cross Hospital, and I believe the time is already here for the more demand of the highly and perfectly educated nurse in our country." STUDENT

THE President of one of our largest National Banks recently said, as reported in an exchange:

The feeling is gaining ground that women are, on the whole, more honest than men. A considerable number of women are now rendering satisfactory service as cashiers and tellers, handling large sums daily without loss or error. One of the most conspicuous traits in the feminine nature is fidelity to trust. Speculation, the chief pitfall of defaulting employes, does not attract women as it does men. Cards and drink also drag down many a male employe, and these, again, are more particularly masculine vices. Some of the largest banks in New York are employing women in positions of heavy responsibility. Banking is an occupation in which men no longer have a monopoly.

THE early training of the Czarina of Russia was simple almost to meagerness and frugality. She was taught to have as few wants as possible and to help herself in every way, taking the greatest care of her clothing and her belongings. Said her mother at one time: "It is important for princes and princesses to know that they have the double duty of being examples in their own lives and of living to serve others as well."

AMONG other things unearthed by Professor Flinders-Petrie in Egypt, are a number of marvelous antique necklaces. Time changes and races pass, but the tastes of women, it seems, continue. There is something strangely pathetic about these old-time ornaments, that may have adorned some famous Queen or Princess of old Egypt.

MISS HELEN GLADSTONE, the youngest daughter of the late Premier of England, is one of the leading women educationalists of her country. She was for some years vice-principal of a large Woman's College, but left this position to take up philanthropic and educational work among the poor.

AT the Mexican gambling tournaments or *ferias*,—and the same may be said of many of the Spanish-speaking countries,—gambling is universal. Even mothers will hold their little ones up to the table that they may try their luck at some game of chance.

AFTER two men had been appealed to in vain to rescue from drowning Leonard Beach, a six-year-old boy of Middletown, New York, Mrs. John Guyer, who was near by when the little fellow fell into the water, plunged in and saved the boy's life.—*Exchange*

HUMAN nature will not flourish any more than a potato if it be planted and replanted for too long a series of generations in the same worn-out soil.—*Nathaniel Hawthorne*

A YOUNG society woman of Philadelphia, Miss Jane Morgan, daughter of the Vice-President of the United Gas Improvement Company, has recently qualified as a master-mariner. She has been given a certificate "for all oceans," the highest mark for navigating skill, attesting to her ability to command a vessel under any and all conditions. She is officially qualified to take command of any vessel, from a coasting schooner to an Atlantic liner, a distinction which only five other women in America can claim.

FRIEDERICH VON SCHILLER

FRAGMENT FROM

"THE ARTISTS" BY SCHILLER

O! happy! and of many millions, they
The purest chosen, whom her service pure
Hallows and claims--- whose hearts are made her throne,
Whose lips her oracle--- ordain'd secure,
To lead a Priestly life, and feed the ray
Of her eternal shrine--- to them alone
Her glorious Countenance unveil'd is shown:
Ye, the high Brotherhood she links--- rejoice
In the great rank allotted by her choice!
The loftiest rank the spiritual world sublime,
Rich with its starry throes, gives to the Sons of Time!

The Wonders of Life

SUPPOSING that mankind had lived in absolute ignorance of the existence of fishes and that some naturalist had at last discovered them. What possible chance would the discoverer have of being believed, if he had no evidence to offer beyond his mere statement?

It would be objected that air is necessary to life and therefore it would stand to reason that no animal could live under water; also that, as our daily observation showed us, animals falling into the water were very soon drowned, submarine animals must be the figment of disordered imagination. Statements, however incredible, come by degrees to be accepted when evidence accumulates, and they take their place among other ascertained facts and cease to excite any astonishment whatever.

It is not air, so it turns out, that is essential to life, but the oxygen in the air, and as seawater contains dissolved oxygen and the fishes' gills are able to absorb this gas and thus refresh the blood, the seeming miracle of submarine life disappears. Astronomers are very apt to assure us that the temperature of one planet, or the atmospheric conditions on another, are such as to preclude the existence of any living creatures, but this assumes that we know the limits of nature's powers of adaptation. Nature is full of contrivance, and it may well be that some simple adaptation to environment, like that of the gills of the fish to their proper element, may be present, and that planets differing widely from the earth may each have its appropriate fauna and flora.

Every newly rediscovered truth at first appears incredible, then it is admitted to be "possible," afterwards "probable," and later on it finds general acceptance. The Twentieth century has many surprises in store, but let us bear in mind when they appear, that they are to be accepted or rejected not as they strike us as credible or incredible (for this mainly depends upon our own imaginative powers), but simply on the evidence brought forward in their support.

JAPAN is divided for military purposes into seven districts. While soldiers of the Japanese army may be conscripted, the difficulties of conscription in Japan are quite the reverse of those encountered in other countries. The number of those who pass the examination is so large that it always has to be reduced by lot, leaving many would-be soldiers sadly disappointed. There are two reasons for this; one, that the Japanese people, unlike many others, are not physically deteriorating from year to year. The other is that the passion of their lives is pure patriotism. To serve their country is the great ideal of the youth of Japan, and it is fostered from babyhood by their fathers and mothers. "To die for His Majesty the Emperor," is the dream of many young lives, and but one thing is ever preferred to that—which is, *to live*, that they may serve Japan.

Facts Worth Knowing

IN JAPAN the government controls telegraph lines and mails, and to a certain extent, the newspapers.

"NO MAN is worth reading to form your style, who does not mean what he says; nor was any great style ever invented but by some man who meant what he said."—*Ruskin*.

THERE are fewer convictions in the criminal courts of Japan in proportion to the population than in any other of the Oriental nations, or in England, France, the United States or any Christian country. Something to think about here, isn't there?

HOW MANY know that the first locomotive ever built in this country had rough wheels and a cog track? And that was only a hundred years ago. The inventor believed, and others agreed with him, that smooth wheels could not draw a load over a smooth track.

RECENTLY there were discovered in the tombs at Beni-Hassan, Egypt, a large number of dolls which are doubtless thousands of years old. Some of them are rudely carved and upon many of them the paint seems to be as fresh as when placed there forty, or perhaps sixty, centuries before.

IT WAS in the same city, Philadelphia, where Betsey Ross, over a century ago, made the first American flag, that the first international peace flag had its birth. On the 12th of October, 1891, on the 399th anniversary of the discovery of America by Christopher Columbus, a committee of representatives from all parts of the world met in Independence Hall, Philadelphia, to plan a congress for the advancement of justice and peace. In the very room where the Declaration of Independence was adopted and signed, was designed and given to the world the peace flag.

MOST boys, as well as girls, wish to know the reason for things; to know *why* they should be good and honest and pure. How they long to find out something about the natural laws we are expected to obey! Raja Yoga gives the reason for these things, and that is what makes it so splendid.

SOME years ago, after the Emperor Mutsuhito had demonstrated that he was the real ruler of his people and had determined that Japan should become one of the great modern powers, his statesmen seriously contemplated making Christianity the state religion. In order to make certain of the wisdom of that move he sent out an embassy of wise men who went around the world studying foreign affairs. On their return they advised against Christianity for the reason that they found more crime, vice and poverty in London, Paris, Rome, New York and other great Christian cities, than in Tokyo or any of the cities of heathen Japan. E.

LIFE'S MIRROR

THERE are loyal hearts, there are spirits brave
There are souls that are pure and true;
Then give to the world the best you have,
And the best shall come back to you.

Give love, and love to your heart will flow,
A strength in your utmost need;
Have faith and a score of hearts will show
Their faith in your word and deed.

For life is the mirror of king and slave.
'Tis just what you are and do;
Then give to the world the best you have
And the best will come back to you.—*Selected*

STUDENT

THE CHILDREN'S HOUR

Harry's Silkworms

HARRY WILSON was a sturdy youngster of eight years, bright, cheery and kind-hearted, but like most boys, fond of fun and mischief. There was one very good point in Harry's character, and that was his intense love for animals. One day Harry's father brought home a little brown box, which he handed to his son, with a caution that he be careful in handling its contents.

Very gently Harry opened the box and was rather disgusted to find—no, not chocolates—but a small piece of paper on which were a number of little round lumps, rather smaller than a pin's head, some grey and some yellow. "They are silkworms' eggs," said Mr. Wilson, "and I want you to watch them carefully every day, Harry, and see what lessons you can learn from them."

So, day by day, Harry carefully examined his little box, but the round spots never changed, and at last he got tired of waiting and told his father that he was sure they must be dead, for they never moved at all. But the very next morning he found that a number of the eggs had burst and a lot of little black things, just like tiny bits of black cotton thread, were wriggling about on the white paper.

Harry had heard at school that silkworms were fed on mulberry leaves, and now that he had his silkworms, it suddenly struck him that he did not know where to find a mulberry tree. So, very anxiously, he ran to find his father and tell him of his good fortune and also of his anxiety about food for the little worms.

"Oh," said Mr. Wilson, "I thought you told me your eggs were dead." "Well, they seemed so," replied Harry, "but"—

"Yes, but—things are not always what they seem," continued his father, "and I think your silkworms have already taught you *that* little lesson." Then he told Harry that if he had no mulberry leaves he could feed them on lettuce leaves. And very soon the "little bits of cotton" were lifted very gently into a larger box, with a glass lid to it, and laid on some nice, tender lettuce leaves, at which they quickly began to nibble.

Day after day Harry changed the leaves for fresh ones, and day by day he watched the worms grow until at last they were almost as big as his little finger, and had changed in color to a dull greyish white. And all they seemed to do was to eat, eat, eat. Harry began to think they were failures, after all, because they were not spinning silk. But his father told him to wait. He said that they were something like certain people, who seem to take in all they can get for themselves, but give out nothing in return. But the time comes when these folks realize that it is better to *give* than to *receive*, and then they start to give out to others all the joy and light and warmth that they have been storing up in their hearts. So one morning, when Harry opened his little box, sure enough, he found that two of the silkworms had left their lettuce leaves and gone into a corner of the box and were there spinning a little golden thread. Of course he hurried off at once to tell his father the wonderful news, and with his help he soon made two little paper cone bags—like sugar bags—and into each he dropped one of the little spinning worms. Harry wanted to close

them up lest the silkworms escape, but his father told him he need not fear that, so they left the bags open and pinned them upon the wall of Harry's room. And the little insects at once started spinning a fresh web, and very soon had made quite a little nest of golden silk. Harry was delighted to watch them as they spun and was much surprised to find that they kept *inside* the web, which they spun around themselves, thicker and thicker, until he could not see any silkworm at all! The poor little caterpillar was quite shut in! But Harry's father told him that inside there, in the silence and darkness, a very wonderful little piece of fairy work was going on, the result of which he would see later.

A few days afterward Mr. Wilson opened out one of the bags, and gently removing the threads that held it, he placed in Harry's hand the little golden ball, or "cocoon" of silk. Then he showed him how to unwind it. Removing first a little fluffy, silky web from the outside, they soon came upon an 'end' of silk. Then, dropping the cocoon into a glass of water, Harry started to unwind the silk on to a card.

Over and over rolled the cocoon in the water and Harry kept on winding and winding until his poor arms ached! He thought he never would get to the end of the silk! But at last it was finished and the insect dropped to the bottom of the glass, still surrounded by a thin white film of closely-woven thread.

This was soon removed, and instead of the white silkworm which Harry had seen spinning its way into the cocoon, he found a lovely brown chrysalis, which he laid in a box of nice, clean bran, and as the other silkworms spun and the silk was unwound from them, each chrysalis was put into the bran box. Harry wondered what would happen next. It really almost seemed as if the chrysalises were dead, for they could not walk or move except now and then to give a little wriggle. One morning when Harry opened his box he cried out, "Oh, papa, one of my poor chrysalises is broken!" and he pulled out an empty brown shell. But the next instant he caught sight of a beautiful white moth fluttering about. And he soon recognized that the chrysalis had only broken so as to let out the beautiful butterfly that had been hidden

within it. This time Harry was able to tell his father one or two little lessons which this fresh change reminded him of, so I dare say you will be able to think them out too. Then the white moth was placed in a box lined with clean white paper, where it was soon joined by the others as they broke from their brown covering, and when next Harry examined them he found the white paper dotted all over with little grey eggs, just like those he had had given him in the spring time. His moths soon died, but they left the little grey eggs behind. And in each egg there was "life," only waiting till the proper season came round to burst out just like the others had done, and go through the same round of change and progress. Harry had learned many lessons from his silkworms—little lessons that told him of some of nature's greatest laws. And I think if we look into our hearts, with this picture of one little germ of life going through its many changes, we, too, shall learn some little lessons that will help us, from Harry's Silkworms.

Art Music Literature and the Drama

The German Poet-Dramatist, Friederich Schiller

"TO this boy I owe my second youth," said the venerable Goethe at one time, referring to the poet Schiller at his side.

This month has been celebrated the 145th anniversary of the birth of the poet-dramatist, Friederich Schiller. Next May will be celebrated, with marked honors in Europe, the 100th anniversary of his death. Gifted, pure by nature, high spirited, with a perfect genius for work and an innate love for his fellowmen, it was not strange that Friederich Schiller had, upon the Germany of his day, a marked influence. If Goethe owed to him a "second youth" Schiller owed much of the richness of his own free life to the older poet. Their friendship was one of the most romantic and purest known to that day of romantic comrade-friendships. Schiller counted as friends most of the liberal minds of the day, Fichte, the two Schlegels, Schelling, Wilhelm von Humboldt and many others; yet to none of them did he declare the allegiance that he declared, and justly, to Goethe.

As a dramatist, Schiller struck a seemingly new note and the revival of some of his best-known dramas at the present time is proof that they contain qualities unusual. Had he possessed a deeper knowledge of human nature, however, had he better known himself, had he felt within his own soul that deep, unshakable conviction that only a true philosophy of life can give, his dramas would have sounded nearer the true note. This is particularly the case in one drama, *Die Jungfrau von Orleans*; for to Joan of Arc's memory Schiller has unwittingly done great wrong in picturing her as being carried away by a personal affection for Lionel, an occurrence not only unhistorical, but impossible to the Maid's character. We can understand today that it was Schiller's desire to touch the heart-strings that induced him to make this departure. His philosophy gave him but slight conception of that higher love which includeth, refineth and transmutes all personal affection; of that higher patriotism which maketh the world its country; of that purer unselfishness which looks beyond kindred, beyond the individual and sees life as a whole. Had he possessed that rarer insight that Theosophy gives, Schiller would have painted the Maid's character differently. He would have sung a song of pure love, love for one's fellow-men. As it is, Joan of Arc still waits the dramatist who shall do justice to her memory.

Schiller, however, because of his soul's refusal to oscillate perpetually between the equally unmoral extremes of an impractical "idealism" and the offensive doctrines of free love, which were current in his day, stands as an example, and men of all nations owe him gratitude. The poet has long deserved more than school-book and class-room recognition, and now he is receiving it. Granting all the limitations of his philosophy, Schiller yet did humanity rare service in his gospel of brotherliness and of beauty. He shall be written as "one who loved his fellow men." STUDENT

SCHILLER'S HOUSE AT GOHLIS, NEAR LEIPZIG
Here Schiller lived and wrote his "Hymn to Joy," in 1785

FRAGMENT FROM

SCHILLER'S "HYMN TO JOY"

IT is said the "Hymn to Joy" owes its origin to the following incident:

When at Leipzig Schiller once saved a poor student from drowning himself in the river Pleisse. The student was destitute and, fearing starvation, had fallen into despair. Schiller gave him what money he had and a few days afterward related the story at a marriage feast. A subscription was there made which enabled the student to complete his studies and ultimately to enter an official situation. Fascinated by this evidence of the reality of human brotherhood, it was to Humanity that Schiller consecrated this Ode.

SPARK from the fire that Gods have fled—
Joy—thou Elysian Child divine,
Fire-drunk, our airy footsteps tread,
O Holy One! thy holy shrine.
Strong custom rends us from each other—
Thy magic all together brings;
And man in man but hails a brother,
Wherever rest thy gentle wings.

CHORUS—Heart to heart, ye mortal millions!
Here—a kiss to all that lives!
Yea starry worlds that shine on this,
Oac common Father know!

All being drinks the mother-dew
Of joy from Nature's holy bosom;
And vice and worth alike partake
Her steps that strew the blossom.
Joy in each link—to us the treasure
Of Wine and Love—beneath the sod,
The Worm has instincts fraught with pleasure;
In Heaven the Cherub looks on God!

CHORUS—Why bow ye down—why down—ye
millions?
O World, thy Maker's throne to see,
Look upward—search the Star-pavilions:
There must Joy's mansion be!

Joy is the mainspring in the whole
Of endless Nature's calm rotation;
Joy moves the dazzling wheels that roll
In the great Timepiece of Creation;
Joy breathes on buds, and flowers they are;
Joy beckons—suns come forth from heaven;
Joy rolls the spheres in realms afar,
Ne'er to thy glass, dim Wisdom, given!

CHORUS—Joyous as suns catering gay
Along their royal paths on high,
March, Brothers, march your dauntless way,
Warriors of Victory!

Technique vs. Mind and Soul

IN so far as musical technique is the result of manual training and brain-mind study purely, one reads the story of intellectual progress alone. It is technique so acquired that leaves one unmoved, the heart chilled, the soul all untouched, because in no sense has the soul been spoken with or to.

Reacting from this, it is not strange that some now go to the other extreme, declaring the soul, or the emotions, to be everything; that technique is not only secondary, but is of little real account.

One extreme is as illogical as the other. "Nor soul helps body more than flesh helps soul." There must be the union of perfect inner feeling and perfect outer form. Jenny Lind was one of the few who realized this; not intellectually, perhaps, but of a surety, intuitively. It is useless to contend that the soul's real message can ever be voiced through faulty technique. Take, for example, the playing or singing of a simple *legato* passage. Let it be imperfectly rendered—the musician may wear the "front of Jove himself;" what boots it? The message is not heard by the soul because untranslatable. Perfectly rendered,

each note is, not blended as they say, but transmuted in its alchemic reach toward the next—each tone a perfect whole, rising from the preceding note as arc lifts its fullness out of arc into the perfect spiral—each tone born from the last, transmuted into its own higher expression by its birth into the tone to come.

It is useless to contend that the purity of perfect expression can be acquired save by careful training both of muscle and of mind. One may feel all the spirituality of Homer in his soul, yet can he translate the Iliad in such a way as to make that spiritual flame a living realization to others, unless he knows the Greek verb and can tell an aorist passive from the O-declension without asking his Hadley & Allen?

We need not less study of technique; we need more. But the real study must follow the guidance of the heart, using mind and body but as garments for the outreaching soul to assume; instruments for it to use.

Then shall come the pure interpretation of music for which humanity has waited long.

STUDENT

RECOGNIZING the good results that come from soldiers singing when on the march, the Italian Minister of War has just ordered 25,000 books of patriotic and military songs for the army as an experiment.

These will be distributed to the men in infantry regiments, and classes for singing will be instituted in the barracks.

A similar experiment made in France by General Poillou of St. Mars has been attended with marked success, the number of stragglers on the march being reduced by 70 per cent., owing to the singing; due, it is stated to the music. H.

Extracts from W. Q. Judge's Writings

THE following extract from one of William Q. Judge's articles, published in 1897, is interesting:

"Our philosophy of life is one grand whole, every part necessary and fitting into every other part. Every one of its doctrines can and must be carried to its ultimate conclusion. Its ethical application must proceed similarly. If it conflict with old opinions those must be cast off. It can never conflict with true morality. The spirit of Theosophy must be sought for; a sincere application of its principles to life and act should be made. Thus mechanical Theosophy, which inevitably leads—as in many cases it already has—to a negation of brotherhood, will be impossible, and instead there will be a living, actual Theosophy. This will then raise in our hearts the hope that at least a small nucleus of Universal Brotherhood may be formed before we of this generation are all dead."

Another extract:

"Theosophists, if they will learn the doctrine and try to explain it, will reform the world. It will percolate everywhere, infiltrate into every stratum of society, and prevent the need of legislation. It will alter the people, whereas you go on legislating and leaving this world's people as they are, and you will have just what happened in France. . . . So you see if something is not done to raise the people what the result will be."

Another extract from the same writer (written in 1895):

"Let me say one thing *I know*: Only the feeling of true brotherhood, of true love towards humanity aroused in the soul of some one strong enough to stem this tide can carry us through to the close of next century and onward. For Love and Trust are the only weapons that can overcome the *real enemies* against which the true Theosophist must fight. If I or you go into this battle from pride, from self-will, from desire to hold our position in the face of the world, from anything but the purest motives, we will fail. Let us search our souls well and look at it as we never looked before. See if in us is the reality of the brotherhood which we preach, and which we are supposed to represent. Let us remember those famous words, 'Be ye wise as serpents but harmless as doves.' Let us remember the teaching of the Sages—that death in the performance of our own duty is preferable to the doing by us of the duty of another, however well we may do the latter; the duty of another is full of danger. Let us be of and for peace, and not for war alone."

And again:

"The only way we can alter the race tendency is by such action *now* as makes of each one a center for good, a force that makes 'for righteousness,' and is guided by wisdom.

"What then is the panacea finally, the royal talisman? It is DUTY, Selflessness. Duty persistently followed is the highest yoga; if you can do no more than duty it will bring you to the goal.

"The power to know does not come from book-study nor from mere philosophy, but mostly from the actual practice of altruism in deed, word, and thought; for that practice purifies the covers of the Soul and permits that light to shine down into the brain-mind."

There Is No
RELIGION
Higher Than
TRUTH

FRIENDS IN COUNSEL

DEAR COMRADES: I do not see why we should be daunted or depressed when we have failed and fallen short of our ideal. The fact that we are conscious of having failed is in itself a proof that we have tried, and surely it is a better thing to have

the pain of knowing that we have failed than to stand on some low pinnacle of attainment and there remain in blissful adoration of our own perfections.

Any one who tries for an ideal, is attempting the as yet impossible, just as the baby does when first he tries to walk. He tumbles as a matter of course, because the inward urge must always precede the outward development; but he has tried, and by the very effort he has strengthened his body and hastened the day of his final triumph. As a matter of fact, however, there can be for us no "final triumph," for every advance we make only reveals a further distance to travel, and every height attained shows us still loftier heights to climb. The only success we should care about is *the having succeeded in trying*. We shall always be failing in perfect accomplishment, but need we ever fail to make an effort? You may remember that a great emphasis is often laid upon the apparently superfluous injunction, "Seek out the way," but no mention is made of the ultimate goal. We may, indeed, well enquire whether there is in all the boundless universe any final goal-post where we may sit down finished and perfected with no further journey to pursue, or greater heights to surmount.

Well for us that the path is endless and our progress unlimited. There are doubtless stages in the journey and halting places for our rest and refreshment, but to suppose that we shall ever be done with the need for striving or be delivered from the consciousness of failure, is to suppose that an eternity of stagnation lies in front of us and that the way of further progress is barred.

We are eternal pioneers advancing, and though we clear the way before us, leaving order and light in our trail, the forest is ever before and the axe and the hatchet are never out of our hands. Let us then leave dependency, and for this moment let us hope and aspire, and when the next moment comes let us go on hoping and aspiring. If we maintain this attitude from moment to moment we shall really have found "the way," and as life is made up of moments, we shall be treading the path all our lives. Comrades, let us pledge each other as eternal pioneers. The regions we have cleared we leave to the settlers with their flocks and families. What care we for smooth roads and broad meadows? For us the forward march and the crashing of the axes in the jungle. Failing, struggling, forward-moving pioneers the world over. P. L.

It is by doing that we learn to do; by overcoming that we learn to overcome; by obeying reason and conscience that we learn to obey; and every *right act* which we cause to spring out of pure principles, whether by authority, precept, or example, will have a greater weight in the formation of character than all the theory in the world.—Morell

Path

JUDGE NOT

by ADELAIDE A. PROCTOR

JUDGE not; the workings of his brain
And of his heart thou canst not see;
What looks to thy dim eye a stain,
In God's pure light may only be
A scar, brought from some well-worn field,
Where thou wouldst only faint and yield.

The look, the air, that frets thy sight,
May be a token, that below
The soul has closed in deadly fight
With some infernal fiery foe,
Whose glance would scorch thy smiling grace,
And cast thee shuddering on thy face.

The fall thou darest to despise—
May be the slackened angel's hand
Has suffered it, that he may rise
And take a firmer, surer stand;
Or, trusting less to earthly things,
May henceforth learn to use his wings.

And judge none lost; but wait, and see,
With hopeful pity, not disdain;
The depth of the abyss may be
The measure of the height of pain;
And love and glory that may raise
This soul to God in after days!

Decay of Reverence and Decline of Discipline

MANY there be who bewail what they term the "fast-disappearing reverence for those things that were held in high regard by our forefathers."

This applies, in degree, to most religions in vogue today, and what is meant is that there is a growing tendency to ignore old interpretations of the law as formulated in each particular bible. They account for it only on the ground of degeneration and retrogression in the maintenance of absolute fealty to their conception of the ideal.

True reverence is not decaying.

To expect permanent adoration, with awe-strickenness, for a divinity of caprice and favoritism is against all logic, and against that law which the Helpers of the Race came to teach. Revolt at a crassly materialized ideal is but the natural result of the upreach of mankind at this time, and with it a longing for a return of the pure principles upon which the highest ethical law is based. The spiritual unrest today is evidence that individual and social humanity are, under the law, trying to free themselves from that which has obscured the truth. The health of any organism is evidenced by the rapidity and thoroughness with which it eliminates from itself hurtful and deleterious matter, and this is true of man's whole nature, physical, mental and moral.

Except for the grossly material true reverence has not abated.

By discipline is meant instruction and government, comprehending the imparting of knowledge and regulation of practice. There is undoubtedly a decline of discipline, due to the fact that, under our present regime, the attention to and activity in our religious nature is only incidental. The chief concern of man has been to so prepare himself that he may be able to care for "number one," meaning the physical or intellectual, relegating ethics and religion to the incidental.

Religion is here meant in its original sense, and as it was viewed and taught by the great teachers of humanity; not an occasional mere rhapsodizing over an extra-cosmic anthropomorphic deity; not a religion from which to ask selfish favors and exemption from those evils which, under the Law, we have brought upon ourselves and are faced with to rectify by effort. But that religion of highest ethical value which means what the word implies and what the teachers knew it to mean, *i. e.*, a binding or holding back of the personal self to permit a fulfilment of the behests of the Christ within—the "I am that I am" of Masonry—the "Father

in Secret, which is within you." The word religion comes from *re*, back, and *ligare*, to bind, meaning as stated above.

As has been said, to the average man religion is incidental, and the same man, a partner in nature's redemptive processes, with will to do or not, blinds himself to that which dominates all else in nature. It is the natural impulse to *expand, create* and perpetuate. To expand in area of usefulness, that we may see the obligation for others; to expand those higher phases of character which we possess that we may "glorify God," which means to mirror forth the attributes of God in the degree we possess them and permit their efflux; to enlarge our conception of the purpose of our being here.

To create within ourselves an overwhelming desire for upreach: to create broader, higher and purer ideals and keep them constantly before ourselves, thus tinting with harmony our every act. To perpetuate those habits of fulfilling the behests of the highest within us, that they may permanently dominate our lives, for this alone increases the self-consciousness of our divine nature.

The evolution of this self-consciousness is the ultimate purpose in life, and its development through the response to our highest behests assures us the only additions to our individual worth which will be our permanent possession both in this and the lives to come. All the great teachers have told us to seek first *within*: "Man know thyself;" "The first study of mankind is man;" "Seek ye first the kingdom, within you," etc., etc.; all this is urged upon a knowledge of the Law which all the teachers said they came to propound and fulfill. And the law means a uniformity of phenomena from cause to effect, nature, habit, God's method of expressing himself, and are processes that are subject to no caprice and none are exempt.

Thus it is that Theosophy applies for the upbuilding and maintenance of those principles which, adhered to, make for the pure, unselfish, wholesome utilitarian life. These principles are worthy of and receive the deepest reverence. If there be in the world today a person or body of people who, by their lives, are demonstrating that they are, to the full, faithful to those principles, they, too, rightly command like reverence. It does not derogate from the worth and standing of teachers of the past that there should be exemplified *now* their lives and what they strove for.

Raja Yoga means the perfect balance of *all* the faculties, the harmonious development of *all* the powers that make the divine-human nature, and Katherine Tingley and her Raja Yoga children are exemplifying these. The children are embodying those noble traits of character that make for the highest type of manhood and womanhood. The profound reverence they hold for their teacher and the strong discipline they joyfully maintain upon themselves attest the normal, healthful functioning of all their faculties. It is their lives and the fruits thereof which demand the just estimate of the real work done by the Universal Brotherhood organization, and it is to them and their work that all other effort is subordinate.

AMOS C. McALPIN

Courage

CAN imagination conceive of a drearier, more trackless waste than H. P. Blavatsky found when, with pioneer courage, she entered upon her work of arousing the slumbering soul of humanity? Every nation had lost the light; religion had become *irreligious*, well-nigh materialized; people had forgotten themselves to be other than mere bodies. It was as an expanse of dull, brown earth, of leaden, sunless sky, and a murky, suffocating atmosphere between.

H. P. B. had the courage to find the few souls in all that waste who could be awakened by her Message of Light. She found William Q. Judge, whose courage was of the steady, holding kind. Katherine Tingley's is the courage of action. She never waits, pauses nor recedes. She charges upon the foe, throwing down the gauntlet to evil wherever found and under whatever cover it may masquerade, both in the world and in the lives of her students. Her courage stands to us as a beacon, an inspiration. She lifts us to the very heights and then challenges us to waver or fall. By the sheer force of her courage she has challenged and has conquered the hitherto unconquerable. She has dared and has accomplished the impossible.

We complain that our lives are little, and confined and prosaic. Is that not because we have not had the courage to make them wide and towering and splendid and heroic? Courage inspires action; mere discussion kills the will and prevents action. Action is the keynote of the present cycle. It alone leads steadily up grade. Let us then act, and if to act requires courage, then let us follow the examples before us and become heroic without any more ado and without any more delay. Confusion will give way to order. Unrest will give way to peace, and out of the smallness of our lives shall be born the Great and the True. G. Y.

I AM THE CAPTAIN OF MY SOUL

OUT of the night that covers me,
Black as the pit from pole to pole,
I thank whatever gods may be
For my unconquerable soul.

In the fell clutch of circumstance,
I have not winced or cried aloud;
Under the bludgeoning of fate,
My head is bloody but unbowed.

It matters not how straight the gate,
How charged with punishment the scroll,
I am the master of my fate:
I am the captain of my soul.—Selected

THEOSOPHICAL FORUM

Conducted by J. H. Russell

Question Do Theosophists believe in war?

Answer I A similar question, "What is the Theosophists' attitude towards war?" was fully discussed in the issue of April 3rd, 1904, of this paper and to that we would refer the questioner. But as the subject has come up again we will give a further brief reply.

Until man has conquered himself, his lower nature, with its army of desires and appetites and passions, there will exist a state of warfare in his own life. He can put an end to it by persistently striving to act in accordance with the divine principles of his higher nature, but until he fully accomplishes this there will be warfare between the higher and the lower. What is true of individual man is true of the human race, collective man, and it is inevitable that war shall continue until the divine elements in humanity shall assume control, and this depends again on the individual, for the race is made up of individuals. This also shows the only kind of war that Theosophists do believe in, viz.: War of good against evil; war to right wrong and to free the oppressed; not war for aggrandizement or national prestige.

The gross form of war, of two nations actually fighting, is but the outcome of man's selfishness which expresses itself in a thousand ways. We express a horror of war, but are so accustomed to man's inhumanity to man in every-day life that we scarcely heed it, but it is just here that effective measures to abolish war must be begun and fully carried out. Only when the principles of Universal Brotherhood shall permeate all classes of society and all nations, will war become an impossibility, for then the root and cause of war will have become removed. It is to this end that the Theosophist preeminently works. STUDENT

Answer II If conditions existing in the world at any time are such that war is the only means known by which wrong can be righted, freedom upheld, or selfish luxury and stagnation, retarding the progress of the race, be broken up, the Theosophist believes in the war that would bring about the change needed. But Theosophical teaching is humane in the highest degree, possessing, as it does, the key to the meaning and purpose of human life, and Theosophists would advocate any means that would be more humane and still effective.

The waste of human life and the suffering entailed by war, the Theosophist must always deplore; but he realizes that men must change before war can become a thing of the past. When all men believe in brotherhood and the interdependence of all human beings, international jealousies and disputes will gradually die away, and all differences will be healed by the realization of a great common interest. So while the Theosophist believes in war as a means until human beings realize a better one, he works steadily to make brotherhood a living power in the lives of men. The International Brotherhood League, a department of the Universal Brotherhood, is a beneficent body, especially concerned with promoting the higher, unselfish interests common to all nations, and performs constructive work in the healing of the nations and the abolition of war. Its noble relief work at Montauk Point after the war in Cuba, and also in Cuba itself, has been recognized and is an example of Theosophical humanitarian effort. M. M. T.

Question How is it possible to distinguish between the conscience and a mere personal desire, when we feel an urge to act in a certain direction?

Answer A similar question was once asked of W. Q. Judge, to which he wrote the following answer:

The divine conscience acts in all struggles for betterment, but clouded more or less in each by reason of education and habit of thought; hence it varies in brightness. It is not possible to make a hard and fast rule for finding out what is the animating motive. If we are trying to get into a better state, it is for us to decide if that be simply and wholly selfish. All actions are surrounded by desire, as the rust is around the polished metal or the smoke around the fire, but we must try. So if we fix for ourselves the rule that we will try to do the very best we can for others, we shall generally be led right. If we rely on the Higher Self and aspire to be guided by it, we shall be led to the right, even if the road goes through pain, for sorrow and pain are necessary for purification of the soul. But if we wish to run away from an environment because we do not like it, and without trying to live in it while not of it, we are not altering ourselves, but simply altering the circumstances, and may not always thereby gain anything.

The question of desire is a very important one, for desire is the great motive power behind all our actions. It is desire which awakes *will*, and sets in motion all the latent energies of our being. But it rests with each of us to decide whether we will govern our desires or submit to be pulled hither and thither by them, their slave instead of their master. It is possible, however, to purify and govern them, and it is in this that the conscience comes to our aid as a check upon our desires and a guide. For the conscience is the voice of the higher nature; it tends always to uplift, never to degrade; it urges always to work for others, never to work for self. We can make our desires come into harmony with the conscience, and the more we strive to do so, the more plainly shall we hear the voice of conscience. If we get into the habit of responding to the conscience, we shall less and less be liable to mistake the impulse of personal desire for its divine urge.

If we are really in earnest in our endeavor to live the higher life, and we should at any time be in doubt regarding the nature of our desire, the best test is an ever present desire to do right, at no matter what cost to ourselves. As W. Q. Judge has said: "What then is the panacea finally, the royal talisman? It is DUTY, selflessness. . . . If you can do no more than duty it will bring you to the goal." If we apply the touchstone of duty to our desires, we shall gradually purify them, and then we shall hear ever more and more plainly the voice of conscience. STUDENT

Question Do you mean by Reincarnation that we are conscious of new life? Or is it like plant life, simply another existence from the same source?

Answer Yes, "another existence from the same source," but that source is the soul. The soul is the root, rooted in the soil of eternal life. Each lifetime that we live is a flower from the root. The flower buds, blooms, decays; in the same way we are infants, reach manhood and womanhood, and old age, and death.

In truth, neither we nor the flower die. When the flower is as we say decaying, it is really passing its living juices back into the stem and root for safe guardianship during the winter. And at our death, all that is worth keeping of our thought and memory, our very *self*, passes back into the soul and becomes again part of it. At our rebirth, the very man or woman that was, the very same stuff or essence of feeling and thought, gradually reenters the brain of the infant, moulds it, develops it, makes it its instrument, and uses it for all the years of life. The only thing that does *not* enter the brain, for this new life, is the actual mass of memories of the deeds and events of the last life. The soul holds them back till, after accumulating strength and wisdom through many lives, we are strong enough to face all those memories without horror or yearning. At present that is not our task; our work is to find the soul, to live our life at once as flower and root, instead of as flower merely.

In this work, as in any other, practice makes perfect. The soul is only denied by those who have never tried to find it. No sincere aspiration towards it was ever made that did not bring some of its light and strength into the lower nature. In no long time its presence becomes as certain a fact as any other in our experience. As the question puts it, "We are now conscious of new life." STUDENT

What is Truth?

ONE of the evils of the present system of teaching in the public schools is the "text-book worship." It would be well if the pupils could be instilled with a knowledge that the compilers of the books are very fallible, and it might urge them to think for themselves rather than receive unreservedly any and all statements which happen to be made in a book approved by the State Board. Some day each student will have to begin doubting all so-called authorities, and the doubting should be one of the things learned at school.

A case in point is the statement made in a *First Book of Physical Geography*, compiled by a B. S., F. G. S. A., etc., who is a professor in one of the leading colleges of this country, that "there are many thousand glaciers in the world, but in the United States proper there are only a few small glaciers, in the Northern Rockies and in the Sierra Nevada."

This is a slander on the Cascade Range of the Northwest, which offers the finest scenery, and the highest peak, and the largest glaciers in the United States; greater, indeed, than those of the famed Mount Blanc. This is not news. One of the largest of the nineteen glaciers was discovered and described by General August V. Kautz in 1857, and as early as the *Tenth Census Report of 1880*, a map was published showing seven of them. In 1889 all of the mountain was mapped; ten years before the publication of the physical geography referred to above.

This is not intended to belittle the real excellence of the work nor the earnest effort of the compiler to produce a better text-book than was then in use. The subject is too great for any one man, and he himself must of necessity have to lean on a large number of former workers whom he recognizes as "authorities." The point here insisted upon is that a class of students should be taught that the text-book they are using is simply the best available at the time, and is not to be memorized as gospel truth. In the monthly examinations, or in the final examinations for promotion, that student who, in answering a question from his own knowledge of the facts, even if his answer is contrary to the teaching of the text-book, should rank high. This presupposes a class of students who have had a Raja Yoga preparation, and also a teacher who, for the same reason, is capable of compiling a text-book. We recognize that this is not the prevailing condition, but we insist that it shall be so. Parents and students who have awaked to this new method of education are demanding its practice, and the rapid advance of the Raja Yoga system proves that the demand shall be met.

F. G.

Life in the Mineral Kingdom

THE mind has two opposite functions which, working together, lead to knowledge: a faculty which studies the diversity of things, or analyzes; and a faculty which recognizes the unity in creation, or synthesizes. The latter, Theosophists would recognize as pertaining to the *Buddhi* or spiritual eye; its influence compels the mind to seek unity and simplicity amid the diversity of nature. In science this process is known as *generalization*; and science is proud of its great generalizations, such as that of the conservation of energy or that of evolution.

It was inevitable therefore that all the visible kingdoms of nature should sooner or later have to be subjected to such a generalization as regards their motive power and mechanism. It was not tolerable that in the higher kingdoms there should be recognized one thing called organic life, and in the lower another thing called inorganic. And it was equally unsatisfactory to speak of man as having mind, animals instinct, plants organic life, and minerals chemical affinity. The need for generalization compels us to seek in all these things a unity of essence, though we must concede a gradation in kind.

But for a time it has been doubtful whether scientists would effect

this result by reducing life and mind to the level of chemical and physical forces, or elevate chemical and physical forces to the dignity of life and mind; whether we were to have a world run entirely by the forces, mind being merely a modification of them; or a world ruled by mind, of which the forces were merely manifestations.

However, the idea of a soulless mechanical universe has been found too illogical and too insupportable, and we are coming to recognize that the one thing which underlies and connects all creation is mind—conscious vital intelligence.

These remarks are the preamble to noticing the work of Dr. Stéphane Leduc of Nantes and Dr. von Schrön of Naples, outlined in a recent article.

The phenomena of crystallization are familiar. A solid dissolves in a liquid, which, when evaporated beyond the saturation point, redeposits the solid in crystalline form. We can see needle-like lines dart through the liquid to be built into the crystals, each substance having its own invariable shape or perhaps two alternative shapes.

But now von Schrön, with a magnifying power of 800,000 diameters, has observed every stage of the process.

First, he says, a little globule disengages itself from the liquid mass which has a different index of refraction from it. Considered attentively, this globule is seen to consist of a network of tiny cells, which resemble, if they are not identical with, those which form the foundation of animal or vegetable organisms. Then appear

little joints in this network, which he calls *petroblasts*, which gradually reveal themselves as consisting of a dark nucleus surrounded by clearer matter. Then the globule begins to lose its perfectly spherical shape under apparently the independent action of these petroblasts, until there appears in its periphery an angle, which he calls the *primitive dominant angle*; then a second angle opposite to the first, which he calls the *diagonal angle*.

Then the axis of the crystal is formed, and the growth proceeds amid activities like those in organic life—a "struggle for existence," a rushing about, a splitting up, and an absorption of the weaker by the stronger. Activity continues until the crystal is fully formed, when all visible movement ceases.

As further illustrating the subject, are cited the work of Prof. Bose of Calcutta, showing that minerals can be poisoned, of M. Jean Becquerel showing that they can be anesthetized, of M. Bichat of Nancy showing that crystals emit rays like animal bodies, and experiments proving that minerals die and can be tired.

Another very important discovery is that the work of crystallization can be quickened by the addition of certain colloids. *Colloids* are non-crystallizable substances which form with water mucilaginous compounds and are distinguished from *crystalloids* by the extreme slowness of their diffusion through porous septa. The addition of gelatine to a solution of potassium ferrocyanide produces a regular formation of cells resembling in appearance those found in the tissues of animals.

Also we learn that, by electrical action, certain metals, such as gold for instance, can be

forced from the crystalloid into the colloid state.

The writer of the article mentioned, in answering the question, Do these researches throw any light on the problem—How comes life? says that they only push the problem further back, and leave the question of life's ultimate origin as insoluble as ever. It must surely be obvious however that analysis can never terminate in unity and that he who seeks for the primal unity by such a method is trying to achieve the impossible. Such methods of research sometimes, as in this case, give us the materials for a new generalization, but they invariably lead also to the discovery of still greater complexity in nature and open up more vistas of facts. We can learn more about the origin of life by studying it in ourselves, and such an inquiry will lead us right back to questions like, What is man? What is Soul, or intelligence or will? H. T. E.

France and the Meat Habit

A REGRETTABLE revolution in the dietary customs of the French people has taken place within the last century—indeed, within the memory of many now living. The great bulk of the nation, the lower middle-class and the peasantry, have been practically changed from vegetarians to meat eaters. This is almost wholly due to huge imports of American packed, tinned and preserved meats.

Formerly the workingman of France would "enjoy" meat but once or twice a year, and then on some unusual occasion, such as a wedding, or on an important anniversary like the great New Year's festival. Today possibly no one in France is deprived of his piece of meat once or twice a day, so largely have the dried, salt and preserved meats from America become a part of the diet of the people.

Now it is sufficiently remarkable to be worthy of comment that from about the time of this change in the dietary habits of the French have certain evils set in—so great and so alarming as to cause very serious disquiet in the highest official quarters. These evils in decreasing ratio of intensity, may be roughly grouped as follows:

1—An alarming falling off in the birth-rate (the so-called "depopulation of territory") the statistics of births and deaths showing that for years past the population has not merely remained stationary, but is decreasing numerically from year to year. To stem this the Government has been trying to coerce the situation by offering money rewards to parents proving a certain number of legitimate offspring.

Five Alarming Evils

- 2—A startling increase in crime.
- 3—An increase of alcoholism.
- 4—An increase in insanity.
- 5—An increase in suicides.

These, of course, are tabulated generalizations. They are probably not wholly ascribable to the adoption of a flesh diet by the French; that that diet may be largely the cause of these evils is by no means unreasonable. If statistics from other peoples could be shown, giving an equal (or greater) consumption of meat by an equal number of consumers, where similar increase of evil tendencies are absent—this would be negative and imperfect testimony to the value of a flesh diet, for the reason that races, like individuals, are different physiological entities,—the maximum of physiological resistance is never the same in two different instances be they races or, indeed, individuals of the same race.

The question is a *cercele vicieux*, so soon as it is attempted to explain it away in a one-explanation-satisfy-all fashion. A flesh diet produces an unnatural (because artificially induced) stimulation of the most delicate and sensitive organs in the body. The blood is whipped into a fiery flood, the heart's action is quickened, the brain

Consumption of Tissue Is Increased

is heated and the nerves are set atense. Consumption of tissue is increased, appetite grows in same ratio of increase, and alcoholic stimulants are sought in a vain endeavor to patch up a truce with Nature by coercing her. Loss of self-control, irritability of mind and body follow, while mental excitement is eagerly sought after by the tense brain.

So the argument chases itself around the circle ever more quickly.

A flesh diet with an abundance of other cooling food may be good for one, and it may not. More authority is arrayed against that, than is for it, by far. Certain it is, that to suppose meat to be essential, in an absolute sense, to health, strength and growth, needs no greater and convincing refutation than the testimony of history. Cæsar's legionaries and Alexander's hoplites ate no meat to speak of, and the reckless dare-devils who won the great Napoleon's victories had little, when they had any at all.

What vegetable food will do for the body is patent enough by the amazing endurance, activity and stamina of the Japanese soldiers, under Oyama, as shown today. Any one who has seen an Indian coolie or a Chinese laborer accomplish his day's work with less expenditure of energy and less fatigue than the meat-eating, spirit-drinking European, will know what rice and tea will do.

Vegetable Diet Essential to Endurance

Undoubtedly the European has acquired habit, and hereditary tendency, to deal with in this question, and those who have tried a vegetarian diet have more often than not been at a disadvantage as compared with their fellows. The general use of tinned and preserved fruits and vegetables by most would-be vegetarians is in itself unsatisfactory, for such foods perforce lose a certain intangible but very real vital quality which fresh vegetable products possess. Quite outside of that point, there is the constant danger and menace of ptomaine and mineral poisoning, from which the very best of tinned foods is scarcely wholly exempt. Another very real difficulty which besets the European would-be vegetarian is the abundance of "refined" foods he is obliged to consume. "Fine white flour" and dephosphated rice and other grain are deprived of the very elements the body mostly needs. The rice of the Oriental is very different in nutritive power from ours; it still contains the inner husk of the grain with all its precious nutritive burden, and ours does not. The Oriental's rice is yellowish-brown (light gold) in color; ours is pure white.

Science has yet to discover a perfect substitute for meat as far as the

Some Views on XXth Century Problems

The Conditions of Genius

AN advertisement of an "arts and technics school," which appeared the other day, concluded its account of the many branches of music taught thereat with these striking words: *Is there any reason why genius should be the appanage of the few?*

We know of a reason or two, and we know that they will never be done away with by any number of "arts and technics" schools. But we can conceive of another kind of school where these intervenient reasons could be surmounted.

Genius is the power to express high feeling in words, rhythm, color, sound or form. The essential is the feeling. Given that, the expression will come somehow. It cannot be retained. At that point may come the schools, which, without the essential, produce only talent or facility.

As we believe that the essential exists in nearly all men, we face the question: Why all men are not geniuses.

Every one can answer it. If we look at some nature scene that arouses our sense of beauty to its highest, we have for a moment a feeling which, if developed and sustained, would be the root of genius, would compel us to find some mode of expression.

But it is not sustained, and therefore cannot develop; the mind wanders off instantly along one or all of a hundred side channels of thought. In a moment we are remembering an item in yesterday's newspaper, or wishing we had brought a camera, or noting that it is three hours since we breakfasted.

An even more formidable obstacle is in the path—our own very personality. The feeling is impersonal; the sense of personality moves across it like an eclipse. It is that which has stood between nearly every genius that ever lived and his own highest possibilities. Yet they must have suspended it at some moments or they would never have achieved anything. And in our flattery of geniuses we make those moments harder and harder of attainment.

Therefore more important to the genius than any other technical acquirement is the power of putting himself out of his own sight. His mind must be so trained that on the obtrusion of the thought of self, it immediately passes to a higher altitude of feeling. Otherwise, without proficiency in this practice, the man must wait for the chance visitations of his inspiration. He cannot command it. If he would have his light burn steady and constant, he must, while necessarily remaining a self, try to forget that he is one. We are taught that he must aim at that place in himself where consciousness burns behind the shadows. Thence radiate those high feelings whose occasional visitations constitute his title to genius. The radiations (in him and in all men) are constant. But the mind only receives them when external or internal conditions throw it into, or permit it to pass into, a receptive condition.

A school for the training of genius is possible. But it must teach bodily self-control, so that the results of indulgence do not clog the bodily mechanism.

It must teach concentration, so that the mind does not wander at the very moment of its inspiration.

It must teach impersonality, so that no vanity, egotism, or ambition are allowed to eclipse the light.

And that last condition is the same as unselfishness. For the act of opening the mind in sympathy with the joys and griefs of others, is the same act, requires the same power, as opening it to its own light. There is no other way of fully dissolving personality. STUDENT

Has Morality a Physical Basis?

A BOY in one of the Eastern States, a fairly good boy, fell on his head a few years ago, and indented the skull. Then he became a very bad boy, even criminal, and "nothing could be done with him."

Recently a surgeon operated upon him, raised the depressed bone, removed growths on the inner surface of the skull, and in thus healing the boy's physical condition, healed also his moral nature. He is again a fairly good boy.

The materialists have seized this as a valuable plum. Behold—they say—a new proof that man's moral nature is but a function of his body. Injure the latter and you destroy the former. Heal one and both are

healed. Of course this is nonsense; but we are so accustomed to read it that we forget that. And such great names back it that we hardly like to stigmatize it very bluntly.

Are there not people of perfect physical health whose moral nature is utterly perverted? Are there not people who have never known a healthy moment and yet are well-nigh saints?

Break the chords of a piano and the most inspired musician gets only hideous jangles. Mend them and he gets music. Is the music in *bim* merely a function of the wires in the piano? And a good musician will get better music out of a bad piano than a bad musician from a perfect instrument.

If digestion goes wrong we feel irritable and resentful. But most men know that those are wrong feelings, and compel themselves to have right ones notwithstanding the difficulty. They are good musicians compelling good music to come from a (temporarily) bad instrument. They know they *can* have other feelings and they know what those other feelings should be. How do they know it? Because those others are already within them, unexpressed. If that were not so, how could they know what to aim at, what to express?

In other words, we are dual. There is a consciousness which belongs to the body and is dominated by the body unless *we* choose to interfere and do the dominating ourselves. The boy had never been taught that simple fact. Yet it is the first that children should be led to understand.

The materialistic creed is the creed of the conquered. They are self-confessed slaves, and therefore proclaim slavery to be the fact of human life. They deny the ideal self and its power, a power which, if used and practised, has no limit in growth. STUDENT

Need for the Heart Doctrine

ONE sometimes hears such a question as, Whether the light of reason or the feelings of the heart are the best and truest guide for human conduct.

There can be no rivalry between true intelligence and the promptings of a pure heart, for they are twin rays from the Divine source of all Life. But what we are pleased to call "reason" in these days may be a very different thing.

When we read widely in the field of speculation and theory, we soon find that all the authorities contradict each other, both in details and essential points. We find them contradicting themselves; we find them declaring their own ignorance. May the race be preserved from subjection to such a "light of reason" as this!

One is often struck dumb with horror at the prospect which is opened out for humanity by the speculations of materialistic physiologists, and scientists who see in the universe nothing but dead material and blind force. These speculators have a certain amount of plausibility and seeming profundity in their own special field of physical research, where they can use their own terminology and fight on their own ground with their own weapons. But whenever they undertake to deal with important matters affecting human life and welfare, they promptly reveal their utter incapacity for sane and wholesome thought. Fortunate it is they are so blind that they thus unwittingly give themselves away.

With these men of "reason" whose intelligence is kindled by no ray of warm sympathy from the heart, and whose pale, cold moon-like minds are quickened by no pulse of generous hopeful human enthusiasm, every question becomes a mathematical problem.

"How should we treat animals?" "How should we treat each other?" Are these questions to be answered by the light of the newest physiological fad or the current theory about atoms? Again, we say, are they to be answered by turning over old ecclesiastical canons, and hunting among the pronouncements of Dark-Age monks for one that shall suit the requirements of our argument?

We have spoken of the *horror* which sometimes seizes on us in meeting with discussions of this kind. It is the horror of what such modes of reasoning and attitudes of mind may one day lead to, if allowed to spread unchecked by any wave of humanity and enlightened thought.

Such things as the using of criminals for physiological experiments may be justified by these methods of reasoning, and there is absolutely no limit to what casuistry and false reasoning may endorse. H. T. E.

Brief Glimpses of the Prehistoric World

Archeology
Paleontology
Ethnology

Modern Apes and Ancient Lions

IN instituting a comparison between one civilization and another, it would scarcely be considered fair to magnify the faults of the one and gloze over the faults of the other, or to scarcely mention the excellences of the former while magnifying the virtues (or alleged virtues) of the latter. Yet this is what we find constantly being done in the pages of our ancient history books.

As H. P. Blavatsky and many lesser prophets have shown, the chief thing which distinguishes our civilization from earlier ones is hypocrisy. We have all the vices that antiquity could show, and in addition some newer and more refined ones; but we cover them with a hypocritical garb of propriety and cant. So deep-rooted is this hypocrisy that it is often perfectly unconscious; and no doubt the amiable historians who enlarge on the beauties and virtues of modern civilization and Christianity are sincere down to a certain depth. Nevertheless it is a shame that children should be taught to shudder at such a thing, say, as polygamy, when the same practice in a clandestine and infinitely more degraded form is so characteristic of this civilization; or that they should be made to look with horror at the alleged cruelties of despotic slaveholders, when the present age is notorious for its callous, though hypocritical and polished, disregard for sacrifice of human life. Add to this that no notice whatever is taken of the fact that the ancient races under consideration were absolutely free from most of the vices and corruptions, moral, mental and physical, peculiar to our civilization; and the unfairness is complete. One is reminded of *Punch's* picture of a vulgar, undersized, dressed-up London snob, with his female companion, leering before the stately, motionless figure of a Red Man at an exhibition. It is true some of the ancient races were not perfect; they may have had a few colossal failings which no one nowadays would be able to copy. But their very vices were free from the meanness which makes up most of our virtues.

It is scarcely surprising that a great soul like H. P. Blavatsky, with vision able to penetrate shams, and imbued with the lofty *spirit* of antiquity should feel a difficulty in finding words strong enough to express her feelings on the subject.

H. T. E.

Zuni and Inca Music—Singing Carried to Great Perfection

FROM the conversation on the Indians and their music, given by Professor Troyer in Lomaland four years ago, and commented on in the *NEW CENTURY PATH*, vol. vii, number 51, it appears that Indian music is much closer to nature than modern music. The Indians seem to recognize that musical sounds have other purposes and other effects than giving pleasure. To them rhythmic tones constitute one of Nature's forces, which she uses abundantly herself and which can be imitated by man. The ceremony of rain-making, also mentioned by Professor Troyer in this connection, is an instance of the intelligent application of the laws of sound and rhythmic vibration to the production of effects in the elements. There are various interesting experiments in physics which go to show how music can create beautiful forms and generate powerful mechanical forces, such as the sound-pictures made in sand on a taut membrane, and the effect of a loud note in shattering a glass vessel. But the mysteries of this natural magic cannot be discovered by our race until it has tuned itself morally and physically better than it is at present.

Easier for us to understand are the moral or emotional effects of music. Yet here our own practices are extremely unintelligent. One of our concerts resembles a kind of musical debauch, with a banquet of many different and highly flavored dishes. The auditor must either preserve an attitude of imperviousness, or, if he is sensitive, be prepared to pass in one hour through a gamut of emotions that would soon ruin the most powerful nervous system. To be used intelligently, music should be played only in the proper season and to produce a certain definite effect; and only one kind should be played. Thus it would be possible to induce in the auditors any required mood, or to assist the will in inducing that mood.

The monotone singing known to ordinary travelers is that of the lower

class Indians, but the music of the cultured Indians is as different from this as concert music is from that of the street boy. The learners go over their singing with extreme minuteness, beginning on the key-note, rising three or four intervals, descending again, and so repeating. The Professor said, "I never knew till then how little I had learnt. There is a wonderful mystery in their melody. I at first thought that perhaps only a single colony sang in this way, but I found that all sang faithfully the same songs."

The tongue of the Zuni's has peculiarities of structure which enable them to produce sounds we cannot; the cliff-dwellers in the Argentine have developed their chest-capacity greatly by the practice of remaining beneath water for a very long time; and when they sing, they hold the head up and forward; points which sufficiently show that the art of singing is studied by this "primitive" people with at least as much care, and perhaps more intelligence, as with us.

Ancient Gold-Mines in Africa

ARCHEOLOGISTS are never tired of the problem as to where King Solomon got his gold from. Perhaps the Hebrew Scriptural tradition has somewhat fettered their imagination in this respect, as it has in others. Whether Solomon was a definite personality or not, it is clear that there were opulent sources of gold and other valuable materials somewhere within reach of the sailing expeditions of the ancient world. The traditions of wealthy regions south of the Nubian desert were persistent, and led more than one ambitious potentate on expeditions of conquest in that direction.

A report states that an explorer has been for the last eight years making excavations at Zimbabwe in Rhodesia, South Africa, and has concluded that he has located King Solomon's mines. At this place there are gigantic ruins. One set are those of a temple, and the other of a fortress. The masonry is of uncemented granite, but there is a large platform and floors made of cement.

Much gold was found here, and also crucibles, furnaces and moulds for ingots. These moulds, it is said, correspond exactly with the size of gold ingots found in Egypt and Syria. The date assigned is about 1200 B. C., and the explorer considered that some \$375,000,000 of gold had been extracted from the mines here by the ancients.

E.

More Proof of Egyptian Antiquity

ARCHEOLOGICAL research continually confutes archeological theories. The teachings of Theosophy, on the contrary, are simply vindicated by each new discovery. The archeological theory with regard to ancient Egypt is that that civilization must have begun a few thousand years back in a primitive state, and that we should be able to trace a gradual growth of culture from that time on to the epoch when the decline set in.

H. P. Blavatsky states, with ample evidence, that Egyptian history goes back immensely further, even to times when the Egyptian priests could journey by land to America. Herodotus gives many accounts proving an immense antiquity to the Egyptian Empire. Thus, according to this teaching, the Egyptians merely handed down all they retained of the wisdom and culture of the great Atlantean race, of which they were one surviving branch, another branch being on this continent.

Professor Flinders Petrie, in excavations at Abydos, has found ten temples one below another, representing a period of time which he puts at from 500 B. C. to 5000 B. C. And among the relics discovered there were some that evince the knowledge of arts supposed not to have been known to the world until a much later date. For instance, among the remains of the First Dynasty was found a vase with purple glaze having an inscription in different colors of glaze; and also carvings in ivory showing a skill equal to that of any place or period.

Thus the reputation of a disparaged antiquity is being on all sides rehabilitated; and with these rediscoveries of the earth's hidden heirlooms of material art are coming rediscoveries of some of the lost mysteries of ancient thought and spirit, which are daily better understood.

E.

The Trend of Twentieth Century Science

Newspaper Science

A LADY student of science has permitted a newspaper to publish—by way of interview—the results of her work. In a sentence it comes to this: that the color of wasps is due to their environment, to the climate, to the degree of heat and moisture in which they live. She may have done other work, but the interview, as published, makes no mention of it. Nor does it give the impression that her outlook upon life is anything but the very narrowest.

"The object of science," she says, "is to evolve a philosophy which shall fully explain the facts of life. What great forces cause the changes, development and progress of organic life? Why is the civilization of today so superior to that of the stone age? Why does son outstrip father and generation surpass generation? Is the determining influence hidden in the heredity, or does it issue from the environment?"

To answer this fundamental question, she proceeds to a study of the color of wasps! "It may seem strange," she remarks, "that any one should select an insignificant insect like the wasp as arbiter in a question of such moment, but that is just what other naturalists have done."

Now inasmuch as the color of wasps is shown to be due to environment only, is it not obvious that civilization, the ascent of humanity from barbarism, the appearance of intelligence and finally genius, must also be due to the same facile cause? So stands, by clear implication, this confident young lady's argument. Find the environment of Pythagoras, Plato and Shakespeare; subject infants to it as Miss Enteman subjected wasps to the necessary heat and moisture, and you can get as many geniuses as you like.

But if, under certain conditions of "environment," great civilizations arise, why, when the environment remains the same, do they fall? Where is imperial Rome? It was, truly overwhelmed by barbarians, whose coming constituted a change in environment. But had there not previously been an inner change in the once virile and martial Roman, there would have been no trouble in dealing with the barbaric hordes.

Moreover Miss Enteman's theory takes no account of the variations described by Professor De Vries as occurring under his very eyes in his garden, where, the environment remaining the same, variations occurred spontaneously, so far from the original type as to constitute new species, yet remaining constant alongside of the originals. Science has to search for a deeper cause than heredity or environment before it will understand variability. But she is very shy of having it forced on her attention.

We should not have dwelt on this young student's work so long had it appeared otherwise than in a newspaper. The majority of readers cannot judge of what they read on science. It is taken on faith, and crude newspaper accounts of the work of biologists are answerable for no small part of the materialism of the day. Editors should hand this work not to the ordinary reporter, but to men who are themselves students of general science. So only can the narrow views of specialists, and the undue weight they attach to their experiments, be corrected and shown in proper relation to the work and thought of others. STUDENT

The Use of the Appendix

THE vermiform appendix, so valuable in furnishing us with appendicitis, has recently found its defender in a noted English surgeon and physiologist. This little organ—a slender tube a few inches long, opening off the intestine—is generally regarded as useless and functionless in man; though in rabbits it attains considerable size, and acts as a digester of cellulose or woody fiber.

Sir William McEvan deprecates its indiscriminate removal. People go on living afterwards, it is true. But so they go on living after the removal of the spleen, and even the stomach.

He pointed out that it is the pet home of a special and useful variety of micro-organism whose function is the digesting of certain matters which no other part of the intestine will condescend to take any trouble with.

It is our faulty ways in diet, and not the malignity of the little appendix, which cause it to give trouble. In other words, appendicitis is not a "visitation of Providence," but the result of infraction of natural law, though this might also be said of other diseases. STUDENT

Saturn's Ninth Moon, Phoebe, Has It a Retrograde Motion?

FULL confirmation of the existence of this minute body has at last arrived. For some time grave doubts were felt as to its existence, but it has now been successfully photographed by Professor Pickering and has also been observed in England. But still the direction of its motion has not been ascertained, and Mr. Crommelin, the Greenwich observer, considers that it must travel round its giant primary, Saturn, in the reverse direction from its fellow-satellites, and, in fact, from all the other planets and satellites except the moons of Uranus and Neptune.

The elaborate superstructures built around the original Nebular Theory depended largely upon the uniformity in direction of the motion of the planets and satellites, and have had many rude shocks lately; in fact they have been greatly modified if not entirely recast in the last few years, and the anomalous motion of Phœbe will cause still more searching of hearts. There are few scientific men of repute now who advocate more than the simple hypothesis of Laplace, but a steadily growing mass of facts is accumulating which, while testifying to the basic fact of the Nebular origin of our system, point more and more plainly to the grand generalizations of cosmic development brought forward by H. P. Blavatsky.

Agnes M. Clarke, the well-known astronomer, recently drew attention to the curious fact that thousands of the spiral nebulae—solar systems in embryo—have, in all cases where they are clear enough to be distinguished, a double structure. The streams of wispy light issue from two centers, and as they wind round in their mysterious spiral form they keep separate for a long distance. This is quite in harmony with the teachings of Theosophy, for the duality of Nature's forces is axiomatic. In electricity, for example, this duality is very conspicuous. In ancient Eastern philosophy a deeper force is spoken of, a conscious and intelligently directing basic force, the hidden root of all the manifested forces of light, heat, cohesion, electricity, etc. This "electro-spiritual" base, called Fohat, is dual in its nature and method of operation. H. P. Blavatsky speaks of the duality shown in its very earliest manifestations, and it is profoundly interesting to the student of Theosophy to see modern science beginning to follow cautiously where the daring philosophers of old trod with fearless knowledge. C. J. R.

Our Reserves of Energy

A WRITER in *Cosmos* brings together a number of interesting facts and quotations on the share taken by the mind in producing and removing fatigue.

In the matter of energy, we are all great capitalists, entitled to a large income. But of that income we only live on the mere fringe and droppings. We let the mind make us feel tired before we are even in sight of the need for the first line of our reserves. The mind knows it is bedtime and produces in perfection all the sensations that call for rest. Or again, in a long walk, the mind notices some small muscular impressions, and as it were generalizes these all over the body so that we say we are utterly tired out.

That the mind does the same in producing out of a few obscure sensations the whole picture of general fatigue is shown by the fact that a little excitement, or a change of attention, will sweep the whole thing away. And the same excitement, or some urgent need, will show how small is the proportion of the strength we usually use to that which we possess. Every physician has seen a maniac, or the victim of *delirium tremens*, perhaps ordinarily a slight and ineffective person, display the strength of six or eight men for many hours.

The mind, in fact, has the key to the reservoir of bodily forces, usually opens the door but a very little way, and constantly reports the full receptacle to be almost or wholly empty.

The same is true on other planes. We have unlimited moral force, capable of overwhelming every passion, habit, desire, or weakness. Here again, the mind stands between, grudgingly opening the door an inch, self-convinced that it cannot do what it can and ought to do. The key, the will, has in fact passed into the hands of the mind instead of the man, and the mind, making the man believe it to be himself, reduces him to powerlessness and to comparative uselessness to his fellows. STUDENT

Brotherhood Revealed in Nature

NOT long ago doublet and triplet daisies were found growing at Point Loma, showing a tendency toward unity which pervades the Point Loma atmosphere. Not only were many flowers united in each head, as is usual, but distinct heads and stems were also united. The daisy and its kindred, with their composite heads of many individual flowers, growing on a common stem, having a common protection about them, existing for a common purpose, and all uniting to form one beautiful and symmetrical whole which promotes the highest welfare of each, are types of brotherhood and might well be called brotherhood flowers. But, in fact, every healthy organism in nature is such a type, for even the simplest organic form, the cell, is a brotherhood of molecules and atoms which work together in harmony to accomplish the object of the cell. And higher organisms are built and continue to exist and perform their functions by the harmonious working of the many cells which compose them. Nothing lives for itself alone. To persistently attempt so to live means death.

Plants work for future generations, giving their energies to the production of seed, providing means for finding suitable homes, and furnishing food for the infant plants. When this is accomplished many plants cease to exist, while others continue the work from year to year. But this is not all. Plants are related to the other kingdoms of nature and mutual helpfulness exists between the kingdoms. Plants are the food producers for animal and man and furnish oxygen for their breathing, receiving in return what they need, carbonic acid. Man is indebted to the vegetable world for more things than there is here space to mention. At the same time man is helping on a higher development of plants.

The cast-off products of all the kingdoms enrich the soil for future plant growth.

Plants furnish honey to many insects which in return fertilize their undeveloped seed, and their special adaptation to one another shows an underlying oneness. The more we study nature, the more we see this oneness, a brotherhood in all.

STUDENT

The Beauty of the Lotus Fountain

THE circular lotus pool, just in front of the main entrance to the Homestead, is one of the most beautiful features of the grounds. The sides are of rough blue granite, about waist high, and in the center is a square pyramid of green-veined marble, from the apex of which issues a thin stream of water, which sprays back into the basin with a musical tinkle and covers the lotus leaves with drops and pools of molten silver, but cannot wet them, because the lotus leaf will not allow water to touch its surface.

Rushes give a pleasing variety of form, and in season there are several lotus blossoms to enhance the effect. A number of goldfish show in brilliant relief against the green of the leaves, while the many young ones, which are yet of a dull slate-grey color, need keen eyes to detect them.

A large frog lives in the pool, and his evening rehearsals are convincing proof of his lung power, though his technique is rather weak.

Taken altogether it is a very charming spot, and one readily understands how any body of water large and permanent enough to have a system of aquatic life in it, is as truly the natural center, the heart of its environs, as the fireplace or stove is of a home.

This was understood by a certain farmer, who, fortunately, had upon his place conditions favorable for making a two-acre pond; and he wisely did so, with results far surpassing his hopes.

It became a resting-place for wild fowl, and even drew a pair of beavers and other water animals.

He stocked it with fish and planted it with lilies, so that it became a source of constant pleasure.

SAN LORENZO RIVER, BEN LOMOND, SANTA CRUZ MOUNTAINS

THE SOUL OF NATURE

by WORDSWORTH

I HAVE felt
A presence that disturbs me with the joy
Of elevated thoughts; a sense sublime,
Of something far more deeply interfused,
Whose dwelling is the light of setting suns,
And the round ocean, and the living air,
And the blue sky, and in the mind of man;
A motion and a spirit that impels
All thinking things, all objects of all thought,
And rolls through all things.

sympathy and understanding of their less developed brothers of the lower worlds.

City-Made Honey

A NATURE Study Museum has been established in Stepney, one of the most crowded boroughs in London, and one of the exhibits is a hive of bees. These bees ply their industry in this spot surrounded on all sides by miles upon miles of streets and buildings, and it is a mystery where they get their supplies from. But bees are capable of extracting nectar from other sources than flowers, and a cargo of sugar on the Thames has been suggested as their feeding ground.

STUDENT

Two Ways with a Wasp

A VERY common way of dealing with a wasp who suddenly appears as an uninvited guest at your table, is to lose your head and strike at him with a knife or napkin and thus convert him into a furious foe. Sometimes a whole party of diners will rise and pursue the luckless insect, finally crushing him against the window pane. Sometimes the wasp comes off as the victor and stings somebody, and then follows more confusion and groans and lamentation.

The better way of dealing with one of these pretty little visitors is to sit quite still and go on as if nothing had happened. You are perfectly confident that no wasp ever attacks an inoffensive person and wastes his energy, or squanders his venom in unnecessary stinging. The wasp comes to your table for precisely the same reason as you do, and to any person of real culture it is a delight to watch him settle on the edge of the plate and suck up the fruit juice through his hollow tongue.

He is a very handsome insect, with his bold markings of black and gold, his elegant shape, his quick nervous motions and those wonderful antennæ on his head with which he examines everything. By a little patient

maneuvering you may induce him to alight on your finger and drink from a bead of syrup in perfect confidence. Now is the time to get out your magnifying glass and you will be surprised at the exquisite detail of the legs and head, the fine hairs, the sheen of his coat and the veining of his clear gauzy wings.

The wasp eats great numbers of flies and thus is an ally to the housekeeper, but it must be admitted that his visits to the orchard make him deservedly unpopular with fruit growers.

It is pitiful to see how people miss opportunities of gaining more knowledge, all for the want of a little

THE first public Thanksgiving appointed by authority in America, was characterized

by a lively sense of deliverance. There was great scarcity of food in the little colony, and starvation stared the settlers in the face. They had decided to keep a fast, but before the appointed day came, a ship well laden with provisions arrived, and instead of the fast, the first Thanksgiving was observed with feasting and great rejoicing.

This was nearly three hundred years ago. Certainly, in the years that have passed, all idea of fasting in connection with Thanksgiving has died out. All the known delicacies among foods, and the elaborate appointments that belong to the prosperous civilization that has been built up in this country, now have prominent part in the national observance of Thanksgiving.

There is an element, however, that is often lacking at this feast. It is the actual feeling of thankfulness. People may celebrate the feast, but it is a fact that there is, too often, not a song of thanksgiving in their hearts.

Is it that we have less for which to be thankful? We can hardly say that this is the case.

Is it that we are less thankful for what we have? We believe that we have a cherishing sense of our manifold blessings. Certainly, we shrink from being deprived of them.

Have we, with the growth and refinement of the means of gratifying our physical appetite and our other desires and fancies, lost that strong, simple realization of present welfare that wells up in the heart as thankfulness? Such as this was felt by the ancient peoples of the earth, and is still felt today by some of the modern so-called pagans, who make a simple offering of flowers or fruit to the great unseen powers whom they believe to be the givers of the plenty the earth affords them.

Have we become such arrogant lords of creation that we feel no impulse of gratitude to the beneficent Nature-Creators?

Have we so lost the feeling of interdependence and coöperation with the kingdoms of Nature below and above us, that we take all that comes to our hand with no response, with none of the gladness of comradeship

The Greater Thanksgiving

with all that lives, that expresses itself in a song of thanksgiving?

Modern life has developed into great complexity. It is possible to do more, to have more, to come in touch with more of what is in the material world, and in the world of thought, than ever before. There are more of conditions that make for the brotherly coöperation of all the peoples of the earth than have ever before existed.

The joy of life, the song in the heart, should be a more beautiful harmony than any ever before sung. Simple, primitive joys should not have died out entirely, but should be reborn in the happiness that comes with more conscious recognition of human destiny and power. But with the development of great complexity of life and its relations, there has not been a correspondingly great demand made upon the human heart by the individuals of the race. On the contrary, we have closed our hearts in selfishness and egotism. We have not developed a ripe and compassionate-enough sensibility to the needs and joys of our fellowmen. Our brother is not to us as our brother. We do a great deal for him from a sense of duty, especially at this very Thanksgiving time. But we do not suffer enough when he suffers, and we are not glad enough at his rejoicing. We do not pour forth from our hearts generously enough to leave space for the strong joy from the great universal heart to enter. We are not as closely in touch either with the nature-forces of the lower kingdoms or the conscious and enlightened Helpers of the realms above the human, as mankind has been in earlier times.

At their simple feasts, and with their offerings of simple fruits and flowers, went a true feeling of closeness to the realities of life. What lies at our hand to do is to lift our festivals of rejoicing and thanksgiving to a higher human plane, and by banishing the half-joys of selfish, luxurious gratification, help to lift all our brothers, heart to heart, and hand in hand. By so simple a thing—apparently—as refusing to overindulge the body, who shall say we may not pass through portals hitherto closed? When we can do this, who knows but the gods themselves may be present?

M. M. T.

A CORNER OF THE LIBRARY—
IN A LOMALAND HOME

A New Departure

ONE western metropolis boasts of a baseball team composed entirely of women. The members play once a week when the weather is fair, and, to judge by appearances, enjoy the game fully as much as the average college girl enjoys basket ball. They play, of course, in regulation gymnasium suits and heelless shoes. Think of two generations ago, or even one, and contrast these with the languid young ladies who then spent their time with an embroidery needle or, most strenuous occupation of all, playing croquet! Baseball certainly seems to be scarcely a woman's game, and yet even that might be played sanely and comfortably. We certainly do agree, however, with the physician in charge of the seminary with which this baseball team is connected when he says: "Before undertaking any line of athletic work a girl should be examined by a capable physician. There is always more or less danger in overexertion when the heart is weak.

After she takes up such work she must remember that her exercise must be symmetrical. It must include all parts of the body. Professional athletes die young. Why? Because they frequently develop one particular organ until the organ becomes so exhausted and overworked that death results. It is oftenest that the heart suffers this danger.

"There is no manner of doubt that much of woman's general illness is due to overeating and general inactivity of the muscles.

"The tendency nowadays is to sap the nervous vitality and to pay little heed to keeping the physical condition correct and healthy. Women who have become interested in outdoor exercise have invariably acquired better health and nerves more settled and reliable. But all exercise must be done with intelligence and discretion. A girl cannot go to a party and dance all night and then play baseball next day without serious detriment to her physical well-being."

A FACT of exceptional interest is the prominent part which women have had not only in the isolation of radium, but in the making known of its astonishing phenomena. It was discovered by Mme. Curie, not at all by accident, but as the result of pure deductive reasoning from observations of uranium and polonium. To the literature of radium important treatises have been contributed by Lady Huggins of the Royal Society, and Miss Willcock of Cambridge. The work of Miss Willcock has consisted mainly in a critical study of the influence of the rays of radium upon chemical change.

THE *Indian Mirror*, a periodical published in India, said recently, "American womanhood is admittedly the finest and the best, physically and intellectually, of all the womanhood of the world. An ideal American woman is the ideal of the world's womanhood. That could not be, however, unless the American man himself appreciated a high ideal."

TEN years ago a young Japanese girl graduated from the New York hospital for nurses and returned to Japan. She married and apparently abandoned her profession, but today, as Madame Yama Soro, she is conducting a class for nurses in Tokyo and is doing her utmost to help stem the tide of the horrors of war.

ALL things, even the smallest, have their share in the universal intelligence.

LIVE in the present and fill your heart with love for the duty of the present moment.

A MAN'S quarrel with the world is only a quarrel with himself.—S. E. Moffitt

Poor Woman's Sphere

HARRIET MARTINEAU, writing in 1840, declared that she found only seven employments open to women in America: teaching, sewing, working in cotton factories and bookbinderies, keeping boarders, type-setting and household service. Today the list of employments open to women runs into the hundreds, and we have women clergymen, physicians and surgeons, bookkeepers, clerks, merchants, saleswomen, stenographers, telegraphers, and even street-sweepers! Several women are licensed engineers and boat's captains, while it would be difficult to find a half-dozen occupations in all the world affords which have not been entered by a few women, here and there. On the other hand, men have taken up not a few employments which were originally considered "woman's work," such as laundry work, dairy work, dress-making, millinery and nursing. Even the ranks of primary teachers are

now being invaded by men, and household service, too, though that women are not yet excluded may be judged from the pitiful wail recorded in today's paper, to the effect that for forty thousand emigrant girls at Castle Garden just one hundred thousand places in New York households are waiting! M. M.

IT is not often that a police court Justice finds it necessary to deliver a gratuitous lecture about woman's inhumanity towards woman. Recently, however, in the Morrisania court, New York, the judge said to a complainant who appeared in court against another woman, "You should have sympathy for this poor woman. She is not responsible for her actions. She is plainly mentally unbalanced.

The trouble with women is that they never sympathize with one of their own sex, but are ready to hound her on the slightest provocation. I am going to discharge this woman, and tomorrow I shall personally see that she is sent to some humane institution." This is a little severe, one must admit, but that this lecture may not have flown wholly wide of the mark, some neighborhoods, even today, bear testimony. H. H.

A Woman Archeologist

IT is almost difficult to associate the name of a woman with the great work done by Madam Dieulafoy, wife of M. Dieulafoy, the famous archeologist, who, at the request of the French Government, made several expeditions to Persia to unearth the remains of architectural art of the times of Darius and Artaxerxes. Madam Dieulafoy's experience has been that of a heroine. At one time they were seventy-five days in the wilderness, the husband ill and the wife herself, his only nurse, stricken with fever. Upon another occasion, with a revolver in each hand, she helped keep a mob of howling fanatics at bay. A rumor had been started among the natives that M. Dieulafoy and his wife were excavating the place supposed to contain the remains of the prophet Daniel. But for courage and presence of mind, both archeologists would probably have lost their lives. The Cross of the Legion of Honor, bestowed upon Madam Dieulafoy by the French government after this expedition, shows how much her work has been appreciated.

After months of toil and anxiety they excavated the wonderful fragment that constituted the throne room of Darius, thus allowing this to be reconstructed in the Louvre, Paris.

Madam Dieulafoy is herself an artist and musician, an erudite lecturer, yet fond of the social side of life.

Her services to archeology have been enormous. STUDENT

IN THE LOMALAND INTERNATIONAL HOME

WE have never once been taught by word or act to distinguish between dogmatic religion and the moral laws on which it has artfully fastened itself, and from which it has sucked its vitality. When we have dragged down the weeds and creepers that covered the solid wall and have found them to be rotten wood, we imagine the wall itself to be rotten wood, too. We find it to be solid and standing only when we fall headlong against it. We have been taught that all right and wrong originate in the will of an irresponsible being. It is some time before we see that the inexorable "Thou shalt and shalt not" are carved into the nature of things. This is the time of danger.

Lomaland

"It will be a cold Thanksgiving, Patience," said the sturdy Puritan, Silas Brent, as he came into the great stone-paved hall and strode up to the blazing fire of hickory logs. Mistress Brent lifted up a pale, sorrow-lined face. The good man turned abruptly and looked out of the window toward the bare forest. The naked boughs were rubbing harshly against each other in the cold wind. He had been schooled to preserve a stern composure, but he dared not meet his wife's eyes then, for fear that his composure would give way.

Brent was a man considered in those times "well-to-do." He had large fields, a comfortable stone house and a stronghold in which all his neighbors might gather and feel safe in times of danger. It had long been the custom for all the village to meet with Mistress Brent on Thanksgiving Day, and it was on this day, just a year ago, that had come to them a terrible grief.

The season had been unusually mild the year before, and Thanksgiving Day being warm and sunny, the children had gone out to play and had carelessly wandered into the forest. Suddenly, one of the little ones gave a sharp cry. She had seen the dark face of an Indian peering from behind a tree. At the same moment the other children caught a glimpse of several dusky forms through the brush. The children rushed to the house crying, "Indians! Indians!" But when the men ran to meet them, no savages were to be seen, and the little three-year-old daughter of Silas and Patience Brent was missing. All through the day and late into the night the men searched through the surrounding forest, but no trace of the little girl could be found. The Indians had come and gone, leaving no more sign than a passing cloud in the summer sky. And during the year no sign had come from the little child.

The Puritans were a strong, stern race, and they knew how to suffer in silence.

Turning from the window, at last, Silas Brent said, sturdily: "Nay, nay, good wife, it would be ill for our friends to grieve. We must not forget their comfort. Others suffer as well as ourselves."

"That is true," returned his wife. "We will make it a joyous day for all, and particularly for the poor."

And here they were interrupted by busy, bustling Dame Goodwin, the housekeeper, who came to summon them to the kitchen to look at the heaps of bread, the dozens of loaves of cake, the rows upon rows of pies, cookies and huge pans of rich, golden-brown crullers.

"What a quantity, Cousin," said Silas Brent. "None too great," was the cheery reply. "You know Thanksgiving Day comes only once a year."

"We will bring these people all the brightness and cheer that we can," said Patience Brent, and she bravely smiled again.

At one o'clock the next day long tables were spread in the great hall between the two wide fireplaces, when, just as the guests were about to

A Thanksgiving Day Two Hundred Years Ago

take their seats the door was noiselessly opened and a tall Indian, wearing the head-dress of a chieftain, stood in the doorway. Glancing around, he spoke to them in broken English. This, briefly, was his story:

The year before, a party of Indian hunters, passing through the forest, had carried away a little girl. They had taken her to the north and had given her to White Fawn, wife of the chief, Grey Eagle. But the chief, since that time, had been killed in battle. White Fawn, grieving for her own little child which had died, grew to love the little daughter of the pale faces and longed to keep her. But she, too, grew ill and before she died she exacted a promise that little Esther should be taken back and restored to her mother. "I have not thought," she said, "that the white squaw, also, may die of grief."

The Indian gave a low call and up to the threshold stepped another with little Esther in his arms. She was dressed in garments of the finest white deerskin, her little moccasins were covered with bead work, and everything about her bore the Indian woman's loving touch. Placing his hand upon the child lightly as he passed, the Indian strode out into the forest, where he was quickly hidden from view. Silas Brent took up his child, gazed a moment in her face and then placed her in her mother's arms.

"She does not know me," cried the mother, as the tears rolled down her cheeks. But the child lifted a little hand, wiped away the mother's tears, then nestled closer to her. Mistress Brent was comforted, for she saw the baby knew her after all. Suddenly Dame Goodwin remembered that no one had eaten any dinner, and such a joyful company as sat down to the great tables never could have been seen before! They were too happy, too excited, to eat very much and the hearts of the parents were full to overflowing with their great joy. The child had met with nothing but the kindest treatment from the first, that was evident, and in her heart Patience Brent felt grateful to the Indian woman who had given her a true mother's love and care. She seemed to be none the worse for her strange experience, and though it had cost her parents, in fact all the villagers, a year of suffering, they all felt something of Mistress Brent's gratitude.

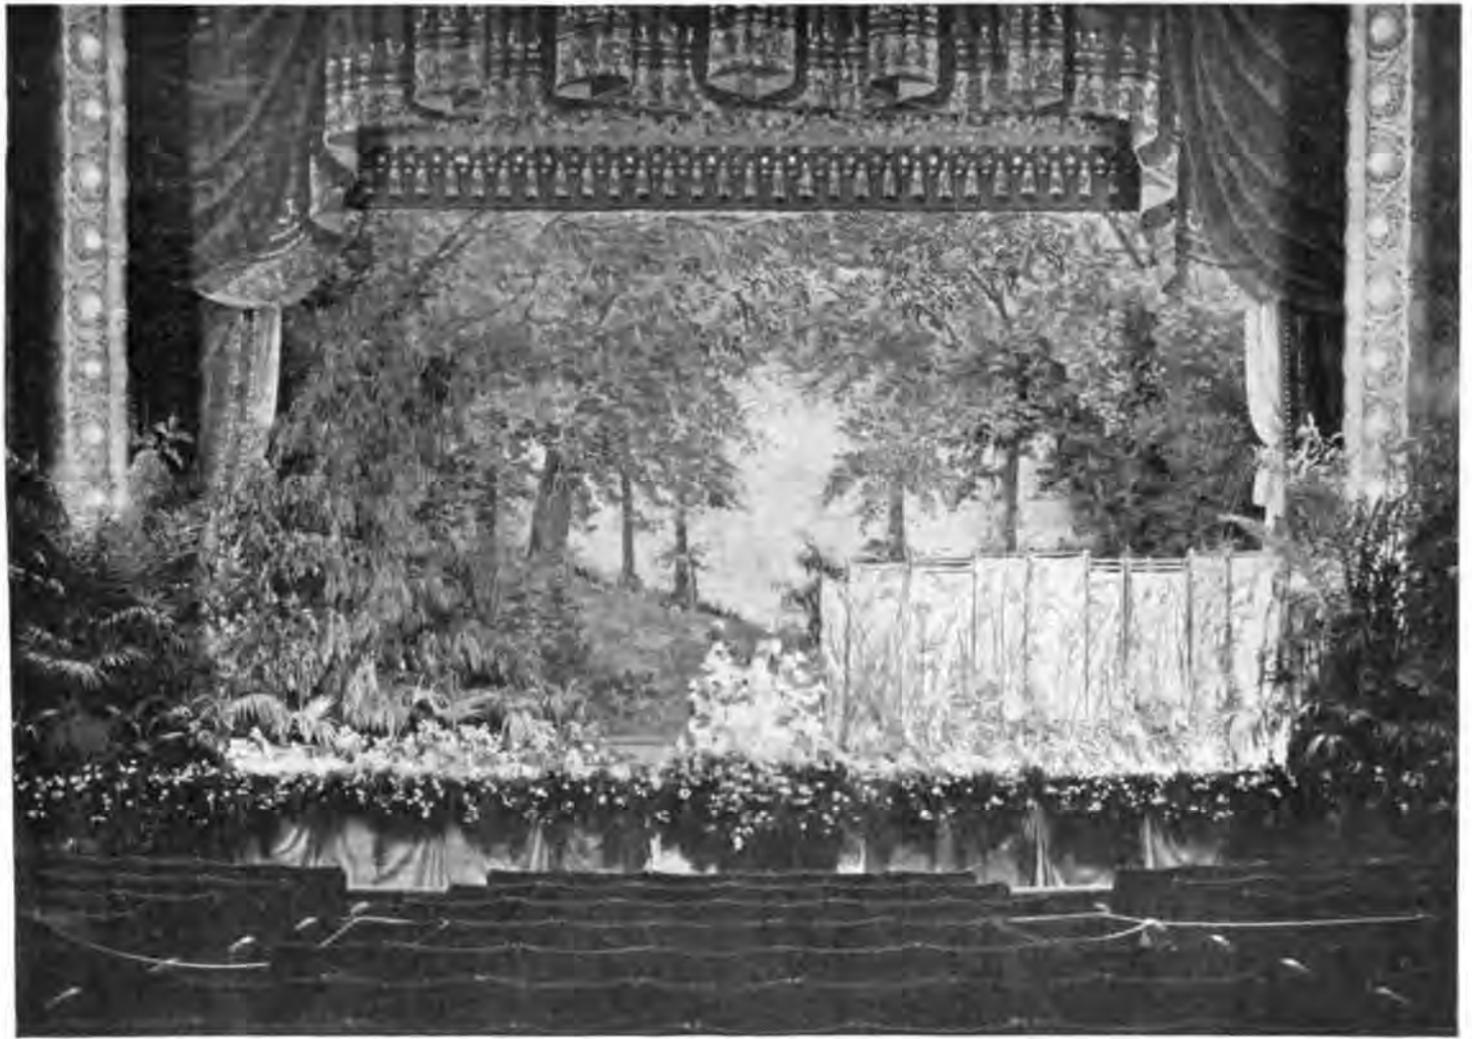

"Good wife," said Silas Brent that evening, "I think we have been greatly blessed. We should truly never have known what real joy was had we not passed through this sorrow."

"And I," said Patience, "am more grateful than you. Not until little Esther was taken away did I find the real joy that comes of bringing joy to others."

Many years after, when Patience and Silas Brent had both passed away and the little Esther was a grown woman, with a family of her own, it still remained the custom for all the villagers to assemble in the great stone-paved hall of Brent Place on Thanksgiving Day. And, after dinner, the little deer-skin costume would always be brought out and again would be told the story of that long year of captivity. STUDENT

LOMALAND STUDENTS AT ISIS THEATRE

ISIS THEATRE was crowded last Sunday evening with an audience that left not one vacant seat in the lower part of the house. The meeting, under the direction of Katherine Tingley and conducted by the Woman's League of Lomaland, was in the nature of a tribute to Helena Petrovna Blavatsky, the founder of the Theosophical Society and Universal Brotherhood.

The opening music, rendered by members of the Isis Conservatory of Music, consisted of "Siegfried's Rhine-Journey," from "The Dawn of the Gods," by Wagner. Moving to the soft music, some twenty-five or thirty of the Daughters of Lomaland, in Greek costume, came upon the stage and took their seats.

Mrs. Isabel Butler, in opening the meeting, said: "The program this evening is devoted to Helena Petrovna Blavatsky, the heroic woman who first carried the torch into our darkened century. Last Thursday was the twenty-ninth anniversary of the Theosophical Society, which was founded by her in New York City, and it seems a fitting occasion to call to mind these early days. We hope the extracts from her writings which will be read here tonight may help you to better understand this great heart, who endured much that she might serve the race and preserve intact for her successor the trust given into her hands, which now has become a glory of light throughout the world, at the great Theosophical Center at Point Loma, under the direction of Katherine Tingley."

Mrs. Marjory Tyberg next read a paper entitled, "Helena Petrovna Blavatsky," from which we quote: "Thirty years ago Helena Petrovna Blavatsky came to America. From her youth she had been a wanderer, seeking ever in the sacred places of earth, far from common men, and also in the busy haunts of men, for wisdom for the answer to questions, 'What is Man?' 'What is God?' 'What is the Human Destiny?' Because her heart was pure, her will as adamant, her vision unclouded by any selfish thought, her mystic quest had its end; and when she came once more to America the Lamp of wisdom was in her hand, and in her heart the knowledge of the Law—all that poor humanity needed, and much more than poor humanity would take from any teacher. To her came the trusted companion, William Q. Judge, and then these two royal workers formed the Theosophical Society and Universal Brother-

hood. This was the initial step of the work which has grown into the world-wide activity and enormous influence of the Universal Brotherhood Organization, now under the direction of the third great leader, Katherine Tingley. H. P. Blavatsky had made her own the superb morality of a world Teacher. We have not the words to speak our love for this great Teacher. We will that our work shall daily be our tribute to her. We will that H. P. Blavatsky's own words, spoken tonight by the women of Lomaland, shall find in your hearts an echo of great love for humanity."

A tribute to H. P. Blavatsky from Cuba, was given by Mrs. Antonia Fabra Stewart. Following this was a reading from Madame Blavatsky entitled: "Is Denunciation a Duty?" Mrs. Samuel Bonn gave a pleasing rendition of a song, "The Unutterable."

A dialogue between two Raja Yoga children over the portrait of Madame Blavatsky, formed the introduction to the reading of seven extracts, each in the nature of a prophecy, from Madame Blavatsky's writings.

Miss Elizabeth Bonn gave an artistic recitation of a poem written by one of Katherine Tingley's students, entitled: "The Pillar of the World."

Several typical extracts from the pen of Madame Blavatsky were read, but that which, perhaps, most impressed the audience, was the reading from *The Voice of the Silence*, a devotional book compiled by Madame Blavatsky for her pupils. From the extracts read we quote: "Let the soul lend its ear to every cry of pain, like as the lotus bears its heart to drink the morning sun.

"Let not the fierce Sun dry one tear of pain before thyself hast wiped it from the sufferer's eye; but let each burning human tear, drop on thy heart and there remain nor ever brush it off until the pain that causes it is removed.

"Remember, thou that fightest for man's liberation, each failure is success, each sincere attempt wins its reward in time. The holy germ that sprouts and grows unseen in the soul, its stalks wax strong at each new trial; it bends like a reed but never breaks, nor can it e'er be lost, but when the hour has struck it blossoms forth." Madame Blavatsky's great heart and her love for Humanity were felt in every line read from her writings.

Art Music Literature and the Drama

Art, Music and Literature in the Twenty-first Century

WHEN we grow pessimistic with overmuch rummaging of the past, it is a good plan, sometimes, to dream of the future. What will the Twenty-first century bring us along the lines of art, music, drama and higher literature? Straws write prophecies and show the direction of streams, and there are diverse and tell-tale "signs of the times" today which may easily serve to write, not mistakenly, some prophecy of the future.

There is a world that is inspirational, that is untranslatable; hence the necessity for art, music and the drama. It is in this world that the soul finds its refuge and strength. It is of this world that the mind writes out translations—in symbol always—for the soul's fair bounty and repast. The great truths, the greatest insights, would remain forever untranslatable were it not for the symbol. Great art, great music, great architecture, great literature, all these are deeply symbolic; otherwise they could not serve the soul save by indirection.

In the Twentieth century, music and art will not only be recognized as necessary factors in education, but many will then learn to discriminate between that baser art which bespeaketh the lower nature and debaucheth the soul, and that pure art and music which is the soul's clear vision and witness. In the Twenty-first century more than the few will possess this insight, and in that day not money will be the test, but character. Our teachers of art and music, our great dramatists, our glorious and inspired writers, will in that day stand in a unique position. Today we see, on the one hand, artists and musicians selling their art for a salary, or struggling, unnoticed, with poverty and neglect. All that must needs be changed when people shall hold the things of the soul at their true value. Is it too much to believe that every legislative assembly in those days shall contain its musicians, its great dramatists and its men of letters? Nor will these be the one-sided products that are furnished, alas! at the present day. Educated by those wiser insights which develop head and heart and hand, the artists of the future will be rounded, matured, their judgment will be worth having, and they will stand side by side with the makers and executors of our laws. The Twentieth century will bring to blossom many things now but in the germ, many things that now are apparently non-existent. But they *do* exist, though beneath the surface and hidden from view. The Twentieth century will compare with this as the full day compares with the dull grayness of dawn.

MORE than two thousand years ago, Plato said of music: "To look upon music as a mere amusement cannot be justified."

And these words were re-echoed in our day by England's great philanthropist and statesman, W. E. Gladstone, when he said; "They who think music ranks among the trifles of existence are in gross error, because from the beginning of the world down to the present time, it has been one of the most forcible instruments both for training, for arousing, and for governing the mind and the spirit of man. There was a time when letters and civilization had but begun to dawn upon the world. In that day music was not unknown. On the contrary, it was so far from being a mere servant and handmaid of common and light amusement, that the great and noble art of poetry was essentially wedded to that of music, so that there was no poet who was not a musician; there was no verse spoken in the early ages of the world but that music was adopted as its vehicle, showing thereby the universal consciousness that in that way the straightest and most effectual road would be found to the heart and affections of man." And today the road *is* found.

Frederic Auguste Bartholdi, a Man of Rare Unselfishness

THE passing away in Paris of the sculptor, Frederic Auguste Bartholdi, lost to the world a man of rare qualities of mind and heart. He was a native of Alsace—that bitter tribute paid by the French in 1872—and it is upon the heights of Belfort, in that province, that one may see his glorious old "Lion of Belfort," carved out of the red rock of the hill that towers above the city. It is a superb work, "majestic, terrible in its fierce immobility; placed like a fabulous being in the midst of this hill of the Vosges,—the last rampart of our independence,—consecrated as to our glorious memory of the defense of Belfort."

Bartholdi is better known in America for his colossal statue, "Liberty Enlightening the World." Few, however, know that we owe him more than the sculptor's work upon it. During the days of the Commune, Bartholdi visited the United States, and here his soul was fired by the freedom and the opportunity of America. Upon going back to France he divulged a plan by which a colossal statue called "Liberty Enlightening the World," should be presented by France to America; and a body of distinguished Frenchmen formed a society to carry out the project. Not only did Bartholdi volunteer his services as sculptor, but when subscriptions came in too slowly he pledged his private fortune to defray expenses. It was largely because of his twenty years of devoted labor on this project that he died poor.

His loyalty to France could not be equalled, yet the thought of America brought to him always a strange and intimate inspiration. To true American ideals he was loyal and his life stands a strong tie between France and America, two countries linked closely in time past, and destined to be linked more closely in that greater time which is to come. STUDENT

COUNT TOLSTOY is reported as having said, recently: "Here with us, of that I am certain, the song plays no role, and even has many detractors and enemies. The old people love to talk of good substantial things, of God and creeds. They like to hear religious works read, and that, in my opinion, is excellent. I approve of that. But what is a song? Quite the same thing as brandy or tobacco, a mere pastime, a shallow amusement that only excites the people to bad deeds, to fighting, etc. In war, song is considered necessary to inspire the soldiers, and appropriate motives are looked for afterwards. But the soldiers are also inspired by brandy, and thus they go to their death,—the fools."

PYTHAGORAS held that harmony and pure melody alone could restore to poise a disturbed mind. Playing on the lyre formed part of the daily exercise of his disciples, and it was a rule that none should sleep without having first refreshed his soul by music; nor should the day's work begin until the whole being had been lifted into something like attunement with the soul by song.

UPON an old Italian violin, dated 1517, is the following Latin inscription: "Viva fui in sylvis: dum vixi, tacui; mortua, dulce cano." Translated, it reads: "Alive, I dwelt in the woods; when living I was silent; now, in death, I sing sweetly."

GEORGE ELIOT spoke truly that, "There is no feeling, perhaps, except the extremes of fear and grief, that does not find relief in music—that does not make a man sing or play the better."

"AMONG the various things which are suitable for man's recreation and pleasure, music is the first, and leads us to the belief that it is a gift of God, meant for man's good and set apart for this purpose."—Calvin

RAKUBAI (Falling Plum Blossoms)

Translated from the Japanese

THE year is returning with spring skies; the grass by the hedge is already turning green, the catkins of the weeping willow are already budding.

How sweet is the fragrance of the plum blossoms!

Lo! time and space fitting, sweetly is heard a flute-like note, as from the upper regions of the air the blossoms fall fluttering to the ground.

To the sound of the flute the blossoms fall fluttering to the ground.

Our Great Anniversary

ON November the seventeenth, twenty-nine years ago, H. P. Blavatsky, with the assistance of William Quan Judge, founded the "Theosophical Society." Growing steadily from then to now, and culminating in the establishment of the great International Center at Point Loma, it was but fitting that those who have the privilege of residence here should commemorate so important an anniversary.

From the youngest to the oldest, all took part in a tribute to the memory of the heroic woman who dared, and suffered, and achieved, so much. Her plans for the elevation of human life were seeds sown, and under the wise direction of her successors, William Quan Judge and Katherine Tingley, they have now begun to come up and flower.

Early in the evening, all gathered at the Greek gate leading to the School of Antiquity grounds, by the classic Greek Theatre, and formed themselves into a long procession. A cloudless starlit sky and a nearly full moon rendered artificial lights unnecessary and lent a touch of mystic beauty to the long line of students, their flags and floral decorations.

One of the children of resident members led the line, followed by Katherine Tingley's Cabinet officers. Then came the School Flag, borne by one of the largest boys, preceded and followed by children carrying H. P. Blavatsky's great literary works. Then a large body of the children of resident Theosophists led by a special group of seven of them carrying victory wreaths and themselves garlanded with flowers.

Following these was a long line of women, those comprising the "Women's League of Lomaland" in advance, beautifully dressed and garlanded.

Next were the men, the elder ones first, and then the members of the "Senior Boys' Club," carrying the flag of the United States.

Lastly was a group of visitors, friends from San Diego—or *Port Orient* as it is beginning to be called. These included some of the very old members of the Theosophical Society.

The two journals, the *NEW CENTURY PATH* and the little sheet written and edited by the children (and for all children), the *RAJA YOGA MESSENGER*, were also represented in the procession.

The march was started by the sounding of seven pealing bells (tuned to the scale) rung four times, followed by the octave once—representing each of the twenty-nine years of the Theosophical Society now merged into the Universal Brotherhood and Theosophical Society.

The procession wound its long way, in military order and step, along the road to the Homestead, around the Homestead, and finally drew up at the foot of the great steps leading up to the Aryan Temple long ago dedicated to the memory of H. P. Blavatsky and William Q. Judge. The carved doors were thrown open and all entered, met by the solemn music of the organ. Ranged in great circles under the dome, with the Cabinet officers and the band of seven children in the center, the procession stood for some time in silence before the curtain, which was lighted from behind; but the silence was broken by the voice of a child, who, unseen, read a very beautiful address written years ago by Katherine

There Is No RELIGION Higher Than T R U T H

Tingley for the use of groups of the organization, dealing with the ideals of life and aspirations which every member is expected to set before himself. "A little child shall lead them."

A few words of tribute to the memory of H. P. Blavatsky were then uttered by the representatives of various nations, America, England, Ireland, Germany,

Finland, Denmark, France, Cuba and others, and by H. P. B.'s old pupils. The leader, Katherine Tingley, also spoke briefly of her predecessors' great work and its results. Finally the International Representative, a member of many years' standing, added his tribute of reverence to the Foundress and her successors.

Then the long line reformed, and each member, passing before the curtain, laid a flower in the center, symbol of the inner offering of his life to the work outlined and begun by H. P. B.

Whilst all this was in progress, the students in residence at The Cliffs—formerly known as the Colony—some of them old and faithful workers, were also appropriately commemorating the anniversary. Great bonfires were lit, both at The Cliffs and at the Homestead, the light being visible for many miles around. The picture they revealed of the white buildings, the great domes, the houses of the children, and the whole grounds, was wonderful and magical in the extreme.

From first to last, the memory of the great Foundress of the movement was in every heart, lit with gratitude and love. Could she have been present, could she have seen, she would have known that nothing of her work, her sufferings or her sacrifice, had been wasted. But, perchance, she may indeed know that, for death is neither for her nor any of us the end of conscious life.

OBSERVER

"THERE is but one Eternal Truth, one universal, infinite and changeless spirit of Love, Truth and Wisdom, impersonal therefore, bearing a different name in every nation, one Light for all, in which the whole of Humanity lives and moves, and has its being. Like the spectrum in optics giving multicolored and various rays, which are yet caused by one and the same sun, so theologized and sacerdotal systems are many.

"But the universal religion *can only be one* if we accept the real primitive meaning of the root of that word. We Theosophists so accept it; and therefore say we are all brothers—by the laws of nature, of birth, of death, as also by the laws of our utter helplessness from birth to death in this world of sorrow and deceptive illusions. Let us then love, help and mutually defend each other against the spirit of deception; and while holding to that which each of us accepts as his ideal of truth and unity—*i. e.*, to the religion which suits each of us best—let us unite to form a practical nucleus of a Universal Brotherhood of Humanity without distinction of race, creed or color."—H. P. BLAVATSKY

"TO TEACH the babes, the little children, their divine nature, to impress this fact upon them is to lay the corner-stone of a helpful, happy manhood and womanhood."—KATHERINE TINGLEY

HELENA PETROVNA BLAVATSKY,
FOUNDRESS OF THE THEOSOPHICAL SOCIETY.

THE GOLD-TINGED HARVEST OF THE HEART'S DESIRE

by CAHAL O'BYRNE

TO the sunblecked Isle of the Apple-trees,
Sweet with the springtime songs of birds,
Where the voice of wave and the voice of breeze
Woo the pink-white petals with old love words,
O'er the red, west waves of the dying day---
A purple flame in a heart of fire,
In the cool, grey eve I shall sail away
To the far dream-island of heart's desire.

There lie the longings of hearts world-worn,
And the gossamer threads of remembered dreams---
A maze of delights on grey winds borne,
Float out o'er the world from the white starbeams,
And each fibre finds out a cold, dead heart
Which it lights to love with its magic fire,
Till each soul awakes to life's full, true part,
The gold-tinged harvest of the heart's desire.

THEOSOPHICAL FORUM

Conducted by J. H. FUSSELL

Question What constitutes a Theosophist?

Answer Although a Theosophist can be easily recognized by one who understands Theosophy, to define a Theosophist is not so simple a matter.

Certainly he is not known by his beliefs, nor by his non-beliefs. Nor is he known by his good deeds, for behind these, which to all appearances are such, may lie a selfish or even a black motive.

He cannot even be known by his general good intentions only, for this might enter on the lists many a crank and fanatic, and a Theosophist must very surely be possessed of common sense.

And yet a Theosophist must have beliefs of some kind; he must perform good deeds, and also have good intentions.

The essential point is that the man be working with his own Soul to carry out the purposes of his Soul. If he is doing this consciously, he is working more rapidly and with greater force than if unconsciously; but in both cases this co-operation puts him in the ranks of Theosophists.

The marks of the Soul are love, gentleness, humility, sincerity, purity, earnestness, perseverance, courage, unselfishness and charity.

When these qualities are seen in anyone, there the Soul is working. And it is present to the extent they are. When they are absent, he has nothing in him akin to Theosophy.

Barren as the earth may seem at times of true Theosophists, we yet see them sprinkled over the world everywhere—sometimes in the most unexpected corners, and sometimes in the humblest places. They may never have heard the word Theosophy, and yet may be possessed of a truer and higher quality of devotion to truth than another whose brain has been educated in Theosophical philosophy, and who is likewise striving to follow the teachings. Another turn of the wheel may illumine these brains and reveal within them a gem of rare purity. G. V. P.

Answer II In connection with this subject the following extracts from the "Key to Theosophy," by H. P. Blavatsky, will be helpful in showing what are the characteristics of a Theosophist:

First of all, because our philosophy teaches us that the object of doing our duties to all men and to ourselves the last, is not the attainment of personal happiness, but of the happiness of others; the fulfillment of right for the sake of right, not for what it may bring us. Happiness, or rather contentment, may indeed follow the performance of duty, but is not and must not be the motive for it.

Duty is that which is due to humanity, to our fellow men, neighbors, family, and especially that which we owe to all those who are poorer and more helpless than we are ourselves. This is a debt which, if let unpaid during life, leaves us spiritually insolvent and moral bankrupts in our next incarnation. Theosophy is the quintessence of *duty*.

Theosophy leads . . . to *action*, enforced action, instead of mere intention and talk. . . . But no Theosophist has the right to this name, unless he is thoroughly imbued with the correctness of Carlyle's truism: "The end of man

is an *action* and not a *thought*, though it were the noblest"—and unless he sets and models his daily life upon this truth. The profession of a truth is not yet the enactment of it; and the more beautiful and grand it sounds, the more loudly virtue or duty is talked about instead of being acted upon, the more forcibly it will always remind one of the Dead Sea fruit. *Cant* is the most loathsome of all vices.

Is equal justice to all and love to every creature the highest standard of Theosophy?

No; there is an even far higher one.

What can it be?

The giving to others *more* than to oneself—*self-sacrifice*. . . . We say, however, that self-sacrifice has to be performed with discrimination; and such a self-abandonment, if made without justice, or blindly, regardless of subsequent results, may often prove not only made in vain, but harmful. One of the fundamental rules of Theosophy is, justice to oneself—viewed as a unit of collective humanity, not as a personal self-justice, not more but not less than to others; unless, indeed, by the sacrifice of the *one* self we can benefit the many.

Then you regard self-sacrifice as a duty?

We do; and explain it by showing that altruism is an integral part of self-development. But we have to discriminate. A man has no right to starve himself *to death* that another man may have food, unless the life of that man is obviously more useful to the many than is his own life. But it is his duty to sacrifice his own comfort and to work for others if they are unable to work for themselves. It is his duty to give all that is wholly his own and can benefit no one but himself if he selfishly keeps it from others. Theosophy teaches self-abnegation, but does not teach rash and useless self-sacrifice, nor does it justify fanaticism.

Question Since Theosophists claim that they are in harmony with the teachings of Christ, why start a new religion in the name of Theosophy?

Answer No new religion has been started under the name of Theosophy. Theosophy is not a religion. It is rather the inner spirit of religion itself. It is and always has been behind every religion, but is not connected with one more than another. It is the mother of all religions, and when any one of them loses its spirit in the letter; when any one of them begins to show signs of becoming a body without a soul—the soul reappears on earth under a new name. This is the meaning of one great teacher after another coming to earth and giving the same old teaching in a form to suit the times. The Teachers teach religion, but never a religion. For truth is eternally the same.

One feels like asking in response to this question, whether Christianity itself is in harmony with Christ's teachings. Is this body an exponent, or a living example of his teaching? If it were there would be no need of Theosophy. As it is, something is surely needed in this age, in the way of religion. No one, I fancy, will pretend to be satisfied with the results of Christianity. And we have had it now for several hundred years, enough to give it a fair trial. One of two things is evident. Either Christ's teachings were worth very little, or the body which bears his name, have paid very little attention to them.

Theosophists are very sure the latter is the case, and they are also sure the old body is so corrupt, and so crystallized in corruption, that it is necessary to start fresh, quite outside of the old body, leaving it to the Karma it has served. For what has the church been about all these years? It makes one's heart ache to think how it has betrayed its trust. What curious complicated forms it has presented to poor trusting humanity, and set them up as necessary to salvation, when they have had no relation whatever to salvation. How it has played upon the best and noblest qualities in men, and through these held them in chains and kept them starving for a breath of pure heart-life. What will the church have to answer for in the great day?

Something surely is needed to make alive the teachings of Christ in the hearts of men, and present them again in all their beauty and power. This is one of the missions of Theosophy. STUDENT

THEOSOPHY tends to destroy pessimism with its companion, despair. Do not allow discouragement to come in. Time is needed for all growth, and all change and all development.

Let time have her perfect work and do not stop it.—W. Q. JUDGE

Only a Pawn

TWO Masters of the ancient game of chess were playing with rare skill and precision.

A third was watching them as also were some half-dozen inferior players. These latter might profit by any brilliant plot and counter plot developed as the game went on; they were scarcely qualified to judge its underlying plan.

Not so the third Master. He saw the possibilities of that game after its first half-dozen moves were made, as the sequel showed. For presently when the white player, disregarding apparently a fierce onslaught made by his opponent, quietly moved his queen's rook's pawn to his fifth square, the third Master turned to a young man seated by his side and whispered: "That pawn wins the game for white."

And so it turned out. The battle raged on for nearly an hour with varying result. First the white player seemed to hold the advantage, then the black player looked triumphant. At last both sides seemed fairly spent and a draw appeared to be the best hope that white could entertain.

Yet he was gradually maneuvering to protect that pawn, moved so aimlessly, as a novice might judge, earlier in the game.

Then he began to move the pawn forward. In another ten minutes black after examining the position intently, turned down his king.

He had resigned!

Ernest Benedict, the young man to whom the third Master made his prediction of white's success, abruptly rose and left the chess room when the game was finished. His face was pale, he was trembling in every limb as he descended the stairs. On reaching the street he looked right and left to see if there was anyone about, and then ran to the nearest drain. Taking a small white packet from his waistcoat pocket he emptied its contents down the drain, and then walked rapidly westward.

In about half an hour's time he had reached Hyde Park. The night was starlit, and the ancient trees in their summer beauty glistened beneath the soft rays of the yellow moon. It was a scene to invite repose and meditation. But it was not solitary. Hyde Park is one of the few open spaces in London where the destitute and homeless may sleep in summer time (and in winter too, if they care) undisturbed by the police authorities. So long as they are orderly they are not shifted.

Young Benedict had slept among these outcasts the previous night. He had then a shilling in his pocket. He was now penniless. After buying some poison, he had just enough left to purchase a cup of coffee at the chess rendezvous near Bloomsbury that he had recently quitted. The plan over which during the day he had brooded with growing determination, was to take the poison when he reached Hyde Park again and then quietly slip into the Serpentine.

However, as the reader will have guessed from Benedict's action after leaving the chess room, this plan of his had been abandoned.

As he wandered from bench to bench under the shadow of those peaceful trees, only to find everyone of them already occupied by slumbering men, he began to feel a strange fellowship with these the *waiting pawns* in life's fierce game. Society's egotistical decision is that they are the "submerged tenth," "human flotsam and jetsam," and so forth; but might not the moment of effective action come for them as also for himself?

At last he found a vacant bench whereon he stretched himself and watched the stars. These mere points scattered over the heavenly dome, were they not all in reality blazing suns? Then a grotesque idea struck him: "That might do for the title of a story," he muttered.

He sat up on the bench and held his sides. He durst not laugh aloud, for round about him several men would begin to swear violently. At last he gasped out, and the utterance seemed to relieve his mirth, "*Suicide of a star!*" For a moment or two he was quiet pondering the idea.

"Ernest Benedict, you are an egotist," said he to himself. "You know you are! Conceited ass to contemplate suicide! you silly pawn! Wait! Wait!" Then he lay down again, and turning on his side slept peacefully.

An Astrology of the Future

THAT astrology was once an exact science can hardly be doubted, for its exponents held positions of dignity and respect among ancient peoples who were advanced and refined in all that makes a civilization. That the study of extra-mundane influences is not today given a high place among our sciences is due to our loss of skill in its application. Operative astronomy, such as is shown in the compilation of a

nautical almanac for the year 1908, which may be taken by an Arctic explorer and relied upon for the correctness of his navigation, is practically exact. Speculative astronomy, where the savant is ever guessing as to conditions and phenomena upon other worlds than ours, is too often quite as worthless as modern astrology.

Astrology today is largely speculative. Its votaries, who generally follow it as a means of livelihood, have in their possession a few grains of truth inherited from the past, but the correct application of the principles underlying the science is yet to be made. If it be true that the perihelion of Jupiter causes sunspots, and if sunspots produce electric disturbances on the earth, and if these, in turn, affect men and plants, then it cannot be well denied that Jupiter exerts an influence upon earth-life. If the position of the moon results in certain ocean-tides, and these tides offer favorable or unfavorable conditions for fishing or clam-digging, then it would be wise to defer a clam-bake till the moon is right for that purpose. When we can see, or think we see, the chain of causes and effects, we consider that we have attained to added wisdom, but when the chain of events is not clear we become cautious, and often very properly cautious, but the facts should not be denied. For instance, stated astrologically, if an opposition of the sun and moon causes a greater distemper among the inmates of insane asylums, will it not also affect other people who are not inmates, but some of whom ought to be? And if some of these outsiders happen to be holding positions of responsibility, say at the throttle of a locomotive or the helm of a steamer, then the probability of railway and marine accidents is greater. In such a suppositional case, if we knew all the causes, then we would not call them "accidents."

These things offer a field of study quite as honorable as that of law or medicine, and in due time men who are well qualified will give us a new astrology which will be fitted to us, and to the time in which we are living.

STUDENT

English Notes

(From our London Correspondent)

THIS week I have been to "His Majesty's Theatre" to witness Mr. Tree's presentation of *The Tempest*. The house was crowded, as usual, and the audience appreciative if not overflowing with enthusiasm. One felt that immense pains had been taken to do justice to this immortal play, but that, notwithstanding the spectacular success of the presentation—I have never seen anything finer in this respect—the effort was a failure.

And why? Simply through lack of faith on the part of the actors. Had they believed, as the Master Bard himself believed, in the *reality* of that which they were presenting, how different would have been the effect upon us all! I have since pictured to myself a company of Theosophists enacting *The Tempest* with the same scenic opportunities. How mightily would the soul of it have found expression! Instead, there was a charming play, in which Caliban (Mr. Tree) was the chief character instead of Prospero, which, for all its wealth of beauty and correctness of enactment, lacked the one essential thing—*Magic!* Alas, poor Shakespeare! *When will thy hour strike?*

As I write a tempest of another sort is threatening this land: The tempest of war. Its occasion, the attack of the Russian fleet upon the English trawlers in the North Sea, will be known already to most readers of the *NEW CENTURY PATH*. Will Prospero subdue Caliban here? I am not without hope, for up to the present the British public, while unanimous in condemning the deed itself, seem most anxious to avoid identifying the Russian nation with it.

The event, surcharged with folly, is an object lesson, worthy of international attention, teaching the exceeding stupidity of war itself. For us to strike at Russia just now seems a bit ignoble, yet we must strike if Russia fails to grasp the realities of the situation. Any other nation would do likewise or be utterly dishonoured! I think of Tennyson's lines:

"His honor rooted in dishonor stood,
And faith unfaithful made him falsely true."

The falsity of the position of civilized nations lies here. Their *theoretical* ethics are those of the Prince of Peace; their *practical* ethics find expression in bloated armaments! There is no true redemption of international honor save in an "International League of Peace." Perhaps those poor northern fishers have not died in vain. WILLIAM JAMESON

THE MYSTERIES OF THE HEART DOCTRINE

Prepared by
KATHERINE TINGLEY
AND HER PUPILS

*The Theosophical
book of the
Twentieth century*

Tells the story and the history of the Theosophical Movement Throughout the World; tells what it is and why it is — reveals the mystery of the Doctrine of the Heart.

The prices are \$2 in cloth and \$1.50 in paper, which barely cover the cost, for it is printed and bound, not gaudily, but with such carefulness and thoroughness of art and craft as to make it unique among modern edition books.

Backward Tendencies

THERE has been of late quite a furbishing and a clattering of the old theological weapons. From the late numbers of a contemporary, we notice that a number of American papers are having a fling at the Revised Version of the Bible. We learn, also, that Professor Sayce, of Oxford, has been again striking "Fresh Light from the Ancient Monuments," in the interests of orthodoxy. His last book bears the title *Monument Facts and Higher Critical Fancies*, which clearly indicates the scope and purpose of his book. Still further, we find that Professor Townsend, Boston, rises to defend "Adam and Eve," and the orthodox interpretation of the Creation story in Genesis; and maintains that the days there mentioned are days of twenty-four hours only!

Differing as these writers do from each other they indicate a certain

backward movement of thought on the part of a number of people, and it is the duty of the man who would help his fellows to first understand them—a thing which though very important is often forgotten. I am convinced that these recent orthodox productions indicate two things, at least; one a general principle, and the other a truth or fact. The general principle is, that when a certain crucial point is reached in the history of human progress, a process of separation or judgment takes place. The leaders of progress move on, and move away from those bringing up the rear. Then, those who cannot, or will not move towards the front separate from it and go to the rear. Even in parts of the world it is often found that where there is a very strong forward movement there also a backward or conservative spirit is strongly manifested.

Higher Crit- ics Opposed by Orthodoxy

What I call the particular truth or fact is this: that if the so-called "higher critics" advance to a position which is untenable, that is the signal for the orthodox guns to concentrate upon that point. This is what we should expect in ordinary warfare, and it is what happens in the strife between the advanced critics, and the orthodox. Take as an illustration of this the case of that celebrated book called *Supernatural Religion*. That book came like a thunderbolt, and its effect, on its own line, can only be compared to that of the *Letters of Junius* on political lines. But the unknown author had gone too far; because the early fathers did not always make their quotations verbatim it was asserted they must have been quoting, not from our Gospel, but from some other records unknown to us. This gave the orthodox critics, great and small, a chance to demolish all advanced criticism! It has always been so from the days of Strauss onward.

Truth Is What the World Needs

In one sense it is a pity that the forward trend should be arrested, even temporarily, because of some over-hazardous speculation or statement. Yet, on the other hand, it is a good thing, for Nature "removes those things which are shaken that those things which are not shaken may remain." Truth is what the world needs, and not dogma, or any particular form of criticism.

With regard to one of the articles above mentioned, that on "Adam and Eve," by Professor Townsend, of Boston, in which he advocates the days mentioned in the first chapter of Genesis as being only twenty-four hours each, we need "only smile and pass on." Judging from the extracts of the book which are given, it is not necessary to take it seriously, unless we regard it as a very serious indication of the way orthodox writers are prepared to twist, not only Scripture, but other things as well, in order to make them bolster up dogmatic theology. A man who can say, as Professor Townsend does, that "the readjustment of astronomical and geological theories during the last quarter of a century, in every instance have been making for, rather than against, the beliefs of the primitive church,"—a man who can say that does not surely expect to be taken seriously.

H. P. Blavatsky Then Stood Alone

The other two matters, the attacks on the Revised Version, and the new work by Professor Sayce are more worthy of notice. Professor Sayce is a great Assyriologist who, according to Canon Cheyne, gave hopes at one time of walking in the path of advanced criticism; but the ecclesiastical influence, apparently, has blasted all these hopes.

In his recent work the Professor spends much of his energy in trying to discredit the advanced criticism generally, because some of these critics once held that the art of writing was of no very ancient date. Professor Max Müller, and others held this foolish position; and Theosophists may remember how H. P. Blavatsky smashed the "learned professors" to smithereens.

She stood almost, or quite, alone then, but the "Ancient Monuments" have justified her position, and Professor Sayce and others now seek to use the monuments to prop up orthodoxy.

This error on the part of some advanced critics should make men cautious; but it would be very foolish to suppose that, because the critics made one mistake, therefore we should undervalue all the work of the advanced criticism.

All students should clearly distinguish between Scripture and the interpretations thrust upon it, and also between facts of the ancient monuments, and the interpretation given to those facts. In 1873-1874,

Becoming an Obstacle to Progress

Professor Sayce wrote that "Assyriology demonstrated the untenability of the traditional view of Genesis;" but now he has come more into line with the orthodox in the Churches.

According to Canon Cheyne, Professor Sayce, "in his historical inferences from the inscriptions, often stands, for good or evil, alone. In spite of this he constantly popularizes his results, without indicating whether they are peculiar to himself or not." Again Dr. Cheyne says:

Why should not this "versatile and Protean scholar" (as Professor Ramsay calls him), who has by his own admission, "not paid much attention of late years to Biblical criticism," and who speaks of "the School of Wellhausen" from hearsay, repair his omission, and seek the assistance of the critics in questions on which he and they are equally concerned?"

Canon Cheyne, who is a friend of Professor Sayce, is certainly one of the greatest scholars of the present day, and though we may not be able to see with him on all matters, yet he is no doubt right when he says, "Our popular literature on the Old Testament is becoming an obstacle to Progress;" and also, perhaps, where he says that Professor Sayce has had it in his power to hinder progress and has done it. REV. S. J. NEILL

The Japanese in Formosa --- A Remarkable Administration

FOLLOWING the annexation of Formosa by the Japanese at the close of the Sino-Japanese war, an era of remarkable administration set in for the Island, which according to all accounts leaves but little to be desired.

The general revenue is already five times what it was then, and local rates have grown to over two and a half times the then figure. The population of the Island has increased about one-half, probably due to a considerable influx of Chinese immigrants.

Among some of the really remarkable things achieved by the Japanese administrative system may be mentioned first the subduing of the half-wild native tribes, as well as the Malay pirates and the Chinese banditti who formerly infested the Island. Thus the peaceable and producing part of the population have been able to pursue their occupations without fear. The sanitary conditions of the Island have been greatly improved; hospitals are everywhere and over 200 Japanese physicians are successfully practising. The use of opium, which is so difficult a problem for Oriental States to handle, is being quite remarkably discouraged by means of taxation and argus-eyed police supervision, the main idea evidently being to prevent new victims to the drug falling under its spell. The Japanese educational system was long since introduced and some 20,000 natives are receiving regular instruction.

Furthermore, more than a thousand miles of good paved road have been laid and some hundred and twenty-five miles of narrow-gauge railway; a complete postal system is established, which includes an adaptation of the French system of postal savings banks, which has become very popular with the people; thousands of artesian wells have been sunk, one district alone, it is said, containing 800; and improved methods of mining, forestry and agriculture have been taught with great success. Camphor, for instance, has a four-fold output as compared with formerly; the gold output is seven or eight times what it was, while coal and silver production has increased in the same relative ratio.

Indeed, the material progress and advance of the Island is so marked and so striking under the Japanese administration, that one cannot help involuntarily wishing that whether Japan be victorious in the present struggle or not, the Japanese will annex and colonize other rich and misgoverned districts!

G.

Deterioration of Physique

THIS question, which has often been discussed in the NEW CENTURY PATH, continues to agitate with growing urgency the circles of progressive thought in England. It has even been made the subject of a government enquiry addressed to medical experts.

The two main causes for deterioration, or for apprehended deterioration, are given as the migration to cities and compulsory attendance of children at school. With regard to the first, figures quoted in the House of Lords show that the percentage of the urban population to the whole population was 50 in 1851 and 77 in 1891. The effects of a city life on physique, especially after one or two generations, are too well-known

to need discussion. The compelling of children during nine years of growth to sit at a desk in a crowded room and work their brains, is doubtless the same, namely to produce weakness of physique and a neurotic tendency. Especially is this the case when the children already pass their lives in streets and tenements and are underfed.

Many intelligent and philanthropic people are trying various remedies. Among these may be mentioned the "Garden Cities" which some large employers have instituted for their operatives, and schemes for providing physical exercises and recreation grounds in the schools.

But alas! while we admire the noble efforts of such lovers of their race, we cannot but feel that their labors will be too spasmodic and disunited for success against the overwhelming tide of human selfishness and indifference; unless such efforts can be united and protected and given direction under the leadership of Universal Brotherhood.

The circumstances cited as causes of degeneration are in reality effects—effects in a chain of consequences of false ideals. H.

The Swiss and the Simplon Tunnel

THE Simplon tunnel, which the Swiss are constructing in the place of Napoleon's old road across the Simplon Pass, will be the longest mountain tunnel in existence, being over ten miles. It is to consist of two separate tubes, each for single track, eighteen feet in diameter and fifty feet apart, connected at intervals by transverse galleries. The first of these is now nearing completion. It was begun at both ends, but work at the northern end had to be stopped in consequence of streams of water at 120° being met with. This illustrates the fact that the internal heat of the earth's crust depends more upon local chemical conditions than upon any constant rate of increase.

The boring is done by the Brandt hydraulic perforator, in which hollow steel borers, about three inches in diameter and furnished with teeth, are driven against the rock with a force of about 25,000 pounds, at the same time being slowly rotated. In this way holes for dynamite charges are drilled. The core of the tunnel being thus blasted out, the widening and lining are afterwards proceeded with.

The tunnel is ventilated by forced draught, and cooled where necessary by an apparatus which sprays the air, so that the labor is rendered even pleasant and healthy. In this respect and in other respects connected with the comfort and accommodation of the immense army of workers, great consideration and philanthropy are shown. When a well-organized government of enlightened people gets to work on an undertaking in which there is no trade competition, the terrible conditions of modernized slave labor (nominally wage labor) disappear. E.

The Philippines Rising from the Ocean

IT is very interesting to note that geologic investigations show that the Philippine Archipelago has been slowly rising from the Pacific since Miocene Tertiary times. In a report on this and kindred subjects, Mr. G. F. Becker says:

The period of upheaval, once initiated, does not seem to have been interrupted by any era of subsidence, and the modern coral reefs give evidence that it is still in progress. It is said that uplifts accompanying earthquakes have actually been observed by the Spaniards, and the earthquakes themselves are spasmodic jars in the process of elevation. The elevation has not been, properly speaking, catastrophic, however, for the tremors which may wreck a cathedral are insignificant from a terrestrial standpoint. On the whole, the uplift has been very gradual, so that even the coral polyp has been able to adjust himself to the changing conditions, building outward into deeper water as his old home was raised too high for his welfare. In this way nearly the whole of Cebú, to a height of over 2,000 feet, has been covered with a nearly continuous sheet of coral, which can be followed seaward into living reefs. Much of Negros has been clothed with a similar mantle. On a small scale, also, off the coasts of these islands, and particularly about Mactán, reefs can still be studied in every stage of upheaval, all those portions being dead which are exposed to the air even at the lowest tides. In southern Luzón and to the northward of Lingayén bay similar phenomena can be observed.

The islands are part of a great volcanic belt which undoubtedly girdles the earth, and along which the formations are similar as to structure and probably of the same geologic age. Andesite, one of the principal forms of the volcanic objects found along the Asiatic coast, gets its name from the Andes Mountains in South America. STUDENT

THIS week's cover-page of the NEW CENTURY PATH, contains the picture of W. Q. Judge, the second Leader of the World's Theosophical Movement.

Some Views on XXth Century Problems

The Banquet of Life

WHEN the healthily-constituted man has eaten enough he stops, wanting no more. When the healthily-constituted man shall have lived enough, he will die willing and content.

That is a fair résumé of Professor Elie Metchnikoff's recent essay on the rôle of science in human life. Expanded a little further, it comes to this:

Man's physical health has never yet, according to the Professor, been such as to enable him to live out his full time. He has always died unsatisfied. To satisfy himself and relieve this natural craving for more life, he has constructed the idea of his immortality, thus oversupplying in imagination the hiatus left in fact.

But were he to be enabled to live out his full cycle, say 120 years, his appetite for life would be satisfied.

Science will do this for him. She will find the laws underlying perfect health, teach him to live in accordance with them, and supply all that is lacking. Old age will bring no loss of memory, no senility, only its natural wisdom. When the meal of life is finished the instinct to rise from the table, to die, will replace the wish to live, and will be immediately followed by a death as painless as the cessation of a spent clock.

There is an originality in this view. The scientist has, so far as we remember, never before suggested that the *desire to live* would itself sometime cease, and cease, too, at the same moment as the *power to live*. This may be true. But "to live," in the sense of the Professor's argument, is not the same as *to continue in being*. The wish to live, to have more of the experiences of the last 120 years, summers, winters, mornings and noons and nights—that wish might go. But when it had gone, would it not reveal another wish, or rather a wish for another kind of life? Because a man desires no more dinner, does he also lose the wish for music? May not the latter be cleared and intensified by the departure of the former?

For the rest, the article is mainly dogmatic materialism. The Professor says, for instance:

"A future life has no single argument to support it, and the non-existence of life after death is in consonance with the whole range of human knowledge."

It is *out of consonance* with the whole range of human *belief*; and that, in our view, constitutes a "single argument" of no small weight. By the time that Professor Metchnikoff's happy era of perfected health arrives, more may be known of the duality of human consciousness, and there will be a juster appreciation than his of the unvarying verdict of the higher of these.

STUDENT

Modern Demands in Religion

THERE are plenty of clergymen, both here and in England, who think it is time to make a complete alteration in the methods of educating their cloth. A noted London preacher, interviewed the other day on the decline in church attendance, said: "It would

be a good thing indeed if no one were allowed to take orders in the Church of England until he had qualified himself by attending a course of Agnostic lectures in Victoria Park or Hyde Park on Sunday afternoons.

The Bishop's examination is almost wholly confined to theology, and that of a kind that takes no account of what I call Sunday-afternoon-in-the-Park Bible smashing." And then he expressed the opinion that Christianity needs restating in terms of modern thought.

Now this being admitted, what kind of new statement is to be made? The average man is increasingly disinclined, it appears, to accept the official descriptions of God, Christ, and man, and their relations to each other. The descriptions and relations want more than *re-statement*; they want *other-statement*. If the average man finds that Christianity, as stated to him, is repelled from his intelligence, religion itself is probably shut to him; for he identifies the two.

The pulpits have made God a man—large, powerful, more or less prescient, more or less kindly and approachable; but a *man*. The average mind objects to the information that the source of men is a man. It is blindly

feeling about for something greater, something that cannot be comprehended in that which issues from it.

The pulpits of the old theology have drawn an uncrossable line between Christ and man. The Son of *man*, "made perfect through suffering," they have pictured as different in *kind* (not degree) from man, thus reversing the error they made respecting God. To Christ's injunction, "Be ye perfect," they have ventured to answer: "*It is impossible; you alone are perfect; not made slowly perfect, but primordially so.*" Thus they have made both Christ, and also suffering, incomprehensible.

Archeological discovery is pushing the time limit of civilization back millennium after millennium. The man in the street is learning to speak familiarly of the mighty pre-Christian Empires. Knowing nothing of the early Christian teaching that Christ had appeared on earth age after age previous to the appearance of this era, teaching entirely dropped out of sight (like the belief in Reincarnation), he wants to know whether all those ages were really in spiritual darkness, and why "God" only chose to illumine the human mind for the first time a handful of centuries ago.

And the man in the street, even though he be a Bible-smasher, is entitled to urge his difficulties and objections, and will certainly continue to do so.

STUDENT

Karma, Harmony, and Balance

HAS a certain prominent press man been reading H. P. Blavatsky's *Key to Theosophy*? It would seem so. He has been a-search for some formula which should completely explain the universe. He thinks he has got it in the word *Balance*. H. P. Blavatsky's word is *Harmony*, which is her one-word translation of the eastern word *Karma*. We like it better than *Balance*.

This writer says that "scientific experience and the higher interpretation of the system of nature point distinctly to one fundamental interpretation—the return of equivalence and compensation in all interactions."

H. P. Blavatsky says: "We describe Karma as that law of re-adjustment which ever tends to restore disturbed equilibrium in the physical, and broken harmony in the moral world." She illustrates its action by the ripples set going at the edge of a lake by a stone. They broaden out to the circle of the shore, and thence are reflected back to the point whence they started.

Physically and morally, Karma is the law of action and equivalent reaction, and this is what the writer quoted makes of his *Balance*. By aid of his principle he perceives three truths.

The first is that the soul is accountable for its actions; that is, they return to it as consequences; "men reap as they sow." To which we would add that they gradually learn from the reapings how better to sow.

The second is that the soul survives the body. This is "the recognition that accountability does not end with the death of the body; that the wrongs which are not righted here must be righted elsewhere; that the good which is not rewarded here must be rewarded hereafter . . ."

Our writer does not appear to see that his reasoning should have carried him on to the idea of reincarnation. Why that "*elsewhere?*" Why not here? Does the returning ripple come to some other part of the shore than that from whence it started? Why does not the soul reincarnate *here* to reap the effects of the actions which it sowed here?

And the third is that there exists "a supreme power that rights things," "a supreme power of rightness." Here again is pure Theosophy.

The author gives the comments of a number of prominent persons to whom he submitted his views. They form an interesting mirror of modern thought. The English writer, W. H. Mallock, thinks that the theory of *Balance* is only the old law of cause and effect, and would lead to a system of pure determinism.

It may be the law of cause and effect, but it leaves room for the continuous action of Free-will as cause.

To do is in our hands; we are only bound to the effects of what we *have* done. We can overcome the whole momentum of habit by standing in soul consciousness every day and every hour.

Paleontology
Ethnology

Ancient Mexicans and Egypt

A SEARCH among some old notes has brought to light the following matter, which is interesting as bearing upon the subject of "America Older than Egypt," recently mentioned in the *NEW CENTURY PATH*. *The World* gave an account of the researches of Dr. Nicolas Léon, the American archeologist, and his colleague, Señor Rodriguez, in the ruins of Cantona, Mexico; and, not only the remains discovered, but the remarks of the writer of the account, afford striking evidence of the growth of opinion as to American antiquity.

The explorers found a city covering many miles of territory, and with walls and towers and houses on every side. So large is the area that it must have accommodated at least half a million people. There are also hundreds of pyramids, quadrangular in shape and orientated, arranged in sets of four around enclosed courts. In some cases the enclosure is further strengthened by walls of stone broad enough for vehicular traffic to pass on the tops.

All the pyramids are connected by elevated avenues as well as by covered trenches, and it is estimated that there must have been 900 miles of roads and 600 miles of trenches.

As usual many utensils have been found, mainly, of course, of the kind most likely to survive the scythe of time: such as pottery, knives and arrowheads. Ornamental cupolas and sculpture in bas-relief abounded, together with statuettes.

If we judge of what the ancient inhabitants were by what has survived of their work, we cannot fail to see that a very advanced civilization must once have flourished here. How much would remain of our own civilization after such a visitation of the hand of time? But what is noteworthy is the comments made on these discoveries, from which the following may be quoted:

Various are the theories propounded, but none of them has a tangible foundation. Writers seeking to find in the Bible the root of the tree of the human family have even ascribed these buildings to the Jews, to the Phœnicians, and to the Egyptians. They crawl about for some clue that shall lead to Shem, Ham and Japhet, instead of taking into account the cumulative evidence of an original American civilization.

But what is sauce for the goose is sauce for the gander. How many theorists are there, proud of their emancipation from Biblical tradition, and yet hampered by some other intellectual fetish, a little more liberal it may be, but still a prejudice? The scientific attitude is to approach all facts with an open mind, using preconceived theories merely as guides to further discovery, and not as fetters to the intelligence. Yet it takes a strong character indeed to maintain such an attitude in the face both of the natural love of one's own ideas, and of desires and interests which may unconsciously urge one to discover what he wants to discover instead of what is actually there. Speaking of the costumes of these ancient Americans, the writer says:

Such was the costume of the lost Atlantis, the costume of prehistoric Yucatan, the costume of the people of the dead cities of Mexico, and, more wonderful than all else, the costume of the ancient Egyptians.

STUDENT

America and Egypt

Besides their pyramids, their obelisks, their towers, and the style of their architecture, there are a thousand links between the civilizations of ancient Egypt and ancient America. To go over the resemblances in art, handicrafts, customs and religions, would take a volume. The early Egyptians, like the Indians of today, like the Mound Builders of—when?—called themselves red men. Both Peru and Egypt believed in the immortality of the soul, in reincarnation, and like the Aztecs, embalmed their dead.

Thoughts from H. P. Blavatsky

HOW much more would Paleontology have learned had not millions of works been destroyed! We talk of the Alexandrian literary lore, which has been thrice destroyed, namely, by Julius Cæsar, B. C. 48, in A. D. 390, and lastly in the year 640 A. D., by the general of Caliph Omar. What is this in comparison with the works and records destroyed in the primitive Atlantean libraries, wherein records are said to have been traced on the tanned skins of gigantic antediluvian monsters? Or again, the destruction of the countless Chinese books by command of the founder of the Imperial Tsin Dynasty, Tsin Shi Hwang-Ti, in 213 B. C.? Surely the brick-clay tablets of the Imperial Babylonian Library, and the priceless treasures of the Chinese collections could never have contained such information as one of the aforesaid "Atlantean" skins would have furnished to the ignorant world.

H. P. BLAVATSKY

Man 18,000,000 Years Old

THE Antiquity of Man is much greater than is at present supposed by science. W. Q. Judge, in a brief summary of the ancient teachings of the Wisdom-Religion, says that man in his present shape appeared 18,000,000 years ago. This statement is not a guess nor a dogma, for it is part of a system of ancient knowledge that is self-consistent in all its parts, some of the keys of which were given by H. P. Blavatsky, and which will some day be admitted by the world, as much of it has already, since her death, come to be admitted.

Opposed to this statement we have, on the part of Science, no single or stable theory whatever. Different theorists assign widely different dates, some being contented with a few thousands of years and others running into millions. The variation in opinion depends largely on the different amounts of time allowed for the deposition of the various sedimentary systems; and also on the unsettled question as to what are the earliest human remains—a question which fresh discoveries continually alter and will alter.

H. P. Blavatsky makes man pre-cretaceous, but science does not yet accept so great an antiquity, partly because no human relics have yet been discovered earlier than Pliocene, or possibly Miocene, times, and partly on account of the exigencies of the theory that man is descended from apes.

Theosophy, however, holds that the anthropoid apes are degenerate descendants of certain early and misguided humans; in which it is supported by de Quatrefages, who says that on the whole there is more evidence that apes were from men than men from apes. Again anthropoid apes cannot be traced much, if any, further back than man, and there would not have been time enough for the "missing link."

There was a special creation for man. If he ascended from the animal kingdom, his divine-human powers must at least have been latent in the animals. But if we examine the animals, biologically, morally, historically, any way we will, we can discover in them not the slightest tendency to progress even towards a higher species, much less to manhood—*unless under human tutelage*. There was a time when man was not material, then when he was partially material, and finally a fully embodied man appeared.

That we have not yet discovered his earlier remains is due to several easily understood causes. First, we have not yet discovered all there is to discover and are enlarging the boundaries of discovery every day. Second, man was never so abundant as animals, he did not have a hard shell, he did not live in the mud, and he burnt his bones or otherwise prevented their preservation.

Science is always inclined to take too narrow and rigid views of things, to take huge leaps and leave vast gaps. It forgets what countless gradations must intervene, and makes no allowance for un contemplated possibilities. It assumes that the kinds of man familiar to it are the only kinds of man that could ever have been. It is too anxious to reduce the plan of the universe to an exact mathematical formula.

Space forbids more than the merest outline of a few of the more important points of this vast subject. In conclusion it may be said that, at the present rate of advance in archeological speculation, science will soon be ready to concede to the Ancient Wisdom all the antiquity it demands. On every side it is being admitted that the duration of eras has hitherto been absurdly and unnecessarily curtailed in deference to theological or other dogmas.

✧ The Trend of Twentieth Century Science ✧

The Shape of the Earth

MEASUREMENTS to determine the size and form of the earth have been made from time to time since the year 814 and possibly before that early date, but it is fair to say that there is not even now sufficient information at hand to warrant the belief that our planet is "a sphere slightly flattened at the poles." Measurements made in different countries do not show the figure to be regular at all, and the external evidence is very conflicting.

If we attempt to get at the probabilities by a study of the other members of the solar system, we are confronted by the fact that the Sun, Moon, Mercury, Venus, Mars, Uranus and Neptune show no flattening whatever, and the two other planets, Jupiter and Saturn, are so enveloped by clouds that no data are available. In the case of Jupiter, the calculated compression of its spheroid of revolution should be 1-14, but the visible flattening of the envelope is 1-17th. Reasoning from this, we should assume that our earth is a sphere and that our measurements lack accuracy.

On the other hand, the study of the curve of the earth's shadow as seen during a lunar eclipse is, to some extent, bewildering. The gradual shading from shadow to penumbra precludes the instrumental measurement of a definite line, but on a number of instances the form of the shadow has been so marked as to make this unnecessary. We refer now to those cases when the shadow of the earth showed it to be egg-shaped rather than spheroidal. A few cases from recent observations will illustrate the point.

At the beginning of the lunar eclipse of October 4th, 1884, the distortion was observed at a time when the shadow was being cast by a region of the earth near the mouth of the River Amazon. On July 22nd, 1888, during an eclipse at 9.13 P. M., Pacific Standard Time, a protuberance was observed by astronomers which was cast by an area in northern Africa. On March 10th, 1895, the same phenomena was observed, and the shadow was cast by nearly the same area, namely, the vicinity of Egypt.

Is it a "coincidence" that these elevated areas, if they do exist, should mark a line which would call to mind the Atlantis which is now covered by water? And if one desires to speculate farther on this matter it may be cited that the eclipse of August 22nd, 1896, showed that a protuberance exists at Easter Island in the Pacific Ocean, which marks the ocean-covered Lemuria! In this case the protuberance caused the eclipse to begin ahead of time. According to Mr. Allen H. Babcock the first contact was at 9 hours, 24 minutes, P. C. T., or nearly 30 seconds before it was predicted, and according to Mr. C. D. Perrine the eclipse began at 9 hours, 23 minutes, 31 seconds, or nearly a minute ahead of the time when the first contact should have occurred. F. G.

Gnomes, Sylphs, Undines and Salamanders

THAT organisms can exist, and do thrive in the four realms of nature, has been held by seers of all ages, and we who live in the air do not need to be convinced regarding the earth and water, but many are sceptical when it is suggested that life forms may be found in fire. In this connection it is possible that a recent statement by Prof. H. B. Torrey, of the University of California, may be a forerunner of others still more remarkable.

He says that "observations taken with the utmost precautions have shown that organisms actually do live and thrive at an altitude where water boils at 208° F., when subjected continually to a temperature of 192° F., which will appear sufficiently remarkable when one reflects that water at 140° F. is unpleasantly warm to the taste as well as the hands, and at 150° is almost unbearable." STUDENT

The "Missing Link"

PROFESSOR VAN SICKLE cables from Java to the Dutch Academy of Sciences that he has discovered the missing link. It is a monkey which builds a nest, bathes, adorns itself with necklaces, sings, and uses a sort of language.

We do not suppose that the Professor uses the term "missing link." That belongs now only to the newspapers. The missing link between two branches of a tree will not be found in the leaves with which they terminate, but at the lower point whence the two branches diverged. It cannot be supposed that the common type which ages ago gave rise to the two branches, man and monkey, has now any representative. Even its fossil remains may now be irrecoverable.

The history of the two, given by Theosophy, is not that of science. And the difference would not be completely indicated by saying that one was the reverse of the other. Man is more than the highest animal. He is the meeting-point of an animal and a spiritual consciousness. And at his origin, the spiritual element contacting the conscious animal form which nature had been evolving, was at first unconscious of it. It was only gradually that the spiritual life was aware of the prick of sensation from its physically-living sheath.

Theosophy teaches that at a time when the contact of the spiritual with the animal had not long been established, and was yet very partial, the monkey diverged from the man and became a small collateral branch, hardly—if at all—advancing in its evolution from that day to this, and giving rise in its turn to many branchlets. And the monkey is but a caricature of even animal man as he was at the moment of divergence. It is the registration and perpetuation of the very lowest degree of even that. Since then, because of the light above him and gradually entering him more and more, man has achieved a relatively infinite progress.

But the monkey has no spiritual reserve as yet active, and is therefore crystallized.

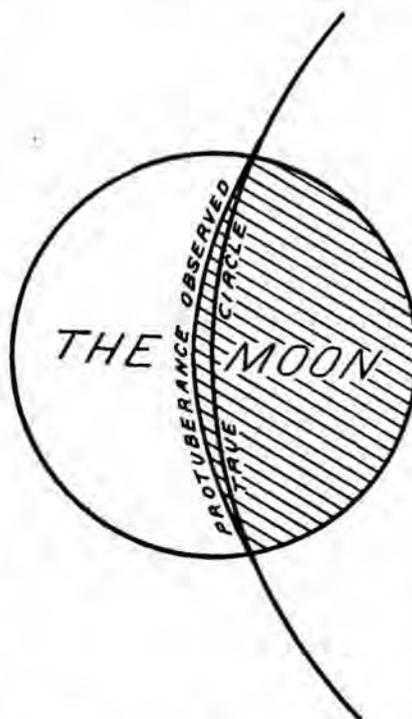

So we can use the term *man* for several things. We can call the highest human animal of that far-back era *man*, or reserve the term for the center of purely spiritual consciousness that began to illuminate the animal center of sensuous consciousness, or for the present blend of the two lights in the common field of mind. Or we can call the soul the *man*; the soul, the original spiritual center whose rays have never ceased. It can no more be

absorbed into animal life than the sun into plant life. But by its rays we are more than animal. The nature of purely spiritual consciousness each of us must find out for himself. As the supporter and inspirer of the highest thought and imagination, it must be beyond both, yet reachable by both. STUDENT

Playing With the Invisible Rays

FROM time to time we read in the press of some martyr to science who, having been experimenting with ultra-spectral rays, is suffering from some curious disease which his brother scientists are unable to understand or successfully treat. Some are attacked by cancerous growths, others by a wasting of tissues or a leprous condition which necessitates amputation. In each case "it is hoped that the world will learn more concerning the pathologic effect of the rays than from the last one." Perhaps it will, but judging from a recent press dispatch the scientists are a long way from any wisdom in the matter. The dispatch says that it is thought that some as yet undiscovered affinity between the metal or the chemicals used in photography and the Roentgen rays may have set up a pathological condition which rapidly produced the disease.

There is no evidence that this was intended to be humorous. Possibly it was only to fill space. Why not say "we do not know?"

Science Is Bringing Back Our Friends

AND now it develops that the germination of certain seeds is accomplished by particular species of fungus, which penetrate the cells and do the actual work of getting the young plant well started. We are also told that plant growth is the result of minute forms of life which transform the chemical elements into forms which the plants can use. The scientists say so, and they know.

Suppose that minds were visible instead of bodies; some would certainly be a very great deal larger and more symmetrical than others. Suppose that under such conditions the laborers on a great building, all ignorant men, were visible, while the superior craftsmen and artisans were not; and that beyond them was the invisible architect looming up grandly above all.

What impression would the observer gain? Naturally, that the building resulted from the activities of the little creatures who were visible. Suppose we accept the idea, now becoming scientific, that all growth is guided by some planning intelligence. Then if we could see the designers and craftsmen who direct the bacteria and fungi, what would they look like? And if we could see the higher intelligence which plans and directs the building of these the whole plant or tree, what would it look like? Yet science by its own discoveries and theories has been brought to admit that there are such beings and that they may possibly be made visible. We are glad that the learned men have discovered things for we shall be very much pleased to welcome back our banished fairies, kobolds, gnomes, elves, nymphs, and dryads as real, proven scientific facts. How proud they will be of their new rank! We shall scarce dare look at the trees or smell of the flowers. Y.

The Mystery of Form

SOME years ago a jugful of nettle tea was thrown out of a house, where it fell on the paving stones. During the night the temperature fell and in the morning the slabs were covered with hoar frost; but in the exact spot where the nettle tea had been spilt, the frost crystals had arranged themselves in the form of nettle leaves! It would almost seem as though the invisible outline of the leaves still lingered on the spot where the decoction had lain, and had suggested that particular shape to the ice crystals at the time of their formation.

More wonderful still are the shapes assumed by the stalagmites and stalactites in the limestone caverns. Here, water dripping from the roof to the floor, leaves a thin film of mineral matter behind it, and this minute deposit, in the course of many centuries, builds up the forms of flowers and fruits and fish, and other natural objects. In the Mammoth Cave is a gallery two miles in length called "The Conservatory," crowded with stone images of flowers. In the Luray cavern may be seen a variety of fish modeled in stone; black bass, silver perch, shad, and mackerel with white bellies and the characteristic forked tails. What has science to say about these strange phe-

A SWEDISH COAST LINE

nomena? The only contribution made by science is the name "Oulopholites," with which she has christened these shapes, but by way of explanation she has nothing to offer.

Of course fairies are dreadfully unscientific, but if science leaves us unaided to grope in the darkness with only our intuition and the folklore of antiquity to guide us, can we be blamed for the suggestions that arise in the mind, or the theories to which we may incline?

The folklore of the ancient world teems with allusions to invisible be-

ings which stand behind all natural effects. They were regarded as creatures having a certain grade of intelligence of their own, who loved order and beauty and worked in harmony with natural law. These little workers behind the veil guided the blind forces of Nature and evolved elegance and beauty from inert, shapeless material. May we not, or must we not suppose that during the long æons while these stonefish and flowers were forming, some invisible design or pattern overshadowed the slow process? Some thing or some one must surely have presided, as it were, to guide the arrangement of the particles to secure

TO THE POINT LOMA CHAPARRAL

LITTLE old trees—so old, so knotty and twisted and gnarled, so moss-grown and covered with lichens, ye remind me of the quaint, aged, long-bearded dwarfs of fairy-lore, and easily can I imagine these little old men peeping out through your gray straggling branches and perched on your knotty and wrinkled old roots lying above ground.

What stories of stress and strain and struggle for existence are written in these bundles of twisted and knotted fibres! What marvelous powers of endurance have ye had through years and years of slow growth, patiently waiting through long droughts for the coming rains, never losing faith but bearing still some leaves of green, a promise of the joyous time to come when anew with leaf and bloom ye would again array yourselves, and once more amid your branches the birds would build and sing, all and Nature rejoice in her festival time.

How many years have ye imbibed the song of birds nesting and singing in your branches? How much of the music and strength of the sea have ye woven into your fibre? What tales do you give to the wind in your spicy breath to bear over mountain and desert and sea?

Quaint little old trees! Did ye have mighty ancestors in a mighty past? And do ye carry still in your toughened fibre some inherited reminiscence of a golden age when gods walked the earth? And do ye promise yet, with each new growth of leaf and bloom your gray old branches bear, the coming of a new and still more glorious age built on eternal foundations? Surely ye show your faith by your works!

BANDUSIA WAKEFIELD

such forms of grace and symmetry. The word fairy is not acceptable to scientific ears, but may we not be allowed the suggestion that some invisible form (composed, it may be, of luminiferous æther) was present to supervise and direct the deposit?

Some such idea is essential if we are to think coherently of the matter at all. We do not need to search the stellar depths to discover mysteries. Only examine the frost work on your window some cold morning and ask yourself why the crystals should adopt a fern-like pattern on one pane, a moss pattern on the next pane and a geometrical pattern on another. Then see if a better explanation occurs to you than the one suggested above.

STUDENT

Intelligence in the Lower Orders of Animal Life

WE are continually meeting instances of surprising knowledge in what we are accustomed to consider the lower orders of animal life. Whether we call it intelligence or instinct, it is certain knowledge. The "kelep," which promises to be the savior of the cotton fields, furnishes an example of this. The "kelep" is a Gautemalan ant which gets its subsistence from the nectar of the cotton-plant, and the boll-weevil is a destroyer of the plant. So the ant makes war on the weevil to

protect the plant, which flourishes in consequence. But without intelligence, how could the ant know that the weevil destroys the plant? There is a species of ant found in the region of the Upper Magdalena River, in the United States of Columbia, which cuts oval pieces out of leaves where the germs of mushrooms have been deposited, plants these, and raises mushrooms for food. So there are gardeners among insects as well as carpenters and other classes of workers. The Universal Mind is active in the small as well as in the great, and the amount of intelligence of any creature is not to be gauged by the size and weight of its brain. STUDENT

You cannot teach people to speak your language unless you can speak theirs.—*Carmen Sylva*

The Higher View

WHEN Sir Joshua Reynolds was asked by an admirer and would-be imitator, "With what do you mix your paints?" he replied with characteristic straightforwardness, "With brains, Sir!" He conveyed part of the truth in that simple reply, as every thinking mother, every unselfish housekeeper, well knows. Who are in a better position to learn that means and materials are but tools to work with, useless when not used by the unselfish master hand, than our mothers and our cooks? Good cooks may make receipt-books, but the best receipt-book in the world cannot make a good cook out of a sloven, a ne'er-do-well, a woman who hates her vocation or one whose sole aim in life is to tempt the palate on sensuous lines.

That is because something more than just flour and soda and salt goes into the dough; something fine, something subtle, but as real as it is intangible. It is an old saying, "Let the cook put her heart into the yeast or the dough falls!" In every form of activity the product contains a certain per cent of the actor's impulses, coarse or fine, be he artist or artisan.

The difference between the taste of the "pies mother used to make" and the wooden flavor of stereotyped cooking, is not all due to imagination and a weary palate. The devoted mother unconsciously puts something of her own impulse into the food she handles; and the same is true of the average person who cooks "merely to make a living." It is not alone cooking in large quantities which accounts for that intangible lack of flavor so painfully familiar to patrons of boarding-houses, restaurants and hotels. Doubtless it is the unconscious effort to supply the subtle "expression" to food, which often suggests the use of condiments and stimulants as flavors. To a degree, the insipidity of food is a measure of the monotony of the cook's life. Perhaps the inevitable reaction accounts for the boarding-house keeper's complaint that the "good cooks all drink."

Realizing that the food eaten is assimilated in a few hours by our bodies, one hesitates to take on the miscellaneous something contributed by the various individuals employed in preparing and handling it. The unsavory foreigners in market gardens, the untidy scullery maids, the unhealthy waiters and pert waitresses, the ill-tempered cooks by whom the food of thousands is handled, make their own subtle impress upon the tissues of those they serve. The habits of "treating," of lunches

between meals, afternoon teas, heavy refreshments at receptions and other social functions, are to be condemned.

To be sure, custom has outgrown the one-time extravagant "funeral baked meats," but we are only slowly evolving from the idea of expressing our social feelings through the stomach. If properly nourished, one does not need food between meals, and to take heavy foods, or, at times, food at all simply for sociability, is a gastric insult. If one is improperly nourished the remedy is not to be found in eating the sweets, etc., of conventional lunches. There are so many "schools of expression" these days, that we, as women, might convince our friends of our hospitality and good-will on higher lines and leave the gastric sac, unburdened, to its legitimate functions.

PHYSICIAN

A Loma Land Dining-Room

FOR the women students of Point Loma the perplexing problem of the proper sustenance of the body has been solved. A peep into their refectory dining-room reveals a spacious hall, for the privilege of using which many city-bound women would willingly pay dear; for the walls are windows all the way around and on every side open to views of sky and hillside and ocean. Fresh air and sunlight, flowers galore, an ideal diet, exquisite cleanliness, and the dignified and gracious service of comrade to comrade; these things are the portion of the women students of Point Loma. Three times a day they gather here from the workshops and studios, offices, schoolrooms and homes. Connected with the

refectory is the School of Domestic Economy, where teachers versed in dietetics and skilled in cookery, train a certain number of students. The fact that all the work of this school is voluntary and undertaken with a full sense of its dignity and importance, lifts it out of the atmosphere of stress and discomfort that in most establishments, both private and public, attend the preparation and service of food. Daintiness, skill and courtesy are requirements that must be mastered early in the course of training.

The women students of Point Loma who daily share the benefits of the refectory dining-room discover, with a profound feeling of gratitude, that food thus wisely and graciously prepared and served, sustains them in more than the ordinary sense. They find that they are enabled to do a higher order of work along all lines because this department of home work has so successfully been lifted to a higher level of human effort.

Do you wonder that we are enthusiasts? Do you wonder that we long to carry to the world's weary homemakers and housekeepers the tidings that the worst problem of all has at last been solved?

STUDENT

BUT farther: Athena presides over industry, as well as battle; typically, over women's industry; that brings comfort with pleasantness. Her word to us all is: "Be well exercised, and rightly clothed. Clothed and in your right minds; not insane and in rags, nor in soiled fine clothes clutched from each other's shoulders. Fight and weave. Then I myself will answer for the course of the lance, and the colors of the loom."—*Ruskin*

What Is Woman's Sphere?

"Is it higher, truer?" Mrs. Blake spoke aloud, unconsciously to herself.

"Well?" responded her husband, looking up from his book.

"Here are some curious instances in Scotland," replied his wife, "of women who do men's work, and men, women's work. Just glance at these figures. It looks as though the old idea of 'woman's sphere' were passing away, as well as the idea that certain occupations should be beneath the dignity of men. A new ideal is taking place of the old. What is it? That is the question. Is it higher, truer?"

"It looks to me," said Mr. Blake, "as though the vital question of the day were growing to be, 'What is man's sphere?' Here we have women classed as 'dealers in money,' dock laborers, coachmen, builders, chimney-sweeps, cycle and motor manufacturers, farm managers, omnibus drivers, paper hangers, plasterers, house agents, etc., and men as milliners, dressmakers and seamstresses, not to mention cooks and housemaids!"

"Is such labor as 'clean-scrub-wash,' said Mrs. Blake, "ever woman's work at all? In one of those articles in the paper it says there are no women, however, engaged in the 'defence of the country.' Now I think the warrior spirit in women is as strong as in men, and I believe every woman who fights for her home, protecting it against evil and disease, within and without, is engaged in the defence of the country. The stand women are taking to have a share in the earning ability of the world may really be a start towards a readjustment of the home on a purer, simpler basis."

"It looks more like the elimination of the home from our social order," said Mr. Blake, "at the rate the women are stepping away from it out into the world."

"That danger is only apparent; it is not actual."

"That is the very point," said Mrs. Blake. "The old order is passing away. These statistics prove it. Here is a list of occupations in which both women and men are engaged: general and local government; clerical profession, legal profession, teaching profession; literary and scientific; art, music and drama; domestic service, commercial, agriculture, etc.; metal work, textile occupations.

"It occurs to me," said Mr. Blake, "that the problem of 'woman's sphere' and 'man's sphere' will be solved when they shall, in the future, do the world's work; when men and women learn to place themselves aright, both in their occupations and in their personal relations to each other; where the one will complement—not interfere with—the other."

"Perhaps through art, music and drama they may learn the law of harmony and work out together along impersonal lines."

"As we are trying to do," said Mr. Blake, "and by the way, should we not practice a little more together before the musicale on Thursday?"

"Yes, indeed," answered his wife, "if you will get your violin I will come to the piano now, and we'll try the *Madrigale* by Simonetti. We will put our theory into practice."

STUDENT

MORE than thirty women are keeping lighthouses in various parts of the United States, some on great rocks, others along our rivers, still others in desolate, lonely places. One lighthouse is situated in the midst of Pamlico Sound, not on an island, but on an artificial structure built directly in the sea.

In times of storm the position of the woman who tends it, is certainly a terrifying one. The most famous of all is, of course, Ida Lewis, of Newport Harbor. Mrs. Lewis, now sixty years of age, has saved many lives and has been greatly honored by the Government. H.

A Queen's Love of Nature

QUEEN ALEXANDRA is exceedingly fond of flowers, and Sandringham, which is her real home, with its stretches of green pastures and woodland, is an ideal country-place residence. The King and Queen differ somewhat, however, in their tastes. One writer says: "King Edward likes trim paths with turf borders, and wide stretches of lawns are his especial delight. If one chances to see a part out of precise order, or comes across a bit of old world statuary, such as the beautiful Grecian well and the Italian fountain, one is safe to conclude that it is the Queen's fancy. A characteristic fancy is that which finds expression in her wild flower garden. Secluded paths wind through it; it hides itself a little back from the avenue of Scotch firs known as the Church Walk. There are no formal flower beds, no trim gravel paths, and almost no signs of gardening or cultivation. But there, growing among the shrubs and looking supremely contented and at home, one sees the English wild flowers, blue bells, forget-me-nots, buttercups, pimpernels, and even the humble nettle. In one of the quietest corners the Queen sometimes takes tea. A large piece of woodland in an outlying portion of the estate is reserved for the cultivation of primroses, great quantities of which are sent to the city hospitals every spring.

"Another of the favorite haunts of the Queen is the summer-house in the rosery, outside which are some ancient bits of architecture brought by the Queen from Greece."

A CORNER IN THE WOMEN'S DINING-ROOM OF THE REFECTORY, POINT LOMA

"**M**Y first introduction to this new type of woman was in the little village at the foot of the Dent du Midi, Lake Geneva, Switzerland. Certainly one gets here a new idea of woman's sphere. The men of the village are the laziest it would be possible to find in a dozen countries. They act as guides to mountain climbers, to be sure, but otherwise live an absolutely idle life.

"The women perform all the hard labor, from pasturing the cattle on the dangerous Alpine slopes to mowing the grass and even cutting the timber.

"One evening I saw a woman returning to the village

from the wood, dragging her husband, an able-bodied man in perfect health, on her wooden sleigh! The costume of these women is the simplest possible, consisting of a coarse blue sack or coat, a rough cap, and not skirts, but trousers!"—*Extract from a student's letter mailed from Geneva, Switzerland.*

MISS SMITH, of the educational department at Washington, who has recently been in St. Louis, was the only woman juror in the educational department at the Paris Exposition. Says an official who was in Paris at the time: "When first elected Miss Smith took no part whatever, understanding that some of the jurors were a little indignant at being expected to serve with a woman. But when the jury began to work it was discovered that Miss Smith was somewhat valuable. Not only was she familiar with the school systems of the United States, but with those of nearly every other country as well. After a few days it became quite the thing to refer to Miss Smith for information, and finally some of the members of the jury found it necessary to consult her before they could think of arriving at a decision!"

THE earliest specimens of block-printing, so far as accessible records indicate, are ascribed to the Eighth century, and we owe them to the Empress Shiyau-toku of Japan, who ordered a million toy pagodas, to be distributed among the temples of the country, each of which was to contain a Dharani text. These texts, many of which are extant, were printed on paper from wood or metal plates. E.

Arthur and the Half-Man

(An old Welsh legend)

ONE day the Emperor Arthur was riding out with his men, when they saw at the roadside a funny little creature, wriggling and shaking himself about and jumping up and down. "Cai," said the Emperor, "go forward and see what is there."

Cai went and saw a funny little man, or the half of one: he had only one side to his head, the right half of a body, one leg that he was hopping on, and one arm that he was waving about. "Good soul," said Cai, "who are you, and what do you want?"

"I am Cynfelyn the Half-man, and I want a word with Arthur."

Cai rode back and told the Emperor. When they came up with the Half-man, Arthur spoke to him kindly and asked him what he wanted.

"To be your friend and chief warrior in the place of Cai," said the Half-man; "and if not, I want to fight with you."

Arthur bade one of them give him a gift and treat him kindly, and after that they all rode on.

Next day they were riding that way again, and saw the same little man. Only by then he had grown another side to his face, and had two eyes and two ears like other people. As soon as they came in sight the Half-man began to call out and abuse Arthur, saying he would fight with him and win half his kingdom. Cai was for destroying the one who so insulted Arthur, but the Emperor bade Cai do him no harm.

After that, whenever they passed, there was Cynfelyn; every day he was more clamorous and abusive, and every day he had grown a bit more; first another shoulder, then another arm, then he was complete down to the waist, and at last he had two legs and was like another man, only puny. Then he grew in strength and size, and as he grew larger, grew worse. At last he was a strong warrior on a strong horse, and one day he shot at Arthur, as well as abused him.

"Lord," said one of the warriors, "let me go forward against him." "As you will," said Arthur, for it was known that the Half-man had been robbing travelers and doing heaps of mischief.

So the chieftain rode forward, but what was their surprise when the Half-man unseated him from his horse and bade him go back and tell Arthur not to be so cowardly, but to come and fight himself.

Hearing that, Cai waited to hear no more, but dashed forward to punish the Half-man. Cai was the best warrior Arthur ever had, but he could not conquer Cynfelyn. They fought until dusk, and they fought until dark, and then they could fight no more. "Tomorrow let Arthur come," said the Half-man.

Cai went back. "Lord," said he, "I have never met such a foe as

this. I could gain nothing from him."

"Tomorrow I will go myself," said Arthur. "It is a pity I did not make an end of him at first; he has done enough injury to my people since."

So next day the Emperor armed and went forward on foot. "It would be improper for me to use my own sword and shield against such a man," he said. "I will take other weapons."

He had never in his life fought such a battle. If by midday he had killed Cynfelyn's horse, he hadn't made a scratch on the man himself by nightfall.

The day after he took his magical shield and the sword the fairies made for him, and mounted his best horse and went forward. That day the battle was even worse than the day before; he had not more than wounded him by evening. Seven whole days were they fighting after that, and not till the end of the seventh was Cynfelyn killed.

"Cai," said the Emperor, "after this I will take up a challenge as soon soon as it is given, come it from whom it may." A STUDENT OF WALES

Facts Worth Knowing

UNTRUTHFULNESS has many disadvantages; it spoils our heart life and it makes a lot of injustice. But the worst is, the boy who is untruthful loses the power of distinguishing truth from falsehood. Few boys think of that until it is too late.

FOUR years ago a fourteen-year-old girl entered the lowest grade of a Boston grammar school. Her parents were Russian Jews. She had never been to any school before and she knew less than a dozen words of English. Last month this girl was admitted without conditions to a Massachusetts college, having gone

through the grammar grades and the Girls' Latin School with honor in four years, a course which ordinarily takes ten years. If this can be done by one who has almost every obstacle to surmount, what should be the record made by boys and girls who are far more fortunate and just as determined?

THE DUKE OF MARLBOROUGH lives on the beautiful estate in England called Blenheim. Every year he gives a flag to the King on the date when the battle of Blenheim was fought. This is done in order that he may keep his residence.

The Duke of Wellington lives in Strathfieldsaye, also a very beautiful estate, and he follows the same rule of giving a flag every year to the English ruler on the date of the Battle of Waterloo.

These flags are then given to the regiments which are on guard about the palace of the English King.

It is a curious but pretty custom, is it not?—dating from the old days when men had more time for sentiment and—in some cases—less anxiety about dollars. And those days are coming again, too. H.

THE CHILDREN'S HOUR

The Raja Yoga Question Box

MANY of the people of the earth once lived unknown to one another. All honor to the bold and brave explorers who have broken down the barriers of ignorance and brought men to know each other.

1 Who was Marco Polo?

ANSWER—Marco Polo was a famous traveler, born in Venice in 1254. When a boy of 17, he journeyed through desert and unknown lands to China. He went to the court of the Emperor Kublai Khan. The Emperor took Marco Polo into his service. He sent the young Venetian to many places in Asia. Marco Polo found his way to the shores of the Arctic Ocean, and far south to Abyssinia and Madagascar. He visited Japan and many islands in the Eastern seas.

The story of his travels made the East known in Europe. People began

to see that the world was very much larger than they had believed it to be.

2 Who was Christopher Columbus?

ANSWER—Christopher Columbus was the greatest mariner who ever lived. As a boy he determined to be a master-sailor. He learned all the sciences a master-sailor needs to know. Columbus wished to sail westward and find the land he believed lay there. He traveled from country to country trying to get ships to sail with. At last the good Queen Isabella of Castile gave him men and ships. In the face of mutiny and hardship Columbus persevered. He discovered many islands of America. Many colonies for Spain were founded in the New World. Christopher Columbus had the faith and energy of one who is great of soul.

A Story of Lomaland Fishes

DEAR CHILDREN: Some months ago seven little goldfish were put into the fountain in front of the Raja Yoga Academy in Lomaland. At first they were very timid, but in a short time they grew so tame that they would come when called and eat out of my hand. One morning when I went to feed them they swam away, which was very unusual, and I wondered what could be the matter. The next day they were even more timid and then I noticed that some of the reeds were broken down and that many of the lotus leaves were torn and the water-fern, as well. I looked sharply around and finally I saw—what do you suppose?—two little bright eyes looking at me from the windows of the grotto which is in the center of the fountain.

What do you suppose they belonged to? To a little squirrel. Then I knew why the fish were so frightened. In some way the squirrel had climbed into the fountain and had not been able to get out.

One of the students, coming up, stooped so he might not alarm the squirrel and stretched one arm over the side of the fountain. You should have seen the little squirrel jump upon his hand, run along his arm, and, quick as a flash, jump to the ground! Can you imagine the thrilling story of adventure that he told his squirrel family, when he reached home?

And the fish crowded around my hand at once and seemed to know that the terrible giant which had frightened them was gone. **ONE OF YOUR FRIENDS**

The Pigeons of Modena

DEAR CHILDREN: In the little town of Modena, Italy, the boys have more than a hundred flocks of white pigeons for pets. These birds have been trained to perform in the air when signals are waved from many colored flags. The boys gather together on the housetops and wave signals which send the birds high up in the blue Italian sky, their white wings flashing in the sunlight. Another wave of the bright colored flags will perhaps part the flock, sending one-half in either direction. Again the flags wave and the birds quickly change their direction and in long sweeping curves come flying back to their little masters with a great fluttering of their soft white wings.

These birds have been bred and trained to obey the slightest motion of the flags. They also know the sound of certain whistles and long ago used to perform in like manner when music was made upon a cornet. Surely they teach many lessons in obedience!

STUDENT

A Lomaland Lotus Pond

DEAR CHILDREN: In many countries of the world there are ruins of what were once beautiful temples. In these temples the light of wisdom was kept burning. In Greece, in Egypt, in India and far away in the heart of Africa, we find the walls and pillars of these ancient homes of truth. And wherever we find temples, with the deep calm that has settled over them for ages, there also we find the lotus flower. For the lotus is the symbol of the power and purity of the soul.

Sometimes the ponds of water within the temple walls are bright with lotus blooms, as in Japan. There, on the wooded mountain slopes, are many temples. In some of them are great vases of golden-colored lotus flowers.

Sometimes a noble river like the Nile in Egypt, makes a broad home for the sacred lotus, near the temples along its banks.

And in India and Egypt we find the lotus as a part of the great pillars of the temples. Everywhere in the shelter of these sacred buildings is found the lotus.

But in *one* place, and one only on earth, can we find a spot where, besides a temple and lotus pillars, and a pond of lotus flowers, there are hundreds of happy children whose lives are unfolding in joy and beauty like the lotus opening its golden heart to the rays of the sun.

Do you know the place? It is Point Loma.

We see a long line of little ones bearing rosy lotus flowers, entering the Temple. If you enter with them, you will hear their Symposium. You will find that they are Little Philosophers.

And early in the morning you may see a band of children with lotus blossoms passing out of the great gate. They are going to teach some of the children who live outside their Temple home. **TEACHER**

DEAR CHILDREN: I must tell you about a little boy. His name is Frank. After his father and mother died, he was given two dollars and a half as his share of the property, and was told to take his dog and make his own way in the world. Some of the officials advised him to go to the poorhouse; others wanted to "bind him out" as

an apprentice to a man the boy was afraid of. The boy would do neither and taking his dog, set out. Asking for work, he went from one farm to another, but this farmer would not have the dog and another farmer did not need the boy. Finally, however, a well-to-do man living near my home heard about him and determined to give him a chance. He said, "Any boy that will stick to a dog as he has done must have good stuff in him," and now the prospects that he has might be the envy of many boys. **H. H.**

YOUNG RAJA YOGA STUDENTS OF LOMALAND BESIDE THE LOTUS POND

THE MYSTERY OF THE RAINBOW

by SCHILLER

Translated for "The Children's Hour" by a Student

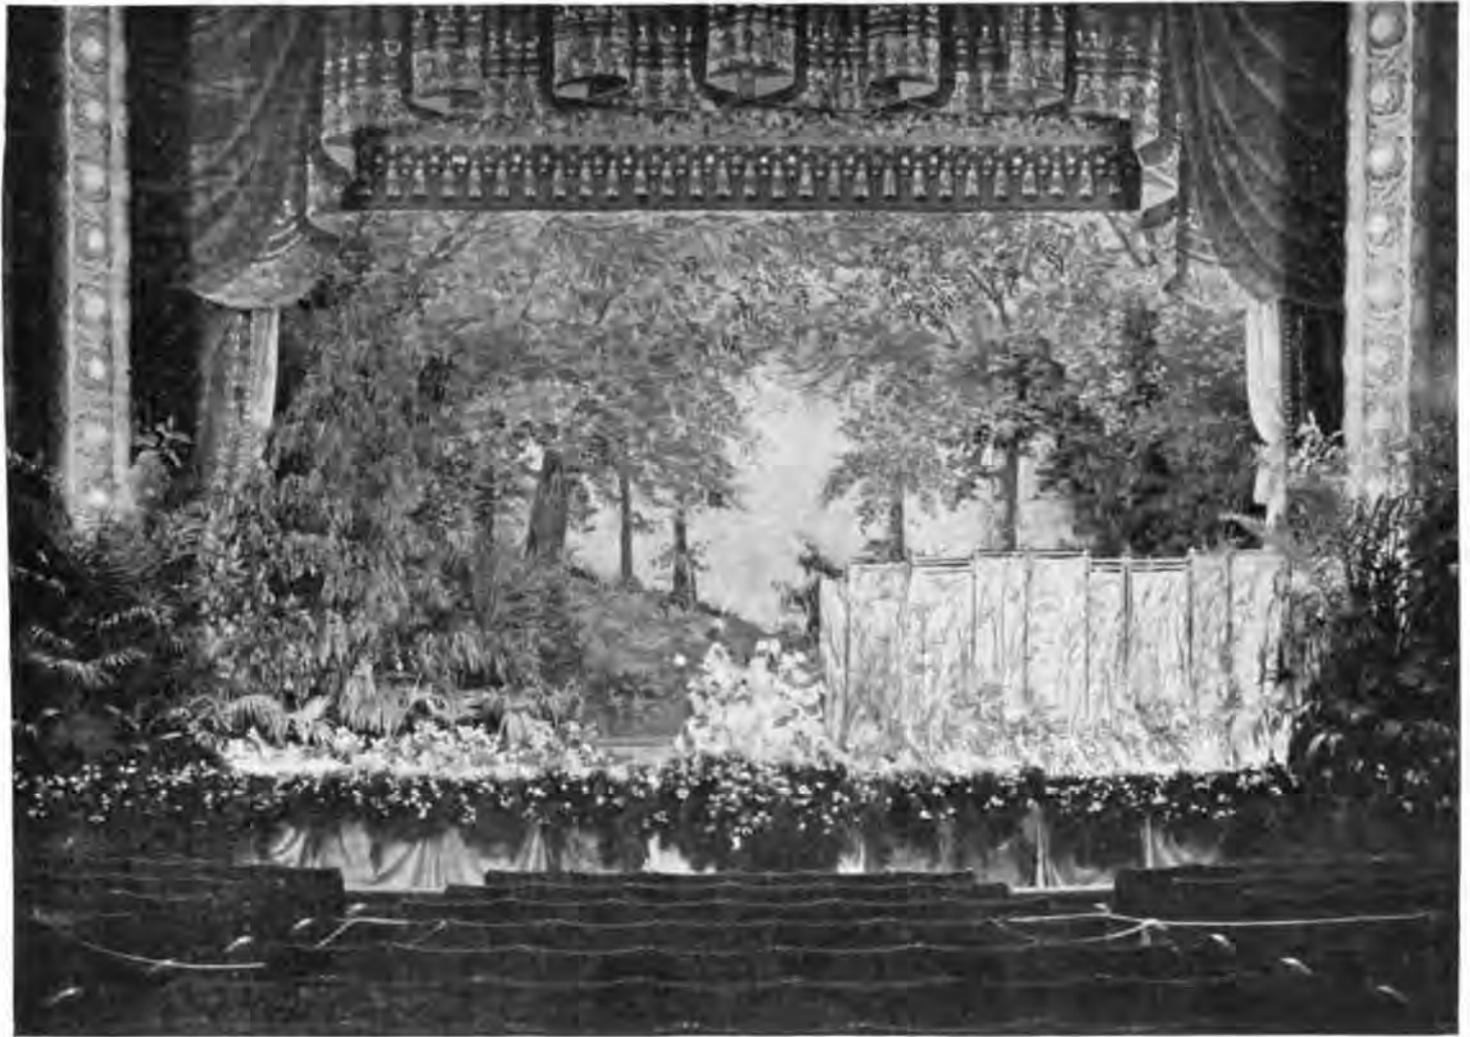

Of pearl is builded the bridge
High over the silvery sea.
It wings its way in a moment
And swings there, fair and free.

The loftiest masts of the shipping
Sweep gently under it, dear,
No burdens pass on its cyric way.
But, it fades as we draw near.

With the waters it comes and glows,
As long as the stream flows free.
Who can tell where this bridge is found?
And the builder, where is he?

LOMALAND STUDENTS AT ISIS THEATRE

THE subject of Katherine Tingley's address last Sunday night at Isis Theater was "A Voice in a Million."

Space will not permit a report to be given *in extenso* of the address, but the fact that the speaker held her audience spellbound from beginning to end, is suggestive enough to be well worth chronicling.

The topic chosen was in itself an absorbing one, the "Voice in a Million," signifying the old, old cry from the few who hold the grains of truth the world still recognizes: "Come ye out, and be ye separate." The speaker showed by her allusions just what that "separateness" meant, the few who are striving by might and main, by voice and example, to change the dreadful current of selfishness and egotism which we all know so well to exist. "Be ye separate from this," rang out the warning in every full sentence Katherine Tingley uttered. "The Truth is with the minority and not with the majority," said the speaker. So also does knowledge dwell with the minority, not with the majority—that knowledge which is the recognition of the Divinity in every human heart, and the power for good and the responsibilities such knowledge brings with it.

Mothers should bring up their little ones in the life and feeling of this glorious reality; aye, mothers should carry the essential Divinity of man in constant daily thought, so that the unborn and the generations to come might feel the sweeping power of this noble idea.

In the light of this superb knowledge made manifest in life would that horrid nightmare of human (in)justice—capital punishment—disappear, and those responsible for this awful thing would "have no part in it any longer." Sympathy, that deep heart sympathy which felt with the suffering of the vilest creature on earth, and which felt its pain as its own—this was still another sign of this greater knowledge of man's Divinity, and it would change the face of the earth. The speaker ended with the eloquent statement that when men learn to recognize this inner Divinity and make it a real thing in their lives, then shall they "become as gods, and know good from evil."

The following press clipping is from the San Diego *Union*, of the following morning:

"The announcement that Katherine Tingley, the Leader and Official Head of The Universal Brotherhood and Theosophical Society, would speak last night, served to fill Isis Theatre, standing room only being available, at the hour of opening. After the overture by the orchestra,

one of the little Raja Yoga girls recited a poem, 'The Chiming of the Bells.'

"Mrs. Tingley's appearance on the stage was greeted with cordial applause from the large audience. Her address was clear, forceful and eloquent, eliciting frequent applause.

"Her words were a plea for greater sympathy, more unanimity of thought and motive, a truer brotherhood, and a more comprehensive understanding and knowledge of the laws of life and soul growth.

"What we need," she said, "is a better understanding of sympathy, a broader sympathy, that has in it the touch of brotherhood; not so much a sympathy that expresses itself in a flood of tears, as a sympathy that comes with dry eyes, but with a knowledge of the needs of humanity."

"She believed that truth is with the minority and not with the majority, and therefore knowledge is with the minority also. The majority are bound down and held, and restricted by popular beliefs and lines of thought, and moved hither and yon, following fads and seeking ease and pleasure. But the minority plods on, knowing their divinity; trusting to the law, being persecuted, suffering, but knowing that suffering is experience and experience brings knowledge.

"Speaking of man's responsibility for his thoughts as well as his acts, she said: 'If a man voices an impure thought, he will meet it somewhere. You may not believe it, but by the mighty hand of the law, it shall come again.'

"Mrs. Tingley made an eloquent plea against capital punishment; she pictured a man led to the gallows, condemned to death. 'We read the horror at our breakfast tables; we are shocked, but within ten minutes we have passed it and are thinking of other things. If we were truly brotherly we could not smile or think of anything else, while these things continue. Those who make the laws, and enforce the law of capital punishment, do not understand the soul life. If so, they would not dare to impede the evolution of any soul.'

"She made a plea for the greater watchfulness of fathers and mothers, for their children, as well when they are asleep as when they are awake. 'Have you not thought,' she said, 'that if parents had this higher life, they could throw a guardian wall around their little ones?'

"I plead with each one of you not to be afraid to be of the minority, and I entreat you to be one in a million."

"The musical program was rendered by a portion of the Point Loma orchestra, this being their second appearance in public. As usual, the performers were invisible, but so persistent was the applause at the conclusion of the program, that the Raja Yoga boys who form part of the orchestra, came to the front to bow their acknowledgement.

"The progress of this orchestra will be watched with great interest." OBSERVER

✻ Art Music Literature and the Drama ✻

Does the Use of Stimulants Increase the Creative Power of the Mind?

THE use of stimulants by authors has called forth considerable discussion, from time to time, as to whether or not this practice increases the creative power of the mind.

It has been said that some of the finest passages in literature were produced while the author was under the influence of some kind of stimulant. To support the theory that the faculties are vitalized and more brilliant work produced under stimulation, a number of instances are often cited.

The poet Schiller found a peculiar inspiration in apples; Byron and Poe used gin; Pope sipped strong coffee and Tennyson smoked while at work; while the great English statesman, Gladstone, was devoted to sherry and egg.

The question arises, "Were these brilliant minds made more brilliant thereby?" At first glance it might seem so. Is it, in reality, a fact?

We know that it is impossible to separate the created thing from the creator. An author's spiritual, quite as inevitably as his mental, condition at the time of writing inevitably leaves its impress and tells its own tale.

The faculties are so wonderfully interblended that whatever affects one part of the nature is felt throughout the whole.

Only when there is harmony and balance, can the best which is seeking expression find an avenue. Leaving out the moral point of view, a stimulant overthrows balance. An abnormal activity is produced by it, which, for the moment, may enable the brain mind to work more rapidly and apparently increase in power, but when the prop is removed by the effect of the stimulant wearing off, reaction comes, leaving not only the brain, but the whole nervous system, devitalized and exhausted.

Had these gifted men better understood their own natures, when the urge came to give out the message they bore for their fellows, they would never have resorted to suicidal means to prepare the brain mind to receive it. But, assuming that flights of genius are more easily made at the urge of a stimulant than otherwise, what about the stimulating effect of a high and true ideal? This, in its appeal to the intuition, in the zest, the absolute exhilaration, that follows its selfless working out, is about as stimulating as mentally-sluggish humanity could at present bear. It is the soul's exhilarant, and from it come no bad after effects, but instead, increase of power and of joy. When heart and head clasp hands in service it is reasonable to suppose that the head has to quicken its pace; but the heart life gives one the power to do this without danger of nervous break-down, or nervous anything except increased capacity and self-control.

STUDENT

A RECENTLY-PUBLISHED book which is worthy of note, is *The Awakening of Japan*. The author, Okakura-Kakuzo, has had a most marked influence upon Japanese art. At twenty-three years of age the scholarly young enthusiast was sent to America and Europe by the Japanese Government to report upon Western art education. On his return he organized the Imperial Art School of Tokyo, of which he became Director. Afterward he resigned the position, and a number of the faculty resigned with him. Together they started another school, whose object was to revive in all their purity the traditions of ancient Japanese art. It was largely due to Okakura's influence that the Society of Japanese Painters was formed, and he naturally became the leader in the reactionary movement against the wholesale introduction of the traditions of European art. His book, written in English, is picturesque and altogether remarkable. His influence is as advantageous to Japan as it is far-reaching. E. W.

The Legend of the Poem Written by Gunadhya

IN some of the old Sanskrit writings, we read of the poet Gunadhya, who writes with his own blood a mighty book of tales. He is pictured as writing in the forest, and this book, when finished, is recorded to have contained over seven hundred thousand slokas.

According to the legend, he sends his book by two of his pupils to King Satavahana, who returns it with words of criticism and contempt. Gunadhya then ascends a mountain and lights a great pile of firewood. Then, final tribute to his muse, he reads aloud to himself page after page of the mighty manuscript, casting each page as it is finished into the flames. Thus perish seven hundred thousand slokas.

But, it is related, while he reads, all the animals of the forest, deer, bear, buffalo and birds assemble and listen, enchanted with the beauty of the verses.

It is further related that, ere he finishes, a hunting party goes out from the palace in search of game for the King; but they find no game in the

forest, for animals and birds are all listening to Gunadhya. They report this strange fact to the King, who hastens to the scene, and begs the boon of bestowing the richest possible gift in exchange for the wondrous book. But, alas, there is then but one sloka still unburned!

Pity is it that some of our latter-day poets are less conscientious than Gunadhya. But time is kind, and, from generation to generation, quietly places in that sepulchre called oblivion reams of indifferent poetry and tons of indifferent prose. There is plenty left, even then, whose rhythm could not hold forest birds enchanted, nor bring forth pleading tribute from any king. STUDENT

"RUSSIAN music, as such, is the application of the science of music as developed during the past 200 years by modern Europe, to the folksongs, the intervals and the rhythms of the various divisions of that vast nation," says a writer in *The Musical Courier*. "By Russian music I mean that music accessible to us, played and sung by us. It is all pessimistic, and this pessimism is not

limited to Tschaiowsky. Borodine, Mossoursky, Sterbatscheff, Balakier-eff, Arensky, Rachmaninoff, Cui, Glassunoff and others are imbued with this same apparently national expression, which is simultaneously manifested by the poets, the writers, sculptors and painters of Russia. It is based upon the final result of the musical expression of hordes of Asian peoples combined with a remnant of decayed Greek civilization, who, during a period covering the same twenty-five centuries, have undergone untold suffering from barbarism through the rude dynasties of the early Ruriks and the Muscovite Czars down to the recent days of Alexander I and II, when the first rays of a new day appeared for this conglomerate mass of humanity. A nation cannot through its composers exhibit joyous moods when its life has been a succession of griefs; that much is self-evident. Russian music is the story of Russian life."

EVEN the rugged heart of Carlyle opened to the divine influence of music, when he wrote: "Music is well said to be the speech of angels;" and again, "See deep enough and you see musically; the heart of nature being everywhere music, if you can only reach it."

IN the Finnish *Kalevala* there occurs the following legend, strangely similar to the old Greek tale of how Hermes constructed the first lyre from the shell and sinews of the tortoise: As the story goes, Wainamoinen went to a waterfall and killed a pike which was swimming below. Of his bones he constructed a harp; but one day he foolishly dropped it into the sea and it became one of the treasures of the Sea-gods.

Universal Brotherhood Organization

Central Office Point Loma California

ON THE SEAWARD SIDE OF POINT LOMA—LOOKING NORTH TOWARD MISSION BAY

A Theosophical Promise

“WHAT is the extent of the influence of the Universal Brotherhood and Theosophical Society?” This is a question often asked. It is difficult to even attempt to describe or outline its far-reaching touch, covering, as it does, the world.

Its international activities alone mark it as one of the great and promising factors to be depended upon in the future, as a key to the tremendous sociological problems the world is quickly marching to meet. The fact that the teachings of Theosophy can be applied to every department of human activity, without exception, gives to the despairing and bewildered mind of man today a new pact with his higher self. Then naturally follows a revolution of thought and feeling which leads to radical self-improvement and a larger view of life.

Rarely does one take up the study of Theosophy earnestly, without finding it fascinating, strangeness and familiarity blended together in a curious unity, so that the whole scheme of life becomes to the examiner a sublime proposition.

Those who fail in continued interest in the Heart Doctrine are the kind who from the beginning sought either to use the great teachings for personal aims, or who entered the Theosophical ranks with a set and determined purpose to destroy its influence in the world.

Why should anyone seek to destroy so greatly humanitarian and progressive a work as this is, one wonders. There are many reasons, and one is that it menaces all organizations or societies which are builded upon the sand—upon the brain-mind calculations of self-styled teachers of the past and present time.

The Universal Brotherhood and Theosophical Society offers no worldly honors or places of promise; neither does it give opportunity for such as profess brotherhood and right action to live selfish and sensual lives. Theosophy is based upon the purest ethics; and it is this which is permeating the international thought-life of the age. It is bringing about really very wonderful happenings in all parts of the world, for everywhere its influence is “in the air.”

KATHERINE TINGLEY

FRIENDS IN COUNSEL

DEAR COMRADES: Lomaland appears to be the home of realized ideals. Castles which have long hovered unsubstantially in the air here take solid form and stand four-square upon their foundations. How much we have all longed for the training of children on natural lines in the days that are gone by! How we have rejoiced when, after much contriving and persistency, we have gathered together a few children in a hired room and taught them Nature songs, and some of the simpler laws of Life for two or three hours in each week.

Here standing in its own grounds we have a little city of group houses, sacred (and the word is used advisedly) to the care of children. Within these precincts the Raja Yoga system holds full sway from dawn to dark and even through the silent hours. Here every detail of diet, exercise, clothing, occupation, the whole environment, is ordered by one of the

There Is No RELIGION Higher Than TRUTH

greatest authorities on the training of the young that the world has ever seen.

In the old days we must all have chafed against that extraordinary license which the usage of society confers upon its members of intruding upon the privacy of another's home uninvited, and either of seeking entertainment from his conversation or using him as the receptacle

into which the visitor proceeds to pour his crude opinions, or the personal likes and dislikes of the passing hour. In this sequestered spot these “devastators of a day” do not appear, and we may devote our whole time and attention to those things which are the realities of life.

Here living is reduced to its simplest necessities. There is ample sufficiency but no extravagant superfluity, the aim being to maintain the body as an efficient instrument for the soul without making bodily indulgence an aim and object in itself. The tents and living-rooms are so compact that housework is reduced to a minimum and we are freed from the slavery of dusting bric-a-brac and sweeping and polishing vast areas of useless flooring. Objects of art and beauty are here.

Industries are followed not so much for profit as for beauty and utility, and the soul of the craftsman is not rent in two between the wish to produce a perfect work, and the exigencies of a financial success. Here and there you come across little indications of budding enterprises, faint foreshadowings of a time when thousands of workers shall be living under these sunny skies, and finding in their labor the divine satisfaction of creating objects of use and beauty for the general weal.

Even now a wish to be useful hangs in the air and newly arrived residents who would be naturally expected to retire to their easy chairs and pass the rest of their days in slippers and repose, seek out some light employment and do their part in keeping the wheels of the daily routine in motion. You may remember that Matthew Arnold in one of his poems speaks of himself as standing between “two worlds, one dead, the other, powerless to be born.” In this uncomfortable situation many of us have halted. The existing order of things was palpably decaying and gave us no foothold, the new order unformed and as yet non-existent; and we like homeless birds hovering in empty space with no rest for the soles of our feet. At last the new world is being born and we who are privileged to help its early development assure you all that we appreciate our opportunity and will do our utmost to hasten its growth. STUDENT

Duty Universal

DUTY is a thing that is due, and must be paid by every man who would avoid present discredit and eventual moral insolvency. It is an obligation—a debt—which can only be discharged by voluntary effort and resolute action in the affairs of life.

The abiding sense of duty is the very crown of character. It is the upholding law of man in his highest attitudes. Without it the individual totters and falls before the first puff of adversity or temptation; whereas, inspired by it, the weakest becomes strong and full of courage. “Duty,” says Mrs. Jameson, “is the cement which binds the whole moral edifice together; without which all power, goodness, intellect, truth, happiness, love itself, can have no permanence; but all the fabric of existence crumbles away from under us, and leaves us at last sitting in the midst of a ruin, astonished at our own desolation.”—Samuel Smiles

Students'

Path

SELECTIONS

THE costliest sacrifice that wealth can make
From the incensed Penates less commands
A soft response, than doth the poorest cake,
If on the altar laid with spotless hands.—Horace

We cannot kindle when we will
The fire which in the heart resides,
The spirit bloweth and is still,
In mystery our soul abides.
But tasks in hours of insight will'd
Can be through hours of gloom fulfil'd.—Matthew Arnold

Second Object of the International Brotherhood League

THE International Brotherhood League is the department for practical humanitarian work of the Universal Brotherhood organization, and was founded by Katherine Tingley in 1897. Its objects are:

- 1 To help men and women to realize the nobility of their calling and their true position in life.
- 2 To educate children of all nations on the broadest lines of universal brotherhood, and to prepare destitute and homeless children to become workers for humanity.
- 3 To ameliorate the condition of unfortunate women and to assist them to a higher life.
- 4 To assist those who are, or have been, in prisons to establish themselves in honorable positions in life.
- 5 To endeavor to abolish capital punishment.
- 6 To bring about a better understanding between so-called savage and civilized races by promoting a closer and more sympathetic relationship between them.
- 7 To relieve human suffering resulting from flood, famine, war and other calamities, and generally to extend aid, help and comfort to suffering humanity throughout the world.

None of its officers holds any political office. The League is not connected with any political party or organization, nor has it any political character; it is wholly humanitarian and unsectarian.

In the light of the second object; "To educate the children of all nations on the broadest lines of universal brotherhood, and to prepare destitute and homeless children to become workers for humanity," let us consider some of the expressed views of the leaders, past and present, of the Theosophical movement, upon the educational question, that we may gather the trend of a truly Theosophical education and what sort of men and women it is likely to turn out.

Turning first to H. P. Blavatsky's work, *The Key to Theosophy*, we find:

What is the *real* object of modern education? Is it to cultivate and develop the mind in the right direction; to teach the disinherited and hopeless people to carry with fortitude the burden of life . . . ; to strengthen their will; to inculcate in them the love of one's neighbor and the feeling of mutual interdependence and brotherhood; and thus to train and form the character for practical life? Not a bit of it. And yet these are undeniably the objects of all true education.

Again, school training is of the very greatest importance in forming character, especially in its moral bearing. Now, from first to last, your modern system is based on the so-called scientific revelations, "The Struggle for Existence" and "The Survival of the Fittest."

All through his early life every man has these driven into him by practical example and experience, as well as by direct teaching, till it is impossible to eradicate from his mind the idea that "self" the lower personal animal self, is the end all and be all of life. Here you get the great source of all the after misery, crime and heartless selfishness. . . . Selfishness . . . is the curse of humanity and the prolific parent of all the evils and crimes in this life; and it is your schools which are the hotbeds of such selfishness.

Further she adds:

. . . of history, he will attain only sufficient knowledge of his own particular nation to fit him with a prejudice against all other peoples. . . .

Speaking of education as it *should be*, this great teacher says:

Children should, above all, be taught self-reliance, love for all men, altruism, mutual charity, and, more than anything else, to think and reason for themselves. We would reduce the purely mechanical work of the memory to an absolute minimum and devote the time to the development and training of the inner senses, faculties and latent capacities. We would endeavor to deal with each child as a unit, and educate it so as to produce the most harmonious and equal unfoldment of its powers, in order that its special aptitudes should find their full natural development. We should aim at creating *free* men and women; free intellectually, free morally, unprejudiced in all respects, and above all things *unselfish*. And we believe that much, if not all of this could be obtained by *proper and truly Theosophical* education.

From the writings of William Q. Judge I take one saying, touching upon the true lines to be followed:

The power to know does not come from book study nor from mere philosophy, but mostly from the practice of altruism in deed, word and thought; for that practice purifies the covers of the soul and permits that light to shine down into the brain mind. . . .

Our present leader and teacher, Katherine Tingley, is practically demonstrating, in the Raja Yoga Schools, this method of education, to the wonderment and delight of all who come in touch with it, and *really* have the welfare of humanity at heart. Listen to her words, and listening, can we aught but feel that the destiny of the little ones is safe in her hands and the evolution of a nobler type of humanity assured? Happy indeed are the homeless little ones that find their way to Lomaland! Nor must it be forgotten that her beneficent influence and methods reach to those preparatory educational centers—the Lotus Groups—throughout the world, where the children also receive a touch of the blessed spirit of brotherhood. The extracts that I have chosen from her words are taken from *The Mysteries of the Heart Doctrine*:

How differently parents would act if they fully realized that their little ones came, "trailing clouds of glory," from a great past, traveling down the ages to the present time..

To teach the babes, the little children, their divine nature, to impress this fact upon them, is to lay the corner-stone of a healthful, happy manhood and womanhood.

Let me have a child from the time of its birth until it is seven years old, and all the temptation in the world would not move it. It will have been taught the divinity of its own soul. This is not theory; it is a fact. The child will become so imbued with the strength of its higher nature that it cannot be moved by all the temptation in the world.

Let the lives of the little ones be so moulded that they will make better citizens than you or I. Let us cultivate a higher spirit of patriotism, a higher spirituality, and a greater spirit of brotherly love.

The world seeks for and requires a practical illustration of the possibility of developing a higher type of humanity and an opportunity for this now presents itself. . . . To accomplish the great purpose in view, utility and harmony are absolutely necessary. When these conditions are established everything is possible. . . . Seeing that the children of today will be the men and women of the future the great importance of this work cannot surely be overestimated. Only by wise teaching, by training and self-reliance, self-discipline, concentration and a recognition of the power of silence, can the lower qualities of the nature be overcome and the highest be developed, so that the children who are brought in touch with this movement shall in their turn become practical workers for humanity. One of the great objects must be to bring home to their minds the old, old teaching that they are immortal souls, not divorced from beneficent nature, but indeed and in truth a part of it.

And so now, in our own time, there is a place on earth, in beautiful Lomaland, where soul life is absolutely placed first, and altruism is the law of life, for the teachings I have given you above are there put into practical application, and before our eyes we can see the result of the fulfillment of the command, "Seek ye first the kingdom of God and all other things will be added unto you," as indeed they must be, since from our divine nature—the God within—comes all that makes life beautiful and noble and joyous! EMILY G. WILLANS

"THE good is one thing, the pleasant another. It is well with him who chooses the good; he who chooses the pleasant misses his end."

THE REIGN OF THE MUSE

by WILLIAM WATSON

WHEN Life was dewy and in the morning mood,
Then was, indeed, the Muse's golden reign;
When Gods and heroes stepped from sculptor's brain,
And perfect with a great perfection stood;
When poets saw the world that it was good,
Worthy a noble and a limpid strain;
And secret Night, and the unravished main,
Kept holy their mysterious maidenhood.

O happy singers of that vernal day!
Fled is the simple bounded world ye saw;
These gods that never dashed the soul with awe,
Sunny imaginations, fled are they;
And on Olympus, blind and ruthless Law
Holds unadored his adamantine sway.—Selected

THEOSOPHICAL FORUM

Conducted by J. H. FUSSELL

Question If the sins of the fathers are visited on the children and many are now suffering for the misdeeds of their parents and of bad laws (say, cases of child labor and consequent misery), how do you reconcile this with the Theosophical doctrine that they suffer for their own misdeeds in a former life?

Answer I It does not follow that because there *is* now suffering, there *was* formerly misdoing. Suffering is not necessarily punishment; it may be benediction; keen suffering for awhile is often just that one last touch necessary to round out an already almost perfect character. Some lives are so grandly lived that they seem to be an invocation to the Divine Law, an unuttered prayer to it to bring suffering, to bring the worst pains of human life, that it may know them and therefore know their remedy. A heart that longs to hold more and more compassion is also longing for more and more pain, in order that by this experience it will know what to compassionate. The Law watches the longings that are secret, unuttered, unformed, even unconscious, as well as the others, and responds *more* fully to them. Great souls compel the law, so to speak.

In another sense also, it does not follow that because there *is* suffering, there *was* misdoing. We do evil while doing nothing. If there is child torture in this town, and you and I, knowing it, do nothing, are we not helping in the evil? To whatever extent we are inactive in presence of evil, we share the doing of it. Many people, seeming to live blameless lives, are yet heaping up much future trouble for themselves in that they do nothing. Negative goodness is often positive evil.

And lastly; when, as we say, the sins of the parents are visited on the children, how do we know that the children were not led to that suffering, to that family, because they *did* need that lesson? Whole lives thus blighted are filled with the seeds of a wiser future.

Answer II While it is true that every act must bring its result, and hence that every evil act will entail suffering, either in this or a succeeding life; it does not therefore follow that every case of suffering is the result of misdoing. Because of the ties that exist between us all, we suffer one for another, and the further one may have advanced along the pathway of life the keener will be the suffering for others, as also the responsibility for others is greater.

But according to the development of the soul, so is its freedom under the law, because of its knowledge of the law; and how else could one help another unless there were also the possibility of suffering with another.

Then, too, the law is compassionate and guides us where we may learn those lessons of life which shall at last bring us to the perfect knowledge of life, which shall round out our characters, making us compassionate even as the divine law itself. The law does not teach by one method alone, not by suffering alone nor by happiness alone.

There is another consideration which, while it does not answer the question, is yet nevertheless worthy of attention. It is that of the apparently undeserved blessings and opportunities which come to men just as frequently as the suffering and hardships. But we are content to take these without any complaining—even as our right. If these are our right, however, then the suffering is also our right and our opportunity, and in

a sense, perhaps, more of an opportunity than the conditions of so-called good fortune.

But aside from all these considerations, which ought not to be overlooked if we would understand the matter, how can we answer regarding the suffering into which so many children are born today? Look at the evil which exists in the world today as the direct result of the selfishness of men. Can it be expected that this selfishness will not have its effect in helping to determine the circumstances of the future lives of those who act thus selfishly and who are therefore to so great a degree responsible for the evil and suffering of today? Christ expressed the Theosophical teaching of Karma when he said, "For with whatsoever measure ye mete it shall be measured to you again." We cannot say how this will be, nor when, but every seed bears fruit and of its own kind. But it is quite in accordance with our ideas of justice that those who in this or a previous life have oppressed others, should return to life into conditions in which they will suffer from precisely similar conditions.

It is therefore quite in accordance with this that the soul shall be born into surroundings which are most in harmony with its present development, and that it would be attracted to a family where similar traits existed. In this way the outer nature and those qualities which are supposed to be transmitted by heredity would be provided for it because they were in harmony with its own development. So while it may appear to one who does not look deeply that the visiting of the sins of the father upon the children is an arbitrary matter without any consideration of justice to the children, a closer study will show that the children are born into a particular family because it is their due and because in such conditions, generally speaking, they can reap the result of their own past deeds; but not forgetting what was referred to above that the law may, aside from any deserts, bring us into such conditions in which we may learn some of those lessons which can only be learned in that way.

Question Is it better to act on one's first impulse or to reason a thing out?

Answer It all depends on where the impulse comes from. If we live habitually striving to follow the guidance of the higher nature, then to the extent to which we have purified our lives we shall be more and more prompted to right by the higher nature, and our first impulses will more and more often come from that source. The purer the motive, the clearer the impulse!

But if we continually seek to gratify the lower nature with its appetites and desires, then that side of our natures being uppermost, our first impulses will most likely originate in it. We can, however, usually test our impulses by the question, "Is this for the good of others or is it purely for the benefit of myself?" A first impulse may be to an act of self-sacrifice, which reason may present many arguments against; many an act of heroism would probably never have been done if time had been taken to reason about the matter and to count the cost. I do not think that any categorical answer can be given to the question, but I would repeat that if we continually seek to live in the light of the Soul, our first impulses will more and more come from that source, and therefore can be trusted in ever greater degree.

STUDENT

Reincarnation and Karma

IT has been often thought that the opposition to Reincarnation has been solely based on prejudice, when not due to a dogma which can only stand when the mind is bound down and prevented from using its own powers. It is a doctrine the most noble of all, and with its companion one of Karma, it alone gives the basis of ethics. There is no doubt in my mind that the founder of Christianity took it for granted and that its present absence from that religion is the reason for the contradiction between the professed ethics of Christian nations and their actual practises which are so contrary to the morals given out by Jesus.

Applied to man's moral life, Karma is the law of ethical causation, justice, reward and punishment; the cause for birth and rebirth, yet equally the means for escape from Reincarnation. Viewed from another point it is merely effect flowing from cause, action and reaction, exact result for every thought and act; for the word's literal meaning is action. Theosophy views the Universe as an intelligent whole, hence every motion in the Universe is an action of that whole leading to results, which themselves become causes for further results.

Theosophical Anniversary—Point Loma Beacons Lighted to Celebrate Madame Blavatsky's Founding of the Society

EARLY last evening the hills of Lomaland, Point Loma, near the International Headquarters of the Theosophists, were illuminated by large bonfires, the reflection of which was seen for many miles, bringing out in bold relief the palatial buildings which crown these hills. The celebration was in commemoration of the twenty-ninth anniversary of the Theosophical Society, founded in New York City, November 17, 1875, by Madame H. P. Blavatsky.

The whole affair was conducted with great ceremony, all of the students of Lomaland participating. There were present many representatives of the Universal Brotherhood and Theosophical Society from different countries, also a number of invited guests.

Although it is not quite thirty years since Madame Blavatsky came to America on her mission, today her work is known all over the world. In 1896 the Theosophical Society was very large, but it increased three-fold during the first year of Katherine Tingley's leadership. It is held by Theosophists that the greatest victory ever won for the influence of Madame Blavatsky's work was when Mrs. Tingley called the Theosophical Convention at Chicago, in 1898, and merged the Theosophical Society into the larger body of the Universal Brotherhood. This explains the name of the present organization, The Universal Brotherhood and Theosophical Society, which many people have regarded as separate bodies.

In Europe

(From our Special Correspondent)

OCTOBER 30, 1904

"THE Psychology of Cities" is a theme that ought to be of some interest to the student of history. We agree that each man has a mind of his own, and we say that when a number of persons dwell or assemble together, they establish what is called a mental atmosphere—the product of the total qualities of their natures. Cannot this idea extend itself to the life and history of cities—especially of those ancient centers of human society known as *Mother cities*?

An *incorporated* thought and character, the qualities of which are evident throughout long centuries: this is what I mean by the term "The Psychology of Cities." He who shall attack this problem resolutely may do not a little towards solving many other baffling problems of Humanity.

These reflections have suggested themselves to me while reading once more a volume of essays by that brilliant and observant writer, Henry Houssaye, called *Athenes, Rome, Paris*. In the opening remarks of a chapter on the latter city, he says:

Paris est né citadelle. Avant d'être ville, il est camp retranché. La première fois que l'histoire en parle, l'histoire l'appelle place forte. "Lutèce, fort des Parisiens," dit César: *Lutetia oppidum Parisiorum*.

And the writer goes on to tell us how, for long years before the Roman invasion, that island between the two arms of the Seine had been a place of refuge and defense. Then he graphically records the many subsequent sieges which this wonderful city has endured.

"Paris est né citadelle!" Ah! the latest of her defenses are surely her greatest? Struggling, this time, not against military attack, but against the subtly combined forces of dogmatic ecclesiasticism, she has emerged victorious! On Sunday last the Chamber of Deputies accepted the principle of the separation of Church and State by a majority of *eighty-eight votes*. What a victory for France, for Europe, for the world! Paris est né citadelle!

There must be some reason why this in Europe spot is sacred to conflicts, the result of which stretch so far. And it is this place, the center of strenuous contests for more than twenty centuries, that strangers regard as a city of innumerable gaieties—Heaven of the Americans! The

contrast is grotesque! While the thoughts of enlightened France have been directed mainly towards that great event of last Sunday, time has been found to express good will towards our neighbors across the channel at a season of peculiar trial. This has been done with rare grace by *Le Journal d'Alsace*, which says:

The character of the King of England increases in grandeur in the same degree as the pacificatory movement to which his Majesty has devoted all his political and moral power.

English Notes

(From our London correspondent)

LONDON, November 4, 1904

The truth is that opinion about war has been greatly sobered by the experience of the last five years.—WESTMINSTER GAZETTE

THE ship of State has passed through a tropical storm. The suddenness with which the tempest arose and the suddenness with which it has disappeared, are events so dramatic that it is difficult to grasp the full meaning of our escape. All that can be said is that England is in a thankful mood today, and proud of its King.

And I believe that the underlying thought of the nation at this moment is: "Cannot something be done for Russia and Japan?" Although there is no lessening of public sympathy with the latter power, there can be detected in the tone of our leading papers a desire not so much for her further triumph as for peace itself; peace with honour to *both* combatants.

Yesterday was the birthday of the Emperor of Japan. I have just been reading an account of him in the *Daily Chronicle* written by one of his subjects in London. Here is an extract:

In conclusion let me tell you what we think of the saviour and maker of modern Japan. He was given to us when we were upon the brink of unspeakable horrors. On the one hand was the feudal baronage with a Government like that of Russia. On the other hand was the dark spectre of a bloody revolution, to end, perhaps, in the extinction of the nation, so that like Poland, we should exist only as a name. He saved us, and therefore we trust him.

I am wondering how the Emperor of Japan and the Emperor of Russia could be brought into direct communication with each other? In the hour of calamity friends should be *bold*. Have they not a common friend in our own King? It is a question of doing the right thing in the right way at the right moment. And is not the moment surely *now*?

Curious Properties of Numbers

UNDER the decimal system of numeration, which is in general use throughout the world, the numbers 11, 12 and 13, have a unique position in relation to their squares. For instance:

11^2 equals 121; 12^2 equals 144; 13^2 equals 169

Now if the numbers be reversed, the squares will also be reversed:

11^2 equals 121; 21^2 equals 441; 31^2 equals 961

Also if the numbers themselves be added together the results are curious:

11^2 equals 121 and $(1 \text{ plus } 1)^2$ equals 1 plus 2 plus 1
 12^2 equals 144 and $(1 \text{ plus } 2)^2$ equals 1 plus 4 plus 4
 13^2 equals 169 and $(1 \text{ plus } 3)^2$ equals 1 plus 6 plus 9

STUDENT

THE Kingdom of God is within us. In the latency of every soul there lurks, among the things it loves and venerates, some earnest and salient point, whence a divine life may begin and radiate; some incipient idea of duty, it may be; some light mist of disinterested love, appearing vague and nebulous and infinitely distant within the mighty void—a broken fringe of holy light, seen only in the spirit's deepest darkness; and therein may be the stirrings of a mystic energy, and the haze may be gathered together, and glow within the mind into a star—a sun—a piercing eye of God.—*James Martineau*.

Childish Views of History

WE shall never get a plausible theory of past history until we cease trying to regard it all as merely a preface to modern history. Prune and twist the facts as we will, we can never force them to adapt themselves to that absurd requirement; and no amount of solemn pedantry will do more than enhance the ludicrous result of such an attempt.

In a chapter on a great religious Teacher and his religion, in a school-book, it is admitted that this religion has more adherents than any other, and that it spread vigorously and far, and has maintained its hold firmly and immovably. Yet the summary given of the tenets of this religion and the teachings of its founder is childish. The only conclusion is that countless millions of mankind, including kings and scholars and

people of surpassing ability in all directions and of various races and temperaments, have for centuries been deluded by twaddle which would not deceive any one in our civilization. Now we may admit that there have always been hordes of ignorant indifferent people willing to follow any leader and accept any rubbish; but we can scarcely be expected to believe that, out of all these millions, there would never at any time come individuals of a free inquiring spirit and enlightened mind. The

Odd, Disconnected & Garbled Doctrine

arrogance of the notion that a Great Teacher could succeed in forcing such nonsense on half the world for millenniums, is pitiable. It is easier to conclude that the writer has got his account of the teachings wrong; and it is all the easier to believe this when we consider the contemptuous carelessness with which all such questions as beliefs of "heathens" and "ancients" are treated. A handful of odd and utterly disconnected facts and another handful of garbled doctrines—and that is what he taught, so we are told.

The *suppressio veri* is as much in evidence as the *suggestio falsi*. We are told that the Teacher preached destruction of the personal self, but not that he preached the attainment of true Selfhood. Thus we are expected to believe that the whole of the Orient is inspired by an ardent zeal for total and absolute suicide, and that nothing better than this lies behind all its fiery and changeless devotion. The Teacher taught the destruction of illusion (in the personal self) that Reality may shine forth; his teaching was the gospel of a fuller and richer Life; and it is that which has caused his teachings to flourish in spite of all opposition from without and degeneration from within.

But our historian has to "present a rational and consistent scheme of the events of history and trace the growth of ideas in the mind of each successive civilization," etc., and if the facts do not fit his plan, so much the worse for the facts.

H. T. E.

Clergy and Brewery Shares

ONE of the speakers in the Church Congress in England spoke indignantly on the question of clergymen holding brewery shares, the investigations of a certain journal having revealed the fact that there are a few clergy in the church who hold quite a large interest in alcohol. This is especially hard on those who are earnestly striving to lessen the liquor evil, for it renders any united action on the part of the church half-hearted and hypocritical. It is almost impossible in these days to keep oneself absolutely clear of indirect and unconscious complicity in nefarious traffics, so involved is the network of our commercial and investing system. But one can, at all events, try one's best, and keep out of those connections which are obviously and flagrantly contaminated. If we cannot find perfectly clean money, we can avoid the dirtiest and refrain from making it any dirtier. Thus we may keep a clear conscience and avoid the absurdity of undoing with one hand the good work we are doing with the other.

But alas! the excuse is so ready that moderate drinking is no harm, and that it is permissible to engage in the manufacture and sale of alcohol for legitimate purposes; and it is to be feared that the culprits will find this excuse amply sufficient for their not too exacting consciences. Temperance reformers, however, know how great is the fallacy in this argument.

The Private Papers of Christopher Columbus

IT appears that the private papers of Christopher Columbus still exist, and are in the possession of the Duke of Alba, a resident of Paris.

The Secretary of the American Embassy, Mr. Henry Vignaud, followed their traces through sixteen descendants and finally arrived at his goal. They include his log book, and many personal documents relating to his first voyage to America. There is considerable hope that this vitally interesting collection may find its way into the possession of the country to which they refer. Apart from these, Spain itself, in its private libraries and those of its monasteries, must contain masses of manuscript, records relating to both Americas and especially the South. Our knowledge of those inhabitants of the latter whom the early Spaniards found there might receive so great an amplification as we can hardly conceive of were these manuscripts made accessible, while, in South America itself, the Incas concealed treasures which must include historical as well as material wealth. These last at all events are safe from violation by unscrupulous and iconoclastic hands.

STUDENT

The Sahara not a Desert

THE notorious Sahara desert has been grossly libelled by misstatements repeated from mouth to mouth without being corrected by actual investigation. This is the declaration of M. Paul Leroy-Beaulieu, who has written a book advocating the development of the Sahara and the construction of railways across it by and in the interests of the French nation.

To begin with, the region is not nearly so much of a desert as is usually supposed; nor is it, as the geography books tell us, denied the blessing of rain. But besides this fact, what desert there is is of a comparatively superficial character, such as would yield readily to energy and industry applied to irrigation, farming and rapid transit. The political question is evidently the most serious one. Though the region is painted on the map as belonging to France, there are various and powerful interests at stake which would have to be settled with the tribes who at present have on their side the "nine points of the law." Mr. Leroy-Beaulieu says:

The world has been deceived regarding both the soil and the subsoil of the Sahara. It is not a waste of shifting sand. On the contrary, all but about a tenth of it has a solid and uniform soil. It rains there with perfect regularity. Any traveler who has spent a period of several months roaming about the Sahara, will tell you he encountered rainstorms, and sometimes very bothersome ones, or at least that he saw traces of recent rains.

Besides the water on the surface there is abundant water underground. The wandering tribes use only what is at the surface or only a few yards beneath it, and as they will have nothing to do with the spontaneous pools, which they allow to be filled with rubbish and polluted by refuse, people have jumped to the conclusion that either water was wholly wanting or that it wasn't fit to drink, when as a matter of fact, very little labor and very little care are required to reach sources of a healthful water supply in part of the Sahara.

The oases are merely irrigated spots and could therefore be extended; beyond them are tracts which have rain and need only to be opened up. Many trees are found besides the palm; for example gum-trees, ethels, giant jujubes, danias, and teboracs—trees which perhaps have become disguised through their French names.

Protection against violence and the construction of railways are what is needed; and, after that, irrigation and intelligent farming operations. There are great mineral resources also to be had.

But to run a colony so as to be a gain, or even so as not to be a loss, to the mother country, needs a special genius. And before this can be attempted there is a country full of mixed races to be pacified and kept tranquil, and international rivalries to be satisfied.

As usual, our enthusiast can see visions of nothing but commerce and material gain. No doubt there are many vast tracts of the earth which could be so industrialized and turned into sources of dividends; but it is to be hoped that some of them will continue as they are until a more worthy and imaginative race is ready to undertake their development on higher lines.

H.

The Cosmic Serpent

A STRIKING view of the origin and decay of worlds is given by a French scientist in the *Revue Scientifique*. Founding his argument on the recent theories of matter and on the behavior of radium, he makes *From the Ether, back to the Ether*, the formula of the cycle of history of the substance of the worlds.

Substance is continuously dematerializing itself. Through many stages it finally dissolves into the tenuous ether, as, through the same stages, it formerly coagulated itself from the same. What we call matter is but the middle point of the cycle. It is the point of strain, the tight-coiled spring, always tending to the perfect relaxation again.

This is direct Theosophic teaching, and is as ancient as human thought. *We* talk—if we are learned, of the "vortex theory" and "spiral strain;" if we are unlearned, the learned teach us their theory by means of the symbol of a coiled spring. The ancients, everywhere, for the very same idea, used the more picturesque symbol of the coiled serpent.

Had not their symbol something of an advantage? It included the idea of the *livingness* of the tense coil. But that of course—the idea that matter is in its way living—is "unscientific." According to Theosophy it coiled itself in response to conscious purpose. *Man* is the outcome of that purpose. Yet substance only, could but make the sentient animal. Then soul conjoined itself, and the goal of the purpose begins to gleam far away. Verily, the new Day dawneth! STUDENT

How an Island Is Born in the Pacific

AT the time of the great earthquake of September 21st, 1897, in the vicinity of Borneo, there was a considerable upheaval of the ocean floor at the northwest coast near Labuan. Mr. Van den Brock, in a letter to the seismic observatory, gives the following details:

The dimensions of the island are as follows: Length, 750 feet; breadth, 450 feet; height, 45 feet.

As to the general aspect of this island which appeared from the depths of the sea, I may say that it is flat; still in the middle of it there is an elevation in form cone-shaped and in general appearance very much like a crater; and from it mud and clay come forth. The diameter of the lower part of the crater is some 180 feet. Inflammable gases are emitted from many cracks or crevices.

Another new island also appeared the same day, near Kudat, to the southeast of the island of Malundangan. It is rectangular in form, measures 360 feet in length, 300 feet in breadth, and but 3 feet in height. This island, according to what the natives say, rose from the sea during the morning of the same day, the 21st. They saw the waves approach; they felt a strong and violent wind; they heard a loud noise; and in an instant the island rose on the spot where before the sea had been more than 20 feet deep.

Human Nature Versus Drugs

LORD KELVIN, the veteran physicist, made some sensible remarks at a prize-giving to medical students in London recently. He said, "I don't see human nature enumerated among the subjects for which a prize is given;" and added that human nature was what they would have to do with, and that was a subject which went far beyond any subject relating to dead matter. Anything that crystallized could now be made by the chemist, but no artificial process could make living matter out of dead. He asked them not to regard their patients as mere chemical specimens, but as human beings. Every student, every nurse and every practitioner had to administer spiritual consolation to the patients. When they kept up a patient's spirits they were administering spiritual consolation to him. "Man cannot live by bread alone," said Lord Kelvin, "and patients cannot get cured by drugs alone." C.

Civilized Asia

The Chinese meteorological "system" fell to pieces during the sack of Peking. The German soldiers managed to get hold of the ancient and curious instruments which had reposed in the observatory of successive Sons of Heaven for quite 2,000 years.

When the Germans finally brought their treasures to Europe, the Kaiser was appealed to to order the return of the instruments to the Chinese, but in vain; and such of them as are not in the German museums are now in the Imperial Palace at Potsdam.

AS an agreeable contrast to the cutting above, the papers the other day stated that almost every mail arriving in St. Petersburg contained silver cigarette cases, watches, trinkets of all kinds, money, and even single rouble notes. These articles are found on the bodies of dead Russians by the Japanese soldiery, and turned in to their officers, who forward them to St. Petersburg for distribution among the relatives of the deceased.

These "pagans" certainly set Christendom an example. P. L.

Seismobacteriology!

THAT earthquakes are connected with pestilences is well known. It is also easy to understand that both are dependent upon the same disturbance of the earth's subtler atmosphere—call it vital, magnetic, or whatever name borrowed from the puny vocabulary of material science approaches nearest to the idea. But material science, knowing naught of the superphysical causes that link physical effects, has to find another explanation for the connection between earthquakes and pestilences; accordingly an authoritative medical paper, propounds the following:

Do earthquakes set microbes in motion, or do they only affect the nerves? is a question which has been raised recently. From early times pestilence has been regarded as one of the accompaniments of earthquakes. Nor is this perhaps a mere figure of superstition. Many instances of epidemics following upon earthquakes are on record. Thus in 557-60 A. D., earthquake years, Constantinople was visited by a pestilence, and in 615 A. D., after more than a decade of seismic disturbances, which extended from Japan to the Mediterranean, the whole of Italy was visited, according to Sigonius, by a fearful epidemic, of which the nature is not recorded. Old writers, such as von Pienciz, an authority on the Lisbon earthquake of 1755, were wont to attribute the proneness to disease exhibited by whole populations during earthquake seasons to shaken nerves begotten of prolonged suspense and broken rest at night.

STUDENT

Frontispiece---William Quan Judge

THIS week's cover-page of the NEW CENTURY PATH contains the face of Wm. Q. Judge, the second in the line of succession of the world's Theosophical Leaders. Mr. Judge succeeded to the Foundress of the Theosophical Society, Helena Petrovna Blavatsky. A successful lawyer, a brilliant writer, and a man of extraordinary insight into human nature, he was well fitted to carry on the great humanitarian and philosophic work of H.P. Blavatsky.

Some Views on XXth Century Problems

What Is a Luxury?

THE late Lafcadio Hearn's recent book, "From Kakori," contains a fine attack upon waste and luxury. How many, after reading and admiring it, will then modify their habits, is another matter.

He speaks of "the reckless consumption by luxury of the labor of years in the pleasure of an hour," and of our habit of estimating our purchase solely in terms of cost to ourselves, never in terms of the cost to the producer.

Part of the reason which makes all such criticism fall to the ground is the difficulty of saying what is luxury and what not. The luxury of one is the actual necessity of another. The problem will not be cleared by lists and classifications. It will only lapse when the aim of each is to serve the common good. Actuated by that spirit, he will accumulate no luxuries. He may accumulate many things that in the possession of others would be luxuries, and that others may think luxuries. But in facilitating his work, and according to the measure of the reality of his dedication of himself to the whole, they remain productively in the common fund. That removes from them the stigma of luxury, and the matter must lie with the conscience of their possessor.

Perhaps the other factor that weakens the denunciations of luxury is the idea that the purchase of *anything* is "good for trade" because it keeps a certain number of people at work making that thing. It does so; but it keeps that much human energy away from the production of things which in *their* use would become the basis of further work. If it were the fashion for people who could not play violins to hang them as ornaments on the wall such instruments would be luxuries, wells of sunken labor. But a violin in the hands of its legitimate user may be the means of continuous work, paid into the common fund, for the elevation of human consciousness.

May we not take it that the sacrifice of a luxury can be made an acceptable offering on the altar of humanity, an actual relief to the weight of the world?

STUDENT

The Ethics of Advertising

THERE is a more than questionable morality in certain kinds of advertising. Some, for instance, are flagrantly untruthful; others are purposely misleading; others just escape the heavy hand of law; but some kinds—and they are probably the most pernicious of all—are a class which panders directly and intentionally to the most selfish and dangerous sides of our civilization. Of such are the kinds professing to give instruction in "psychology"—"so that others will be made to think what you want them to think." Fortunately, such "ads." attract but the weaker and more gelatinous of our human brethren. The strong man is quite self-sufficient, and relies on himself.

Yet there seems to be not the slightest doubt but that writers of such advertisements consider their methods perfectly legitimate and meritorious, for it has come to be the general idea that everything is fair in business, and that the office of the advertising man or the salesman is to *make* the public buy the seller's wares, whether they need them or not. The main thing is to make a sale, and that salesman is considered best who sells the most.

But there is another side to it. What right have we to influence people to buy that which they do not need or should not have? That it can be done is well known, and it is done everywhere. The advertiser would be furious if anybody were to ask him to pick a pocket, yet that is exactly what he proposes to do, in another way.

Advertising is an art, and its legitimate office is to make known to other people what one has to offer, and to do it in such a manner as to attract their attention, and to explain as far as may be all the good features of that which one has to dispose of.

A right-minded advertiser will guard the other person's interests quite as carefully as his own. That such methods "pay," is the universal testimony of all who have given them an honest trial, and they are greater in number than our pessimists would have us believe. STUDENT

Have We Reached Our Limit?

PROFESSOR STARR, of the University of Chicago, thinks that the Caucasian race has run its course. It must now yield the first place because "it has little more to learn in culture, education or anything else"! Does he mean that it has exhausted its *capacity* of learning, or that it has actually reached the limit of human possibility?

Anyhow he thinks it is now about to go down hill and see its place in the foremost files of time taken by the yellow race—by which he seems to mean primarily the Japanese. "The educated Japanese of the present day know more than ninety-nine out of 100 honor men graduating from our universities."

Has the Professor no other data than such as that? For if not, he has utterly confused racial virility and staying-power with mere university learning. In matters of culture and education it is more nearly true that we are beginners than past masters. With how many of the wealthy is not the beauty of some object of art reckoned according to its money value? What would be the opinion of a Greek upon our æsthetic sense as revealed by our homes and our cities?

If culture is understood to include the higher and nobler patriotism, how much of that is in our midst? How much of the devotion that would *sacrifice* something for the country's greatness and for the purity of its city and state life, instead of *profiting* by the one and soiling the other with greed and ambition?

If education includes training in self-control, the drawing forth of the higher nature in domination of the lower, the arousing of the spiritual center, the awakening of the divine instincts of compassion, loyalty and brotherhood, can we say that our education is much more than begun?

Before we say that we have finished our course, let us each make for himself his own ideal of a great character, let us think out to the full the ideas we attach to the word *great*, and in the light of that note where we stand. We shall at least be saved from the view that we "have little more to learn," even if we have to admit that we are for the time almost stationary and some other peoples going forward. OBSERVER

Food-Fads Cannot Cure Civilization

THE reading of an article on diet fads reminds one once again of the inevitable conclusion that you cannot cure the body much ahead of the mind. Take the case of a person who has got his body so out of gear that he cannot turn good food into good blood. Give him a diet that digests itself, give him predigested meal, meat extract, give him even blood itself. He may regain health for a time, but his bad habits will soon disarrange him again, and his normal digestive powers will have become atrophied.

But take a man who is determined to remodel his course of life but suffers from past errors and, under the supervision of a physician, such remedies may be of great value. But, mark, only as medicines, not as foods.

Another important point in this prepared food question is this. Inability to digest wholesome foods comes from the depraved habit of living on the fitful energy derived from food immediately after its injection into the stomach. Then, instead of allowing the food to digest further and so impart more energy, a fresh meal is taken and treated in the same way. Thus the stomach becomes converted into a sort of brewer's "mash-tun," brewing alcoholic and acetous ferments. To remedy this, food is taken which can be digested immediately. Thus the evil is pandered to, and the patient makes his dietary conform to his ill-regulated regimen.

What he should do is to so reform his habits that he *can* digest wholesome food, and make his body fit the wholesome diet rather than adopt a depraved diet to suit a depraved body. And if artificial foods are needed at all, let the doctor have the handling of that matter,—assuming for the sake of argument that the doctor himself is a real doctor and not a mere fellow conspirator. There are not few who prescribe to the wishes and fads instead of the needs of the patient. H.

Brief Glimpses of the Prehistoric World

Archeology
Paleontology
Ethnology

Ancient Empire of Saba

IN a recent issue of the *NEW CENTURY PATH* allusion was made to explorations of the buried cities of Zimbabwe in South Mashonaland and their identification as one of the principal sources of ancient gold-supply.

Whether or not this was the Ophir mentioned in *Kings*, it is obvious that it was a great source of mineral and vegetable wealth and the seat of an advanced civilization. Ophir has been placed in India; and Biblical scholars, connecting the name with that of one of the descendants of Shem (see *Genesis 10*), place it in Southern Arabia.

The date of the building of the temples found here is placed at 1200 B. C., by calculations based on their orientation taken in connection with the precession of the equinoxes.

The ruins were known to the Portuguese in 1510 from reports of Arab gold and ivory traders, but were lost sight of until 1868, when modern travelers began to rediscover them. They were, however, mostly buried, and the present explorer has spent two years in excavating and studying them. They consist of three groups of temples and forts, which have been called the Elliptical Temple, the Valley of Ruins, and the Acropolis ruins. These cover an area of about two miles by one and a half, which represents but a fraction of their ancient extent.

The Elliptical Temple is a massive structure of small granite blocks, some of the walls being 15 feet thick at the base and 8 at the top, and reaching even now a height of 30 feet. Within are many narrow tortuous passages and also courts. They remind one of the ruins of some old feudal castle—massive stone walls, narrow passages, steep ascents and descents, a mingling of natural architecture with artificial. The theory is that these monuments represent a colony of the ancient empire of Saba or Sheba, a powerful state in Solomon's time and long before.

The outside face of the Temple has a mural decoration in the zigzag design representing water, and this faces the rising of the sun at the summer and winter solstices.

Within is much gold and various stages of manufacture, crucibles, etc. There are stone emblems and carvings belonging to a symbolism originally sacred and pure but which has always been liable in degenerate times to profanation; and, as usual, it is the latter alone which the modern archeologists are able to detect. Because divine potencies were symbolized by forms found in the natural world, it does not follow that these forms were worshiped. Future archeologists, finding our chalices and petrified wafers, may infer that our civilization was a race of stomach-worshippers!

STUDENT

Evidences of the Ice Age in Britain

ARECENT Ordnance Survey Report gives some interesting particulars about the very marked evidences of glaciation in Brecknockshire and the neighborhood, S. Wales. The ice sheet which in the days of the last Ice Age spread all over the northern parts of both hemispheres, reached in this region the shores of the Bristol channel, but was split into separate streams by the carboniferous escarpments. So immense was the flow of ice that it overtopped the valleys, as is shown by the grooved rocks found on the hill tops. Hills 1300 to 1800 feet high are mentioned as being glaciated to their very summits, and all minor obstacles were overridden by the glacier. The usual glacial drift, formed of fine-ground rock mingled with angular debris, is of course abundant.

STUDENT

All Monoliths Erected by—Phœnicians!

TRULY wonderful are the methods of "exact" science, which laughs to scorn the testimony of ages, and relies solely upon modern perspicacity and ingenuity. It can build any theory out of any facts, however miscellaneous and unsuitable. Out of hundreds of possible inferences it picks out with unerring instinct the one which will lead to its theory, and it does this at every fork of the road. Other reasoners might arrive at other conclusions.

Here are some scarcely credible lucubrations on the gigantic monoliths found all over the world. The lucibrator asks, How did the ancients contrive to transport such colossal blocks to great distances and then

rear them? His answer suggests a wandering of the mind from the point at issue rather than a satisfactory answer. *It was the Phœnicians; they did it.*

The reason for thinking it was the Phœnicians is that the blocks are (so it is said) always found "near the mouths of rivers or along their courses," and the Phœnicians were a maritime people. One would scarcely have arrived at such a conclusion from the data given, and hence one naturally looks further in search of the *real* reason for the conclusion. This reason, which masquerades as a "confirmation," is undoubtedly what started the theory; and the theory, once started, the rest followed naturally enough. Phœnician writings and symbols have been found on the stones in America, in France. This merely shows, to ordinary intellects, that somebody wrote on the stones in symbols or characters similar to those which the Phœnicians used. But whether it was the Phœnicians who wrote or some other people cognizant of the same signs and whether a person who writes on a stone is necessarily the one who erected it, are questions which are unnecessary to answer as they are obviously irrelevant.

Again there is the possibility that the stones are found near water-courses because they were transported by water.

It is mentioned that the scientist responsible for this theory began by endeavoring to get *all* the monoliths in the world, from Stonehenge to Easter Island, under one category. Having done this, the next need was a maritime people. But the Druids, etc., were, as shown in previous propositions, not maritime, and the Phœnicians were. Wherefore, etc. Q. E. D.

Knowledge Lost Through Selfishness

MUCH of the wisdom and ability of the ancients, by which they could move gigantic stones and do other things we cannot, may be explained by the theory that they were endowed with faculties, both of perception and action, which we have not. Such faculties became lost through the degeneration of the human organism, due to selfishness and its resulting vices of intemperance, etc. They can be recovered only by a return to brotherhood and its attendant improvement in habits.

Thus the science of the future is bound up with the moral progress of the race, and is inseparable from ethics, as Science always ought to be. We cannot study science, or indeed anything, apart from ideas of human improvement and welfare; if we try, we run into a blind alley, and our science becomes harmful or impotent. But an unselfish heart, enshrined in a pure body, will find the great forces of Nature at its disposal as naturally as breathing and walking. Any attempt to gain such knowledge for selfish purposes must result in failure; and, in case of partial success, that success will speedily be followed by the retribution which always visits the violator of Nature's laws.

E.

The Inca Treasure

THE *Mexican Herald* alludes to a report that the Inca's treasure has been discovered at Chayaltaya, Bolivia, and enumerates various attempts to discover this treasure that have been made from time to time. It is the treasure that was sealed up at the time of the treacherous murder of the Inca king by Pizarro. The story, it will be remembered, is that this treasure will not be revealed until the last vestige of Spanish rule has passed from America. We do not know precisely what meaning should be attached to that phrase "Spanish Rule," but it is to be hoped that it has a wider sense than the merely national one and includes everybody likely to behave in the way the Spaniards did. May the Inca treasure remain safely guarded until trusty hands are ready to use it aright!

H. P. Blavatsky, in *Isis Unveiled*, writes interestingly of this treasure and of other buried treasures in different parts of the world. H.

The Rock Wall of Texas

THE Rock Wall, which has given its name to a town and county in Texas, is believed by archeologists to have been the work of some prehistoric masons, although science claims it for a natural formation.

It appears to have been the fortification for a settlement, the site of which has since been covered by the Red River deposit; for geologists say that the Red River once flowed this way to the sea. The stone is not of the kind quarried for building purposes near Rockwall, but resembles brick manufactured from the local clay deposit. STUDENT

✻ The Trend of Twentieth Century Science ✻

Strange News From the South Pole

IT is practically certain that proofs, entirely unexpected by the general, or even the scientific, public, of the existence of men and mammals in former geological ages at the South Pole will be brought forward as soon as the fossils, etc., brought back by the brave little ship "Discovery" from the Antarctic regions are exhaustively studied. Already it has leaked out that some great surprises are in store for us, and that current ideas of geological periods will, most probably, have to be entirely changed when the full results of this important expedition have been given forth. According to the newspapers, "In speaking of the matter, Sir Clements Markham was most guarded. Still, he admitted that the fossils must in any case mean much. They may upset all the theories as to the Polar System and the geological origin and age of the world."

From the remains of sub-tropical plants, coal etc., we know that the North Polar region once enjoyed a very hot climate, and if a similar state of things existed at the South Pole, as seems now practically certain, it will be almost impossible to doubt any longer that the earth's axis has changed considerably in its relation to the sun. H. P. Blavatsky showed the need of this to explain many difficulties, and she mentions that the South Polar lands were once a portion of ancient Lemuria, the vanished continent, then peopled with great civilized races. We await with profound interest for further news from Antarctica, for, as slowly but surely, relics of the past are brought to light and proofs of the vast antiquity of human civilization increase, we are learning to see our own affairs in their proper relationship, and in truer perspective, as well as to look forward understandingly to "that great Divine event to which all nature moves."

C. J. R.

The New Physiology

IT would appear that though all the organs generate electricity in the course of their work, the lungs generate more than any other. Both positive and negative currents may be obtained from the walls of the air sacs. The large quantity generated from the lungs suggests that each cell may be a little battery, though the nature of the generating elements is no more known than in the case of electrical fishes.

One may predict that the physiological text-book of fifty years hence would be hardly comprehensible to a student of today. It will not only contain the few crude facts known now in the domain of physiology, but a mass of others of a wholly different kind. The organs and systems will be studied, we should say, primarily as light and electricity and magnetism generators. What kind of rays each emits—A, B, C, I, N, X, perhaps beyond the capacity of the alphabet to indicate—what kind of electricity, the intensity of the magnetic field, and the degree in which these are subservient to will and feeling, such must be among the matters dealt with. And a physiological photograph of a man may then differ as much from his *carte de visite* as a lamp flame from its lamp.

PHYSICIAN.

Scientific Palmistry

PALMISTRY of a certain kind seems to be passing into the realm of science. The researches of Wilder indicate that the palmar lines of different races have definite peculiarities. Among others he examined the palm markings of Chinese, Negroes, Mayas, Whites and Indians. It appears that though individuals of each race differ, they differ around a racial type. This type is sufficiently fixed to enable the race to be determined from this one indication alone. But this is only true where the race is pure. Where, as in this country, there is a complex mingling of races, the palmar lines show the mingling of the types, and vary widely in arrangement.

It is curious that here and there in a race an individual may be found whose markings closely follow another type. Mr. Wilder does not seem to have followed this hint home by trying to determine whether the mental characteristics of such an individual were rather those of the other race than of that in which he was born. More work along this line is wanted, and may even throw some light on history. STUDENT

What Does the Sea-floor Hide?

AN invention of an Italian mechanism renders it possible to explore the bottom of the sea without leaving the ship's deck. This instrument—the "hydroscope"—somewhat resembles an enormous reflecting telescope. The picture of the sea-bottom is transmitted up the tube and thrown upon a mirror at the top. The top perforates a floating platform, and observers stationed thereon can thus inspect the floor of the ocean. At the lower end are powerful lenses radiating light into the depths of the water. Associated with this instrument is an elevator which having seized some desired object, can be inflated so as to carry to the surface so great a weight as forty tons.

May it not be possible that one day some disturbance of the sea-floor, volcanic or seismic, or even the slow rise of a sunken peak, may bring into view some relic of a bygone race, dwellers thereon ere ever it sank beneath the waters? How the imagination of every civilized being would be stirred by such a discovery, some tablet or fragment of a building from the long vanished Atlantis! Perhaps the priest of Sais, who gave Solon the tradition of a vast Atlantean civilization, may yet be vindicated. Suppose from the Pacific floor another Easter Island began to rise, sister to the one whose mighty statues remain so absolute a mystery to this day, and one of its imperishable laval statues began to show its outlines through the mud! There may be strange problems in store for archeology to solve.

STUDENT

Bird Flight

THE problem: how certain large birds manage to rise great heights into the air with little or no motion of their wings, is calling forth some curious hypotheses. The last explanation we have noted is the most remarkable of any. Its naturalist author was on a mountain peak in the Caucasus, watching the flight of a great eagle. The bird finally rose to such a height as to be a mere speck in infinity.

The method which he is credited with adopting was this. With a single motion of his wings he glided horizontally forward. Then, lowering his head, and raising his wings till they almost touched above his back, his onward motion became a glide downward along an aerial inclined plane. Having accumulated as much downward velocity as he needed, he checked it by making his wings again horizontal and raising his head. By this means, still going onward, he translated his downward impetus into an upward one, and now glided up an inclined plane to a higher point than that from which he started. Bicyclists will now learn that they can generate enough momentum in going down a short hill to carry them up a long one.

The explanation reminds one of the man who levelled the flat bottom of his boat so that it might float down stream on level water!

Why take so much trouble to avoid the hypothesis that certain birds can alter their magnetic relation to the earth and thus "suspend gravity?"

STUDENT

A Vanished Lake

TERRESTRIAL changes are of course in continual progress, but they are ordinarily so slow (as we count time) that they attract little of our notice. A German periodical calls attention to the fact that Lake Shirwa, in Central Africa, has now disappeared. Forty years ago it was thirty miles long by fifteen broad. It was part of that long line of water which running from north to south of this huge continent, practically divided it into two. From the Nile this water line is continued into Lake Victoria Nyanza.

From thence it runs down through lakes Alexandra, Tanganyika, Nyassa and Shirwa, to the Mozambique channel. Perhaps it is being gradually obliterated. The land strip on the east of it was probably contemporary with parts of Lemuria; that on the west was doubtless part of Atlantis. As the former sank, the latter rose, in its turn to be submerged. Only their edges, with the included line of sea survived to tell (or hide) the tale of two lost continents.

Some of us forget, in reading our geology, that the great earth-changes there described are still in progress and will be for future ages. STUDENT

The Music of Trees

AS every tree has a character of its own, so every tree has a music of its own. Trees lend their leaves as harps for the wind to play upon, and a forest of various kinds of trees furnishes a grand nature chorus.

All the poplars have taken special pains to suit the hanging of their leaves to the play of the lightest zephyr, and the aspen leaves will be in motion when all other kinds are still. The cottonwoods, which are a species of poplar, respond to the touch of the wind with a music like the ocean's waves. One could lie beneath them with closed eyes and be lulled to sleep with a sense of the nearness of the sea and its music. The eucalyptus, in an ordinary breeze, gives forth music like the patter of gentle rain upon a shingled roof, and this increases in power with the force of the wind. The palms and especially the Canary date, furnish a fairy-tripping music. It is not difficult to picture about every such tree a circle of happy sprites dancing to the music of the leaves. The song of the pepper-tree is silent save in a very strong wind, and then it is as soft and feathery as the tree's own foliage.

And what shall be said of the soft, low whisper of the wind through the pine-tree's streaming plumes? It is angel music, and standing in listening silence beneath the majestic trees, one is filled with a sense of something inexpressible save by the pine's own music, which charms and holds one in its spell.

So the music of each tree touches some responsive chord in the human heart and shows our kinship with all.

STUDENT

The Ant-Lion

UNDER a large palm-tree, east of the Raja Yoga Academy grounds, may be seen many little pits in the sand in the shape of inverted hollow cones. These are made by the ant-lion for the purpose of entrapping his prey. As there are seats under the tree, workmen who have been engaged on the grounds have eaten their lunches there and scattered the crumbs. These have drawn the ants and other insects, and while they are there for the crumbs, the ant-lion is there for them, and has made his pits in greatest abundance under and near the seats where the crumbs would fall thickest. Does the ant-lion know the food of the ant? It is presumable that it does.

STUDENT

Weeds

AS things out of place are called litter or dirt, while in place they may be very desirable, so plants growing where not wanted are called weeds. But there is a large class of hardy plants that generally are not wanted at all, because they take sunshine, soil, moisture and room that are desired for other plants; and their very commonness makes such beauty as they may possess disregarded. Their real worth is not known, and while they seem to be a hindrance, they are a help to

the one who likes them least, the tiller of the soil; for in keeping them out he keeps the soil mellow for the growth of desired plants, which are also fed by the decaying bodies of the weeds; and he keeps himself in a healthier condition because of the outdoor exercise.

But so-called weeds have virtues. They are largely medicinal in character, and many of them are invaluable remedies for ills that flesh is heir to. Nathaniel Hawthorne says we do not yet realize the place in creation allotted to weeds, and asks: "What hidden virtue is in them that it is granted to sow themselves with the wind, and to grapple the earth with this immitigable stubbornness, and to flourish in spite of obstacles, and never to suffer blight beneath any sun or shade, but always to mock their enemies with the same wicked luxuriance?"

Perhaps if we could penetrate nature's secrets, we should find that what we call weeds are more essential to the well-being of the world than the most precious fruit or grain." We may well emulate their steadfast faith and courage and indomitable perseverance.

Cats That Mother Birds

LAST year a cat mothered two jackdaws, jealously guarding them from a dog, and snuggling down with a fore-paw round each bird. A jackdaw's nest was robbed again this year, and the young birds given to the cat

Thy melodies of woods, and winds, and waters;
Till he relent, and can no more endure
To be a jarring and discordant thing
Amidst this general dance and minstrelsy.—Coleridge

to mind. She undertook the duty without ceremony, and the same pretty picture was enacted till her adopted children were able, and only too willing, to take care of themselves.

This cat, whose instincts are so domestic, has many wild habits. It leaves home for weeks together, to take up its residence in a rabbit's burrow. On being called, it comes to the mouth of its retreat, but not any further, and to all intents and purposes becomes *feræ* for a season.—*Ex.*

"Let women live true to themselves: then shall dawn a better day for the whole race."

IN the year 1900, there were revived in Lomaland by Katherine Tingley the ancient Olympic Games. On Thanksgiving Day, 1904, the four-year interval of the time-honored Olympiad having elapsed, the second celebration of the games took place in the Greek Theatre at Point Loma, California.

This institution of ancient Greece which, in the year 776, B. C., attained such celebrity, was of such significance to the various States represented that all the events in Greek history following it were dated from the great festival. It was a great factor in promoting the common interests of the Greek States, and in encouraging the high standard of physical development that prevailed among the people; besides emphasizing the truth, that man's body as well as his mind, requires discipline, and that only when both are well under control can there be a harmonious development of the whole being.

It is hard for us to realize what this great periodic festival meant to the Greek people. At first the games lasted but one day, and consisted of tests in foot-racing. But their fame and success grew with time, and at last every known contest of skill and strength (excepting always any exercise with weapons), was added, musical, artistic and poetic competitions being included. The festival extended over five days, and was celebrated in the beautiful valley beside the temple-crowned hill of Olympus. The period of the festival was regarded as a sacred time, and no act of hostility was permitted in all Greece. All arms were laid down and men were at peace with one another. Those successful in the contests were not weighed down with the heavy trophies that belong to our day. A simple wreath of wild olive was the only prize of the victors. But this was considered an extraordinary honor, and the wreath was preserved as a sacred relic in the family of the winner. If a Spartan, he might henceforth fight next to the person of his king, in battle. Hercules himself, so the legend goes, planted the wild olive along the course of Olympia, and the victor's wreath, twined of its leaves, was a symbol of high honor. The scene of the revival of this ancient institution at Point Loma, was one to live in the memory. The whole great Theatre "clean scooped out of a hillside, with the sky above, and the sea before, our seats," had been arranged with many a suggestion of old Greece. A bugle call had summoned the residents, who formed in festive procession, bearing with the American flag, the purple and gold flag of the School of Antiquity, and that of Greece. One of the events of the contest was

A Lomaland Olympiad

a military drill by a group of the women students of Point Loma. Physical exercise in the open air is a

part of the daily program in the women's life at Point Loma. It has been the experience of the women that here, where the air is so pure and health-giving, and the mental environment such as to free the powers of the soul, there is a stimulus to the assertion of a command over the body in exercise, hitherto unthought of. It is a delight to meet a group of these women-students returning from an hour's brisk drill in the Amphitheatre in the early morning, showing in every step that the body has been, for that day, attuned to harmony. Who of us does not think, with a thrill of pleasure, of an early morning ball-game in the summer, when the pure sweet air, the quiet light of the recent dawn, the freshness of the earth, and the calm of the ocean near by, so inspired the players that their steps were fleet, their voices silent, they ran more swiftly, tossed the ball more lightly and with keener aim, than ever before. It will be well when

women realize that a wisely-directed and patiently-sustained effort on their part is necessary to overcome the sluggishness of the physical body, caused by centuries of wrong living. But they are beginning to discover for themselves that physical exercise, directed by a well concentrated mind, and undertaken with energy and a sense of its benefits, awakens the body to new endurance. It is the blossoming of the

soul that expresses itself in a new firmness of will and a new sense of unity among women, that will give a great lift to the whole physical life of woman, and make it possible for that life to express her ideals. In ancient Greece it was known and understood that soul and body must develop in harmony. Training in gymnastics was not enough; for out of mere strength may easily grow rudeness. Knowledge of music, of the inner harmonies that generate purity of mind, was not enough; there was the possibility of an excess of the gentler qualities. But where these two were harmonized there, as Plato tells us, "the soul is both brave and temperate;" the body becomes its alert, responsive vehicle.

It is surely significant that at the revival of the old Olympic Games in the Twentieth century, at Point Loma, women entered the field.

The meaning of it is, that in this century women, as women, demanding nothing but what their awakened inherent capacity commands, have stepped into the arena of life with the confidence and courage born of soul-knowledge. It means that all the world shall be better and brighter, because more clearly shines the light of soul. STUDENT

LET us not always say
"Spite of this flesh today
I strove, made head, gained ground upon the whole!"
As the bird wings and sings,
Let us cry "All good things
Are ours, nor soul helps flesh more, now, than flesh helps
soul!" — *Browning*

The Mother's Point of View

NEWSPAPERS tell queer tales. On page one of a recent New York daily occurred the following account of a certain "one-eyed Mike," an East Side hero who had become famous through rescuing divers people from burning buildings. It appears that he has, for some years, figured as a very particular hero in the eyes of the public because of his exploits in this line. On page seven occurred a modest little paragraph which many readers probably did not connect with the thrilling account of Mike's exploits, but which, however, is a part of the same story. It briefly recited that Mrs. Kate —, the mother of this hero, was in the Harlem Court on the previous day to ask the city for aid. She proved to the satisfaction of the judge that she was destitute and without support and "was told to apply to the Charities' Commissioner;" that was all.

What is heroism, and was "Mike" really a hero? Was

Ease is the way to disease

A Chinese Woman's Opinion

DR. YAMEI KIN, the first Chinese woman to graduate from an American Medical College, said in a recent lecture:

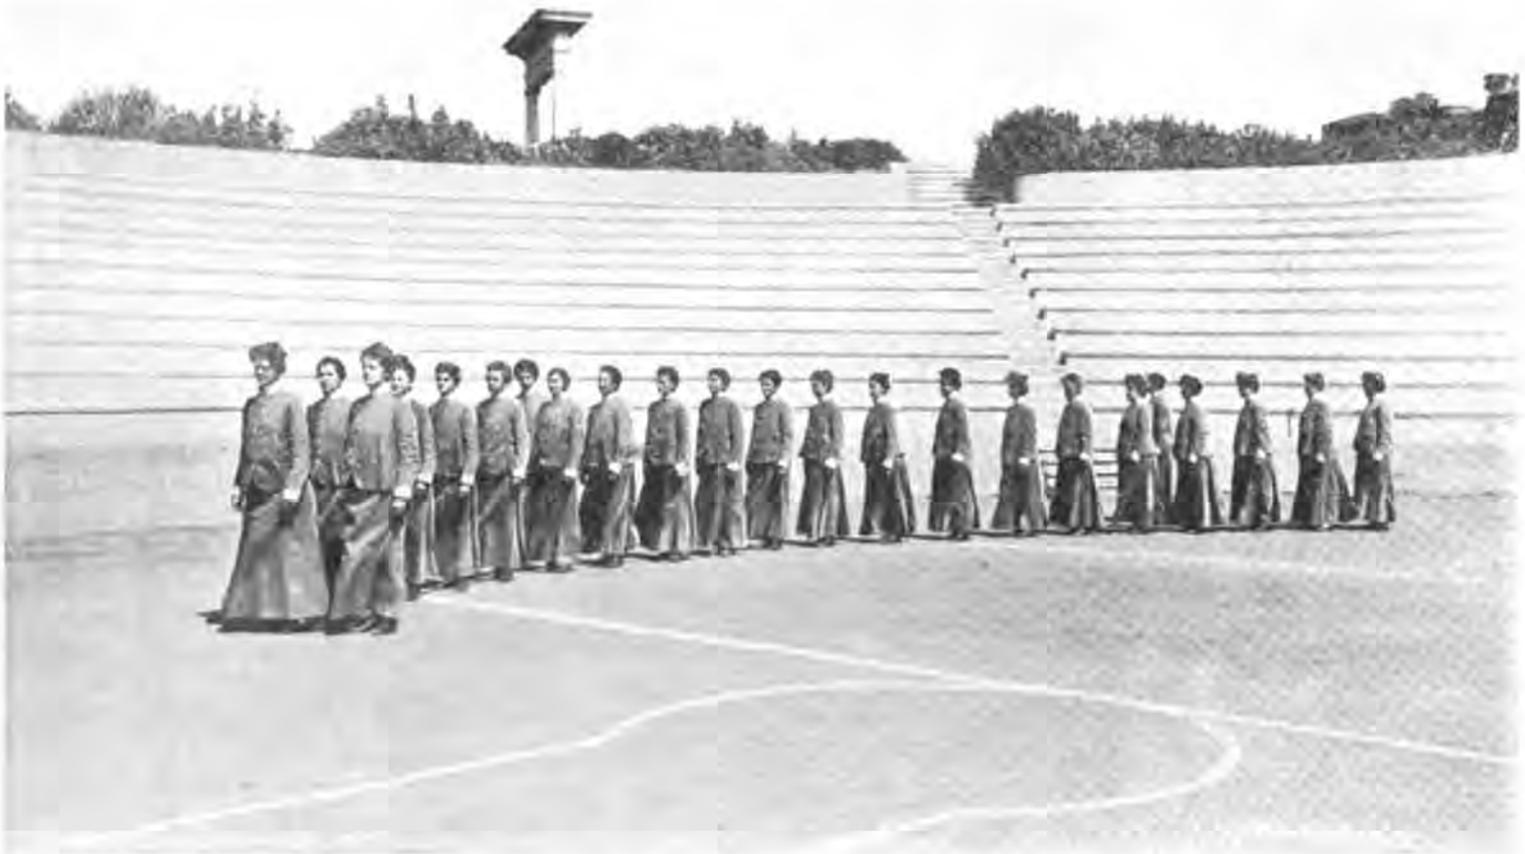

But I doubt when the war is over, when Japan has weakened her military strength and expended her energy, whether the European nations will allow her to keep what she has gained through bloodshed and by glorious victories.

Then will be the time when her old friend China will come to her assistance.

China is the backbone of the Asiatic countries. And her strength lies in her great middle class, from which her aristocrats are taken. She is superior to European countries in that she is not burdened with a degenerate body of aristocrats. The strength with the English and with Americans lies in the large middle class, with the artisans.

You great Western people, because you are so successful, do you think that by your great strength you can cast us all in your mold? Where you have attempted to do so you have only given us your vices. Can't you give us something better? Now is indeed your opportunity.

**The

it not easier, perhaps, for him to dash through fires to the plaudits of a crowd than to have done his plain and simple duty by his mother? Yet, if he had been willing to do the harder and more obscure duty, he might have done so-called "heroic" deeds, just the same.

Few cannot recall some splendid young fellow who has given up brilliant prospects, who has perhaps staid at home from a war which aroused his very soul, for the sake of taking care of an old father or mother. Many a noble heart has chafed under the necessity of doing the humble, obscure duty, of being forced to make the humble and unnoticed sacrifices, rather than those easier sacrifices which the world calls great. Truly, it is more difficult to conquer one's self than to take a city. Even the daily newspapers teach us that much, if we can read between the lines, compare notes and sift evidence. STUDENT

IT is largely due to English women that the lace industry of Ireland has been revived. Today comforts are creeping into many of the little homes among the peat bogs of Ireland because of the lace-making industry. Carrickmacross appliqué, Guipure and Point lace, almost as exquisite as anything that old Venice might have shown, are made by the deft fingers of young Irish girls, and their life is at last becoming something different to that of the hopeless, struggling existence of their mothers. Much of this they owe to their English Queen. H.

A YOUNG Russian woman is acting as interpreter and scout with General Keller's army now in the mountains about Liao-Yang.

Her father is a patriotic old soldier who had no son to send to the army and so sent his daughter. This is not her first service, as she was in Manchuria during the early Boxer trouble, and later served as guide and interpreter throughout the entire campaign. For bravery at this time she received a presentation sword and the campaign medals. This woman, Elena Smolka, had been reared according to Cossack ideals. It was because she had a knowledge of several languages, in addition to patriotism and an inclination to serve—not because of reasons melodramatic—that she gained special permission from the Czar to enlist.

DRESS is costly today, but it can scarcely compare with some of the gowns of medieval times, fashioned of the costliest of samite, embroidered in gold and real, not imitation, jewels. It was very usual for the women of medieval Europe to have their own arms and those of their husbands embroidered in gold and jewels on their robes. Occasionally the arms of the wife appeared only upon the robe, while those of the husband were embroidered upon the mantle. The most costly material then known was used for these mantles, and by law women of other than spotless character and high repute, were forbidden to wear them. Truly, that custom were well worth reviving today. M.

OUR YOUNG FOLK

"The Precious Moments in Life"

Read at a recent Public Meeting by one of the Raja Yoga lads

THERE are times in life when one would rather have an hour to himself than all the riches of the world. Such an hour we value highly; but what about the many hours of the day that we skip over lightly, never thinking of what we could accomplish in seemingly insignificant moments.

A lost article we can recover, a million dollars lost we can gain again, a fallen building we can rebuild, score upon score of things we may lose and yet regain; but a second, the small breathing-space of time called a second, once passed, will never come back to us again; no, nor to any other who might come after us. It is passed, and it is beyond the power of the immortals themselves to bring it back again.

We all know this, yet the majority of us do not give it a passing thought, but go through life, indifferent to the many hurrying seconds of the day. This precious time, which nothing can buy, which nothing will stop in its journey, is ours whenever we want it; ours to use if we are wise; ours to waste if we are ignorant.

On the space of a second may depend the rise or fall of an Empire; a criminal act or a kind deed for or against humanity; may depend the after life of a man. Every second that we use properly will benefit not only ourselves, but all with whom we come in contact.

The time we use in jabbering nonsense we can use in reading something sensible; the hours we waste in just pampering ourselves with self-gratifying thoughts we can use in thinking something which will be of help to others; for little kind acts which will take but a few minutes to do may relieve the sufferings of some one.

Time will not wait for us, but we must keep up with time. Time makes constant changes, which, however small, count for something great.

We must keep in mind that golden thoughts are built in golden moments, and that, however short the moment, we can, as it passes, add a golden thought and act to our lives, making the lives of others happier.

Those who have used their time to the best advantage have gained something better than other people; they have grown wise while others have remained ignorant—of time itself. Minutes are precious to those who work unceasingly, but are a burden to those who are idle. To throw time away is a crime which the civilization of today is forever committing. There are too many idle people waiting for others to do things for them; they do not consider that time is precious to others if not to themselves. Seconds give way to minutes, minutes to hours, hours to days, days to years, and as time goes rolling past us it leaves behind the works of the great, and we may then look back to the time when we let the precious minutes pass by, and regret. And well we may, for we cannot use them again, and can only make up for them by exertion in those hours rapidly approaching.

We should all feel it our duty to use time wisely, to make every hour precious by our careful use of it. Every minute of the day should find us doing something, not only physical work but mental work as well. Few of us stop to think—to meditate—on something incomprehensible to us. We may deem it unnecessary, but the use of a minute in this way will do for us more than we imagine.

Let us, hereafter, use every hour in doing and thinking something worthy of humanity, and we shall gain for every minute used thus, that which will last us forever and make us stronger than we ever were before. Time is for us to use wisely and well—not to WASTE!!!!

Facts Worth Knowing

THERE are more miles of railroad in the Pacific states and territories alone than there are in the Pacific colonies of all the other countries in the world.

A CHAMOUNIX peasant was the first to ascend Mont Blanc in modern times. That was in 1786 and it was not until the beginning of the Nineteenth century that the ascent was accomplished by a woman.

WILLIAM OF NEWBURGH once said of the Britons, "They are little to be feared as warriors and little to be trusted as citizens." Boys, you might learn that sentence with profit. The man who is little to be feared as a warrior—for we are all warriors, or should be, if not against evil without ourselves, then against the selfish impulses in our own hearts—is not to be trusted as a citizen. He will shirk his citizen-duty and then blame his neighbor because vice and crime have things all their own way, and because the state he lives in is not what it ought to be. The ideal citizen is the ideal warrior for truth and if all men were such, be sure we would have no wars for gain and for power, and the world would soon forget what battle-fields are like.

IN ALL ancient religions, fire was the symbol of life itself. In the *Zend-Avesta* it is stated, there is "a Fire that gives knowledge of the future, science and amiable speech." In myth and legend we read of "the Burning Torch of Apollo," also of the brilliant sparks on the helmet of Pallas and the staff of Mercury. And now we read that in India the most ancient fire still existing was consecrated twelve centuries ago. This fire is fed five times every two hours, with sandal-wood and other fragrant materials. To the ancients, fire was symbolic of the spiritual living power within one, only kept alive and burning by the ever loving thought, the kindly word and deed.

FRESNO County, California, produces 40,000 tons of raisins yearly, on an average.

The Story of the Greek Acanthus

DEAR BOYS AND GIRLS: Have you ever heard the story of the Greek Acanthus, and of how a wise artist designed from it the Corinthian Capital? Well, this is the story:

Once upon a time there was a little girl who loved the leaves and flowers more than anything else. One sad day, she passed away. She had no father or mother, but the old nurse who cared for her loved her devotedly, and to show her love she placed the child's little basket of toys upon her tiny grave, covering it with a square tile to keep out the rain. As it chanced, she placed it right over the root of an acanthus, a plant which dies down in the fall to come up again the following spring. It was then winter and she did not know, of course, that the plant was there.

In the spring the architect, Calimachus, happened to pass by the grave and there stood the little square tile-covered basket of playthings, surrounded by a glorious garment of acanthus leaves. The basket had been placed directly over the center of the living root, and, when spring came with sunshine and showers, the bright beautiful leaves had grown up about it, clasping it like so many fairy hands.

Reaching the tile the tops, of course, bent slightly outward and from that Calimachus got the idea which later he developed in the beautiful Corinthian capital.

All through Greek and Roman decoration the acanthus leaf plays a prominent part. Raja Yoga children know about it, and on the slopes of Loma Hill today is to be found a species of acanthus almost identical with that of old Greece.

A RAJA YOGA TEACHER

FRAGMENT FROM ODE

by RALPH WALDO EMERSON

UNITED STATES! the ages plead,—
Present and Past in under-song,—
Go put your creed into your deed,
Nor speak with double tongue.

For sea and land don't understand
Nor skies without a frown
See rights for which the one hand fights
By the other cloven down.

Be just at home; then write your scroll
Of honor o'er the sea,
And bid the broad Atlantic roll
A ferry of the free.

And henceforth there shall be no chain,
Save underneath the sea
The wires shall murmur through the main
Sweet songs of liberty.

For He that worketh high and wise,
Nor pauses in his plan,
Will take the sun out of the skies
Ere freedom out of man.

THE CHILDREN'S HOUR

The Raja Yoga Question Box

SWEET music brings us close to the purity of true heart life. Let us honor all true musicians.

1 Who was Mozart?

ANSWER — Mozart lived a hundred years ago in Germany. He played the piano when but five years of age, and at the same age composed a little *minuet*. With his sister, he appeared before large audiences in concert when a mere child. He was beloved by the Emperor of Austria and was a favorite with Marie Antoinette. He died very young, leaving nearly eight hundred compositions. He was kind and

loving all his life. All people owe him a debt of love and gratitude.

2 Who was Dvorak?

ANSWER — Dvorak was one of Bohemia's great musicians. His father, who was a butcher, wished him to follow his own trade. The gifted boy had great difficulty to obtain a musical education. He had few teachers. He once said: "I have learned all my music from Nature, from the trees and the blue sky." He became a great composer and often said that America would some day be the musical center of the world. In this we know he spoke prophetically.

The Warrior Way

THEY sat on the grassy bank by the river, and Susie's sweet little face was very serious.

"Muriel!" said she, "it is not so easy to become a knight as you would think."

"No, I don't believe it is," replied Muriel thoughtfully, "but it is overcoming all that tries to keep us back that makes us knights. There is no other way to grow fearless and brave. I think it is very wonderful, don't you? Sometimes a kind of picture—a picture that moves and changes—comes when I think about it; a great muddy cloud pressing around us, full of all kinds of living thoughts and feelings and moods that try to keep us from looking upwards to a glorious light shining above. These living things don't want us to see that light, because when we do, we begin to dimly remember that it is our real home, where we came from, and a longing to return springs up and brings with it thoughts of what is pure and simple and beautiful—to show us the way—and a light shines in our hearts. That is the beautiful part of the picture! But when it happens, the hideous thoughts and moods crowd in and try to make us miserable and cowardly, and do all they can to make us forget the dim remembrance, because if we remember, and stand firm and true, the light in our hearts shines like a beacon-light on the dark cloud, and the hideous beings die, because they can only breathe freely in darkness. So they do their very best to keep us in gloomy moods.

"But if we face them, within ourselves—that is the only way we can do it, because they are invisible; but they are there, sure enough, for we can feel them—so, when we really and truly face them, the victory of the fight shines all over us, and the light streams on us from above, and grows brighter and brighter in our hearts with even the very tiniest thought and feeling that chooses our real home."

Susie had listened intently. "I do believe," said she in a solemn voice, "that a muddy thought was trying to creep through me, whispering all the things it could think of to make me a coward! I won't have it!" And her eyes flashed. "Bravo, Susie!" cried Kathleen. "Meg said, too," continued Muriel, "that the light is the home of everyone, no matter how degraded they have become, or how long they have forgotten it. They can return if they only look upwards and will fight through the gloom."

Student Homes of Lomaland

About the Birds

DEAR CHILDREN: I live in the heart of a great city. When I first came here I was lonely and sad for I had lived in the country, where birds awakened me in the morning, and where flowers bloomed close to my window. But I thought the birds might come if I could fix them a little home, so I planted some large lilac bushes and, as it happened, there were already syringa bushes and one or two little hemlocks at the edge of my tiny yard. O, city yards are so tiny!

Well, the people who had lived here before had trimmed up these shrubs like trees. I changed all that. It took a year or two, but I felt paid at last to see the branches droop down, broad and thick and low. Best of all, the birds came, then. In all that city street there was not another place where they could build their little nests safe from peeping eyes. I counted seven nests in my little yard before summer was over. And you should have seen how many birds always stop to make me a call as they pass through the city, particularly in the spring when coming

North and in the fall when going South. I always keep a pan of water in the yard, and here they stop to bathe and refresh themselves. And all this in a city yard, so tiny that no one but a Japanese would think of calling it a yard at all!

A LOTUS GROUP TEACHER

THE mother of President Loubet, of France, still lives in the little peasant home in Marsanne, where she has lived for many years, and frequently Loubet goes out to pay her a visit. The old homestead lies along a small river, shadowed with poplar trees. All about are the usual farm buildings, the animals, the chickens, the farm laborers and busy milk maids. It was on a bright day, recently, writes a friend, that the President of France slipped away from his cares and went out to the farm. His mother was kneading bread.

"Really, my dear," said the President, "you must stop this heavy work." But the good old lady declared she could not do that for no one else could knead bread so well as she.

"Well, today," replied her son, "you must let me do it for you."

So he took off his coat and kneaded the bread himself—just as King Alfred did once, you remember, many hundreds of years ago. I wonder if the good old mother trusted him to bake it—as the peasant woman trusted King Alfred—and whether, if so, he let it burn! E. H.

THE LIP AND THE HEART

by JOHN QUINCY ADAMS

ONE day between the Lip and the Heart
A wordless strife arose,
Which was expertest in the art
His purpose to disclose.

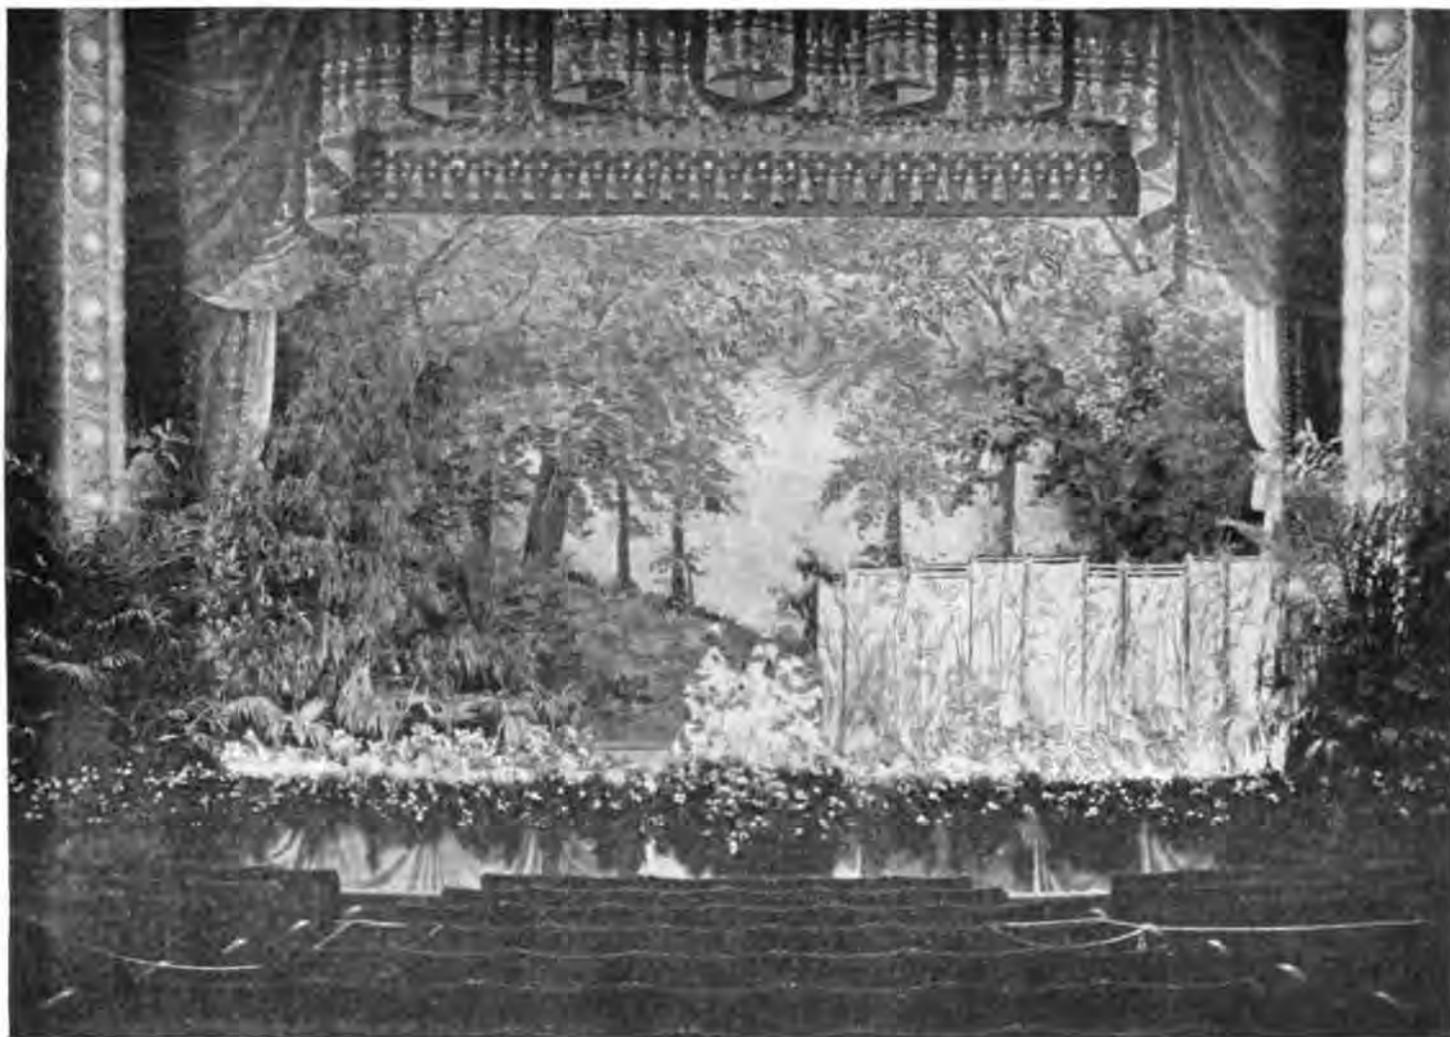

The Lip called forth the vassal Tongue,
And made him vouch---a lie!
The slave his servile anthem sung,
And braved the listening sky.

The Heart to speak in vain essayed,
Nor could his purpose reach ---
His will nor voice nor tongue obeyed,
His silence was his speech.

Mark thou their difference, child of earth!
While each performs his part,
Not all the lip can speak is worth
The silence of the heart.

Isis
Theatre
San
Diego
California

LOMALAND STUDENTS AT ISIS THEATRE

THE meeting Sunday evening, under the auspices of The Aryan Theosophical Society of Point Loma, filled Isis Theatre, as usual, with an attentive audience.

The musical program, exquisitely rendered by students of the Point Loma Conservatory of Music, was as follows: Overture, "Zampa," (Harold); "Invitation to the Dance," (Weber); Duo, from "Sampson and Delilah," (Saint Saëns).

The first paper of the evening was read by Miss Julia Hecht, one of the teachers in the Isis Conservatory of Music, on "The Refining Influence of Music." In part, the speaker said: "Few are there, indeed, who do not have a love for music in some form. It may be for a musical instrument, for the inspiring, patriotic national song, or the simple folk-song of childhood, or for the song of birds. But how many are there who give to music its true place in life, or realize its importance as a vital educational factor? Few, very few. The old idea that music is merely an 'accomplishment' has not altogether died out, and some there are whose motives for study are principally a desire to make a display, to be praised, or to 'entertain' in a superficial sort of way by playing light drawing-room music (which generally is but an accompaniment to conversation).

"Those who are talented are often spurred on by hopes of fame or wealth, and the child prodigy is reared from infancy with the idea of the importance of his own personality, and that he must shine above the musical horizon as a great star. Everything is sacrificed to this end, and his technical training is forced to such an extent that the soul doesn't get a chance, and he becomes merely a brilliant, mechanical player, who is self-conscious, vain, envious, often morbid, interested not so much in music for the advancement of his fellow men, as for his own selfish gratification or benefit. If some of our so-called 'artists' played behind screens where the personality is lost sight of, and the dextrous work of hands cannot be seen, how much applause would they get? Would the artist himself feel serene, and in his rightful position? Would the music heard satisfy the souls of the listeners? To listen to music without seeing the artist is the ideal way. The benefits of music are derived

through hearing. Music is sound and was not made to be looked at. If we are listening with heart and soul, we do not watch for technical feats. If the music is satisfying to all that is best in our hearts, and beautiful in the true sense, we may be sure that it is well executed."

"What Theosophy means for California," was the subject of a paper read by Henry Turner Patterson. "No matter what the position from which an investigator takes his view," said Mr. Patterson, "he sees two opposing forces eternally at work in the world. One we call good, the other we call bad. But he is not at all likely to notice that there has been such clearly-defined method in the working of these forces that it can only be accounted for by presuming an intelligent direction of them. This leads to a consideration of the place and part to which California is entitled in the great scheme of national, international and racial evolution upon which we are entering. A place and part resultant from convergence, in this time and place, of lives from the past and present which will cause this state to become one of the focal points of the globe. And then there will be a divergence of influence in all directions. In this scheme San Diego, of course, the southernmost city of the state, the point of orientation, or Point Orient, is a most important factor."

Continuing, the speaker pointed out in a most interesting manner, how various causes and influences in the past had united to bring population to the Western Hemisphere, and form here the beginning of a new race. He gave reasons for his belief that here, in this Golden State, would be the best of this new and higher civilization—a veritable Golden Age.

The closing address was by Master Iverson L. Harris, one of the Raja Yoga boys; his subject being, "Point Loma Students to be the World's Workers of the Future."

THE Aryan Theosophical Society, late of New York, holds regular weekly public meetings every Thursday evening in Isis Hall, Isis Theatre Building, 1120 Fifth street. These meetings are conducted by Students of the International Theosophical Center at Point Loma. Tourists seeking further information in reference to the work at Point Loma, will find these weekly meetings not only entertaining but instructive.

Art Music Literature and the Drama

What Is the Meaning of "Internal Evidence" in the Dramas of Shakespeare?

NOW that the Bacon-Shakespeare controversy has been laid to rest, commentators have had time to delve on other lines of brain-mind conjecture and are worrying at present this question: "Was Shakespeare ever in Italy?" One authority declares he never could have been for the simple reason that he was never out of England in his life. Another is equally certain that, as biographers are fallible, and as there were conveyances in his day, Shakespeare might have been in Italy as well as not. Such a theme as this is always fertile and naturally, a third commentator, begging the question, declares that perhaps Shakespeare was acquainted with some person who had been in Italy, and that this person told him all about it.

And all this has come about, so they say, because his Italian dramas reflect so marvelously the atmosphere and spirit of old Italian days; the palaces, the people, the glorious old cities, the crumbling walls and the azure Italian sky. Says a recent writer,—and one may be forgiven for lingering over description so simple and exquisite:

Draw a line from Milan eastward. You find that it touches Verona, Padua, Venice. In the spaces between the four towns place roads and country houses and a forest for adventure—and you have the Italy that Shakespeare most dearly loved.

"In fair Verona, where we lay our scene;" "Fair Padua, nursery of the arts,"—there is always the touch of

the one who loves and cares because he knows. It is not that, having read of Italy, Shakespeare pictures all of the country thus. He discriminates. He does not love Rome, or Florence, or Mantua, as he does the honored four. Mantua is a convenient place for his characters to go to when banished from the favorite towns. Toward Florence he is lukewarm, in spite of the streets haunted by the memory of Dante, and in spite of the hillside made immortal by Boccaccio. Rome has his admiration but not his love.

Venice, then as now, was celebrated as the Queen of Waters, and as a city in which gondolas go gliding through a vast network of sombrously shadowed waterways. But Shakespeare knew—what many travelers even now reach Venice without knowing—that the city is also threaded by narrow and interlacing streets, joined by numberless little bridges. Every building has an outlet into this system of thoroughfares; and, though the water-ways are freely used, it is by land, and on foot, that the Venitians go about their ordinary business. Thus it was, likewise, when Shakespeare was there. He knew that the gondola, except for pleasure and purposes of state, was almost altogether used by lovers and by visiting tourists, and that the ordinary citizen walked upon the pavement. So when Gratiano was asked to show Nerissa, the supposed lad, the way to Shylock's home, it was not "Get him a gondola," but, briefly, "Show my youth old Shylock's house;" although Nerissa was to go from one end of the city to the other. Over and over again, in Venice, Shakespeare's scenes are street scenes. His revelers, his maskers, his men of business use the streets. On the streets is the great and varied life of the city.

But it is different when it comes to love. He knows the local customs, and he knows that the privacy of the gondola peculiarly fits it for lovers and courtship, and so we read:

But there the duke was given to understand
That in a gondola were seen together
Lorenzo and his amorous Jessica.

He saw, too, the Venetian women, sweet and fair. No wonder he makes Des-

demon beautiful! And the Venetian faces haunted him, as they have haunted many a traveler since. "Those girls of Italy, take heed of them,"—it is a king of France into whose mouth he puts these words.

So much for what is called "internal evidence." Had Shakespeare written nothing outside of his Italian plays, this might settle the question, but he wrote others, many others, and while there are occasional anachronisms and slight errors of detail, here and there,—for pocket encyclopedias were not in Shakespeare's day invented—his Italian plays are not exceptional in their marvelous rendering of local color. Unfortunately for the commentators, there are other plays. When was Shakespeare in the Bermudas—if the West Indies really stood for the environment of his character of the *Tempest*, as is believed. Was he ever on the seaboard of Bohemia, in the Athens of Alcibiades, in the Alexandria of Queen Cleopatra, or in old Syracuse, where solemnly walked the two Dromios? True in local color, also, are his pictures of old Rome, of the Rome of Julius Cæsar, of the Consul Coriolanus and of Titus.

Did he walk, too, in the medieval Denmark with Hamlet? And what proof have we, so far as "internal evidence" goes, that Shakespeare did not live in the Briton of King Lear, in the England of King John or Richard III, in the Troy of Priam and his many sons?

"Internal evidence" is a flexible term and may signify many things. Had each of these marvelous plays come into the scholar's world unsigned by any known name, no two bearing the same signature, undated,—just discovered by some archeologist—what would their "internal evidence" infallibly have induced us to conclude?

Shakespeare, the "myriad minded," who among dramatists has possessed his marvelous knowledge of human nature—who, since the days of Eschylus? Many a dramatist has longed to pen life as though he understood it, and humanity as though he loved it, but none, in modern times, has yet been able, save Shakespeare alone. What can Shakespeare's works be, judged by that "internal evidence" which is deeper and more conclusive than the brain-mind theories that go by that name today, but the crystallized expression of the experiences of many lives, the result of much living in many lands? Given one life only—by all that that theory concludes Shakespeare, our thousand-souled dramatist, were an

impossibility, a paradox, just mere evidence that the Law writes its fairest records under the seal of a denial of its own decrees. There is no logic in such a view. Those who have some insight into the true philosophy of life, who see the logic in Reincarnation and the justice in Karma, can sift even with truth what Shakespeare's plays hold of "internal evidence." A truer than brain-mind insight is needed; a knowledge of finer and subtler laws than those which govern intellectual or material life, or even the placing of participles! Shakespeare stands before humanity today as a great Teacher. No dramatist of modern times has known human nature so well. None has possessed in such degree that finer knowledge, intuition, which can be naught but the blossom upon a living tree whose roots reach into the dawn-mists of past lives. E.

LION OF LUCERNE, SWITZERLAND
(A famous piece of work, known all over Europe)

"THE BATTLE AT FINNESBURG,"

FRAGMENT FROM AN OLD ENGLISH BATTLE POEM,
Written in the Sixth Century

Hleothrode tha heathogcong cyning:
"No this na dagath castan, ne her draca ne
scogeth.

ne her thisse healle horn naes ne byrnath;
fugelas singath,
gylleth gracg-hama, guth-wudu hlyaneth,
scyld scefte oacwyth; an scyaeth thes mona
Wathol under wolcnum, an ariseth wac-daeda
the thisse folces with fremman willeth;
Ac onwacingath an, wigcud mine,
habbath cowre land, higcath on ellen,
Winnath on orde, wescath anmode.

Translated into Modern English, it readeth thus:

CRIED aloud, then, the war-young king: "this dawneth
not from the East, nor here dragon flieth, nor here, of
this hall, light burneth; birds sing, chirpeth cricket,
war-wood soundeth, shield answereth shaft. Now shineth the
moon wandering under the skies, now arise woe-deeds that this
folk's quarrel will perform. But wake ye now, warriors mine!
hold your lands, think upon valor, strive in battle-line,
BE ONE-MINDED."

Olympian Games at Point Loma, Thanksgiving Day, Thursday, November 24

ON the 24th of last month, the great American autumn holiday of Thanksgiving was celebrated at Point Loma with a very interesting presentation of the classic Olympian games inaugurated by Katherine Tingley four years ago. The ancient spirit of the Olympian games, so truly religious in their beginning, was thus brought into close union with the modern spirit of the Thanksgiving festival.

Two of the students were crowned victors in the games with due and fitting ceremonial. Mr. R. Machell, the artist, is quoted in the following extract which initiated the series of addresses given:

"This is Thanksgiving day, and if any people in the country have reason to be thankful it is we who are here today. We have reason to thank the Good Law which has made this possible, and which has given us the privilege to be here under the guidance of teachings which are the embodiment of the Law.

"The Leader of our Universal Brotherhood organization here built the first Greek theatre in this country and instituted the Olympian games, and re-established the old Greek drama.

"There have been games and athletic sports probably as long as there have been men on the earth, but that which made the Olympian games famous throughout the ages was their religious character.

To the Greeks the spiritual life was the great reality, and all life was religious because all life was based on the One Life—the spiritual æther that pervades all nature, animate and inanimate, and is the one basis of Universal Brotherhood. This spiritual life, or æther, was called by the Greeks Zeus. The so-called games were the recognition of this divine principle in life, manifesting in the perfection of human activity as displayed by the finest types of men, who took part in these truly religious ceremonies known as the Olympian games.

"In founding this organization and in establishing these games here in this Greek theatre, our leader has opened for the world a new era, and those who are here learning the true life of Raja Yoga will know the truth, that the spiritual life underlies every act of daily life, and thus will show to the world that the daily life so lived is pure religion. Katherine Tingley has sown this seed and soon all the world will copy this example, for 'all can grow the blossom when all have got the seed.' We who are here today, and later all the world, will thank the one who gave the seed, our great Leader, Katherine Tingley."

To speak of having sapphire skies and fragrant breezes seems nearly superfluous to Californians, yet as the so-called rainy season has now begun, it is well to chronicle the surpassing beauty of the day.

The magnificent theatre, built strictly on lines following those of identical structures of ancient Greece, was a fit and beautiful place for certain of the games. Above was the eternal peerless blue of the southland; in front, through the natural architecture of the cañon sloping to the sea, were the happy dancing waters of the ancient Pacific; around and on all sides breathed peace and joy and everlasting hope.

There Is No RELIGION Higher Than TRUTH

FRIENDS IN COUNSEL

DEAR COMRADES: You may remember that William Q. Judge in the hour of deepest trial, found solace in work. The work, he used to say, would remain, long after the storm then raging would have been forgotten. But what constitutes work?

Outward activity is not the whole of work. One man may attend a meeting and contribute nothing to all appearance beyond his mere presence. Another man may be taking an active part in the proceedings. Yet it may be that the silent member is doing a unifying, consolidating work of a very high order, while the other is only tearing down and sowing seeds of disruption. "One could be confined in a prison and yet be a worker for the cause," for the very wish to work is in itself work and of a superior kind. The results of this inner work are usually quite untraceable by the brain-mind.

The force goes out, but we cannot follow up to its result. This perhaps is why some of the best workers seldom speak of what they have done, the simple reason being that they do not know themselves. They cannot say "lo here," or "lo there," the result "cometh not with observation." It is hidden, secret—"occult," if you will. For instance, if a passionate man sets about the task of controlling his temper, it may seem to his thoughtless companions that he is losing his old fire and becoming negative.

The truth is, however, that he is exerting more energy than before, because the power by which he holds his anger in check is of necessity greater than the force that is controlled. Such a man unknowingly is emitting a spiritual force of incalculable potency, that purifies the moral atmosphere in which he moves.

Mr. Judge in his "Letters" says, "The spiritual force being impersonal, fluidic, not bound to any constricting center, acts with unimaginable swiftness." The key to this kind of work is that it be done *impersonally*. If we do anything with one eye on our work and the other looking out to enjoy the effect we produce upon the spectators, it is evident that the force we put out is tied and constricted by our personality, whereas if we work thinking only of the good of the whole and relinquishing all personal interest in the result, the force is free and unfettered. It is then like the lightning which breaking from one quarter of the sky, instantly pervades the vast expanse.

Self-study, self-discipline, the resolute facing of the great problems which each must do singly and alone, are often harder tasks than to appear in public as a social reformer. Many a man, terrified at the call to self-conquest and the lonely search for the Light of lights, seeks to drown the still small voice by plunging up to the neck in philanthropic enterprises for the relief of human suffering. All honor of course to every honest effort for man's welfare, but some there are, perhaps, whose activities are prompted by the wish to excuse themselves the harder interior work which must be carried on unthanked and unperceived by men, and without the plaudits of the crowd. STUDENT

FACING WEST FROM CALIFORNIA'S SHORES

by WALT WHITMAN

FACING west from California's shores,
 Inquiring, tireless, seeking what is yet unfound,
 I a child, very old, over waves, towards the house of maternity, the land of migrations, look afar.
 Look off the shores of my Western sea, the circle almost circled:
 For starting westward from Hindustan, from the vales of Kashmere,
 From Asia, from the north, from the God, the sage, and the hero,
 From the south, from the flowery peninsulas and the spice islands,
 Long having wander'd since, round the earth having wander'd,
 Now I pace home again, very pleas'd and joyous.
 (But where is what I started for so long ago?
 And why is it yet unfound?)

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question The influence that Theosophy has upon the spiritual and moral life can be readily understood, but how can it be applied to commercial life?

Answer I Theosophy is not a religion for just one day in the week, nor special observances set apart from daily life, but it is religion, science and philosophy for every moment of our lives; it is divine wisdom, and should be a living and guiding power in all we do. As Emerson has said:

"There is no great and no small
 To the Soul that maketh all,
 And where it cometh all things are,
 And it cometh everywhere."

And commercial life is not exempt from the divine workings of Universal Law. There is nothing in our lives that is not of consequence, nothing upon which we should not turn the searchlight of Theosophy to test its character, whether it be good or whether it be evil.

Now we all have some part in commercial life; we either buy or sell, or do both. The buyer, the seller and the producer are interdependent, and each owes a duty to the others, and all must work together for the common good to produce the highest welfare of each and all. The producer should furnish that which is genuine and of good quality, and should receive for it its true value, and he who buys should be not only willing but glad to pay for things what they are worth. If this were the case, we should soon be done with shams; but the desire to get something for nothing, or for less than it is worth, is responsible for sweat-shops and all the big bargain advertising schemes in which shams play a large part, and the victims of which reap what they sow.

Unfairness in commercial life does not lie at the door of buyer alone, nor of seller alone, but at the door of each one who tries to get the best of the bargain at the expense of another, for what he gains for the time the other loses; but the accounts are not closed, and the divine law of justice will sometime make things square. However, unfair dealing is not alone in the results of the deal, but in the motive actuating each one who tries to get something from another without a fair return; and the one who does this and fails is just as much at fault as the one who does it and succeeds. Both are adding to the burdens of humanity, which some day they must help to lift. Now, if each one had the same regard for the welfare of the one with whom he deals as for his own, how the clouds of care and distrust and insincerity would clear away and the sunshine and beauty of joy and uprightness and trust take their place. Then would Theosophy be a ruling power in commercial life, for the true Theosophist always seeks the highest welfare of all.

May the day of the reign of Theosophy in commercial life not be too far distant.

BANDUSIA WAKEFIELD

Answer II Theosophy being the Wisdom Religion, is applicable to all life and so must apply to commercial life as a purifying and ennobling influence and as this influence permeates the world, stock jobbing operations will disappear and failures will become unknown.

That centers of distribution of the peoples needs must be maintained will be generally admitted and that there is a hard, brain-mind selfish motive stalking through the commercial life of the day is evident to any observer who looks upon the commercial centers in our great cities and notes the actions of commercial men. It is but fair to say that, inter-

mingled with this maelstrom of selfishness which contains its own seeds of ruin, is rapidly growing a higher-motived, purer commercial life, which in due time will take supremacy in the world.

The desire to make money is the strong selfish force that urges to wrong commercial life. The desire to be a helpful factor in the world is the impulse that urges to right action in business life. The selfish man may make his coveted money but he is building on the sands and his greed at any time may cause him to overreach himself, and his structure to be overturned; the man of right motive may not make money at once, but must in due time succeed if his enterprise is needed in the community and is conducted with honor and common sense.

The money part is necessary, and very necessary in this commercial age, but it must always be made an incidental and not the all important factor. A parallel may be drawn between the uses of money in the commercial body and the circulating medium of the human body, and the coins in use may be compared to the red and white discs of the human blood, and carrying the life and energy by which the commercial body is sustained. And can we not go further, see the necessity for a heart action and pure life to keep up a healthy circulation in the commercial body as in the human body? On the other hand it will be seen that hoarding up great stores of the circulating fluid or turning it in wrong channels will cause congestion and death, hence the need of a continuous circulation of the vital fluid, and an ever watchful eye that it goes through its natural channels and into the parts that need it most.

And it is only by acting on the principles of Universal Brotherhood that this can be fully done, for selfishness is at the root of all congestion in the body politic; while brotherhood, kindness, sympathy are life-giving, expansive, liberating.

A bright sign in connection with this is the undeniable fact that commercial institutions are depending more and more upon the moral record of the man who seeks their good will and trust, and this will grow to be so more and more until Universal Brotherhood shall be accepted by the nations and we shall be more active to help others than we now are to help ourselves.

A. S.

Question How may one know when an action is entirely unselfish?

Answer That which determines the unselfishness of an action is the motive with which it is done. And here the same question will arise, for our motives are usually mixed and are not wholly pure, but contain some element of selfishness in them. If this were not so we should be very much farther progressed than we are. But this should not discourage us, we can still go on, we can at least strive to purify our motives and to act more and more unselfishly.

Much help on the subject of right action can be gained from a little book called the *Bhagavad Gita*, and there the keynote of perfect unselfish action is given as that which is done without attachment to results. If we determine that a course of action is right and then perform that action to the best of our ability, being content to leave the results to the law, we shall come to see more and more clearly what is the right course to pursue. First comes duty, and with this should come the effort always to benefit others and to keep the self in abeyance. In the *Book of Golden Precepts* the first step is declared to be, "to live to benefit mankind," "to practice the six glorious virtues is the second." And so, while recognizing the difficulty of freeing our motives and actions from selfishness, we can still make the effort to act for others, to seek their interest and welfare. Then gradually we shall approach the goal.

STUDENT

Race Karma.

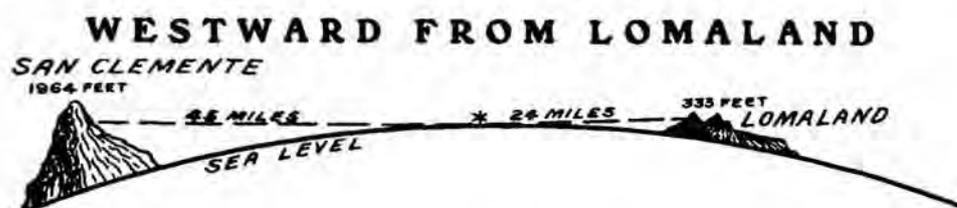

AND just as all these phases of the law of Karma have sway over the individual man, so they similarly operate upon races, nations and families. Each race has its Karma as a whole. If it be good, that race goes forward. If bad, it goes out—annihilated as a race—though the souls concerned take up their Karma in other races and bodies. Nations cannot escape their national Karma, and any nation that has acted in a wicked manner must suffer some day, be it soon or late. The Karma of the Nineteenth century in the West is the Karma of Israel, for even the merest tyro can see that the Mosaic influence is the Karma of Israel, for even the merest tyro can see that the Mosaic influence is the strongest in the European and American nations.—JUDGE

The Jo-Khang at Lhasa.

WE hear a good deal of Potala, the great palace-temple of the Grand Lama, outside Lhasa, and even see pictures of it derived from Chinese sources. But this is a mere public show-place in comparison with the Jo-Khang (also called La-Brang), which is the very heart of Lamaism, and is situated in Lhasa itself. Not only strangers, but even natives of doubtful devotion, are excluded from this sanctuary. Lately the Chinese viceroy himself was shut out, and it was in retaliation for this act that the Chinese authority availed itself of the presence of the British mission to extort a permission to enter and view part of it. One can only speculate as to how much of the temple remained unshown and what preparations may have been made before admitting the spectators.

The outside is without beauty, and is so crowded by small, mean government office-buildings as to be practically invisible, though the five gilded roofs are to be seen from a distance.

Entering the portals, the visitors found themselves in the first courtyard, a space open to the sky, surrounded by a veranda with columns, and evincing its great antiquity by the defaced painting on the walls and pillars. At the opposite end a door opened into the second court, bright with hollyhocks, stocks and snapdragons. The sides of this are surrounded by small chambers, built in the solid wall, each a shrine containing an image and altar, dimly revealed in the intense gloom by butter-lamps. The whole place reeks with grease and the vapors of grease, the accumulation of centuries; but each image has a dirty rag, with which it is occasionally wiped. There are so many of these gloomy shrines that even the Lamas seem scarcely able to distinguish them. In the center of this court is an inner sanctuary, shut in by shelves containing images of Buddha, and further darkened by numerous screens and draperies; and it is in this court that the chief wonder of the Jo-Khang is found. There are two statues, one life-size, the other colossal, representing Buddha, not squatting, but seated on a throne, European fashion.

This attitude is recognized as indicating the Bodhisat in his next incarnation. No one knows how the tradition of so representing the Master arose, but all agree in expecting his next appearance in the West.

Passing through successive courts and chapels in ever deepening gloom, one arrives finally at the innermost shrine, in which is the Jo itself. The great statue sits almost hidden among innumerable golden offerings of lamps, bowls, etc., made by devotees of many ages, but dimly revealed by the glow of the butter-lamps all around.

The most remarkable point about this statue is that the face of Buddha is here represented, not with the usual sad smile and inscrutable look, but with an expression of youthful radiance.

The legend is that this statue was made from Gautama himself before he left his palace at Kapila-vastu, and that it was made by Visvakarma the constructive force of the universe. It is of gold, alloyed with silver, copper, zinc and iron, representing the four elements, and is covered with priceless jewels, one of them a flawless turquoise six inches by three. It was given by the King of Magadha to the Chinese Emperor for his help when the Yavanas were overrunning India; and was brought from Peking in the Seventh century by Princess Konjo as her dowry. The ornamentations and other accessories of this image and its shrine are too numerous to be advantageously described, and their opulence is

enormous. In another part of the Jo-Khang is a statue second only in importance to the Jo itself. It is that of the guardian goddess, Palden-Lhamo, three-eyed, crowned with skulls, and covered with gold and gems. Besides these images the temple contains innumerable others of great interest to the student of ancient Wisdom.

The contrast between the inestimable riches stored up in the sanctuary and its squalid surroundings, is a wonderful symbol of the condition of Buddhism with its vast store of secret wisdom and its outer garb of degraded superstition. STUDENT

A Priest on the Church of Rome

AN English contemporary contains the following report of one of a series of lectures delivered by a priest of the Roman Church. What does it mean?

The Religious World—Father Suckling on Roman "Unity"

The third of his remarkable lectures—considering the quarter from which they proceed—was delivered by the Rev. R. A. J. Suckling on Wednesday evening, and dealt with the vaunted "Unity" of the Church of Rome. This, said Father Suckling, was the most powerful weapon in the armory of Roman controversialists, who contrasted the "High," "Low," and "Broad" divisions of the Anglican Church with their own alleged unity. But the divisions of Anglicans were much exaggerated, for all held the same creed, while the unity of the Roman Church was mere superficial uniformity. This uniformity had been obtained by terrible processes of bloodshed and forgery, which had stained the history of Christendom. The Anglican Church had also persecuted, but she now repented of her error; but the Roman Church expressed no contrition for her dragonades, merciless massacres and infamous Inquisition, and could not do so, because *ex hypothesi* the Pope was infallible.

Again, the Greek Bishops had pointed out that the whole Papal system rested on the forged decretals of Isidore. Moreover, the division of our part of the Church Universal had certain compensations. An eminent Frenchman expressed his amazement that the Church of England had produced two successive orthodox Christian Prime Ministers, like Mr. Gladstone and Lord Salisbury, who could not possibly have been produced under the system of the Church of Rome.

Pursuits of the "Cultured"

COMPLACENT moderns who hold up hands in pious horror at the excesses of the degenerate Roman Empire might do well to consider the following item. It is the report of a great news agency—part of that mighty institution of modern civilization, our free and enlightened press—telegraphed all over the world; and is just the bare outline of a long description of a dinner given by Mrs. — to the leading members of society in honor of the birthday of her pet dog, named "The Mighty Atom."

The tables were fully decorated with red dahlias and candelabra with red shades. Seven dogs were present. Each was placed in a high chair and served with cutlets and sausages by five butlers, who were assisted by the fair owners of the dogs, seats being provided for the ladies behind the animals. The menu also included salads, ice cream, and chocolates. A birthday cake, of the regulation type, and illuminated by three candles, was provided, with the words, "Mighty Atom, three years," inscribed upon it.

And while women are squandering money to induce men to wait upon dogs, thus spreading among various creatures a contagion of degradation, thousands are dragging on a life of chronic starvation and want in the immediate neighborhood. This is the Christian civilization which we are burning to introduce to the heathen in their blindness.

The Awakening of Egypt

POSSIBLY nothing strikes the traveller in Egypt more strangely than the sight of the many tall chimneys of the sugar refineries, which greet his eye at frequent intervals along the Nile, between the ruins of ancient Memphis and the town of Asswan at the first cataract. It is something unexpected—very. The mind of the traveller is on other things, on things and matters appertaining to the glory and wonder of ancient Egypt; on its temples, pyramids and colossal monumental relicta. His brain is filled with the memories of age-old things, and with marvelous pictures of triumphant Pharaohs returning from distant conquest, preceded and followed by files of chained and manacled captives; with romantic imaginings of the holy mysteries celebrated in the penetralia of temples, pyramids and subterranean labyrinths

by the austere and holy men of a by-gone age, when the sacred lotus still grew in mystic seclusion in the quiet places of holy Nile; with the loves and hates and fears and hopes and strivings of square-shouldered and fierce Egyptian men, and long-eyed, laughing and light-hearted Egyptian women.

Therefore, when from the deck of his stately dahabiyah, through the morning mists or the dancing quiver of the sunset, he sees the high-pointed monument rise in tapering beauty before him across miles of waving green fields or rich black soil, wonder and silent admiration are turned into an unuttered mental protest when the heaven-darting obelisk turns out to be the ugly brick chimney of a sugar refinery. Nevertheless a very positive realization comes home to one of the splendid and stately panorama the ancient traveller on the Nile must have had before his eyes some score of thousands of years ago, —aye, even forty centuries ago.

For ages has Egypt been sleeping. The Hyk-Shos, Babylonians, Ethiopians, Assyrians, Persians, Arabs, Mamelukes and Turks successively held sway over the waning civilization of the Nile valley, or defeated the emasculate armies sent against them; and during all this time has Egypt and her wonderful civilization been running down the scale of disintegration with constant and increasing velocity.

The Battle of the Pyramids introduced a new order of things, and European civilization then seemed to first plant its influence in Egypt. Egypt's knowledge had passed, in part, to Europe through Greece, and on the return of the cycle was once again knocking at the doors of the country whence it had issued aforetime.

Large Increase of Foreign Trade

The progress of Egypt in the ways of civilization since the country passed under British rule has been astonishing, and shows the unique recuperative powers of the land. Abuses of many different kinds have been abolished, or moderated; and so positive and real an impulse has been imparted for progress and advancement, that the foreign trade of Egypt shows an increase so large, that excepting Japan possibly, the figures stand relatively far above those of any other country during the same time.

Another remarkable sign of the economic progress of Egypt may be seen in the extraordinary increase of coin circulating. In 1903 the figures were given at \$7,500,000; in one year later, *i. e.*, 1904, this had jumped to \$20,000,000. Egyptian Government bonds are today considered to be the best kind of security, and are quoted at higher figures in European money marts than those of some European States. The national wealth of Egypt is greatly augmenting; land has risen in value considerably; taxes are being reduced, and foreign capital from all quarters is seeking investment in Egypt. Besides, the standard of life of the people is far superior to what it was some years ago.

As said above, the Nile valley today is dotted with European obelisks in the shape of towering factory chimneys. Ancient Khemi seems to have entered upon a new era of growth and progress. One wonders what its future will be. Will the land of the Pharaohs become an international recreation ground for the world?

All Nations Are Represented

The length of the Nile valley up to Asswan, on the rapids of the first Cataract, is quickly becoming far other than a stretch of Arab territory. Many Europeans, all nationalities represented among them, and Americans, have built themselves handsome villas on the banks of the wonderful river near the principal towns, drawn thither in part by their business, in part for health. History repeats itself. As the Egyptian gentlemen built themselves handsome villas along the Nile, under the cerulean blue sky of North Africa; as Greek aristocrat and Roman patrician did the same in later times,—so does the first inflow of European civilization do the same today.

Handsome and palatial hotels are built and are building in places long given over to Arabs, dirt and misery; immense schemes for building colossal reservoirs and for irrigating the unfruitful sandy wastes are on foot and in the air; railroads are built and are building far into the Sudanese deserts—to and beyond Khartum; from Cairo to the second Cataract regular passenger and freight steamers run nearly every day in the week, and the air is alive with the sound of the martial clash and clatter of dinner plates and laughing voices mingling with the regular

**A Country
of Bathos
& Grandeur**

rhythmic beat of the steamers' paddles; the private dahabiyah is moored at will along the banks of the river, and the white-helmeted knight of the brush and palette may be seen quietly smoking and working, as coolly and with less annoyance than he would have

in painting an Italian *paysage*. It is bathos and grandeur, musty memories and modern life, the rush of civilization and the inimitable incessant cry for "Bukseesh" all jumbled together in one strange dissonant whole. It is locomotive and camel, age-old dahabiyah and modern steamer, cross and crescent; it is "qismet" and "I will."

But the ancient river flows on forever, twisting and winding in its tortuous course through the arid and rocky uplands and the rich black soil of Lower Egypt, bearing its eternal lesson of Youth and Rejuvenation, as a River of Life flowing like young blood amid old bones and dried and desiccated things.

The Spirit of Progress has touched Egypt with the sweep of its mighty wing, and the ancient land is awaking to a new lease of life. Once more shall her valley be peopled; once more shall her people sing as they till the sable soil and swing the harvest knife. And from the mingling of the races which shall fill her barren plains with fruitfulness

**A Future
of Glory**

and her granaries with plenty there may arise a stronger and gentler race of men, who shall stretch their hands over to that other continent in the West, where races are mingling today, in the grand recognition of a newer kinship—that of the Universal

Brotherhood of a Humanity of one blood and one life; not that of race alone. If this come to pass, ancient America and ancient Egypt shall have met again on the turn of the cycle.

Katherine Tingley's Crusade to Egypt and around the world, of 1903-1904, may have added more impetus to the above in certain ways than will—in all probability—ever be known to this generation. Point Loma may yet see itself reproduced in Egypt by the efforts and wisdom of Katherine Tingley. G. DE P.

English Brewery Dividends—A Hopeful Sign

CERTAIN facts tend to show that the habit of drinking is on the decrease among the general public, the increase in the drink bill being accounted for by excessive drinking of spirits by a comparative few.

Thus at the meeting of a Brewery Company, the chairman, in announcing that there would be nothing with which to pay either ordinary or preference dividends, said that loss of business had been felt by the trade generally in England. The loss was greater in the towns than in the country, and was attributed to the fact that the nation was becoming more sober, and to education and improved workmen's dwellings.

Music-halls too are renewing their license without even asking for a drink license. They find that the audience is of a better class and easier to manage when there is no bar, and that a liquor license is a loss to business.

Thus it seems evident that people in general are gradually learning the lessons of temperance and abstinence; and also that there must be a class among whom excessive spirit-drinking increases with terrible momentum. STUDENT

A Fossil Egg from Arizona

THE fossil egg, discovered in the gravel of the Gila River, Arizona, is rather a curiosity, as fossilized eggs are very uncommon. Another is said to have been found in South Dakota. Egg-shells, filled with hardened mud, are found in the Tertiary Rocks of Auvergne in France; but some would not call these fossils, as the shells are not petrified. Geikie, however, uses the term fossil to denote any organic remains dug up, whether petrified or not. This egg is supposed to be thousands of years old. It had been replaced by hard siliceous material and was about 2 1/2 by 1 1/2 inches in size, being probably that of a water-bird. When broken open it was found to contain not albumen but bitumen. S.

George Washington's Ancestry

THE ancestry of George Washington is still venerated in England. In London a meeting was recently held at the Mansion House, the Lord Mayor's official palace, to promote an appeal to Americans for the restoration of the fine tower of Purleigh Church, near the very ancient town of Maldon in Essex. The Rev. Lawrence Washington,

great-great-grandfather of the President, was rector of Purleigh from 1632 to 1643.

The United States Consul, and Mrs. Mary Lee, a great-granddaughter of Martha Washington, were among those present at the meeting. The chairman outlined the progress of the several branches of the Washington family in England in various places. H.

The Apes of Gibraltar

THE only place in Europe where monkeys are found in a wild state is the rock of Gibraltar. They are identical with the Barbary apes which inhabit the north of Africa, and are supposed to have traveled into Spain when that country was joined to Africa by dry land, now submerged. These apes, which once numbered several score, wander about their barren home and earn a precarious subsistence by turning over the loose stones and devouring the scorpions hiding beneath them. They very adroitly twist off the deadly stinging tail, and then proceed to munch the unsuspected scorpion with as much relish as if he was a nut. Recently, however, the soldiers quartered in the fortress have been amusing themselves by shooting these interesting relics of a bygone time, until now only six remain! This is to be regretted from many points of view, and should be condemned by all those who are interested in the children of Nature, who give variety to the landscape and endow each locality with their own distinctive charm. STUDENT

Ancient City in Chile

REPORTS mention the discovery of an ancient city in the Andes, 250 miles from Aranco, Chile. The date is put at two thousand years ago. It was found in a small valley after weeks of hardship, and contained stone houses well preserved, but crumbling and moss-grown. With these were ancient farming implements and tools of stone, and hermetically sealed tombs, giving evidence of advanced civilization. The city is supposed to have had fifteen hundred inhabitants.

The report says it was "inhabited presumably by Aztecs of much larger stature than those who lived in Central America." Hitherto the name Aztecs has been applied to the ancient Mexican Nahuas. Chile was under the Incas in 1600, and before that was occupied by the Araucanians and other tribes. The neighboring Patagonians average a good deal over six feet in height. E.

An Arabic Typewriting Machine

ASYRIAN artist and inventor, Selim Haddad, has spent years of labor and talent in reducing the Arabic alphabet from several hundred characters down to fifty or so letters, and in making a typewriter for it. The twenty-nine letters of the Arabic alphabet are, in writing, multiplied to nine hundred by the various positions and mutual relations of them; but this number has been reduced enormously by using composite characters each of which does duty for several, and by other simplifying devices. This invention will render accessible a great mass of valuable literature, as it will immensely facilitate the making of books in Arabia, Turkey, Syria, India, Persia, Egypt, Abyssinia, Tunis, Morocco, and all places where Arabic is used. STUDENT

Yellow Journalism v. Civilization

IN the constitution of the Hague Tribunal, and in the phrasing of the many Arbitration Treaties now obtaining between the Powers, it is expressly stipulated that "questions involving the honor" of the disputants are reserved from the operation of the Tribunal and the Treaties.

It is therefore a remarkable sign of the times that the Baltic Fleet incident, in which Great Britain and Russia *do* consider their honor involved, should have been handed over to international arbitrators for adjustment. There would have been even less difficulty in the matter if it had not been for the efforts of the yellow journals. STUDENT

Marvels of Modern Telegraphy

THE other day the telegraph lines between New York and Chicago were, as a result of storms, temporarily incapacitated. The Postal Telegraph Company in New York accordingly communicated with the other city *via* the world-circuit, 25,000 miles, that is by way of London, Gibraltar, Alexandria, Aden, Bombay, Madras, Hong Kong, Guam, Manila, and San Francisco. An answer came back in an hour. STUDENT

THIS week's cover-page of the NEW CENTURY PATH, contains the picture of W. Q. Judge, the second Leader of the World's Theosophical Movement.

Some Views on XXth Century Problems

A Scientist on "Forgiveness"

SIR OLIVER LODGE has momentarily left the path of science, which he treads with so much renown, in order to deal with some points usually left to theologians. He writes on "Sin and Forgiveness," in *The Hibbert Journal*. The ground he takes is somewhere between that of Orthodoxy and Theosophy, nearer, however, to the latter.

Forgiveness of sin, in Professor Lodge's view, and according to Theosophy, consists in restoration of the relationship to the divine; "it removes no penalty; it may even increase pain, though only that of a regenerative kind; it leaves material consequences unaltered, but it may achieve spiritual reform."

"It leaves material consequences unaltered"—if men would but grasp that, their lives would be cleaner and their prayers would lose all selfishness. Their prayers would be—not for forgiveness as it is ordinarily pictured, but for the return of the divine touch upon their hearts. And *this* petition never fails for its reply. The longing and the response are parts of one act.

But the sin remains. "An eddy of conduct," says Professor Lodge, "can only disappear by expending its energy in producing some definite effect. In one sense, therefore, a penalty must follow every inharmonious action: a penalty not falling on the wrong-doer alone, but involving the innocent likewise, and bringing needless pain into existence."

Professor Lodge's view here stops short. That of Theosophy goes further. He who inflicts pain must at some time or another so fully endure that pain in himself that he understands it; so fully that the sight of it in another, and the mere thought of inflicting it on another, awakes it in himself. That is *compassion*, a feeling-with. And it necessarily begets compassionate action. And the same Law (Karma) by degrees brings him face to face with all those whose lives his selfish acts have embittered, so that he may atone and rectify in abundant measure. If Sir Oliver Lodge had accepted the idea of Reincarnation, he would doubtless have stated the Law as fully as Theosophy states it. Without that, his statement must necessarily leave the matter incomplete, leave our sense of justice unsatisfied.

But as it is, he deserves our gratitude for replacing the orthodox ideas of Forgiveness and Atonement with something much nobler. STUDENT

Male and Female Mortality

A FRENCH scientist discusses the curious fact that though more boys are born than girls—in the proportion of 106 of one to 100 of the other—yet there are always more women alive than men.

Wars, and the more dangerous occupations of men, at once suggest themselves as the cause. The looser habits of men, their readier access to alcohol, and the fact that society does not frown on male lapses as it does on female, also come into one's mind.

M. de Varigny dismisses all these, though allowing them some weight, on the ground that "the mortality among males is the greatest during their early years, before they know what vice or intemperance means." He is therefore driven to the conclusion that in some obscure way, men (or rather males) are not as healthy as females.

Need we go up such a blind alley as that? There is an evil prevalent among boys, whose extent is beyond the conception of those who have not made boy-nature a special study. At countless schools where it is handed on as it were by tradition, a habit is unfailingly taught to the new comer. Nearly all parents, and the majority of even schoolmasters and physicians are blind to its extent, and to the moral and physical wreck which it makes of its victim. Early tuberculosis in boys, anæmia, the set of evils generally regarded as producible by cigarette-smoking, unnatural depravity and malignancy of nature—all these should rouse a suspicion and prompt a close investigation. So gravely and rapidly may the centers of vitality be depleted that the processes of brain and body building are often slowed beyond entire recovery. It cannot be questioned that the rising death rate from many diseases affecting the nervous system and the frequent failure of the youthful promise of genius find here one, and not the least, of their causes. It may be remarked finally that the Hebrew race is nearly exempt. PHYSICIAN

Virtues Physical and Moral

HOW much of character has its roots in the physical nature, and how much in the soul? How much belongs to the man and how much to his body? The question is raised in a philosophically-minded contemporary, and the writer gets his answer from a discrimination between those qualities which illness alters and those which it does not.

Courage (of a certain kind), energy, and good-temper vary with health. So does what is called good-nature. Certain intestinal troubles, and some heart diseases, produce fear—not only that state in which trifles look very portentous, but a state of fear that does not link itself with any idea at all. An attack of influenza or biliousness will destroy energy, in the former case sometimes for weeks. And who could be good-natured, as an instinctive condition, during an attack of neuralgia?

Then there is another set of qualities, such for example as sincerity and honesty, with which states of health have nothing to do. Our contemporary classifies these as constitutional, or, as we should put it, belonging to the soul.

But is such a classification of virtues tenable? Is it not more correct to say that perfect health makes the *manifestation* of virtues easy, disease difficult? There are healthy people who are neither courageous, energetic, nor good-tempered. And there are invalids who are all these things; their virtues are so dominant that no clouds of malady can obscure them. There are others who, not yet at that stage, will to get there; who in increasing physiological obstacles only recognize increasing need for their wills, and who so effectively and self-dominantly use them that a bystander does not even detect the effort. It is not true that there are *any* virtues which in weak natures or almost indifferent ones, may not be obscured by bad states of health.

In our contemporary's view, it is *substitutes* for courage, energy and good-temper, which the will creates when the physical nature does not supply them. A most curious contention, for it means that after death when the body is left behind, the soul remains with only substitutes for some of the most important virtues! Surely a subtle phase of materialism?

The truth is the reverse. A body in good health, at peace with itself, with no wants ungratified, produces a very fair imitation of good-nature and good-temper. Post-prandial promises are easily made. Good health flows over easily into activity. This, and the courage which is a merely animal inability to appreciate danger, have nothing to do with *will*-based energy and courage. *All* the virtues date back to the soul, and have often to be forced into manifestation by the will, against the resistance of the body which it is the indwelling soul's task to guide. STUDENT

Red Indian Grievances

IT is time that the grievances of the Indians should receive a fuller measure of public attention. They have little power of making their wrongs known, and for one grievance that gets into print, one illegal encroachment of white men, one case of neglect, cruelty, or injustice on the part of the official agent, there must be many that never become known. An educated and enlightened Indian, speaking for his people of the Pueblo village of Isleta, N. M., said recently:

"If the Pueblo Indians, always peaceful and law-abiding, cannot get justice from this great government, the Indians sooner or later will have to open negotiations with the Mexican government for the establishment of a colony of Pueblo Indians in that Republic."

It is a mistake to consider the Indians, as a whole, a numerically dying race. Their higher tribes are capable of complete civilization, are ready for our modern life. We extend our care, our protection, and even our welcome to immigrants from other shores, people often far inferior in morale and intelligence to the average Indian. But for him, no immigrant, but native here ere ever the Anglo-Saxon Race was born, our living link with an immense past, any treatment will do. He may be robbed, pushed off his reservation on to waterless land that would starve a goat, and utterly neglected even by the very agent appointed to look after him. There is no political capital in *his* cause. STUDENT

Pre-existence and the Starry Heavens

TO wander alone under the star-spangled vault of night is to come under an influence unique among the experiences of our life.

We are impressed with a dim sense of immense antiquity and a profound conviction that the soul of man is an undivided portion of that ocean of life which animates and sustains the boundless whole. Why this should be so is very easy to understand if once we admit the idea of the pre-existence of the soul in other bodies on the earth—of its having been concerned with many different civilizations at one epoch or another of the world's history.

When the soul enters into possession of a new body and looks about it for the first time, everything appears strange. The architecture and the costumes, the languages and the religions, have all been altered since last he trod the solid ground. The very contour of the land and sea has undergone a change, dry land now appears where formerly the ocean rolled, and where the deserts used to stretch is now the tossing sea.

But when with newly dawning intelligence he gazes for the first time at the stars he finds one part at least of the visible scene which wears the same appearance as when he lived on earth before. The bold outlines of the Dipper, the beaming cluster of the Pleiades, the blazing Dog Star and the Milky Way were all familiar sights to him in other lives, and from his former bodies he has looked out upon the glittering host unchanged from age to age.

Small wonder then that the aspect of the unclouded sky of night affects us with the thought of immense antiquity, that it inspires with confidence and calm and awakens an undercurrent reminiscent of those earlier days. Detailed recollection is indeed wanting; but an overmastering conviction is borne in upon our minds that we have lived before and that the essence indestructible that underlies and permeates the sparkling scene is indeed one with our own life.

Civilizations decay, empires crumble into dust and continents have sunk beneath the waves, but the eternal pilgrim, man, can nightly rest his gaze on the unchanging sky. P. L.

Textile Skill of the Incas

THE new Peruvian Hall of the American Museum of National History contains the results of eleven years' exploration of the land of the Incas, and numbers seventy-five thousand specimens.

The empire of the Incas centered on the lofty plateau around Lake Titicaca, and was extended in all directions by conquest, so as to include most of Bolivia and Peru.

This ancient race appears to have had consummate skill in every art whose remains have survived; but perhaps patience would be a better word, for time seems to have been plentiful and rush unknown. We may reasonably infer that in other respects, concerning which exploration has failed to enlighten us, the same sterling qualities of craftsmanship yielded the same matchless results; and that these wonderful relics were the work of a people equally admirable in their other achievements.

It is to the custom of interring with the dead specimens of all the objects used in life that this collection is due. Textiles form the most striking feature. The ponchos and mummy-clothes are dyed in colors which cannot be excelled by the best modern dyes, and which have remained brilliant to the present day. Art-schools are sending students to study the designs and coloring. They had vegetable dyes whose secret has passed away with them. The weaving is equally remarkable, and

the cloth is finer woven and has more threads to the square inch than any modern fabric. The freshness and brilliancy of the specimens is remarkable; the patterns are geometrical or represent birds and animals, and sometimes plates of solid silver ornament the cloth. The wild vicuña supplied a fine silky wool of an imperishable ruddy yellow color, and the llama and alpaca were used for coarser fabrics. These ponchos are said to have been wrought by captive maidens and to have required about a year each to make. In pottery similar skill and imaginative power are shown. The forms of water vessels and vases are most varied and beautiful. They are made of clay, red, black and other lighter shades, and are handsomely glazed and decorated with pictures from life. The immense buildings of Cuzco, the Inca capital, of which scarcely anything now remains above ground, show that the race excelled also in masonry, joining stones accurately without mortar and polishing them. STUDENT

Discoveries in the Roman Forum

THE excavations in the Roman Forum by Commendatore Boni confirm in a striking manner the records of classical writers regarding the statues and buildings erected there, whose foundations are now being identified. Following the discovery of the base of the Domitian statue, has come that of a statue mentioned by Pliny and by Livy; namely, that of Q. Marcius Tremulus, in front of the temples of Cæsar and of Castor.

It is now almost certain that bucchero ware, the pottery used for sacred vessels, is not a proof of great antiquity, as was formerly believed; for vases made of it have been discovered in the hollow of the foundation-stone of the Domitian statue, and it is extremely improbable that they were antiques when buried. This will alter some of the conjectured dates assigned by archeologists.

Another find is that of the remains of the monument said to mark the site of the Lacus Curtius, which were found to the west of the Domitian statue. The ruins of a circular altar of tufa were discovered, with small pits and a gutter for sacrifice. STUDENT

Statue of an Ancient King

WHAT is probably the oldest representation of a Babylonian king yet found, and is supposed by some to be the oldest statue in the world, has been dug up at Bismya, in Babylonia, by some recent explorers. It was found in fragments several feet apart, and is that of a man bare

from the waist up, clad in a shirt of what seems to be overlapped leaves, stout, bald-headed and smiling. The material is white marble, and on it are hieroglyphics showing it to be the representation of a King Da-Udu. This is conjectured to be identical with David, an ancient king of Ud-nun, the old name of the city where the image was found.

Archeology in Madras

H. P. BLAVATSKY speaks of the Jains as being descendants of the oldest and original inhabitants of India, before the mysterious hordes of white-skinned Brahmins came and dispossessed them. They claim that Buddhism existed before Buddha, and was derived from their wisdom. The cave-temples of the Jains have been explored to some extent, but they still contain secrets yet to be revealed. In the Cuddapah district of Madras, a colossal statue of a Jain Tirthankara (or Avatar), surmounted by a five-headed serpent, has been found; this illustrates the use of the serpent as a symbol for a master of wisdom. STUDENT

"CHANGELESS ABIDETH THE SPIRIT FOREVER"

HE gazed on all within him and without him,
He watched the flowing of Time's steady tide,
And shapes of glory floated all about him
And whispered to him, and he prophesied.
Than all men he more fearless was and freer,
And all his brethren cried with one accord,—
"Behold the holy man! Behold the Seer!
Him who hath spoken with the unseen Lord!"
He to his heart with large embrace had taken
The universal sorrow of mankind.
And, from that root, a shelter never shaken,
The tree of wisdom grew with sturdy rind.
He could interpret well the wondrous voices
Which to the calm and silent spirit come:
He knew that the One Soul no more rejoices
In the star's anthem than the insect's hum.
He in his heart was ever meek and humble,
And yet with kingly pomp his numbers ran,
As he foresaw how all things false should crumble
Before the free, uplifted soul of man.

— From "Ode" by Lowell

The Trend of Twentieth Century Science

Spontaneous Generation

A CORRESPONDENT of *Nature* reopens the subject of "Spontaneous Generation"—the origination of living from not living matter.

This phenomenon has never been proved *not* to occur. But it has never been seen, and its non-occurrence is therefore assumed.

Every chance has been given it to show its existence, but it does not avail itself of the opportunity. Suitable solutions of inorganic and organic matter, enclosed in bottles, are carefully boiled so as to destroy any life that might already be present; then the vessels are plugged with cotton-wool, so that air—but no germs of life—may get in; and set aside for months. No life appears, no fermentation, no germs.

Nature's correspondent argues that the experiment is not fair. The line between living and not living matter is so fine and wavering that any manoeuvre such as boiling, which killed the former, might destroy the chances of the latter. Some not living matter might be present which was on the very point of passing over into life. It may be that boiling would push it back again far into the rear ranks of the not yet living. It has recently been shown that crystals, just at the moment of their formation from solutions in water, conduct themselves almost exactly like living cells. For a moment or two between the dissolved state and the fixed crystalline state, they enjoy a kind of life. And conversely, some bacteria can hardly be distinguished from crystals except by the fact that they will only multiply in organic matter—that is, in refuse animal or vegetable stuff. And we know that metals are seriously affected by boiling, taking a long time to recover from it.

So the method used to kill existing living matter in the bottle may also spoil the chances of matter that was about to become living.

It seems hardly reasonable to assume that spontaneous generation does not occur. Decay, *back-going*, is everywhere; metals rust; radium degenerates into helium. Must there not be at least an equal amount of formation, *on-going*? Is not the pulling to pieces but a preparation for a higher putting together? If not, there is no evolution.

Some day, and soon now, the question will arise of the spontaneous generation not alone of *living* matter, but of *very* matter itself. The doctrine that matter and force are unchangeable in quantity, on which Haeckel relied for his materialistic scheme, is becoming very senile and decrepit. It is suspected that both may be constantly emerging from, and merging into, that which is neither of them—ether. Not a single fact is known to science to disprove the possibility that in our own bodies, every moment, our own wills are superintending both processes, even that our most casual and transient emotions may constantly draw matter and force from, or permit their return to, the same mysterious alembic. And this human process may be the analogue of a greater, of which all visible nature is the field. The doctrines of materialism are nothing but canonized assumptions.

Can a Planet's Axis Change?

"Some say He bid His angels turn askance
The poles of earth twice ten degrees and more,
From the sun's axle; they with labor pushed
Oblique the centric globe. Some say, the sun
Was bid turn reins from the equinoctial road
Like distant breadth to Taurus with the seven
Atlantic Sisters, and the Spartan Twins,
Up to the tropic Crab; thence down amain
By Leo, and the Virgin, and the Scales,
As deep as Capricorn, to bring in change
Of seasons to each clime."—*Paradise Lost, Book X*

IN a recent comment upon the peculiarities of Saturn's unruly ninth satellite, Professor Garrett P. Serviss, formerly Secretary of the American Astronomical Society, says that "there are mathematical reasons for thinking that originally the direction of the rotation of Saturn was contrary to what it is now." He thinks that the ninth satellite may be the oldest of all, and existed before the change in Saturn's axis took place, and also that the axis of Uranus was tipped half-way over.

Whether this be correct or not the motion of the new Saturnian moon

must be explained somehow. It moves in what one would say was definitely the wrong way, that is to say in a direction exactly opposite to that of its eight fellows. "The same peculiarity" says an astronomical textbook "has been assigned to the moons of Uranus, but in this case it is apparent only."

It is evident that the fact that planets' axes change during the ages is being forced upon astronomers from the discoveries which are being made from time to time, and it will not be long before the statements of H. P. Blavatsky relating thereto will be better understood and accepted. Professor Serviss says "this is one of the romances of astronomy," but it is a romance that will upset all the time-honored fallacies. It strikes a blow squarely at the nebular hypothesis. Frequently during the past century it has been suggested by students that changes in the earth's axis would explain many things in geology and cosmics, but the text-books have fought shy of the facts. The theory has been suggested by Professor John Wray, Dr. Edmund Halley, Professor William Winston, Sir Henry James, Sir John Lubbock, Frederick Klee, Professor J. J. H. Teall, Dr. J. B. Dimbleby, and Professor Serviss has on more than one occasion inclined towards it.

A Danger—Official Hypnotism

ONE of the chief purposes of the newly chartered *American Institute of Scientific Research* is to make hypnotism respectable and bring it to the front as a means of treatment. Those are almost the words of Professor James Hyslop, of Columbia University, one of the Institute's founders. With him are a number of others of equal note. The further object is the study of human nature, from the scientific side. The whole program, in the words of Professor Hyslop, "promises more for the race than any investigation ever undertaken by man."

We agree: more evil. For whereas hypnotism has hitherto been under something of a cloud, and, in this country, been mainly employed for exhibition purposes, it now receives the sanction of the professors of the Institute and of the two eminent divines who figure on the board of trustees. It dons an orthodox and official robe. From the practise and standing of the Institute, every medical practitioner, licensed or unlicensed, in the country, will gain encouragement in the employment of hypnotism; and the public, encouragement in submission to it. And from the medical profession the wave will broaden down to the laity. We expect in a few years to see the establishment of as many "hypnotic parlors" as there are now "massage parlors" and "electric institutes."

A few of the evils lie clear on the surface. The relation between the doctor and his female patient is often enough abused as it is. Hypnotism usually reduces the subject to complete passivity of body and of mind. Suggestion can prolong this mental passivity after the awakening, to indefinite periods. It can cause the memory of that which occurred during the hypnotic state to be rendered entirely latent. And each induction of the state makes the next easier, places the subject more and more completely in the operator's hand. Yet the public assumes that directly waking occurs, all traces of the state (*except* those that go on working curatively!) are swept away and the rapport between patient and operator brought to an end.

Surely a little reflection will make it obvious that one who has been hypnotised is never again as if he had not been, never again quite so positive, so self-contained; it may one day be discovered that the relation between subject and operator, once established, is never again completely annulled.

We can only hope that the evils of hypnotism will quickly become so manifest that the people will themselves rise and make an end of it.

STUDENT

Silver-Plating Wounds

SOME French surgeons are now dressing wounds with silver leaf. The leaf is simply placed on the surface of the wound or ulcer, packed down so as to fit closely, and the margin sealed with colodion. The results are said to be very remarkable. If our memory serves us, there are evidences from antique human remains that this method was known and used in archaic times.

STUDENT

Genius is essentially Feminine.—Thoreau

IT is not the first time that little Corea has figured in the martial history of Japan, for the greatest event in the history of the latter country was the discovery and conquest of Corea in the Third century—and the glory of that the Japanese owe to a woman.

A Warrior Woman of Japan

great reward for his brave deeds."

In the ancient Land of the Rising Sun women not infrequently filled the throne, and often occupied places of honor and dignity. Long ago, however, when the sea all about Japan was an unknown sea; when other lands, of course, did not exist, since they could not be seen by vessels cruising along the shores; in that day there was a Queen whose name was Okinaga Tarashihimé, best known under her title "Zingou," meaning "Glorious Deed of War." Historical records tell us that she was very beautiful, intensely religious, intelligent and courageous far beyond the measure of her husband, the Mikado, himself a Warrior.

In 193 A. D. the Mikado set boldly out for one of his little islands to stop a rebellion. Like a wise husband, he took his wife with him, and while he went on she stopped at one of the smaller islands to offer worship to the gods. When she sailed on, meeting her husband, she told him that one of the gods had spoken to her and through her, saying: "Why do you try to conquer Kumaso? There is another country, large, rich, full of treasure. Lo! it shall be yours without bloodshed." But Zingou's husband had no notion that a god could speak through a woman! Absurd! Besides, there being no other land in sight, it was evident that no other land existed. More than that, the sea was unknown and unexplored. Why should a Mikado throw away men and ships to follow up a fancy? So he staid in Kumaso, and was promptly slain in battle. The courageous Empress then took command of the army and brought the rebellion quickly to an end.

Having already made up her mind to find this unknown land and conquer it, Zingou then proceeded to do so, and by her eloquence succeeded in convincing her commanders that she knew her own mind.

New ships were built, and shortly Zingou and her fleet set sail for this unknown land. That was in 201 A. D. Her final orders to her soldiers surely prove that ancient Japan was not, as some historians persist in declaring, "barbarous and savage."

"There must be no plundering."

"Be merciful to those who yield, but give no quarter to the stubborn."

"Disdain not a small band of enemies yet fear not great numbers."

"Deserters shall be punished, but the victor shall receive passing

this wise, saying, "The spirit of peace, Zingou, will guide and protect; the spirit of war will lead your ships across the sea." Inspired by this, she sailed boldly out, and by and by the unknown shore loomed into view. She had reached Southern Corea. Fortunately for Zingou, the Coreans were as ignorant of geography as the Japanese. Their king was so astonished at the sight of this host of strangers in their white-winged battle-ships that he lost his wits. He sent envoys at once to Zingou and delivered up to her the country without a single battle—as the gods had declared would be.

Less than two months were consumed in this whole remarkable enterprise, and Zingou, shortly after her return home, became the mother of a son, Ojin, or Hachiman, by name. He became a great warrior, lived to the age of one hundred and ten years, and later was deified by the Japanese as the God of War. Analogies might easily be traced between Zingou and Ojin, the mother and child as pictured by Japanese artists, and Isis and Osiris of the ancient Egyptians. Still more glorious is the thought of Zingou as type of that militant motherhood which is a redeeming force. Mothers today may lack opportunity for outer conquests—but how about the inner, the conquests over the demons which besiege the conscience and the mind? How about that undiscovered land known as the human heart? Were all mothers Warriors in the true sense, standing close to the gods, and conquerors of that domain which the gods today plead with them to enter and rule—*themselves*—truly, their sons would be Warrior-Scions of a godlike, glorious race. Such shall be—such must be—the mothers of the future. STUDENT

JAPANESE houses surely teach us a lesson in simplicity, cleanliness and comfort. In the higher sense they are far more artistic than our own. Instead of loads of unused furniture, some of it frankly intended for nothing but show, one finds no chairs at all, merely soft, exquisitely woven, straw mats and a few cushions. Instead of myriad pictures, good, bad and indifferent, which stand—so mistakenly at times—for decoration, there will be, perhaps, but a single rare vase in a recess and, opposite, a simple *kakemono*; that may be all even in Japanese homes of wealth. What a lesson to those of us who examine honestly our overloaded parlors and drawing-rooms and libraries and reception-rooms and other rooms!

Is it not easy to understand the remark once made by a cultured Japanese, "In Japan, I am happy to say, we have passed the bric-a-brac stage!" S.

Harriet Maxwell Converse

WE have met together, and we the elder brothers, condole our younger brothers for the great loss they have met in the death of the Ya-i-e-noh. She was like a great tree in the forest; her strength supported us; like a vast, spreading branch she sheltered us. Her kindness and compassion were to us as fragrant blossoms. And now the tree is cut down. The branches shelter us no more.

With these words was opened the beautiful and impressive ceremony of "Adia-Kow-Ha," the Death Feast of Mrs. Harriet Maxwell Converse. Such a tribute has seldom been paid by North American Indians to a woman of an alien race. Mrs. Converse, a writer of unusual talent and recognized ability, a lover of all that was noble and pure in nature and in life, one among the few to whom friendship, loyalty and trust were not mere words, will yet be best known to history for her years of devoted work among the Indians; particularly those of the New York reservations. More than once has she succeeded in heading off legislation adverse to their interests, and in promoting the passage of laws calculated to be of benefit to them, in protecting them from injustice; in helping them out of their difficulties, and in advising and teaching them.

The Indians, themselves, fairly worshiped her. It is interesting to know that her father and grandfather were both noted for their friendly interest in Indian tribes. Both had been adopted, according to Indian patriarchal ceremonies, into the tribe of Senecas, the grandfather becoming a member of the Wolf clan; Mrs. Converse's father, of the Deer clan; and Mrs. Converse herself, later, a member of the Snipe clan and its Chief. Her Indian name was *Ya-i-e-noh*, and when she died, a year ago, the Indians were plunged in grief.

According to the Indian custom, when any one of their number of particular eminence dies, a "Death Feast" is given; a solemn ceremony taking place on the tenth day after the death, or, in case that falls upon a regular feast day, then one year from the date of the death. It is because of this that the death of Mrs. Converse, which occurred early in November, 1903, was postponed until November 18th, of this year. The delay of ten days is in accordance with the Indian faith. Being devout believers in the immortality of the soul, the Indians hold that for ten days after death the soul hovers about the scene of its earthly body and that the final release does not come until the end of that time. They also hold that the soul returns to earth on the anniversary of the real death.

The ceremony was an impressive one, held on the Cattaraugus Reservation, in Erie County, in the Snipe clan's Long-house.

So-No-Gah, one of the elders, said:

We ought to thank the Great Spirit for having sent this good woman among his people as a messenger of his love for them. Let us not forget to be grateful to her for her words of wisdom, for her words that urged us to abstain from vice and evil ways. Let us thank her for her work among our white friends in our behalf and for teaching us to know that which we, of ourselves, could not know. Whether at home with us or far away, she was always our friend, our Ever-watchful One.

STUDENT

TO the memory of Anne Devlin (Campbell), the faithful servant of Robert Emmet, who possessed some rare and noble qualities; who lived in obscurity and poverty and so died, the 18th of September, 1851, aged 70 years.

SUCH is the headstone story of a neglected grave of the last century, to which public attention is now being called.

This Irish girl who could not be wheedled or bribed into giving evidence against her master, had a quality of devotion that resisted every form of torture and compulsion. She suffered years of imprisonment in jail, was hung by the neck until almost dead, goaded with bayonets, kept for a year in solitary confinement—all to no avail. This soul could not be forced into a false position. Yet this woman lived in obscurity and wretched poverty, and finally was buried in a pauper's grave. Today the nobility of her character is beginning to be recognized. Is the world at last awakening to a new sense of justice? STUDENT

The Student Homes of Lomaland

AS the world moves on, perplexing problems confront the home-makers who wish to leave the world better for their efforts. They would willingly transform their home-making instinct into something widely helpful and more beautiful. In short, they are ready for a higher order of home and family life.

But what can they do in the world as it is today? How can they isolate, without separating, themselves from the complex machinery of life in the world? To these workers the student homes of Lomaland promise a solution of the difficulties.

In these homes the machinery of daily duties has been so simplified that the lives of the home-makers will be virtually doubled, because of the hours that they have free, hours ordinarily filled with duties relating to useless details.

It has always been supposed that to have a home in just the right order, one woman at least must give a great deal of time to it. In a good many cases one woman gives all her time, and most of her being. Some generous-minded men have regretted that the gifts they appreciated in their wives were left to run to seed for want of time to use them. And they have wished for something better and different in the way of opportunity for their cherished companions.

In Lomaland the student-life leaves the wives and mothers free for many hours in the day. Undreamed of capabilities have blossomed forth in many of these women, side by side with those which they had longed to have time to put to use. The influence of homes where such happily active men and women contribute to the atmosphere, promises new and brighter things for the world. H.

ONE OF THE LOMALAND STUDENT HOMES

WHERE children are not, heaven is not, and heaven if they come not again shall be sever:
But the face and the voice of a child are assurance of heaven, and its promise forever.—*Swinburne*

A CERTAIN London paper has just distinguished itself by an attack upon women's clubs. The writer,—a woman,—declares that unless a woman wants to smoke, drink, bet and flirt she has no need of a club. To quote: "Women's clubs are becoming as plentiful as betting offices, and have just about as good a moral influence on the community."

Dear, dear, dear! What kind of clubs are those to which this writer has entrée? Could not some respectable and compassionate woman be found who would introduce her into circles different from those to which she has been accustomed? It cannot be possible that women's clubs in England are so very different from those in America, where it is conceded that their influence is strengthening, uplifting and broadening in every way; that home life is better, mothers are wiser because of their influence. The probabilities are that this writer has been sadly deprived on certain lines and is therefore about as competent to handle the above question as a street Arab who knew nothing about any life but slum-life, and who had never seen anything but the dime museum theatre, would be competent to discuss the question. "What is the influence of the Higher Drama?" or, "Has music a part to play in the awakening of the soul?" E. H.

IT is strange how slow men are to recognize that in all matters of practical hygiene the women are necessary. We shall never have clean cities until they undertake the job, nor shall we know how to be good national housekeepers until the private housekeepers of the nation extend their hereditary function to public needs and duties. Every time the women are given a chance to clean up a dirty city, carry on a crusade against public disgraces and immoralities, they are successful, and there is at once a new order of things. In one State the men, the eaters of meat and makers of laws, legally allowed the butchers to carry on their work in such a diseased and disgusting manner that the health and morals of the whole people were affected. One woman alone reformed and cleaned up the whole abuse and made the slaughter-houses of the State models of hygienic order and decency.—*American Medicine*

OUR YOUNG FOLK

A Raja Yoga Christmas

WE all believe that "giving is more blessed than receiving," but with the children at Point Loma this belief is a part of their every-day life. At no time does it show forth more clearly and beautifully than at Christmas, when each one is busy helping the other to make something that will give pleasure on that day.

About the first of December of last year there seemed to be, even to a casual observer, something unusual in the air. The Point Loma children appeared to be brimming over with some delightful secret. How earnest and busy they were!

The Raja Yoga Day School was preparing a surprise for the school children, to take place two days before Christmas. All were dismissed at eleven o'clock, on that day, and told to come back in the evening at seven. As soon as they were out of sight, the big Christmas tree was put up. Then the large wagon from Point Loma arrived with just about a mile of smilax. Think of that, eastern friends! We used well-nigh a mile of the freshest and most beautiful of Lomaland smilax! The whole entrance and stairway and upper hall was festooned with smilax and roses. The large assembly-room was decorated with garlands of it, caught up with flowers between the electric lights, over the entire ceiling and around the walls. Great vases of brilliant poinsettias glowed from every corner, and glorious hibiscus banked the pianos and mantels. The Christmas tree was laden with glittering ornaments and cobwebs of silver and gold. Near it were tables filled with fruit and brightly-colored bags of goodies. Another table was covered with flower-jars decorated in the most artistic way with raffia in many colors, while grouped around were beautiful paintings in very unique frames. The parents noticed these immediately, and many an enquiring glance was turned in their direction.

When all the children were assembled on the stage, singing their Christmas songs, there was heard a jingle of bells and in came Santa Claus, a bit out of breath from running with his heavy pack of presents. After greeting all the children, he presented the flower jugs and pictures to the Raja Yoga Day School from the Raja Yoga children at Point Loma, and told them they had covered these pretty jars and also made the unique picture frames. The pictures themselves were sketches made by Miss Edith White of Lomaland, some in California, some in New England and others in Hawaii. Then we all understood why they had been so very busy and so happy the last few weeks!

What a joyous Christmastide it was, and what a lesson to the children of the world! Instead of a spirit of selfish "getting" there was the sweet, pure spirit of loving and unselfish giving. E. H.

LIEUTENANT-GENERAL PRINCE FUSHIMI, who came to the St. Louis Exposition as the Mikado's special envoy, is the Senior Imperial Prince of Japan. He has long been a warrior. At the wonderful victory of Nan Shan Hill, the Prince commanded the first division, and, after the battle, he visited the wounded, doing much to relieve them. On one occasion, many years ago, in Formosa, he was caught in ambush by a large force of natives. All of his men would have been killed had it not been for his personal bravery and wisdom.

The Prince is beloved by his people because of his courtesy. It is said his strongest rebuke to erring men is, "Would it not have been better had you done this another way?" Or, "Is it not true that you should have acted otherwise?"

Prince Fushimi's eldest son, Hiroyasu, has also distinguished himself in the present war between Russia and Japan. Japan, in sending this distinguished warrior, whom she could ill afford to spare at this time, has paid to America, her comrade-nation, a signal compliment. Beyond a doubt this will serve to strengthen the bonds of brotherhood which are already so strong between the two nations, America and Japan. E.

TO CRITICS

WHEN I was seventeen I heard
From each censorious tongue,
"I'd not do that if I were you;
You see you're rather young."

Now that I number forty-seven,
I'm quite as often told
That this or that I shouldn't do
Because I'm quite too old!—Selected

Facts Worth Knowing

THOSE who have visited the Parliament at Tokyo, Japan, say that it is the most businesslike institution in the world, because there is so little talking in proportion to the work accomplished. Even a Government Bill of great importance is brought forward, debated, and adopted or rejected, in less than a week.

A FIRST-CLASS battle-ship costs as much as all the buildings of Harvard University put together, and these number ninety-four. Which pays best any-

way, schools or battle-ships, peace or war?

A FEW weeks ago occurred the death of Chief Joseph of the Nez Percé Indians. Twenty-six years ago he surrendered to General Miles, with the following words, "From where the sun now stands I fight no more against the white man." He kept his word.

THE boy who takes proper care of his body, keeping it clean, strong and pure, is never called a "coward" or a "goody-goody." He is simply considered to be sensible. Why should the boy who takes care of his heart to keep it clean, and who doesn't propose to let his character become soiled and ugly, why should he be called "goody-goody" or "cowardly"? Now isn't it queer, the twisted ideas some people have? And haven't we Raja Yogas a perfectly splendid chance to straighten them out?

How many know that the stalks of sweet corn might be turned to most valuable account? They contain much more sugar than field corn, and Professor H. W. Wiley, the Government chemist at Washington, says that if the sugar in the corn stalks now going to waste in this country, could be converted into alcohol, we would have a sufficient quantity of it to drive all the machinery of our factories, to run all our railroads and steamboats, to heat and illuminate our houses and light the streets in every city of our Union. Think of this!

Nature's Intelligence

WHILE mutual helpfulness and interdependence among all the kingdoms of nature may everywhere be seen, perhaps nowhere more strikingly than in the helpfulness of insects to flowers and flowers to insects. The flower hides away the precious nectar in some inner recess which, it may be, can only be reached by a particular insect specially fitted for it; and the way to this inner feast is so constructed that the insect must leave upon the waiting stigma the pollen gathered from another flower. Then, too, in addition, it often must take from this flower, in departing, its pollen for another. This arrangement and adaptation can only be satisfactorily explained by the existence of an indwelling intelligence in nature, one Mind and Soul working through all.

Night-blooming flowers that are fertilized by nocturnal insects are usually light in color so as to be readily seen; and they are also generally very fragrant, which enables them to make known their whereabouts to their insect friends. Some flowers that are open both day and night, such as the petunia, give out their fragrance much more strongly at night than in the daytime. The petunia is visited by the humming-bird moth, which is nocturnal in its habits. But how does the flower know that the insect flies at night and that fragrance or lightness of color may be needed to bring the guest? What, but the common, indwelling Intelligence has adjusted their mutual relations? Exotics usually do not bear seed that will grow; that is, fertilized seed, because, in importing the plants, their insect helpers are not imported with them.

An attempt was made to introduce red clover into Australia, and seed were sent which produced a luxuriant crop and many blossoms. But these, in their turn, bore no seed because the bumblebee was not imported with the clover. When this was done, later, there were plenty of seeds.

Nature, in her wisdom, placed these friends together in the same land, but man in his ignorance separated them till he learned better. Experience is continually teaching him that only to work in harmony with nature is to work wisely and well. A LOMALAND STUDENT

THE CHILDREN'S HOUR

The Raja Yoga Question Box

IN the early days of Japan's glory among the brave and the learned were many women. In those days noble women were held in public honor and esteem.

1 Who was Zingou?

ANSWER—Zingou was a warrior queen of Japan in the Third century. She was brave and wise and beautiful. To her belongs the glory of the conquest of Corea. The Japanese honor her for her heroic deeds. Zingou trained her son to be her bravest soldier and a wise general.

2 Who was Hachiman?

ANSWER—Hachiman was the son of the Empress Zingou. His reign as Mikado was long and glorious. Many beautiful temples in Japan were built in memory of this great king. Every year a festival is held in honor of Hachiman and the heroes who have died for their country. It is the warlike spirit of Zingou and her son that still lives in the soldiers of Japan.

3 Who was Murasaki Shikibu?

ANSWER—Murasaki Shikibu was a celebrated Japanese writer. She lived about A. D. 1000. She held an official position at the court of the Mikado. This gifted lady wrote a book called *Genji*. It is one of the most famous books of Japan.

Seed-Children of the Lotus

DEAR CHILDREN: I wish to tell you about the seed-children of the lotus, after which the children's Lotus Groups and Lotus Home are named.

The lotus plant provides for its children a queer but pretty, top-shaped boat, which is very light, and so floats easily on the water. It has nice little oval rooms in the upper story, and sky windows that are always open to let the sunlight in and let the seed-babies peep out, and also get out when they are ready. In each little room there is one, all wrapped in a brown cover, and if you had a full-grown one and were to take off its brown wrapping, you would find inside the image of a perfect little lotus plant, only needing to grow up.

When the time comes to get ready to grow, these little lotus babies no longer live in the air and look out toward the sky and see the face of the sun, but sink down through the water into the dark mud below, there to take root and grow up again through the water into the air and sunlight, there to unfold in beauty and bloom and send forth children of their own to help make glad the world. We, like the seed-children of the lotus, have come down out of a region of freedom and light, where the Divine Sun shone upon us, and we are planted here in this earth to grow up into the beauty and bloom of a noble life, and give forth the fruits of love in thought and word and deed to make glad the world. And we must ever keep our windows open at the top that the divine light may shine down into our hearts.

THE other day I saw a curious incident. A horse was standing in front of a store, and just before his head was a buggy in which sat a lady. She was surprised to notice the horse reach forward, seize her whip and drop it upon the sidewalk. The whip was replaced in the socket several times, and the horse repeated the action again and again. Perhaps that wise horse knew where whips belonged!

L. L.

Two little children of New Hampshire got lost the other day and spent the night in the woods. One was five and the other seven. They would have been alone had not the family cat followed them. Next morning, when they were found, the neighbors asked them if they were not afraid. "Oh, no," said the little five-year-old; "why, we had kitty with us!" And perhaps "Kitty" did help to care for those little lost tots! Who knows? There is a loving protectiveness about little animals that very few children—or grown-ups either—understand. Kindness to animals is one of the broad foundation-stones of Raja Yoga training. M.H.

A Quiet Hour

MOLLY, Tom and Percy were sitting or lying on the grass in the shade of some tall trees, one hot Sunday afternoon, when Tom, shutting his book with a bang, exclaimed: "I don't know how it is, but I no longer care two straws about reading!"

"I know how it is," said small Percy with his customary energy. "It is because, here, in Lomaland, we ourselves are our heroes. We are young knights, in an enchanted country, killing self-fish giants. We are Sir Galahads."

"Rather a mixture, isn't it?" queried Tom, "Jack, the giant-killer, and Sir Galahad!"

"No, no mixture at all, to be sure. We just are Galahads preparing our armor and our 'goodly blades' and 'tough lances' for the quest. It is so much more interesting to be our heroes than merely to read about them!"

"And then, too," added Molly: "There is nature's song! I never tire of listening to her secrets."

"What are they?" said Tom.

"What, tell another's secrets! No one knows her song but those who hear it. To me her silent language, understood by the heart alone, is the language of that day, when all the world shall have learned love, and real Raja Yoga helpfulness." M. V. H.

In the Lotus Pond

DEAR CHILDREN: Do you remember about the seven little fishes who were so frightened one day in the Lomaland Lotus Pond by a little squirrel? Well, that was long ago. Today, instead of seven fish there are hundreds. They are all sizes, from the tiniest little specks to the first seven, now so large. How they have grown! Some are gold, some are silver, others are gold and black, still others are green like leaves.

There is one handsome little fellow who is a gold-and-silver fish. When he was small he had a very funny little tail. It looked as if it had been put on crosswise. He was very timid, always swimming by himself, and he always ate his dinner alone, and I thought he might be ashamed of looking so curious. But by and by he grew larger and his tail became, O, so beautiful, and now he is not a bit timid or lonesome. More than that, all the other fish appear to be very proud of him!

His tail, which was so ugly and awkward at first, has grown into a beautiful "fan tail," so that now he is the most graceful fish in the whole Lotus Pond family; and the fish that let him alone before are proud enough to swim with him now! I wonder if fish are anything like people. Do you suppose they care about appearances and like to be thought in the fashion? ONE OF YOUR FRIENDS

LOMALAND STUDENTS AT ISIS THEATRE

THE Universal Brotherhood meeting at Isis Theatre last Sunday evening, conducted by students from Point Loma, was well attended, the addresses calling forth warm applause. The musical program was well arranged and delightfully rendered.

The opening address, by Miss Amy C. Lester, was entitled: "Love is immortal: There is no death." In part, she said: "The word love has been so debased that one almost hesitates to use it; but yet there is no other. Sympathy and compassion are included in it, but they do not express the whole of it. True love 'seeketh not itself,' does not demand possession; *is not* where there is even a possibility of jealousy; gives always and takes nothing; is ready to sacrifice all things, up to life—but not that it may be gratified—only and solely that it may help the higher welfare of the other. Obviously, women have this higher love in their hearts; and among women, preeminently mothers. For the very essence of motherhood is compassion.

"The mother's love and compassion is the stay of the child. It is a constant presence around the child and in its heart. When it is old enough to understand itself, it may feel it and respond to it. The child may feel the enfolding power long after the mother's death, and if it be wise it will know by that that she still lives and still gives.

"It is the message of Theosophy that the soul that is compassionate lives; goes on living, watching, helping, encouraging, uplifting, giving inner life, saving, protecting, and that those thus loved can, if they watch themselves and look into their own heart-life, know by the constant interplay from heart to heart that the other, the one thought dead, lives on, is not dead. Not by a voice, not by a message that any words can embody, not by a presence that any eyes can see, may they know this: but by a continuance of that same heart-touch which they felt in life."

Master Antonio Castillo and Master Montague Machell, two of the Raja Yoga boys, attired in Greek costume, read papers. Their subjects being, respectively, "My Dream of Ancient Atlantis," and, "A Talk About Art." Both papers showed much study and thought.

The closing paper of the evening was read by Mr. J. H. Fussell, his subject being, "The Mark of Cain." The speaker, after referring to

the popular confusion regarding the enigmatical narrative of Cain, and the various conjectures as to what the characterizing mark of Cain may have been, said: "In its general acceptance the story is plain; Cain was angry and slew his brother. 'Am I my brother's keeper?' he said, when asked what had become of Abel. The mark of Cain is the mark of the fratricide, whatever it may be. Cain is the type and synonym for all those who hate their fellowmen, their brothers, and who, by word or deed, or by any other way, kill their brother. Upon all such, whether visible or not, is the Cain mark. H. P. Blavatsky uses the word 'Cain' as the synonym for all the evils that spring from unbrotherliness; and the present Leader of the Universal Brotherhood has said: 'Unbrotherliness is the insanity of the age.' It is a real madness, bringing misery to the doer of unbrotherly actions as well as to the sufferer by those actions. This mark of Cain—how terribly it is stamped upon our so-called civilization of today—this insanity, this madness, how widespread and general it is!

"In the story, Cain, through a sudden madness of jealousy, slew his brother, but men now in most cruel but legal fashion, and by slow degrees, bring death to their brothers, not through any sudden fit of anger, but through the coolest and most calculating ways of making money out of the lives of their fellowmen.

"Greed, selfishness, the madness for a little evanescent pleasure; these and similar things having their root in unbrotherhood, have turned the world from a quiet home into a perfect mad-house, where nearly all are insanely scrambling to rise upon the prostrate bodies of their brothers;

"Commerce is a recognized warfare that knows no truce, no pity. It is waged like the elemental struggles of the brutes in our metropolitan cities. And even women and little children are trampled down into the mire, soul and body, that a few people may get a larger dividend; and the world looks on and wonders why it suffers. Only as men and nations really awaken to a sense that they are all brothers, and that their best interests consist in acting in a spirit of brotherhood always and in all things, will the spirit of Cain and the mark of Cain pass away." Art Music Literature and the Drama

The Degeneracy of Church Music

THERE was a time when music in the churches had high religious power and dignity. The classics have left a heritage that once inspired reverence and spiritual elevation. For nearly four centuries all the great composers have contributed liberally in that line thus to further a deeper religious sentiment of the Christian nations. Especially prolific were Bach, Purcell, Haydn, Mozart, Händel, Mendelssohn, Beethoven; all these have had a beautiful conception of the elevating character of religious music, and their works once exercised a great influence on the devout public.

What have we now in the congregational churches? At best, a paid quartette with little conception of what a religious musical service should be; a clergy that is almost universally ignorant of even the fundamentals of music; an apathetic public which has forgotten that there may be any value in church music at all. There is small wonder that the devout worshipper should manifest so little interest when he is compelled to listen year in and year out to the hymns that are patterned after the jig and dance melodies of foreign nations. With rare exceptions, no attention whatever is given to simple successions in the selections, to promote an elevating religious feeling. The flock is allowed to drift along in easy sing-song fashion. We need only to look at the advertisements of the musical attractions at Sunday services to discern at once the lack of intelligent application. And, indeed, how could it be otherwise when the clergy is utterly wanting in that higher musical knowledge that religious teachers, above all, should possess?

Professor Locke Davis of Yale University has recently published a timely article on the subject. He says:

The reform of church music! We sigh mournfully, as we think of the greatness of the work. It is safe to say that most of the church music now being produced will, because it violates the best standards of the past, be buried in oblivion in the future; and deservedly so, for most of it is mechanical and entirely lacking in spontaneity and freedom. What is the style? It is almost entirely without the genuine marks of musical feeling. The style most affected is the popular, rousing, but jerky, medley, the only religious part of which, as a rule, is the words, and these very frequently are maudlin, sometimes even silly. Sensible people laugh at it. There would be a better show of reason for the degeneracy of our modern styles if nothing better had ever existed, or if men were not living who have it in them to compose in a higher vein of feeling.

E. A. NERESHEIMER

PUTTENHAM, a Sixteenth century critic, wrote, in the beginning of his book, "Of Proportion Poeticall": "It is said by such as profess the mathematicall sciences, that all things stand by proportion, and that without it nothing could stand to be good or beautiful. The Doctors of our Theologie to the same effect, but in other terms, say: that God made the world by number, measure and weight; some for weight say tune, and, peradventure, better."

THE conditions which produce right or artistic tone are the same in all voices, in all languages, in all nationalities.—Meyer

ONLY that is poetry which cleanses and mans me.—Emerson

Ancient Works of Art Discovered in the Lake of Nemi, Italy

TWO thousand years ago Diana's temple at Nemi, Italy, was a place of pilgrimage. It is said that the Lake of Nemi, close to which still stand the remains of this old Temple, is the most beautiful spot in that part of Italy. It is the crater of an extinguished volcano. For many hundreds of years the peasants in this vicinity clung to the tradition of a mythical galley which was, many centuries ago, sunk in the lake. Modern scientists scoffed at the idea; but recent discoveries made by one Signor Borghi, prove that the old tradition is really the record of an historical fact. Recently, by means of boats, machinery, derricks and other necessary constructions, he has brought to the surface of the water many works of art and artisanship, all archaic and beautiful—bronzes, plaques, tiles, plates, slabs of porphyry and many objects of enamel and mosaic of the greatest artistic value.

These give unmistakable evidence that the galley sunk so many centuries ago had intimate connection with the Temple on the shore, and that in all probability it was built and decorated splendidly as part of the sacrificial worship to the Goddess Diana.

CUCKOO SONG

(Not only one of the earliest of Old English songs, but the first to be found with the music to which it was sung:)

SUMMER is icomes in,
Lhude sing, cuckoo!
Groweth seed, and bloweth mead,
And springth the wode as.
Sing, cuckoo!

Awe bleateth after lomb,
Lhouth after calve cu.
Bulloc stereth, bucke verteth,
Merie sing, cuckoo!
Cuckoo, cuckoo!

Wel singes thu, cuckoo,
Ne swik thu never as.

IN MODERN ENGLISH

SUMMER is come in
Loudly sing, cuckoo!
Groweth seed and bloweth mead,
And springeth the wode now.
Sing, cuckoo!

Ewe bleateth after lamb,
Loweth after calf (the) cow
Bullock starteth, buck seeketh,
Merrily sing, cuckoo!
Cuckoo, cuckoo!

Well singest thou, cuckoo,
Cease not thou ever, now.

raphy is largely read; history very largely; books on religion comparatively little.

JOUBERT used to say—how truly: "Voulez-vous connaître la morale? Lisez les poètes; ce qui vous plaît chez eux, approfondissez-le: c'est le vrai; ils doivent être la grande étude du philosophe qui veut connaître l'homme." Our poets are, at times well-nigh our only truth-tellers.

I KNOW I AM DEATHLESS

by WALT WHITMAN

I KNOW I am deathless.

I know that this orbit of mine cannot be swept by a carpenter's compass;
And whether I come to my own today, or in ten thousand or ten million years,
I can cheerfully take it now or with equal cheerfulness I can wait.

Births have brought us richness and variety and other births have brought us richness
and variety.

The Principles of Theosophy Applied to Daily Life---Education

FIRST, what are the Principles of Theosophy? And to answer this question we should, before all, have a definition of Theosophy, though to enumerate its underlying principles would make clear its meaning. However, let us first state that Theosophy is *Wisdom*, not mere knowledge, or comprehension by the brain-mind, but knowledge with something added—knowledge and the application of knowledge towards its supreme end. Then, before going further, we must ask what is the supreme end of knowledge? Is it not that which relates to the supreme end of *life* and to the very essence of our *being*?

The word Theosophy contains all this in its literal meaning, it contains a reference both to the essential nature of man and to the supreme end of knowledge, and we have in the word itself not only an indication of the deepest problems of life, but an answer to them. The literal meaning of the word *Theosophy* is God-Wisdom, godlike wisdom, divine wisdom. This then is the subject before us, "Divine Wisdom applied to daily life—divine wisdom applied to education."

Think of it for a moment and then say, if we can apply divine wisdom to our life, if we can base our education of the young and of ourselves upon the principles of divine wisdom, have we not a solution to all the problems of human existence? This then is the general proposition. But we must go further and from the general statement we must come down to particulars. Briefly, we may state, as the fundamental principles of Theosophy, the following:

Starting with the literal meaning of the word Theosophy as divine wisdom, we have this—that man is a soul, that he is divine. Were he not so, the very word Theosophy would be utterly incomprehensible to him. Then further, that as a soul he is immortal and lives many lives on earth, and that his pilgrimage is not by chance but under law, that in fact the whole universe is governed according to law, and that as the origin of man is divinity itself, so is divinity his aim and goal.

What a flood of light this philosophy throws upon the problem of education. For this is the position that Theosophy forces us to take:

- First—That the child is a soul.
- Second—That this soul has lived before and will live again on earth.
- Third—That each child's character has been built up through innumerable lives and is still in the process of building, that each is reaping now the harvest of his efforts, his thoughts and deeds in the past, and is sowing the seed for harvests yet to come.
- And Fourth—That no child, no man or woman is separate from us, but that all are linked together, the welfare of all depending on the welfare of each, even the most insignificant.

For here is another of the basic principles of Theosophy, likewise contained in the very word. It is the *Unity* of all, and, applied to human life, it is *Brotherhood*—Brotherhood as a fact, not as a mere sentiment, but which nevertheless requires our full cooperation for its realization and this is identical with what we have before referred to as the supreme end of life.

Do we not have here the basis—the only true basis for education? Can we call that education which is not based upon it? For education will be seen to be not for the mind alone, or for the body, but for the whole nature, physical, mental, moral and spiritual. For our life is not

alone of the mind nor of the body, but of the heart, and it is the heart under the guidance of the spiritual nature that should rule. The mind and the body should be man's servants, not his masters.

It is these principles of Theosophy that our Teachers, first H. P. Blavatsky, then William Q. Judge and now Katherine Tingley, have given us by which to guide our own lives, and it is these principles that we see in active operation in the educational system of Raja Yoga inaugurated by Katherine Tingley, and being carried out under her guidance in the Raja Yoga Schools.

Theosophy as a mere theory will never lift the world, never even change the life of a single individual—but put into practise, applied to daily life, applied to education, it will transform earth, it will ennoble and beautify life. Whatever our own lives may have been we at least have this responsibility placed upon us to remove the stumbling blocks from the way of the children. This then let us do.

STUDENT

How to Study Theosophy

I

THEOSOPHY must be studied not alone with the mind but with the heart, if we would make it a living power in our lives. Simply to learn with the intellect so much of it as may be expressed by words and to talk glibly about it is not to have made a complete study of Theosophy, for the most important matter has been omitted, and that is the practice of its principles. A person might study surveying and have a fair intellectual comprehension of it, yet, without practice, could not properly be called a surveyor. So our study of Theosophy demands more than the application of the intellect. Every principle is to be applied to daily life and proven by our experience. Then we shall not simply see the reasonableness of the teachings, but we shall *know their truth*, and it will be a part of our very being, a shining light within the heart that will guide us in safety through all trials and difficulties and radiate forth as a helpful influence in the world. In no other way than by thorough application to all the events of life, to our own motives and actions, thoughts and desires, can Theosophy be properly studied.

While it covers and permeates all life, the heart of it is in the heart, in our own hearts, in the hearts of others and of all; and in all we should study it; and when we find it in all as we find it in ourselves, then shall we know our kinship and our oneness with all, and the bond of Brotherhood for us will be riveted past breaking; and all ways will be open for the inflowing and outgoing of light and love.

B. W.

II

To those who wish information upon Theosophical matters, the perusal of the literature upon these subjects is, of course the readiest and most effective aid to thought.

But to one who desires a realization, a comprehension, of the profound truths of which it treats, there is no other course than that of right action. In the sincere effort to help others the veils of knowledge are drawn aside and, by right of such divine service, the worker becomes possessed of divine knowledge. If the body acts, it learns the physical possibilities of action; if the mind acts it grasps the laws of action; if the heart acts compassionately for others, it attains a knowledge of the great purpose of action. When these three forms of knowledge exist in one person, in full degree, such a one knows Theosophy, all others are learners, possessing wisdom to less extent.

It is related of Madame Blavatsky that when a certain very enthusiastic convert asked her to teach him occultism she assigned to him as his first lesson the task of caring for an old invalid pauper and her little grandchildren. The lesson was refused and the man seen no more, yet by such means, and only so, can we find the heart life, the light of life, which is the meaning and beauty of existence.

Surely a mental knowledge is of value, as a guide-book is, to inform us what to expect in a new country, but a reading of the book will not suffice, to know the country one must visit it, and to know Theosophy, one must *live* it.

STUDENT

IF ONE accepts the doctrine of Universal Brotherhood, which is based on the essential unity of all human beings, there is a long distance yet intervening between that acceptance and its realization even in those who have adopted the doctrine. It is just the difference between intellectual assent to a moral, philosophical, or occult law, and its perfect development in one's being so that it has become an actual part of ourselves.—WILLIAM QUAN JUDGE

SI DESCENDERO IN INFERNUM, ADES

JAMES RUSSELL LOWELL

ONE band ye cannot break,—the force that clips
 And grasps your circles to the central light;
 Yours is the prodigal comet's long ellipse,
 Self-exiled to the farthest verge of sight:
 Yet strives with you no less that inward might
 No sin hath e'er imbrated;
 The god in you the creed-dimmed eye closes;
 The Law brooks not to have its solitudes
 By bigot feet polluted;
 Yet they who watch your God-compelled return
 May see your happy perihelion burst
 Where the calm sun his unaged planets broods.

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question What do you consider to be the main work that lies before Theosophy in this Twentieth century?

Answer I Twentieth Century Theosophy will teach the principles of Theosophy to the world and demonstrate them by an actual application to and use in all the departments of life. The science of right living, based on true philosophy and knowledge of the law will then be established. A great, true religion will come back to the world, a new leaf in the book of life will be turned, and this will give the impetus to great revivals in art, literature and the drama. When the soul is awakened by the teaching and practice of Brotherhood a greater expression of the divine in the beautiful will be possible than has ever been known.

A new touch will be given to literature. Is there not all the past, all that has been written, to be interpreted from the standpoint of the soul? I believe that Twentieth Century Theosophy will perform the miracle of introducing morality into the conduct of public affairs and thus save institutions, noble in themselves, but corrupt in their executive, to the purposes for which they were intended.

Twentieth Century Theosophy will raise the ideals of living of men and women and from these improved relations will spring homes that will be powers for good in the world. The teaching of true household economy will do much to ameliorate conditions that now are appalling. By giving to people that which awakens and nourishes the higher nature, by a many sided appeal to this neglected part of man's nature, the problems of the ascendancy of the lower will become fewer. Art, music, the drama, simplicity, healthful living, the morality of brotherhood, will be used by a master hand and will save the people.

When the teaching and practice of brotherhood have cleared the atmosphere of life, when there will have been generations of children educated by the Raja Yoga system, all over the world, life will be something which we are not liberated enough to picture. The most important thing for us to realize is that the Twentieth Century has begun and that we must do our part to bring about the glorious fulfilment. M. M. T.

Answer II More fully elaborated this subject would be "Theosophy applied to the needs of today." For Theosophy is as old as time and is forever the same. It is the formulation of the eternal principles upon which the universe is founded, and must be the same in essence for any century.

But just because it is eternal and universal and applicable to any conditions, its expression will vary infinitely. It is that wonderful adjuster which constantly tends to correct the evils in human life, to bring it in all its phases to the normal line.

The expression of this force today will differ from the past not only in having more complex and subtle problems to cope with, but in being able to attack them more openly. The time seems to be ripe, or fast ripening, for clearing away the masks. And so Theosophy of today will have the task of shelling off the husks of vanity and selfishness, one by one, and revealing to humanity the deceit and foolishness on which they have fed themselves, and the utter impossibility of arriving at their destiny by their present methods. Yet not only destructive is it, but more essentially constructive. Side by side with the tearing down, it is building. As fast as it shows what is corrupt or useless in the past, it

builds a model for the future, so that there is never chaos, but a gradual remodelling process.

Instead of patching up old civilizations, or temporizing, or directing the current toward the lesser of two evils, as Theosophy has often been forced to do in the past, it has now before it nothing less glorious than the forming of a new civilization. The whole social fabric it has to reconstruct. All the old institutions must fall and new ones arise in their place. And yet, so gentle and wise are its methods, that the transformations may often take place unawares. The old institutions disappear, but as they crumble, the stones are used again in the new. Old ideals, old desires, old standards, all must enter into the purifying current, and make of the Twentieth Century a new era.

Question Of all the innumerable thoughts that occupy the brains of men and women, so few seem to have any high purpose, the great mass being aimless, careless thoughts which drift in and out of the brain seemingly without our volition. Do these latter leave any impress and if so, how guard against them? What finally becomes of them?

Answer There is hardly a more important question than this of the thoughts which we permit to occupy our brains, and of our responsibility for our thoughts. It is true that the whole course of our past life determines very largely the class of thoughts which find lodgment in our minds, but through the exercise of the will it is possible to change the character of our thoughts. It is an old truism that two things cannot occupy the same space at the same time, and in this lies the secret of our power to change the habitual character of our thoughts. True, it cannot be done at once, but just so far as we keep our minds busy with thoughts of a certain character, to that extent will thoughts of an opposite tendency be kept out. And here we can answer the question, how guard against the drifting thoughts which we encounter at every step of life's journey. It is by keeping the mind occupied with those thoughts which we desire and will to think. For after all we do think those thoughts which we really desire and which are akin to our natures, or rather to that part of our natures which we permit or will to be uppermost.

Most assuredly the drifting thoughts leave an impress if we leave our minds open to them. The dropping of water will wear away the hardest rock, and so will the drifting thoughts break down the strongest defences if these are left unguarded. On the other hand, by being constantly on guard and vigilant, by maintaining a positive attitude, keeping our minds and thoughts pointed and directed towards the attainment of the higher life, we gain strength every time we successfully resist the entrance of any drifting thoughts, or of any evil thoughts consciously directed against us. And by keeping our minds turned in this direction, we shall attract those thoughts to us which are akin to our higher nature and which will therefore continually strengthen and uplift us.

In reply to a similar question, William Q. Judge wrote:

It has been said that "thoughts are things," an assertion with which I am prepared to agree entirely; and I also firmly believe that the time is not far off when their substantiality will be recognized and understood by science more fully than at present.

A thought implies many things besides pure force exerted. If force is exerted, then there must be that which exercises it. What is this and what is the effect of the exercise? When we think, it is known that there is a disturbance or disintegration of the grey matter of the brain. But next we must observe that there is at the same time physiological disturbance, change or alteration in the whole frame. For instance: a thought of shame or disaster or punishment may bring all over the body a hot flush or a cold shiver; the thought of a great danger just escaped has made men dizzy and women faint. Is there nothing in this? Further, each thought makes a picture. . . . Still further . . . it follows that every thought has its picture preserved, and by that means what has been done or is being done may be known unerringly. Therefore thoughts, while they may be fugitive so far as concerns the thinker, are not so otherwise, but persist as seeds for good or evil in the whole race.

But, still more, every thought leaves a seed in the mind of the thinker, no matter how fugitive the thought was. The whole sum of such small seeds will go to make up a larger seed for thought, and thus constitute a man of this, that, or the other general character.

Thoughts, then, are highly important, for, as a great Teacher has said, we are made up of thought; as we think, so we act, and will act and as we act and think so will we suffer and rejoice, and the whole world with us. STUDENT

A PROMISE FOR INDIA

by H. P.

VAST land of ancient glory, fare thee well!
 Farewell, O Aryavarta! brow-begemmed
 With Himalayan peaks. A little while,
 O home of sacred shrines, from thee we part---
 A little while, then come again. Today,
 We say, O India, humbled low, "No more
 Thou holdest sov'reign sway. The jewelled crown,
 The sceptre, and the royal robe are lost.
 Inert, with ashes smeared, with dull, fixed eyes,

Thou sitt'st before thy old-time gods and dream'st
 Of what has been, but from thy grasp lett'st slip
 That which is now." O land of jungles deep,
 O land where nautch girls dance, O sunny land,
 Land of the Rishis once, beloved home
 Of Vishnu, Shiva, Brahm, today we say
 To thee "Farewell." Tomorrow we shall say,
 "Arouse thee from thy long-time sleep. Behold
 How quick revolving cycles bring to thee
 Again, the glories of the past, but new---
 An incarnation but begun, which, when

It has attained the fulness of its growth,
 Shall far excel in grandeur, greatness, wealth,
 In learning, wisdom, what has ever been."
 The gods return. The four-fold powers proclaim
 The hour for thy rebirth has come. Once more,
 From their well hid retreats, the mighty ones
 Come forth and mingle yet again 'mongst men.
 India, arise! India redeemed, awake!
 Soa and companion of the gods, look up!
 The time of penance has gone by; the time
 Of thy redemption long-deferred, has come.

WHY this city of India, with its beautiful palaces, dwellings and imposing forts, should have been deserted when in a flourishing condition, is known to but few. It is verily a mysterious town, uninhabited, except by a few priests who live in the court of the palace, and by a small number of very poor people who live on the outskirts of the city.

The Deserted City of Amber

There are no signs of decay about the place; it seems to have been deserted only yesterday.

Up the hills the huge elephants move slowly along with majestic step, like sentinels guarding the secrets of this strange and beautiful place.

The former inhabitants of this deserted city, and the Maharajah who formerly held forth in princely state in the palace, many years ago took up their habitation at Jeypore, which is reached in a few hours' ride from Amber. Jeypore is in the heart of Rajputana, and is strictly Hindu. During several days stay of the writer, only two Occidental faces were seen on the streets. Jeypore was built in the Eighteenth century by a Maharajah of Amber, which left the latter city deserted. Both Jeypore and Amber have a poetic coloring so unlike that of the West; and there is an indescribable charm in the silent streets of Amber, and in the tall, white towers of its palace: it is fascinating and yet pathetic. One wonders what the urge could have been which forced the Maharajah to leave so beautiful a place.

To reach the center of Amber, the writer rode on a huge elephant along a narrow pathway, by the side of the wooded hills, through winding ways of beautiful scenery, under the guidance of two dark mahouts, one of whom was riding on the neck of the elephant, and the other lead-

ing the way, carrying the great key of the palace gate. Just on the summit of the hill is the imposing palace; and from there the mystery of this wonderful city is more truly felt.

Just beyond, higher up on the crest of one of the hills, is an old fortress, whose real history has never yet been given to historians. No man, it is said, is allowed to visit there, except the Maharajah, who is the only one privileged to enter the gates of this ancient place.

The people seen in the streets of Jeypore are most dignified and courteous. When they pass you, you feel the refreshing influence that comes from the absence of the Western stare, and from the gentle brotherliness which is expressed without words by these people.

"The celebration of Divali is a most interesting festival. Everything is a blaze of light, jewels, and glittering marble. Nautch girls dance, courtiers move about, torches flash and flare, strange instruments emit a weird and soulful harmony.

"In the pleasure grounds, back of the palaces of Jeypore, are great tanks filled with crocodiles; and not far off are the huge stables filled with elephants and horses. At the gates of the palace, black-bearded, warrior-like Rajputs stand on guard. An Oriental picture of wondrous beauty was this festive scene; and yet Jeypore was but the prelude to Amber."

Amber and Jeypore were visited by a number of Theosophists in 1896. The records kept of the trip to Jeypore and to the city of Amber, which contain much of great interest, have never been published. At some later day, it is more than probable that they will be presented to the public in book form under the supervision of Katherine Tingley. STUDENT

Attacks on the Revised Version

IN an article some time ago, I spoke of the strange fact that many of the orthodox have shown a strong preference for a later, and corrupt text of the Scriptures, rather than for an earlier, and comparatively correct text. The earliest uncial MSS., which bring us nearest to the time of the Apostles are, in the opinion of some of the orthodox, outweighed by the literal weight (avoirdupois) of the numerous, but corrupted MSS. of the Tenth century and onward. This is one of the almost incredible things of history, and it is difficult to account for it. It would seem that the conservatism of the churches cannot reach back beyond a certain point. The Fathers, and even later times limit the vision of orthodox conservatism. But that nobler conservatism which seeks the foundation-head, which goes back to Christ, and tries to place be-

fore us the words and spirit of the great Teacher, that they reject. It is too far back for them. If it be of such moment to believe that every word of Scripture is "God-inspired," one would naturally think that those holding this dogma would be eager to get the earliest, and therefore the best, evidence for the words written by the Evangelists. Yet, strange to say, this is not the case. They prefer the modern MSS. because they are numerous to the ancient MSS. which are, of necessity, comparatively few. And, more than that, it is people of this cast of mind who cry out against the Revised Version; who cried out against the revision of the text in the days of Erasmus, and who cried out against Jerome's translation 1000 years before. It is the same spirit in all these cases. It is the spirit which has animated some of the orthodox to cry out lately against the Revised Version. I refer now to the views expressed by certain American newspapers, such as the *Brooklyn Eagle*, the *Inter Ocean* of Chicago, and the *Springfield Republican*. The *Eagle* says the interest in the Revised Version was ephemeral; and that in it the sacred text is torn limb from limb; and has been left a lacerated bleeding mass by the butchers. Any one who could write in such a way about the foremost scholars of England and America hardly deserves to be quoted.

The Same In all These Cases

The *Inter Ocean*, while giving the Revisers pre-eminence in scholarship over those who made King James' Version, thinks that they have failed to give us as good English as that found in the so-called "Authorized Version." The *Springfield Republican* thinks the revision should be revised, and brought back to the English of the old version.

Old Version of Scriptures Liked Best

It is a very difficult thing to get people to change from a thing to which they have long been accustomed, even though they know it is defective, as we see in the case of the common English spelling, which is hopelessly bad. This is one of the reasons, and I think the chief reason, why so many have stuck to the old version of the Scriptures. They had become used to it, and did not like the change. Besides, the truth is, they did not feel such a deep, vital interest in the correctness of the words of the Scriptures—it was enough for them if certain passages had the old familiar sound.

None of those newspapers, above quoted, care to say that the old version is as correct as the new. No, but the words, in some cases, were new to their ears. The old passages had not the old ring. It was too much trouble to find out why the passage had been changed; too much trouble to see if the New Version gave us the words of the Evangelists with approximate fidelity. Now it hardly needs to be said that the consensus of competent scholars is in favor of the New Version, if for no other reason than that it is based on a fairly correct text, whereas King James' Version was not. The matter of the English is of very secondary consequence. If we use the New Version

Love of Pure Truth Secondary

we shall get to like it, as men have got used to the old, and like it for that reason; for words mean to us very much what we put into them. What O. W. Holmes says of meerschaums, violins, and poems is true of all good writings, and especially true of sacred Scriptures. The thing which is excellent is "capable of absorbing an indefinite amount of essence of our own humanity," and thus it becomes "gradually stained through with a divine secondary color derived from ourselves."

It was in no small degree because the Revisers recognized this principle that they refrained from altering the old version wherever they were not compelled to do so by the Greek text. From the days of Erasmus nearly every revision of the text or translation of it, has been a kind of compromise. The fear to offend the orthodox has often proved stronger than the love of the pure truth. The New Revision should have been a *New Translation* based on the oldest and best Greek texts. Then if the orthodox really loved Scripture for its own sake, really loved truth, they would have accepted it gladly and got used to it. But an important thing has yet to be mentioned: the interest in any version of the Bible is growing less keen.

This is a pity, though it is a fact, for the Bible is full of splendid teachings, if we could but read it apart from ecclesiastical glosses. As Christ must be rescued from the teachers of the letter so should the Bible, that collection of so much practical wisdom. REV. S. J. NELL

Literal Interpretations of Figurative Language

A PROMINENT cleric, addressing Sunday-school teachers on Science and the Bible lately, made a remark which may serve as a text for some thoughts on the question of symbols and myths generally. He said that nowadays we had ceased to take all Bible stories literally, and had come to realize that they were "imagery which clothed certain spiritual lessons." For young children there was very little difficulty, for stories were to them the natural vehicles of moral lessons, and they did not venture to ask if it were true or if it really happened. But older children wanted to know, and one must be prepared to give them an honest answer.

There is a universal language of symbology by which truths are conveyed to the enlightened understanding. And it would seem that the mind of a child is able to understand this language, whereas the mind of a grown person does not perceive the meaning and tries to extract one from the words in their literal sense. In the Bible it is evident that whole races or nations are sometimes denoted by the name of one person; as, for instance, when Abram flees from Chaldea, or where Moses sees an Egyptian fighting with a Hebrew. And similarly, in classic stories, where the history of ancient races, their wars and their migrations, are often allegorized as stories about individual heroes and warriors. Again in Hindu sacred lore, Vaivaswata Manu represents the original Aryan race.

It will surely be realized ere long that to take an allegory literally, or to interpret the picturesque and hyperbolic style of oriental description in the same literal way as we should interpret a recipe book, is to evince a total lack of the sense of humor, and to pose as a pedant of the most portentous solemnity.

The key to an understanding of ancient myths and symbols lies in a much wider and more generous culture of the intellectual powers and the imagination. The "scientific" eye is much too narrow in its field of view, and what it sees is distorted by the dusty spectacles of theory and prejudice. One needs to be a poet as well.

Take, as an example, the legend of the "Thunder-Bird" given in the NEW CENTURY PATH, Vol. VII, No. 52. Was this bird that came and taught people how to raise huge rafters, and that afterwards assumed human shape, a real bird? Or may the Indians be allowed to have used metaphor or imagery?

We forget, too, that all our own writing is highly metaphorical and symbolic, and would seem strange indeed to a reader not bred in the peculiar notions of modern civilization. Especially is this the case with our science, which has an abracadabra and jargon quite peculiar to itself.

STUDENT

Ancient Beliefs about Bells

ONE respect in which it must be admitted that we can scarcely claim to have surpassed ancient and heathen craftsmen is the casting of bells. The material now used, three parts of copper to one of tin, is the same as that discovered by Layard at Nineveh. Some of the largest bells in the world are in Buddhist temples; and Huc, in his *Travels*, gives an account of a Chinese bell-foundry in which very large bells are cast with what we should call primitive apparatus, and beautifully embossed and carved.

Bells were at one time "baptized," even in Christian England, the old pagan custom being, as so often, grafted on to the adopted religion. The Bishop performed a solemn ceremony, in which candles were burnt, the bells incensed, washed with water in which salt had been sprinkled, anointed with holy oil and the sign of the cross, and solemnly dedicated. It was believed that their music could drive away devils and dispel storms—a heathen superstition. Nowadays we have no devils, and so there is no need to drive them away; and, as for storms, they are caused by the sun's heat acting in conjunction with the earth's rotation and the varied contour of terrestrial and oceanic areas, modified by electrical and magnetic forces; and to pray to that would be ridiculous.

Silver is, curiously enough, almost as dull for bells as lead; and the votaries who used to cast their gold and silver ornaments into the melting-pot, did not add to the value of the bell—at any rate not in any sense that would be understood nowadays. Yet they may have imagined in their ignorance that a bell containing the embodied tokens of so much generosity would possess enhanced charms against the devils.

The Passing Bell, now tolled to announce that some one *has* died, was

formerly rung *during* decease; it being imagined that the departing spirit was protected thereby. Our ancestors seem to have regarded the passing of the spirit as a natural process which could in some way be facilitated and safeguarded by human care; which was surely irreverent enough.

H. T. E.

People's Doubles

MUCH interest has been aroused abroad by a judicial case turning on mistaken identity, and letters are being written to the papers from all quarters giving instances of people who have doubles; usually from the people themselves, complaining of the way in which they are accosted by strangers. The case is rather serious when a man of position and credit has a double who drinks at bars, as one correspondent complains; but it becomes even more so when a man is arrested and identified by numerous witnesses instead of his double. In cases of real duplex character the police say that it is no unusual thing for a criminal to be his own double; that is, to live a twofold life, half as a respectable citizen and half as a suspicious character.

An ancient doctrine has been unearthed to the effect that God creates people in pairs, but this will not account for the cases where people have many doubles. Such cases, however, are usually prominent men whose features are well known to every eye, and the resemblances are only in broad feature and not in detail.

E.

All-Round Character of Japanese

A WRITER on the Japanese who are coming to America to engage in rice culture, says that one cannot tell, when he employs a Japanese, whether he is the common laborer he pretends to be or the son of some dignitary, or commissioner of agriculture, or representative of a banking house. All conduct themselves in the same manner, live in the same style according to the station of a farm hand, and work as industriously at the plow and other duties. All have a substantial banking account.

This is an example of the all-round development so much prized by the wise. Labor should be regarded as a privilege in which all may share, as they share the air and sunshine; but fashion has made it a sign of degradation. A division of society into a class that does not labor and one that does nothing else, is bad for both. Aristocracy should be based on character, not on occupation.

STUDENT

Deepening of the Mediterranean

IT appears that the Mediterranean is rapidly deepening itself—that is, rapidly as geology reckons time. In this case the deepening seems to be about 9 feet in 2000 years. The evidence is this:

Formerly a bridge 3000 feet long united Leucade to the Continent. It is no longer visible, but its foundations are 11 feet below the surface of the water. At Rhenea a submerged dock of Roman construction has been found about 9 feet under water. And at Itea, in the bay of Amphissa, there is a mole also 9 feet submerged.

Is Atlantis still sinking by way of balance to Lemuria's tendency to rise? For now and then the appearance of small islands in the Pacific is noted.

STUDENT

Pugilism in a New Light

A NOTED ex-pugilist is now teaching boxing in connection with a New York church. His class is large and growing, and he himself is a member of the church. The two reverend Fathers are in thorough sympathy, even enthusiastic, says the *New York Sun*.

The pugilist was duly interviewed, and we learn from him that "the Church and the Ring are being drawn closer together each day . . . boxing should be encouraged in every church in the country."

In these days of "smoking Sunday services," magic lanterns in the pulpits, and other devices for constraining the reluctant to listen to sermons, how would a short preliminary pugilistic contest do, say of five rounds? What may we not expect?

H. C.

Frontispiece---William Quan Judge

THIS week's cover page of the NEW CENTURY PATH contains the face of Wm. Q. Judge, the second in the line of succession of the world's Theosophical Leaders. Mr. Judge succeeded to the Foundress of the Theosophical Society, Helena Petrovna Blavatsky. A successful lawyer, a brilliant writer, and a man of extraordinary insight into human nature, he was well fitted to carry on the great humanitarian and philosophic work of H. P. Blavatsky.

Some Views on XXth Century Problems

Against Old Age

IT does not seem impossible to frame a prescription against old age, if by that term we do not mean mere numerousness of years. There is no doubt that the causes of senility begin to be generated very early in life, and there is also no doubt that many of them could be prevented or antagonized.

The condition of senility is one of *fixed habits*. Why permit any habit that cannot show a pass marked "useful?" Why fix 11:15 as the hour for a morning walk, and be seriously disturbed because something compels its postponement to 11:20? Habits will grow like fungi, and ere we notice, the living center is wholly overgrown.

The senile mind *lives in the past*. This habit we cultivate all through our years. Looking with a stayed satisfaction on something done, instead of being alert to that which now presents itself, is one root of this habit. Longing for the repetition of any scene gone by, is another. Longing for a future event connected with our own personality, must be another, or perhaps another aspect of the same.

Old age *resists new views*, cannot accept new personalities into its range of interests, cannot hold its attention long upon what others are saying. It lives within. The antagonism of this is to take great care to understand and appreciate new views, to be interested in all human sincere beliefs, to arouse oneself habitually to a brotherly touch with every one entering one's life or even only quickly crossing it; and when others are talking, to refuse to permit attention to sink back into the rut of memories and half thoughts that make up most persons' inner current.

There are two great vivifiers of consciousness. One is to keep it ever responsive to human needs and pains, beginning with those about us, and expanding to the whole field.

The other vivifier is the soul, that center of higher mind, life, will, and consciousness, which is a constant light in the heart. All humanity's teachers have enjoined it upon us that we should daily renew our life at that fountain. It does not get old; its pulsations never cease; it is the bridge to immortality. It was of it that the real alchemist spoke as the elixir of life.

To all this resistance to mental stiffening, there is a physical counterpart. Muscles should not be permitted to shorten and stiffen, nor joints to set. The body, like the mind, needs to be held alive and mobile everywhere.

STUDENT

Bowler-izing History

A CURIOUS light upon the limitations of John Ruskin's mind is thrown by his comments (quoted in a contemporary) upon certain of the books recommended in Sir John Lubbock's list of "The Hundred Best Books." Ruskin objects to the works of Kingsley on various grounds, but especially to the story of *Hypatia*, because "it is the most ghastly in Christian tradition, and should forever have been left in silence." On the same general ground, the martyrdom of Giordano Bruno, Joan of Arc, and many another should be left unrecorded. But is it not by the study of the lives of the great martyrs that we come to understand the force that has ever tried to block the path of human freedom and progress?

On somewhat similar grounds Ruskin objected to Gibbon. "Primarily none but the malignant and the weak study the decline and fall of either state or organism." This astonishing opinion, obeyed as an injunction, would preclude our ever understanding any of the causes that have wrecked the civilizations of the past. History would become a meaningless pageantry of wholly disconnected scenes.

Ruskin objects to Voltaire also: "He has no place in the library of a thoughtful scholar." Here we have the same keynote. Voltaire, amid much rubbish, wrote criticisms of his time which helped to awake the forces of the revolution, to make history.

Ruskin undoubtedly affords many minds a certain stimulation; but there must have been in him an unwillingness to face the whole of the facts of life, or an inability to see them, which takes him out of the category of the great guiding lights of our time. STUDENT

Our "Diffuse Consciousness"

THE senior physician of one of the largest lunatic asylums abroad, in a recent lecture, characterized the mental state of the majority of the civilized races as one of "diffuse consciousness, of an ill assortment of barren facts and ideas;" and their mental processes as wanting in seriality of thought, closely allied to, and readily passing into, states of actual dementia.

Dementia, he added, is largely on the increase; and by way of cause, he pointed to the over-education, and premature, and faulty, education of children, and to the system of cramming for examinations. This last evil has been pointed out by every critic of education for a generation. We all agree about it, and it may be supposed that our "diffuse consciousness" is the reason why we cannot focus our disapproval into a practical emendation.

We are all aware of our diffuse consciousness, and we have evaded all sense of shame by means of a theory of mental limits. Finding that our minds are unable to remain still enough to sink beneath the phenomena of the world into the underlying reality, we have decided that the reality is "unknowable." Our minds, we say, can cognize and deal with nothing that has not come to us by way of the senses; and as the senses deal with nothing but surface shows, no more can the mind. We are not at all bothered by the fact that the preliminary statement is not true; that the mind can get, and deal with, and talk about, waves of inspiration from the higher nature; that it can understand such ideas as those of love, duty, and the like. And, thus entrenched in our self-permitted ignorance, we are compelled to deny that mind, stilled by a steady will, can transcend the senses and enter into relation with the living reality of which all that the senses perceive is the veil.

So the education we give our children is the outcome of our theories. We sin against them by commission and omission: on the one hand we grievously overstrain the fact-learning function, and on the other we leave the deeper faculty whose use gives life and happiness, unused and therefore undeveloped. "Raja Yoga" is the development of this.

STUDENT

Imagination as a Power

THE ordinary person, asked to define imagination, would probably explain it as the power of creating mental pictures which have no correspondence in fact. It is because we limit our idea of imagination to that definition, that we fail to use it for the transmutation of our whole lives.

Granted—but only for the argument—that imagination cannot mould external actualities, it has great moulding power over our inner attitude towards the externals. Man can foreshadow himself, and then move into his own creation. The very trifles in which we do even commonly use the power, might reveal in part a great secret.

Lying down in bed, we resolve to wake at a determined hour in the morning. What is that but an imagining of ourselves as awake at that hour? We have created in advance the awakenss, and at the determined hour we harmoniously move into our creation.

Men and women, honestly trying, fail a thousand times to surmount their weaknesses because they do not rightly invoke their imaginations. The picture they are creating and holding is *that of themselves failing*. And so each time they move into their own failure. Why not imagine the existence of the external conditions, whatever they are, that are the field of failure: and then imagine themselves in that moment triumphing, at once feeling the temptation and the inner strength and exaltation which makes it no temptation?

This use of imagination awakens will; the holding of the created thought draws into it the will current which, moment by moment, makes the subsequent realization more certain. At last it is easy to see how men, holding through life the idea of their extinction at death, or of their joyous birth into a new consciousness of life, may actually secure the *reality* of the latter and the strange *realization* of the former—a consciousness that has persuaded itself of its unconsciousness! Brief Glimpses of the Prehistoric World

Archeology
Paleontology
Ethnology

The Australian Aborigines

THE Australian natives are the degenerate descendants of the Lemurians or Third Race, whose chief location was the continent occupying what is now the South and Central Pacific and represented only by the islands in that quarter. Most of the Third Race progressed, and from them, through the Atlantean or Fourth Race, the present "Aryans" are descendant. But a few were untrue to the divine spark, and, lapsing into bestiality, produced degenerate descendants.

Modern speculation has puzzled itself over the question of the origin of the Australians. No influence from other races can be traced and they have evidently been long isolated. If they ever migrated from any spot that might be supposed to be the cradle of the human race, it must have been untold ages ago. One writer, we learn, "has seriously promulgated a theory connecting the central aborigines with the lost Ten—" but enough.

But little of value is likely to be discovered by researchers who approach their subject with contempt instead of respect; and the following case illustrates the kind of spirit which seems to be thought fitting on the part of ethnologists. In an article on the aborigines it is mentioned entirely without comment that a book is profusely illustrated with photographs

depicting scenes in connection with the most exclusive ceremonies, all knowledge of which is carefully kept hidden from all but initiated members of the tribe. In explanation of how it was they were allowed to see, it was pointed out that one of the authors has spent the greater part of twenty years amongst the Arunta tribe, and that both of them are regarded as fully initiated members of the same tribe.

One of the symbols used in the ceremonial of one of the totemic families, and drawn on the ground, represents a circle or disc with five wavy arms or tentacles; and there are three other discs around it. E.

Mountains Were Sacred in Antiquity

AT the last British Association meeting, the chairman of the Geological Section devoted his address to what is described as an enthusiastic panegyric on mountains. He remarked, among other things, that it was merely one of our self-complacent errors to regard the moderns as the only venerators of mountain scenery, and the ancients as having had no soul for such things. It was a primitive and universal instinct. He referred to the various historical peoples with whose love of mountains we are familiar, such as the Hebrews of the Bible, and the Greeks; and cited Olympus, Parnassus, the Delphic cliffs, Ararat, etc., as well-known instances of sacred mountains; and the modern example of the Japanese Fusiyama. Also, shrines and temples were found on mountain-tops, which were the goal of pilgrimages made by devotees who believed that "they fell there more readily into spiritual trances."

We cannot think of any great civilization of the past that has not had its sacred mountain or mountains. India, with its Mount Meru, is a notable instance; and, though the identity of that sacred peak is lost to modern knowledge, the towering summits and plateaus of the Himalayas are still regarded, both by the Hindus on the one side and the Thibetans on the other, as the abode of all that is sacred and pure, and the fountain of divine knowledge and influence. It is unnecessary to speak of Sinai where Moses received the Law, of Lebanon, of the mountains on which Elijah and Elisha disappeared from mortal sight, or of the mountain on which Jesus was transfigured. Students of classical history can recall plenty of instances of celebrated mountains in classic times.

In America, and everywhere where the relics of ancient empires and ancient faiths are found, mountain tops still preserve the foundations of

TO THE MUSES

by WILLIAM BLAKE—Selected

WHETHER on Ida's shady brow,
Or in the chambers of the East,
The chambers of the sun, that now
From ancient melody have ceas'd:

Whether in Heav'n ye wander fair,
Or the green corners of the earth,
Or the blue regions of the air,
Where the melodious winds have birth:

Whether on crystal rocks ye rove,
Beneath the bosom of the sea,
Wandering in many a coral grove,
Fair Nine, forsaking poetry:

How have you left the ancient love
That bards of old enjoyed in you!
The languid strings so scarcely move,
The sound is forc'd, the notes are few!

temples. Churches have always been built on hills; and in this connection one is reminded of those curious stories, for which the cumulative testimony is so strong, of foundation stones for prospective churches being mysteriously transported in the night from valley to hill-top, presumably by nature spirits whose haunts would have been disturbed.

It is an interesting characteristic of the early inhabitants of Western America that they built their dwellings high up among the lofty cliffs, amid sun and pure strong air, and not in shaded valleys as the people of the old world have so often done.

Following this ancient western tradition, the inhabitants of Lomaland dwell on the summits, overlooking ocean and land, and the Raja Yoga School and Academy are built high up in the golden sunshine and away from the stagnant influences of valleys.

Even now, in its materialistic way, the world recognizes the healthy, exalting influence of high places; but the ancients recognized in the mountain-tops an influence far more potent and refined than can be described even by the phrase "spiritual trance." But only those who can ascend the mountain-tops of their own inner nature are able to discern the pure influences that nature breathes on her summits. There is nothing in our present modes of worship that prevents them from being celebrated in the most low-lying and crowded areas. A modern fashionable church, a séance-room, a stock-exchange, a saloon—how out of place would these modern sanctuaries be on a mountain top? E.

The Bamian Statues

THROUGHOUT all ancient tradition we find unanimous mention of a race of giants which peopled the earth and were dispossessed by heroic light-skinned noble invaders from the mysterious Aryan source. These giants were wicked, being sprung from "sons of God" who had prostituted their divine powers to lust and earthy power, thus breeding a race mighty in stature but without the light. The early chapters of the Bible tell of them, and of the huge tower they built. Similar Cyclopean masonry is found in various places and tradition ascribes it to the same source.

The Bamian statues are the largest statues that have been found. The largest is 173 feet high, or 70 feet higher than the Statue of Liberty. Two others are 120 and 60 feet, and there are again two still smaller ones. The largest represents a man draped in a kind of toga.

Bamian is a small half-ruined town in Afghanistan at the foot of one of the summits of the Hindu Kush. The cliffs which line the valley contain the remains of massive stone towers, and their faces are for six or seven miles honeycombed by innumerable ancient cave-dwellings. The site of the ancient city is marked by mounds and the remains of walls and other buildings. The statues are carved in niches in the cliff; they are much disfigured and are coated with stucco. On each side of the niche of the greatest statue are stair-cases leading to a chamber near the head, which shows traces of elaborate ornamentation in azure and gilding.

The ancient city, named Djooljool or Ghulgulah (according to different transliterations) was destroyed by Genghis Khan.

Archeologists consider the figures to be Buddhas, citing as evidence the enormous ears. But H. P. Blavatsky maintains them to be the work of the gigantic race mentioned above, adducing much collateral evidence in support of this contention. The large ears are an ancient symbol of omniscience, as of "one who hears all." Many vestiges of these ancient gigantic races yet remain to be discovered, and are every day being discovered. There are vast unexplored tracts in Central and Northern Asia, where desert sands hide the ruins of cities and mighty structures devastated by that Napoleon of devastators Genghis Khan. Their discovery will fill more gaps in the pages of history and vindicate the authority of the venerable records for which H. P. Blavatsky so cogently argues. E.

The Trend of Twentieth Century Science

"The Study of Human Nature"

AS in America, so in England, hypnotism is about to take a new step into official scientific recognition. A society has been formed "for the study of human nature"—the Ethnological Society—and at its first meeting Dr. Hollander will give an address arguing that hypnotism, "properly employed," is a great aid to medical science, and "incidentally" (!—we quote from the naive newspaper report) to humanity. It reads like a too frank defense of vivisection. The parallel is correct enough.

The science of today will hardly get at the secrets of human nature till it acquires more respect for the science of the past, and also acquires the courage not to be stayed by the word "superstition." That word is indeed the closed gateway to larger fields of knowledge than our generation dreams of. Already a few, even in the front of the scientific ranks, have opened it and passed in a little way; but they dare not speak, dare not suggest even that Paracelsus was not wholly a quack, a "charlatan" however "magnificent," or that Van Helmont knew some things better worthy the attention of modern medicine than everything written on hypnotism since Charcot and Liébeault officialized the subject. Surely the study of human nature, like charity, begins at home; in the study of the forces that play in our own consciousness, that tempt us to evil and inspire us to good, of their hidden roots, and of their relation to will and imagination and the centres of creative vitality. With this study the ancients began their investigation of man, and they carried it down to the point where modern psychology and physiology of the laboratories stops. The science of human nature of the future must blend the two. So only can its experiments and statistics get their full illumination.

STUDENT

Indigestible Ants

WE all know that it is one of the ways of Nature, in protecting her creatures, to confer some gift upon them. Either they resemble the leaf, or what not, on which they dwell; or they have an odor or taste very offensive to those who would otherwise consume them; or they resemble some other creature who has, or who stings; or—and so on forever.

In all these cases it is *each individual* who possesses the safe-guarding peculiarity.

For many reasons one may be sure that in the eyes of Nature, a colony of ants—like a hive of bees—is an individual. What *we* should call a class or group of individuals in the colony, *she* regards as an organ in the collective individual.

It would appear that there is a species of ant, described by Edmund Selous in his *Romance of the Animal World*, in which each colony (Nature's "individual") contains a small group (Nature's "organ") set apart for defence of the whole against birds. But the defence consists in their being so absolutely indigestible, so productive of post-prandial discomfort to any bird that does eat one, that the whole species is almost immune against bird-attack! For the bird cannot distinguish this class from the rest of the colony, and so has learned to avoid the whole.

How Nature brought this amazing variation into being, no one can say—unless we assume that she is intelligent, which is very unscientific!

STUDENT

Photography in Colors

THE great problem of photography in colors must certainly be nearing solution; but it cannot as yet be *shown* to be doing so. From time to time the newspapers announce that someone has solved it, but the next week's issue "enables us" (with a certain superior air) "to announce that there is no truth, etc."

Dr. Koenig was the last investigator credited with the invention. But it now turns out that he has only discovered a curious effect of light on certain dyes. Mixed in the dark, the compounds are colorless; exposed to light, the ingredients resume their natural colors. This is nearly as far off as ever. What we need is a compound which on being exposed to light of any given color, yields *that* particular color. STUDENT

Narcotic or Stimulant?

NO small part of the evil of alcohol-taking in our time is due to the use of the word *stimulant*. The word conveys the idea of an awakener of vitality, and carries almost a psychological suggestion. Would it not be better to take a word nearer the facts, even if we come to the exact opposite and have to say *narcotic*?

There is a set of mechanisms in the nervous system which have the function of *restraining* the output of energy in various organs. The heart has one of them. Now if this heart-restraining center is paralysed, narcotized, the heart will of course beat with greater energy and speed. But is that true stimulation? Is it comparable to sunlight, oxygen, or good news?

Another of these regulates the calibre of blood-vessels. If this is paralyzed, the vessels left to dilate, and the brain flushed with blood, can we call it stimulation, even if, as a result, thought runs quicker?

The whole of the effects of alcohol are thus explicable as a set of paralyses, the checking or inhibitory mechanisms being the first affected. The process can be followed out almost to any degree of detail.

We cannot speak of alcohol as paralysing the higher nature, and thus leaving the lower to riot more or less unchecked; but we *can* say that it deadens the response of nerve elements to the fine touch of the higher nature and makes the personal man less and less aware of the note from above which now sounds ineffectively.

So we may justly appeal for the use of a fresh term, better applicable to facts, carrying no false suggestion and betraying no one into an action which he would not lightly risk in fuller knowledge. PHYSICIAN

Alcohol as Food

IT is now pretty generally accepted by medical science that alcohol *is* a food.

That means that the body can actually consume and burn it as it does sugar. But only a very small quantity; if the dose is more than about one-and-one-half ounces, the surplus is thrown off unchanged.

But it is also agreed that it is the very worst of all foods. In the very act of playing that rôle, it also poisons. So its description as a "food" is for scientific rather than popular reasons. Says the *Lancet*:

Sea-water may be used in the boiler of a steam-engine, and the steam from its evaporation will transmit the energy of the fuel to the revolving wheels; but its corrosive action on the steel forbids its use except in emergencies. We commend the analogy to our thoughtful readers before they commit themselves to a definite answer as to whether they should class alcohol as a food in the widest sense of the word.

To use another analogy: it may hereafter be found that some part of a dose of quinine or morphine, used as medicine, is consumed in the body, and to that extent answers to the definition of food. But would they ever be so used by any sane person?

One cannot but sincerely regret the use of the word "food" in connection with the use of alcohol. There are plenty of people only too eager for any sort of excuse for the use of this particular drug. PHYSICIAN

Color in Crustacea

COLOR in crustaceans has been studied by naturalists with interesting results. The common crustacean, *hyppolyte varians*, which inhabits the sea-weeds around the shore, matches the colors of the weeds with wonderful accuracy. Its tints vary through green, yellow, brown, and red; and it invariably makes for a kind of weed having the same color as itself. It can change its color to suit its surroundings, and it has been found to have three pigments, red, yellow and blue, by which it can operate a "three-color process." This power of changing color is usually ascribed by naturalists to a desire for self-protection; but this theory seems more in harmony with the wooden survival-of-the-fittest theories of nature than with a broader and more balanced view of universal life. Nature's color effects are pleasing and harmonious; and no doubt the beast merely fulfils the general law of harmony and fitness when he seeks to adapt himself to his surroundings. He feels more at home where he belongs, just as we humans do. E.

The Whims of Breezes

Of all the nature-spirits, which were known in earlier times, those of the air seem to have been the first forgotten; but now that we have re-admitted what we knew all the while—that all natural phenomena are the actions of unseen beings, we may restore the Ariels to our list of acquaintances. No doubt everyone, in the rural districts, has had frequent occasion to notice the existence of currents of warm air on a sharply cool morning, even when there is quite a noticeable breeze which would seem certain to sweep them all away or mix them together.

What is it that keeps these warm currents separate? May it not be that there is an atmospheric condition which we cannot perceive otherwise than as a difference of temperature?

Then again it will sometimes happen that a wind strong enough to make the tree-tops sway, will scarcely flicker a lamp-flame; while some mischief-loving little zephyr, so slight as to be scarcely noticeable, will puff out a lamp in an instant, or tug at the flame till he wears it out. One night it was perfectly calm, not a breath stirring, when all at once a runaway gale swooped past; shaking all the trees, tossing up the dust and chasing shingles and papers furiously about; all at midnight. In two or three minutes he was gone and there was the same perfect calm as before.

Then there are the steady, business-like winds which go straight ahead, evenly and gravely, and other frisky little breezes that travel by starts and whims, stopping to run around a clump of trees, or to throw a bushel of dry leaves into an old hawk's nest, or to take a hat off to play with. Indeed it takes but little observation to find as much and very similar difference of character in winds as in people; and even insane madmen, like cyclones.

Meteorology and psychology may yet prove to be more closely allied than we have heretofore supposed. Y.

The Night-Blooming Cereus (Cereus Grandiflorus)

It would be difficult to conceive of a more beautiful flower than the night-blooming cereus. The plant belongs to the cactus family, but has no spines. Its leaves are really flattened or winged stems which bear on their edges buds that grow into blossoms or into other leaves and stems. So the plant in bloom presents the peculiarity of having its blossoms hang from the edges of its leaves by the long curved tubular portion of the flower, which is about twice the length of the spreading portion. In the illustration given the tubular part of the flower is

NIGHT-BLOOMING CEREUS

by Mrs. S. C. HALL

STRANGE flower! Oh! beautifully strange!
Why, in the lonely night,
And to the quiet watching stars,
Spreadst thou thy petals white?

hidden except in the case of the bud at the top. Here it may be seen where it springs from a leaf and passes downward through shadows and then curves upward into the swelling bud. This tubular part and the outer narrow floral leaves are more or less pink in hue, while all the rest of the floral leaves are purest white in color and waxy in texture.

But the most interesting, unique and beautiful part of the blossom is that within the chalice of floral leaves. The long style, tipped with a circle of radiating long white fingers, as may be seen in one of the lower flowers of the picture, lies along the inside of the lower petals, and is bordered on each side by stamens, massed together at first and parallel with the style, but afterwards curving upward over it forming an avenue to the center of the flower.

The fragrance of these flowers is equal to their beauty and is present all the time, but at regular intervals they breathe it forth in such volume and with such force that all the surrounding air is filled with it. This is their sweet and cordial invitation

to the distant creatures of the night that are their special helpers. Those that are near may read their welcome in the marvelous beauty spread before them. And what a welcome must they find if the nectar equals the loveliness and the fragrance. Right in the doorway of this home of sweetness and grace is the open hand with its long dainty white fingers outstretched, and into this hand the happy guest may lay his burden of precious dust as he goes joyfully on his way down the anther-bordered avenue to the inner banquet hall, taking with him when he leaves another precious gift for another flower hostess. STUDENT

Beauty in Nature

“NATURE is a sea of forms, radically alike and even unique. A leaf, a sunbeam, a landscape, the ocean, make an analogous impression on the mind. What is common to them all—that perfectness and harmony, is beauty. Therefore, the standard of beauty is the entire circuit of natural forms—the totality of nature; which the Italians expressed by defining beauty *il piu nell uno*. Nothing is quite beautiful alone: nothing but is beautiful in the whole. A single object is only so far beautiful as it suggests this universal grace. The poet, the painter, the sculptor, the musician, the architect, seek each, to concentrate this radiance of the world on one point; and each in his several work, to satisfy the love of beauty which stimulates him to produce. Thus in Art, does nature work through the will of a man filled with the beauty of her first works.”

LYZEKIL, SWEDEN—A TYPICAL COAST LINE

Strength and honor are her clothing and she shall rejoice in time to come.—Proverbs xxxii: 25

A GAIN has come the Christmas-tide, that blessed season "which engages the whole world in a conspiracy of love." Yet to mothers it brings peculiar problems and even temptations, particularly to those who long to bring their children happiness of the right kind.

One great problem is that of children's toys. It is the mother who selects the toys which are to be placed upon the tree; the toys whose influence on the lives and characters of her children is far more significant than she realizes. Yet how many mothers know what is really at stake as they pass down long aisles in front of the toy counter in some great store?

Long ago, in some of her earliest talks to mothers, Katherine Tingley pointed out to them their greatest need at this gift-making time—*discrimination* between toys which help to unfold all that is purest in the budding soul, and those that merely feed the love of power and generate a spirit of cruelty.

The child has a right to *the proper kind of toys*. Who would deprive him of the opportunity to enter in spirit into the great industrial life of the world? Surely no one who has even a spark of compassion in his heart. Give him, then, his building blocks, the little hammer and nails and saw, but *teach him to use them as they should be used*. It is just here that the mother finds the need of a knowledge of Raja Yoga, or, in other words, of "sanctified common sense."

And as to depriving the child of whips, toy pistols, pop-guns and bean-shooters—ask any normal child which is the greatest joy—to watch the birds come and go in his yard, caring daily for the little pan of water and the meal of crumbs, shielding the birds in nesting season,—or to kill them with the bean-shooter? Children are not approached in the right way, that is the difficulty. How many parents wish their boys were not cruel and selfish and yet treat them constantly as if they were!

And above all, let the child have toys which teach him love of life and compassion; and then show him how to be careful of them. The child who is allowed to tear to pieces his little woolly lamb, or to whittle up his building blocks, will, later on, be cruel to the pets about the house, willful, and destructive to household belongings.

Yet mothers have a still greater problem at Christmastide and that concerns the toys given their children by fond relatives. It is just here that they should enter their province and claim their right, which is the right to select such toys as their children should have according to their

The Mother at Christmastide

best judgment and to discard the others. If it is impossible for the mother to do this, then let her see if she can-

not turn disadvantages into advantages. Take for instance, that common Christmas gift, the tin soldier. Well, do real soldiers always spend their time shooting each other and cutting each other's heads off? Is it not possible for the child to play that his little soldiers are guarding some citadel or building a great fort, as the Pilgrims built their fort for protection's sake and for peace? May not soldiers as easily be Builders as Destroyers?

Just such obstacles as these may be used as stepping-stones to the Great Opportunity. Wisely unselfish mothers are true magicians—and let us not forget, *at Christmastide*, that as there is an unselfishness of wisdom so there is also an unselfishness of folly. Such as these will transmute—easily, joyously, naturally—every destructive tendency of the child's nature into one that is creative, upbuilding, upward-striving.

Then, most important of all, let the mother ask of herself these questions: "What does the Christmas festival really mean? Shall it help my child to live the next year better, or shall it prove a hindrance? Is my child a soul or is he a body, merely? Shall I degrade him by giving him what he may think he *wants*, or shall I give him what I know is best? Shall I, through mistaken kindness, allow him to cram his stomach with sweets, spoiling his temper, ruining the day for himself and for others, and planting seeds of perhaps serious illness; or shall I fill the day with joy and the sweet, pure pleasure that comes from wholesome games and an unselfish sharing of wisely selected toys?"

Children, let us not forget, are far nearer to that real light than are their elders and they understand more quickly than we do how much more blessed it is to give than to receive. Let the mother see to it that her child plans some little gift for each member of the family; that he helps, too, in preparing for the festival; above all, that he learns some new song to make the others happy on Christmas Day.

In giving to mothers a better understanding of child nature, Theosophy becomes at Christmas time a veritable benediction to the race. It is only the mother who has a true insight into the child's nature who can put aside the momentary wish to gratify the child's whim and hold to the vital problem of what is for his best good. Truly, the mother who has Raja Yoga in her soul; in whose heart is that light which lighteth all problems and maketh possible the fulfillment of all peace, has the key to the door which shall some day open, that the whole race may pass into the realms of the illimitable and the pure. STUDENT

A Japanese Woman's College

LAST week we visited the School for Peeresses which was founded fifteen years ago by the Empress Haruko. It stands in one of the most aristocratic parts of Tokyo and, except that it is very simple in its appointments, seems like other high-class private schools for girls. Something over four hundred Japanese girls from the best families attend here, and are instructed in very much the same branches as are our girls at home. We visited a number of the classes, among them those in drawing, sewing, painting and science. The English teacher, a woman, said that the course comprised twelve years, the girls being admitted usually about the age of six and graduated at about eighteen. Besides the usual branches, English and French are taught. One feature impressed us most favorably, which was a recess of fifteen minutes after each recitation. The girls were all interesting types, slender, fair-faced, with light skin and jet black hair. Their hands and feet were exquisitely small and dainty and they dressed, I am glad to say, in their native kimono.

Just now the Empress is superintending the preparation of medical supplies for the army. She is still actively interested in the School for Peeresses, but the war at present occupies all her attention. Her name, Haruko, reads in translation, "spring-time." She was brought up, of course, and educated in the old way, as might be expected in the case of a family as conservative as her own. But she has become, however, most progressive, and has been one of the first to assist her husband in introducing modern ideas.

Contrary to the ancient custom, she frequently appears at ceremonies and public entertainments, and one can understand, seeing her dignity and her sweetness, why the Japanese people are so devoted to her. Those who are best informed as to the "woman question" in Japan, tell me that for the great advance made in recent years the Empress is chiefly responsible.—*Extract from Tokyo correspondence*

THE Queen of England recently commissioned two ladies, Miss McCall and Miss St. Aubyn, to make a tour of inspection of Japanese hospitals. They received, besides ordinary courtesies and privileges, the opportunity of going upon a Japanese hospital ship and of seeing Japanese methods of army nursing.

Their report was wholly commendatory. They said, "The Japanese carry out their work in a most creditable and admirable fashion. It was splendid, wonderful. The medical science and nursing skill of the Japanese are equal to anything that could be seen in any European nation."

FROM Rome comes the news of the death of Rosalie Montmasson, the only woman who took part in Garibaldi's famous expedition of one thousand in the conquest of Sicily. Rosalie Montmasson's courage won her a decoration from Garibaldi's own hands, on the battle-field.

AT SLAGEN, Norway, was recently unearthed what was evidently the pleasure yacht of the wife of a Norwegian chieftain. It dates from about the year 900 A. D. No weapons were discovered in the boat but, instead, a loom and other housewifely articles.

SOME four thousand women in Germany are now engaged in the government telephone service. On their withdrawal from active labor, they are given a government pension on the same terms as men.

A WOMAN, Mlle. Virginie Loveling, has been for many years at the head of Flemish literature in Belgium. She is famous not only for her charming verse, but for several remarkable and scholarly novels.

What Constitutes Crime?

TWO sisters who kept a little candy store in Brooklyn, New York, have been recently committed to the County Asylum for the Insane as the result of the worry induced by careless gossip. These sisters, Ryan by name, were of unblemished character, but their prosperity aroused the jealousy of a woman who lived near by. She started scandalous and utterly false stories which, the sisters hearing, became the cause of continued anxiety to both. This undermined their health and at last brought on, in one case acute hysteria, and in the other case, melancholia.

Where lies the responsibility in such cases as these and can the action of this gossip monger be described by any other term than crime? And what more startling evidence of the inadequacy of our statutes than the fact that the jealous, murderous-minded individual who has wrecked two lives still goes scot-free? There is, however, a Higher Law, and its final judgment upon law-breakers such as this woman will be something not gracious to contemplate. E.

A GLIMPSE OF THE HALLWAY IN THE LOMALAND INTERNATIONAL HEADQUARTERS

IAM the woman, the light in darkness. I come, I light darkness that becomes an illumination. I tear off the eye of Horus when is suppressed his coming at the festival of the fifteenth. I am the woman, the light in darkness.

—From the Egyptian "Book of the Dead"

MISS JEANNETTE GILDER was one of the first women to engage in newspaper work in this country. Had she written nothing beside her remarkable book-reviews, she would have won an important place for herself in the profession of journalism. She is well known as an author.

IN THE reigns of Henry III and Edward I, four abbesses were summoned to Parliament, and as late as the reign of Edward III, ten peeresses received writs to take their seats in that august body. So much for woman's rights in the old days.

IT WAS Artemisia, Queen of Halicarnassus, who assisted Xerxes in his expedition against Greece. Her valor caused him to remark that his men all fought like women and his women like men!

THE prize offered recently by a leading newspaper of one of our large cities for the neatest home garden in the city, was won by a woman who was old, poor and infirm.

CHINA has a National Biography, devoted entirely to women. It contains more than 24,000 names. What will be the measure of revelations on the "woman question" in that day when China gives to the West her real historical records? Doubtless we shall meet surprises little foreseen.

OUR YOUNG FOLK

Elsie's Christmas Dream

IT was the day before Christmas and Elsie had attended the Lotus Group meeting that afternoon and had heard a Symposium given by the Lotus children. It was called *Little Philosophers*, and it told about certain "stumbling blocks" which kept boys and girls, and other people, too, from becoming warriors for the right. At the end of the play the "Little Philosophers" had chanted, "To glorify the living word of Christ; to help Humanity; to make Theosophy a living power in all lives."

Elsie went home a little more thoughtful than usual. She was a good girl, when she took the trouble to think. But she often acted and spoke without thinking,—she thought it was easier. That night when she went to bed, the memory of the little play was still with her. "How I would like to remove some stumbling blocks myself! I would just throw them right out of the people's way!" And she was still quietly thinking as she put her curly head upon the pillow. "Yes, I am going to remove a whole lot of stumbling blocks! How ugly Willie was this morning! What a lovely piece they chanted at the end! I hope I shan't burn the porridge tomorrow. Willie—porridge—stumbling blocks—" and then came a sigh and Elsie was fast asleep and dreaming.

Suddenly, a bright, clear light seemed to fill her little room, and there stood the most beautiful Being she had ever seen. Her whole heart went out in joy as she said, "Who are you? So noble and so bright!" And the beautiful Being replied, "I am your good angel—I am the real Elsie!"

"Oh!" said Elsie, "why, I had no idea I could ever be anything like you! I wish you would stay with me *always!*" The beautiful Being replied, "I can, if you will let me. You have put stumbling blocks between us; that is the trouble."

"Stumbling blocks!" said Elsie. "Why I haven't any stumbling blocks! I knew other people had, of course."

"Elsie," said the beautiful Being, "would you like to see your 'stumbling blocks?' But remember, if you need my help, ask for it."

The beautiful picture faded away and Elsie, still in dreamland, gave a sudden little jump. There, at the foot of the bed, stood a tiny, ugly gray Imp. He walked leisurely around the room just as if he belonged there, and took up a stocking that Elsie had begun to darn some days before, but had never finished. Then he sought out the most comfortable chair in the room and sat down and began to darn. Elsie was much amused as she watched him, and particularly after a few moments when he grew tired of darning and laid down his work, picking up a novel which Elsie had been reading. "Well!" she said, "you are a lazy fellow. Who are you, anyway?" "One of your stumbling blocks, Elsie," the Imp replied. "My *what?*" said Elsie in amazement, "My *stumbling blocks!*" "Yes," replied the Imp, "I am 'Indolence;' but, dear, dear, what a nice book this is! I think reading is *so* much nicer than darning stockings, don't you?"

Elsie colored a little as she answered, "Yes." The Imp continued: "I don't like work, anyway, do you, Elsie?"

Elsie felt still more uncomfortable as she said, very low, "No, I—I—don't."

Just then she caught sight of a little brown Imp at the looking-glass admiring himself, straightening out his hair and very, very carefully adjusting his necktie. "Hm!" said Elsie. "You must be very vain. Who are you?" The imp replied, "Well, you see, I must appear to the best advantage, for I am really very good looking! My name is 'Pride.' I don't like to appear just *anyhow*, like these common Imps.

Would you, Elsie? Would you like it if you weren't any prettier than Dolly Jones, or couldn't play the piano any better than that Robinson girl?" Elsie colored again and thought she would not argue, as she suddenly caught sight of two more Imps, dressed in green, with such ugly selfish eyes. They were walking around and around, looking at some of Elsie's sister's things that lay on the table. Suddenly they caught sight of a pretty little brooch, which Elsie had often wished belonged to her.

One Imp seized it and tried it on. "You'll have to put that back," said the other, "it isn't yours." In an instant the two Imps threw the brooch on the floor and trampled on it. "Oh!" cried Elsie, "what have you done?" One of the green Imps said, "Well, you would have done it yourself, would you not, if you had only had the pluck?"

Elsie hung her head, for she knew that this was true. "We are sisters," said the other green Imp, "and our names are 'Jealousy' and 'Envy.'"

Elsie was beginning to feel very uncomfortable, and then she noticed that Imps kept coming in, one after another, until her room seemed to be filled. One little fellow, all dressed in red, was something terrible. He strode about, his eyes flashing, cutting right and left with his shining little sword, and he said all of the bitterest and most terrible things he could think of. Elsie trembled, for in her dream she remembered she

had said those very things to her sister the day before when something went wrong. At last she began to understand.

Courageously she sprang out of bed and rushed at the Imps, determined to kill them, but they dodged right and left and only laughed at her. Around and around the room she chased them and they laughed still more, low and mockingly. At last, exhausted, she flung herself upon the bed and burst into a flood of tears. She thought of the beautiful Being and she cried, "Oh, won't you come and help me? I want you! I want you!" And just as she spoke, the glorious golden light filled her room once more and the *real Elsie* appeared again, this time as a Warrior, armed with a shining sword. At the sight of the War-

rrior the Imps slunk away. But the beautiful Being said to Elsie, "Are you sure you want the Imps to go? You know you always clung to them! You have really been quite fond of them especially the green ones." Elsie sobbed, "Yes, yes, I know, but I didn't understand." But by this time, as the Warrior stood there, all clad in light, the Imps disappeared; they could not bear the bright light and perhaps the Warrior's sword frightened them.

"Don't go," said Elsie, "stay, stay always. You make me so happy!" But at the sound of her own voice Elsie awakened. The sun was just rising and its long rays, coming in the eastern window, fell across her bed. It was the morning of Christmas day. "How beautiful everything is—*everything!*" said Elsie. STUDENT

TODAY'S paper gives an account of a young boy in St. Paul who, hearing the cries of a little kitten, and knowing it to be in distress, stopped and hunted for it. Finally he discovered that the cries came from a sewer into which the kitten had fallen. He called other children to help him, got a ladder and rescued the little thing. But why was this put into the paper? Is kindness on the part of boys so uncommon? Alas, I am afraid it is. Cruelty to cats and dogs is of daily occurrence, particularly in our great cities. Raja Yoga surely has enough to do in just bringing back that sweet comradeship between boys and animals which once existed, but which somehow we seem to have forgotten. But this is just what Raja Yoga will do! STUDENT

THE STUDY HOUR—YOUNG STUDENTS OF THE RAJA YOGA ACADEMY, POINT LOMA

THE CHILDREN'S HOUR

The Raja Yoga Question Box

SHALL we not find every year greater cause for gratitude to noble statesmen and brave pioneers?

1 Who was William Penn?

ANSWER—William Penn was a noble man who greatly aided his people in the early days. He was born in London in 1644, and became a Quaker while a student at Oxford. For this he was expelled from the University, and was later imprisoned several times. He came to Pennsylvania with many immigrants and was made Governor. He was always just to the Indians.

2 Who was John Quincy Adams?

ANSWER—John Quincy Adams was the sixth President of the United States.

He was also the son of John Adams, the second President. He was born in Massachusetts in 1767. He graduated at Harvard college, and later traveled and studied in Europe. He did not leave public life when he had finished being President. At eighty years of age he was still a statesman. They called him "The Old Man Eloquent."

3 Who was Henry Clay?

ANSWER—Henry Clay was born in Virginia in 1777. He was a poor boy and gained his education after many struggles. He served our country at a critical time, always upholding the authority of the Union. He was associated for many years with Calhoun and Webster.

Christmas and Raja Yoga

THOSE who have seen the Raja Yoga children of Lomaland feel that every day is to them a Christmas day, and this is true when one judges them by their love and unselfishness. But, for all that, something new does come in on this beautiful anniversary of Christmas time—"La Nochebuena," as the little Cubanos call it—something that helps the whole year to be sweeter and more pure. Just as a fire which never goes out, yet springs for a moment into new life and more glorious flame when fragrant fuel is added, so the heart-light that shines through the faces of Raja Yoga children all the year, shines even more brightly on Christmas day.

There is an old legend which says that whenever a Saviour is born upon earth a new star appears in the heavens; and a very, very ancient manuscript, which we should not know about today had it not been translated by Madame Blavatsky for us, tells of Nature's great joy at the coming of a Helper of Humanity. "In signs of praise both Heaven and Earth unite. A chant of love ariseth from the flaming Fire and flowing Water, from the sweet-smelling Earth and rushing Wind.

"Hark . . . All Nature's wordless voice in thousand tones ariseth to proclaim: Joy unto you, O men of Earth; a new Saviour is born!"

So it seems like a part of this greater story which tells us of all the world's great Teachers when we read of the Star in the East which guided the Wise Men to that little cave in Bethlehem; and there are many legends, too, telling us how Nature rejoiced at the tidings of great joy, the tidings that a Helper had come to men. Christmas time is a great joy time in Lomaland, a Thanksgiving time in the real sense of the word. To Raja Yogas it stands not alone as reminding us of Christ's coming, but as reminding us of all the great Teachers who have come in the past and of those who will come in the future.

Raja Yogas, above all, hold Christmas day in their hearts as precious and beautiful; not a day for selfish enjoyment, but a day when Christ's sweet spirit of unselfish love shines out anew from all hearts.

To spend a Christmas Day in Lomaland is a rare privilege. I hardly know which most richly profits by the joy and beauty of that day, the grown-ups or the children. Both seem to find then a new joy, which is saying a great deal, for "life is joy" every day in Lomaland. Even the tiniest tots help, and Christmas itself seems like the blossom on some lovely tall tree. M. H.

The First Christmas Tree

MANY years ago Madame Blavatsky published in "Lucifer," the magazine which she founded, a little Russian legend about the Christmas tree. It ran something like this:

At that beautiful time when the child Jesus was born there grew beside his humble home in Bethlehem three trees, a pine, an olive and a palm; and on that wonderful evening when the Star of Bethlehem appeared in the east—that Star which carried to all who understood its meaning the glad tidings that a new Teacher of Men had come—all nature rejoiced and the three trees wondered in their hearts what they might give to the Christ-child as a worthy and beautiful gift. The olive tree, which they say grew at the very entrance of the little cave in which he was born, brought forth glorious golden fruit. The palm lifted its great waving fronds, like the vast, shadowy arches of a vault, offering a protection against heat and storm. The little pine alone had nothing to offer, or so it seemed, and the poor little tree stood in dismay and sorrow, vainly trying to think of something it could present as a gift to the Baby Christ.

In its grief its branches drooped lower and lower, and finally, so they say, the sorrow of its heart forced from its bark and branches a flood of hot, transparent tears.

Twinkling in the blue canopy of Heaven, a silent waiting star perceived these tears and saw the beauty and love in the heart of the little tree. This star spoke with her companions, and lo! a miracle took place. Hosts of shooting stars fell down like a great golden shower upon the pine. Upon its drooping branches they rested

until they twinkled and shone from every needle from the bottom to the top. Trembling and joyful and proud, the little pine lifted her weeping branches and stood radiant before the eyes of all, in dazzling brightness. And from that time, so the legend tells us, and in memory of the sweet comradeship between the pine tree and the stars, men have followed the custom of ornamenting the pine tree with numberless lighted candles on Christmas, the birthday festival of the Christ.

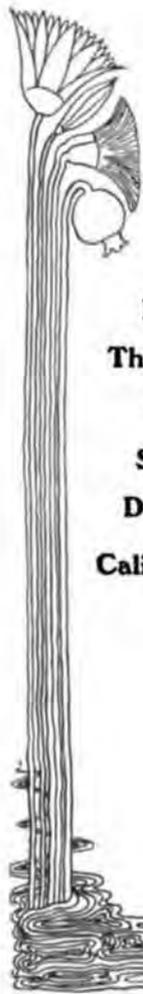

THERE is a proverb that says, "Kindness accomplishes more than severity." The power of kindness is very great. Every cross word we keep ourselves from saying means another step in the right path. If the white men who first came to America had been kind to the Indians there would never have occurred so many massacres. Let us try to be more kind and helpful. Kindness makes heart-light and heart-light makes joy. H.

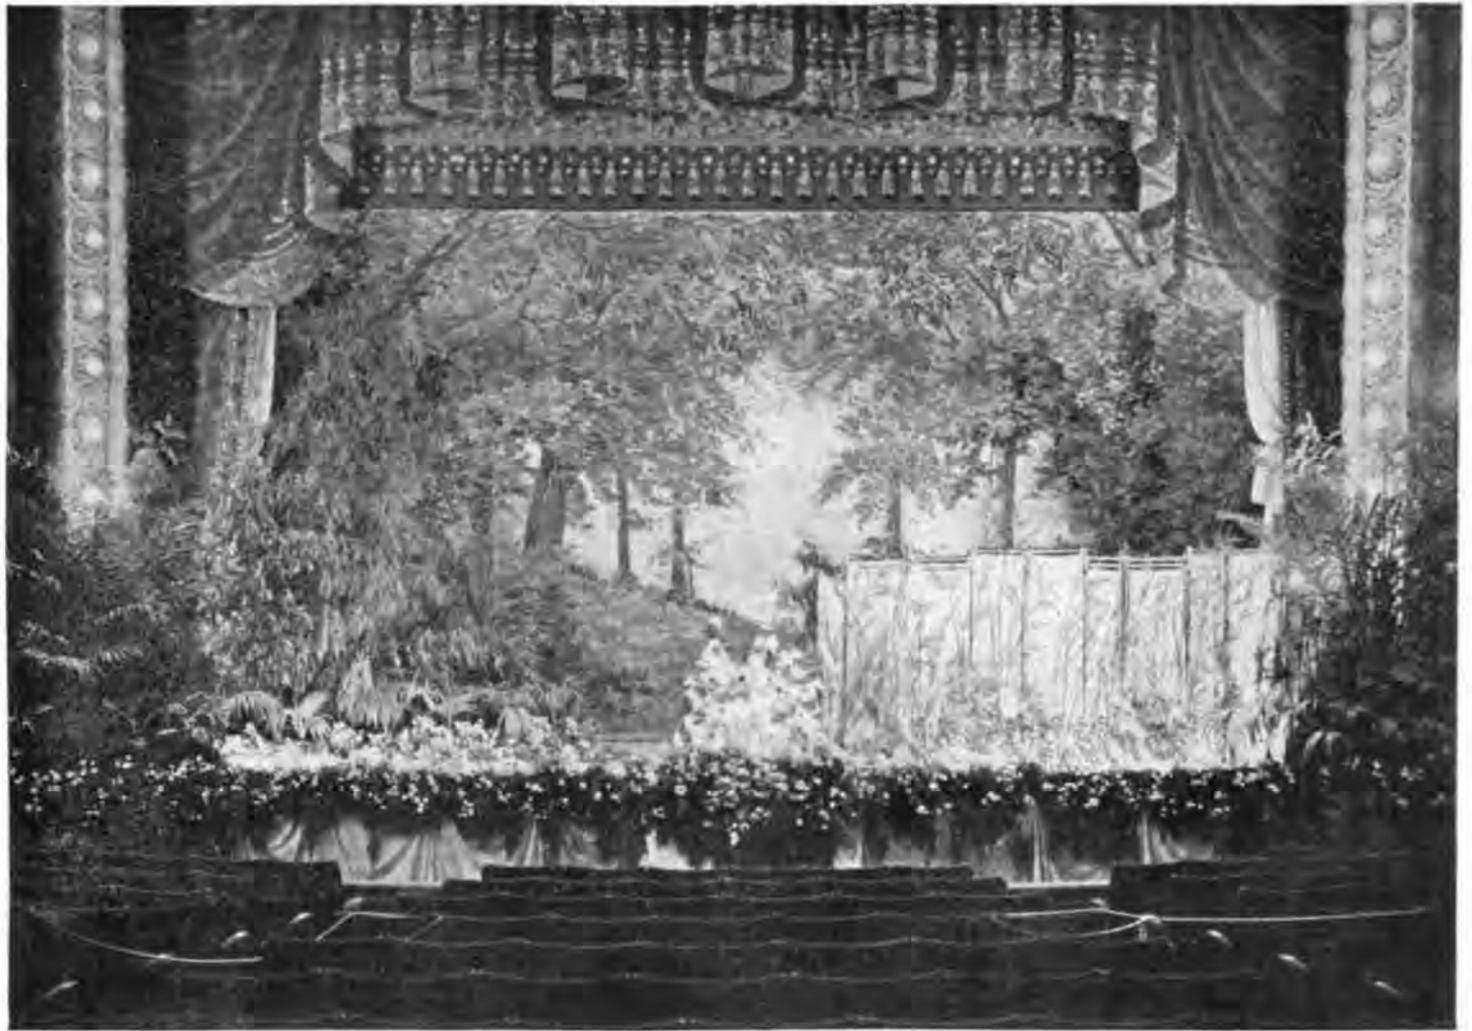

CHRISTMAS IN LOMALAND
Students of the Raja Yoga School gardening
Raja Yoga Academy in the distance

THE clouds had been heavy and dark all day,
I had looked for the sun in vain;
But sweet and clear, in the maple near,
The robins sang in the rain. *

Ah, boys and girls who sit and sigh,
And of dreary days complain!
In cloud and sun work bravely on,---
The robins sing in the rain.—Selected

LOMALAND STUDENTS AT ISIS THEATRE

THE Point Loma students who conducted the meeting at Isis Theatre last Sunday night, were greeted by a large and thoroughly appreciative audience. The music at these meetings, usually furnished by students of the Point Loma Conservatory of Music, is always a delightful feature, but the music rendered at this meeting was even better than usual. The program was as follows: Overture, *Coriolanus* (Beethoven); violin solo, "Concert Fantasie" on themes from *Faust* (Alard) by Mr. Reginald Bland; theme and variations from the celebrated *Trant Quintet* (Schubert); finale from *Quintet in E flat* (Schumann).

Miss Julia Hecht read a paper entitled, "A Helpful Hint." In part she said: "The student of human nature who is endeavoring to carry out in his daily life the maxim of the Hermetic philosophers, 'Man, know thyself,' discovers that truth has many aspects, each of which must be carefully considered and made full use of, as a means to the great end which he has in view.

"Perhaps the most important of all the ideals which must be cultivated is the necessity of being positive, which may be further described as the attainment of the capacity to step out instantly into the cause of right action, the moment that the path of such action is discerned. To do this, it is clear that we must keep ourselves constantly on the alert, inspired by the confidence which comes from experience, that we have an outward monitor, guide and teacher. The divine part of ourselves is ever ready to lead us in the path of truth. The teaching of all the great ones of the past is clear on this point, and there are many now living who can verify it from their own experience. The power to appreciate all true teaching comes from within, and not from without. The spoken word may awaken this power when the learner is ready, positive and alert, but the active power of knowledge is found in the recesses of the heart—in the silence of the soul.

"Epicetus, the philosopher, divided all things into those which are in our power, and those which are not in our power. He shows that our will, our acts and our opinions, are in our power, and that our happiness depends upon their proper exercise; whilst happenings external to ourselves, are not in our power, and should have no concern for us. This

is only another way of stating the Theosophical teaching that we have within ourselves a divine potentiality over ourselves, our thoughts and acts, whilst external happenings come to us from the Law.

"To be true men and women, to be true to one's self, calls for this positivity of soul. Whoever is inspired by a desire to do right will cultivate it to the utmost as his greatest treasure. It represents self-denial, the sacrifice of the personal nature, and this is not the gruesome task which it has been represented to be, but is a path of joy and usefulness."

Mr. J. H. Fussell read a number of extracts from the teachings of William Q. Judge, indicating the purpose and destiny of the Society. From these quotations are given as follows: "Referring to a letter received in 1884 from one of the great helpers of the race, we find: 'Let the Society flourish on its moral worth, and not by phenomena made so often degrading.' The need of the West for such doctrine as Karma and Reincarnation and the actual unity of the whole human family is dwelt upon at length in another. And referring to some of the effects of certain phenomena, it is said, 'They have to prove . . . constructive of new institutions of a genuine practical brotherhood of humanity, where all will become co-workers with nature.' This is the great tone running through all the words from these sources. It is a call to work for the race and not for self, a request to bring to the West and the East the doctrines that have most effect on human conduct, on the relations of man to man, and hence the greatest possibility of forming at last a true Universal Brotherhood. We must follow this program and supply the world with a system of philosophy which gives a sure and logical basis for ethics." A special Christmas entertainment by the Raja Yoga children of Point Loma, was announced for next Sunday evening at Isis Theatre.

"THE moral sentiments, the moral law, devotion to unselfish ends, disinterested love, nobility of soul,—these are Nature's most highly wrought products, latest in coming to maturity: they are the consummation toward which all earlier prophecy has pointed. . . . Below the surface din and clashing . . . we hear the undertone of the deep ethical purpose, as it rolls in solemn music through the ages, its volume swelled by every victory, great or small, of right over wrong, till in the fullness of time it shall burst forth in the triumphant chorus of Humanity purified and redeemed."

Art Music Literature and the Drama

The Music of Christmastide

BEETHOVEN wrote of his Mass in D, "From the heart it came and to the heart it penetrates." Handel said, in commenting upon his *Hallelujah Chorus*, "I did think in writing it that I saw all Heaven before me and the great God himself."

Year after year Christmastide is made glorious, in spite of the obstacles that dogmatism has placed between men and the real Christ spirit, by the presentation in many of our churches of Handel's "Messiah." It is the one great musical uplift of the year. During the rest of the twelve months the worshippers of our civilized lands may, if they choose, listen to operatic airs sung by paid choirs, or may themselves sing such cheering hymns as "Weary of Earth and Laden with Sin," or "O, Come Ye and Mourn." But on Christmas day something new comes in, spite of creeds, and this music, classic in its own right, has made the Christmastide festival in many a church a far more spiritual thing than it otherwise could have been.

Handel composed his immortal "Messiah" "for the benefit of poor, distressed prisoners for debt;" and in his own day the musical societies in Dublin always gave this for the benefit of charity. Few musical works have had such enduring recognition. "The Messiah" speaks to the soul; it is almost the saving grace of our Christmastide reunions.

Pity it is that we have not songs appropriate to Christmastide in our homes throughout the land. Why should we feel that the best music is not to be had save through the offices of a paid choir? When will we realize that music should sound a note of deeper appeal to the heart and soul? Where are the simple Christmas songs for the home, for small gatherings, for family reunions, songs which may be sung even by little children? The human heart is pleading for such as these. We have many so-called Christmas songs, but how many of them speak to what is best in the nature and purest in the heart? How few of those which are really classic are simple enough for children! Is it not a curious commentary that we, today, have to go back to Reinecke for the simple and to Handel and Bach for the noble, complex and grand at Christmas time?

Where are the composers of the simple songs and choruses that we need? Truly, they shall be with us in good time, possessing more than merely technical knowledge, more than any composer yet does possess. They shall do more than merely picture the Christ and the Christ story in song; they shall do more than simply utter an appeal to men to fashion their lives after the Christ life. The composer of the future will embody in his music the greater conception of the living truth that the Christos—the true Christ—is within each heart, awaiting only the opportunity to step forth.

STUDENT

A BEETHOVEN SOCIETY has recently been formed in Tokyo, Japan, by resident Japanese musicians.

IT does not need that poetry should be long; every word was once a poem.—*Emerson*

THERE is a Greek saying, attributed to the Orphic seer, "The father of metre is rhythm, but, verily, the father of rhythm is Great Zeus himself."

The Japanese Woman in Literature

THERE is nothing more fascinating, and indeed more restful to those who are weary of our present-day, insistent, literary style, than the classical periods in almost any literature.

This is especially true of the classical age in Japanese literature, a period extending some six hundred years in length, an age that is particularly interesting because in it women were important factors. In the *Manyoshu*, a collection of the earliest of Japanese poems, there are many names of women. In the great era called the Heian period, the two greatest poets are women, the great glories of that period of Japanese literature being the *Genji Monogatari* and the *Makura Zoshi*, both written about 1000 A. D. The author of the first was a noble lady, who held a position at the Court of the Mikado, her name being *Murasaki no Shikibu*. The language of her poem is today the acknowledged standard of the classical period. The second masterpiece was written by a lady in waiting to the Empress, herself a direct descendant from one of the Mikados.

STUDENT

BACH wrote a Christmas oratorio for congregation, singing chorus and orchestra. His chorals inspire the most casual listener with the spirit of true praise and true gratitude. Who was it built up that fallacy that Bach's music is hard to understand, impossible to play; that it appeals only to the intellect and is indeed not fitted for any but mature minds? Never was greater mistake made. Bach's music, while fortunately untinged with sentimentalism, is as pure, refreshing and sweet as the water of a mountain spring.

Two European musicians who have recently visited America have placed their fellow men under distinct obligations for their efforts to revive Sixteenth and Seventeenth century music.

They have spent years in restoring the clavichord, the virginal, and the marvelously beautiful harpsichord of the Seventeenth century. To the accompaniment of these and the cithern, *viola d'amore*, *viola da gamba* and others, these artists, dressed in costumes of the period, sing the songs of the Sixteenth and Seventeenth centuries.

IT is well known that the Greek tragedy had its origin in the chorus; and though, in process of time, it became independent, still it may be said that, poetically and in spirit, the chorus was the source of its existence, and that without it a totally different order of poetry would have grown out of the drama. The abolition of the chorus, and the debasement of this sensibly powerful organ into the characterless substitute of a confidant, is by no means an improvement in the tragedy.—*Schiller*

THE earliest Japanese printed book of which any record exists—though that many records, not yet accessible to the world at large, do exist there can be no doubt—appeared in the Twelfth century.

POETRY makes immortal all that is best and most beautiful in the world.—*Shelley*

POETRY interprets by expressing with inspired conviction the ideas and laws of the inward world of man's spiritual nature.—*Matthew Arnold*

BAS-RELIEF FROM THE ARCH OF TITUS, ROME
["The Triumph of Titus"]

MUSIC: AN ODE

WAS it light that spake from the darkness, or music that shone from the word,
When the night was unkindled with sound of the sun or the first-born bird?
Souls cathralled and catrammelled in bondage of seasons that fall and rise,
Bound fast round with the fetters of flesh, and blinded with light that dies,
Lived not surely till music spake, and the spirit of life was heard.

Christmas

A ROYAL day is Christmas-time for those who in the spirit of the Teacher Christ, have lived in the light and strength of his teachings. These teachings are the same in essence as those which were written aeons before Christ was born.

Christ is a link—one of the many great souls who have given their lives for the betterment of humanity.

Even for those who have not lived in the light of Christ's teachings, for those who have turned away from the light, it can be a royal day; the beginning time of a golden future. For his words, "Love ye one another," "greater things than these shall ye do," "the kingdom of heaven is within you," hold the essence of a great hope, and an encouragement such as the despairing and the heedless need. If a man were bereft of all knowledge of higher things, and knew not his divinity, he might yet find in these three sayings of good will from Christ, the inspiration and help which would lead him to seek to make his life perfect—that he might go unto the Father which is truly in Heaven; and Heaven, as Christ taught us, lies within ourselves. He said: "Blessed are the peacemakers, for they shall inherit the kingdom of God." Seek the light, find the peace, and live righteously. Peace on earth, Good Will to men! Christ was a Theosophist; he had no dogma, no church, no creed.

Time will rescue Humanity's Friend, the Christ, from the confusion of the Babel of the Twentieth century. He is claimed by many, but followed by few. Yet time is kind, and interiorly, man loves the light.

Through suffering and experience, man will find his place and gain the knowledge which will lead him to the Truth. Then, lo and behold! there shall be a re-awakening of the Spirit among men. For they shall succeed in separating the false from the true; and they shall have driven, as Christ did, the money-changers out of the Temple.

Then Christmas-time will have a new meaning; and Christ the Teacher will be vindicated. Theosophy holds the key to the mysteries of life and death. Study Theosophy, and study the teachings of Christ; his Sermon on the Mount; and then tell yourself the truth your soul would have you know.

No more now can you look indifferently upon the sorrows of others, or be indifferent to your duty. When the real meaning of life is once understood by you, then you are challenged by the Highest of Laws to render unto Cæsar the things that are Cæsar's, and to be a sweet example of an honest man.

You will then go forth arrayed for battle, to be for evermore champion of justice, in the name of the holy Christos, the living incarnation of the Most High in you, from which Jesus the martyr took his name. LOTUS

WORK, according to my feeling, is as much of a necessity to man as eating and sleeping.—*William von Humboldt*

OUR sufferings must necessarily be supportable by reason of the fact that it is we who inflict them on ourselves; we suffer precisely in the degree in which we identify ourselves with them and cooperate with them.—*Novalis*

There Is No RELIGION Higher Than T R U T H

FRIENDS IN COUNSEL

DEAR COMRADES: After the heat of summer, the first rains of early winter always seem to mark a new era in the life here. Countless hidden seeds start into sudden life and carpet the brown earth with green. Sometimes in unexpected places

seeds spring up. Here a patch of oats, scattered by a feeding horse; there a seedling pepper tree; and by an effort of the memory you call to mind the circumstances of their chance sowing in the months gone by. But the faithful earth forgets no charge committed to her keeping. She reproduces everything when the rains come.

So is it with the Law that rules our lives; no deed or word, no look or gesture, at discord with the underlying harmony but must some day again confront us to our shame. Yet though the action of the Law will smite the back of a hardened transgressor with heavy stripes, for those who unwittingly offend in minor details, its mild adjustments are as gentle as a mother's reproving caress. It can blast and shatter like a cyclone; it can rebuke as softly as a zephyr that fans the cheek of a sleeping child.

This law of equilibrium compels acceptance at first hearing with all but the most bigoted. It is so reasonable and all-sufficing in its scope. Fully embraced and consistently applied to life's problems, it will solve them one by one and draw the whole philosophy in its train.

Upon this Law the lion-hearted Blavatsky relied. She left nothing to chance, she implored no special favors from Heaven; but relying on her own resources and believing in her own Divinity, she started out as a creator of the New Order of Ages that she longed to see. Men sometimes complain of the grip of the iron Law and of the hard necessity of Fate. The wise ones never spend their energies repining at conditions, for they know how utterly plastic is the present moment which, slipping past us moment by moment, goes to make up our future environment. So our great founder lived from day to day; grasping the present moments flying by, she moulded them to forms of truth and beauty for coming generations.

Great as was the work of H. P. Blavatsky as known to us, the unseen work was more. She was a mighty and incessant sower of thought seeds in the broad field of the public mind. No moment of her busy days but left her freighted with some close-packed pregnant germ of thought. Some of these seeds are sprouting visibly before our eyes through the efforts of her Successors, W. Q. Judge and Katherine Tingley. The Raja Yoga Schools, the weekly magazine, the Conservatory of Music and Drama, and the discipline of the students' life, are part of the present Leader's work. But all these are as nothing in comparison to the myriad plans that yet lie latent and concealed, and that one day will burst their clod and clothe this sad old world in a robe of beauty. P. L.

To Members of The Universal Brotherhood Organization Throughout the World: Your attention is called to your yearly dues, payable January 1st., 1905. These should be addressed to E. A. NERESHEIMER, Treasurer of The Universal Brotherhood Organization, Point Loma, California.

F. M. PIERCE, *Secretary General*

Students'

THE PATH

Path

IN THE TRANQUIL DEEPS OF SILENCE!

AND yet---
 How grand is silence! In her tranquil deeps
 What mighty things are born!---Thought, Beauty, Faith,
 All good;---bright Thought, which springeth forth at once,
 Like sudden sunrise; Faith the angel-eyed,
 Who takes her rest beside the heart of man.
 Serene and still; eternal Beauty, crown'd
 With flowers, that with the changing seasons change;
 And good of all kinds. Whilst the babbling verse
 Of the vain poet frets its restless way,
 In stately strength the sage's mind flows on,
 Making no noise;---and so, when clamorous crowds
 Rush forth,---or tedious wits wake the senate-house,---
 Or some fierce actor stamps upon the stage,---
 With what a gentle foot doth silent Time
 Steal on his everlasting journey!---Cornwall

Cyclic Growth in Nature

WHAT do we mean by cyclic growth in Nature? In the motion of Mother Earth and her sister planets around the sun, and the sun itself with the planets of its system in their immense circle round what we can reasonably assume to be a still greater sun, and following this idea, even that sun with its systems upon systems of suns, revolving around a yet more vast and stupendous center; and so on, and on:—figuring in space, this living symbol of cyclic process in Nature, in her mighty eternal march of evolution.

Taking our minds from contemplating the infinitely vast systems of worlds and suns, suppose we change our focus, and make a microscopic examination of our earth, *one small body*, in comparison with all these suns upon suns and worlds upon worlds. What do we find? We find the infinitely *vast* in the smallest of, the small. For we find our Mother Earth a hive of lives, but more than this, every life itself being full of *teeming millions!* Take *one* grain even, out of the sand of all the seashores on the earth: take *one* drop in the water of all the oceans, rivers and lakes in the world, take *one* speck of vegetable life, on *one* leaf of all the trees that grow: take *one* tiny piece of the body of *one* animal or *one* human being, of all the animals and human beings in the world: and each and every one of these will be composed of thousands of molecules, each being a distinct world rotating upon its own axis, and being itself a hive of still more minute lives. And so in the presence of the plans of Divinity we find the same wonderful system in the infinitely small, as in the infinitely great.

Now let us reverse our sight to within, what do we find? We find Unity. We find wheels within wheels, worlds within worlds, in higher and higher states of being, of finer forms interpenetrating one another, and states of consciousness more and more perfect; till at the very *center* of our being, within the very *heart* of our system we find the sacred source of all life:—our Divinity. This is the foundation of all worlds both within and without, and is at the very innermost heart of all Beings, “from whom all proceeds and to whom all must return.”

Here is the permanent place, the eternal abode of the Perfection of all things to which all growth leads in all the worlds. Each physical life however great or small has its cycle of bodily existence comprising its birth, youth, maturity, old age and death. This in man is the personal life, which neither begins nor ends with just one such existence, for he needs large experience and opportunity to perfect *his* nature, and many and many such cycles does he have in his “great journey to the sacred seat.” He builds for himself the bodies he inhabits, their location and surroundings, being attracted to or repulsed by, that which he wills or desires; and the process by which he builds is also cyclic. His every thought and feeling, in every moment of the day is creative and these creations form his lives, his heavens, and his hells.

As the Teachers say: “The pepper plant will not give birth to roses, nor the sweet jessamine’s silver star to thorn or thistle turn.”

Thoughts both progressive and retrogressive, right or wrong, wise or ignorant, have an orbit, a cycle of their own. They are created, they go forth with the silence, and they return to the center which gave them birth. If we watch our lives, trying to create nobler cycles of being, as it is our duty to do, the natural object of our existence, we find the demonstration of this fact, that our thoughts and feelings work in cycles, they come back. “Curses like chickens come home to roost,” is an old and very true saying and the converse is also true. It is in the completion of their cyclic round that the critical moment arrives, as to what attitude we take, whether we will lift ourselves into a higher cycle of consciousness, with all its better environment or degrade ourselves into lower conditions, one or the other being inevitable and so we ascend or descend in our great cycle of evolution. If we only self-consciously took up our work, and decided rightly every time, we would ascend into higher and higher states of consciousness with amazing rapidity and be of enormous benefit to our fellowmen and all beings. However when we work unitedly together for the common weal *sincerely*, immense progress is made; and it is a glorious thing to know, and to feel that such progress is possible, for that helps more than we at first dream of, and brings round its strengthening and reassuring influence, when we are most in need, giving us the courage to begin, and to make another effort to reach our journey’s end in the ever-living presence of Divinity. T. W. W.

Right Study

THE real object of all study, as I understand it, should be to find a reason for action; and reasonable, sensible action, or living, is so true, so self-evident, that we have the sayings, “Example is better than precept,” “Actions speak louder than words,” and many another. We never can know Theosophy to be a living truth until we not merely study it, but live it.

Every department of life is included in Theosophy; and so, in Theosophy, we find that our relation to the universe, to mankind, to every detail of living, has its good and sufficient reason. Thus Theosophy gives the key to right thought and action, and the power to discriminate between good and evil. To study rightly we must study with head and heart, and also seek to put into practice that which we feel in our hearts to be the truth. It is by the study and practice of Theosophy, by both of these, that we come to know Theosophy as the truth, because it enters into and becomes part of our life. STUDENT

The Chain of Work

HUMAN work should be one vast chain, nowhere broken. We all live on the work of all men; it passes into our possession as food, clothing, house and other needed things. For all, we are debtors. We could not live one minute without it. And so it takes every minute to pay it, the only arm of payment being our will. Whilst we do not use it, the debt runs up, and we become a hindrance and not a helper to the world; our life and honor lie in work. Otherwise the work, the energy, the life, of other men *disappear* into us, and do not reappear. If we would keep the chain unbroken, it *must* reappear as work and thought. And it equally disappears, is equally broken, if, whilst not lazing or castle-in-the-air building, we work and think only for ourselves.

Will works at both poles. At the far end, it effects that to which it is directed. At the home end, it builds the character of him who wields it. Will is nature’s builder; *it is life engaged in building*. The moment we cease to use it and relax, we are beginning to disintegrate. The world’s great figures, who have known something of the secret of life, found their relaxation in change of work. They never ceased to wield will.

Let us do our part to keep the chain of human work flowing and unbroken. Let us do all things, even rest and relax, because we have willed it. So only can we protect our rest and relaxation from the ever-inpressing forces of disintegration. Our debt to humanity takes twenty-four hours a day to pay; we must extend the meaning of “duty” to no less a span. It is the only path to the heights where stand those who have made an army out of that rabble which in most of us constitutes character. STUDENT

“DUTY is based upon a sense of justice—justice inspired by love, which is the most perfect form of goodness. Duty is not a sentiment, but a principle pervading the life; and it exhibits itself in conduct and in acts, which are mainly determined by man’s conscience and free will.”

THE POET-PROPHET

TENNYSON

THE poet in a golden clime was born,
 With golden stars above;
 Dower'd with the hate of hate, the scorn of scorn,
 The love of love.
 He saw through life and death, thro' good and ill,
 He saw thro' his own soul
 The marvel of the everlasting will,
 An open scroll,
 Before him lay.

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question What is the right place and use of the mind in your philosophy? From what I have learned of Theosophy, it seems to be given a quite different position from that which is accorded it by most people.

Answer I We are all familiar with mind in a general sense, but do not know that there are two aspects, a higher and lower, the lower only being in common use, and that this lower is often *irrational* and unreliable; also that there is a right use of mind and a wrong use, yet such is the truth. If it were only possible to realize how the best powers of the mind are stultified and blinded when we are the slaves of desire, of selfishness, lust, egotism and hate, half our troubles would be over. And what a travesty, compared to real thinking, is our process of reasoning, that Carlyle has aptly termed "attorney logic."

The right use of mind consists in accepting the soul as guide, interpreting the messages of the soul, regaining again the conscience and discernment we have so long insulted and refused. We require to alter our basis of action and our manner of seeking for the truth, and instead of making the senses the sole avenues of knowledge, turn to the God within with reverence, and accept the statement of Theosophy that untold divine powers within us await unfoldment, and that we have spiritual perceptions which exceed the senses in power as the sun does the moon. And the new old truth is again stated; the great key to unlock all our latent possibilities is the mighty magic key of applied Brotherhood, the power of which is more practical and scientific than merely sentimental. To quote the first Great Leader of the Universal Brotherhood, H. P. Blavatsky, "To live to benefit mankind is the first step." This precept, when applied, is the great adjuster of our mental powers, the great restorer of disturbed harmony in thought and act.

All observation conducted by the intellect alone is limited in its range and encompasses only the superficial and impermanent—therefore only the half of truth—but the deeper, underlying cause the intellect cannot reach because its constitution will not permit it, the range of its powers being limited. Argument is useless, the basic laws of nature require no argument, they are to be applied and individually made a living reality. Take the law of Brotherhood and make it the corner-stone; a true, broad, noble basis for action; this becoming a habit will make a natural living impulse towards high and clear thinking. E. J. W.

Answer II Without going into detail, it may be said that the teaching of Theosophy on the subject of the mind is that it is not the highest part of man's nature, and that consequently it should not be given supremacy. For the right use of the mind it should be regarded as an instrument of the soul, and it is only when illuminated by the soul's light that it can fulfil its highest function.

The teaching of Theosophy is that the mind is dual; the higher mind being the vehicle of man's spiritual consciousness, his true self-consciousness as a spiritual being; and the lower mind, held in subjection by the brain and physical senses and dependent on them, relating man to the outer physical world. And regarding the latter, it is clear that unless the physical nature is purified and controlled, the brain mind will continually mislead and betray into falsity and error. This is not generally so regarded in the world, but the time must come when, through the influence of Theosophy, it will be universally recognized that for the acquirement of true knowledge the purification of the whole nature is absolutely essential.

Man does not yet know the extent of his mental powers, because he

is as yet ignorant of the prime necessity of purification in order that the higher powers of the mind may become active. The keynote to the right use of the mind is given in the words of William Q. Judge: "The power to know does not come from book study or from mere philosophy, but mostly from the actual practice of altruism in deed and thought, for that practice purifies the covers of the soul and permits that light to shine down into the brain mind." STUDENT

False Prophets

Question Why does the Universal Brotherhood organization *discourage* the pursuit of health and the acquisition of occult powers by means of breathing, exercise, postures, etc., which are now being extensively taught? Are they not quick and easy methods of attainment?

Answer The ease with which these various systems may be adopted is a measure of their value. You cannot get something for nothing, however much the bargain-counter spirit in the modern blood may seek it. One must pay the price for the reality, though clever counterfeits are offered cheaply on every hand. Altruism, which is the basis of right development, is far more difficult to cultivate in a selfish world than physical or even psychic ability.

The growth of real, permanent power depends upon enlarging the consciousness. Outgrowing the constricting limitations of the narrow, personal nature by means of broader, kindlier and more generous impulses, initiates the real self into a larger world of feeling to which the respiratory and other physical functions are, even unconsciously, easily adapted. The strong, sustained desire for increased poise and strength with which to help others will develop the body of consciousness, that mould upon which the steadily changing stream of material cells is instinctively arranged. With the altruistic will operating the body, if it is free to respond and reasonably trained, all organs will be stimulated toward harmonious activity and the intuition increased. Only distorted and ill-balanced methods attempt to attain the plane of finer sense by mechanical means. This is on a par with the idea of a flying machine with which to reach the kingdom of heaven which, meantime, is "within" and attainable, not by wings but by will.

Even the physiologists are too intent upon laboratory experiments to note that kindness and love, and happiness create a subtle sense of buoyancy and expansiveness which give a strength and courage not obtainable from mere food, hygiene and gymnastics.

It is true that unusual powers may be obtained by the various systems so widely advertised to a credulous and eager public. It is putting the cart before the horse, however, to make the consciousness dependent upon physical measures. Power thus cultivated belongs to the trained body and will be lost with the death of the body producing it; while the negative or positive selfishness evolved will carry its limitations into the future life. On the other hand, a sense of the unity of human interests gives a real gain in consciousness, which, carried over from life to life, is able to upbuild a suitable body.

Symmetrical development is the ideal attainment and is produced naturally when physical and mental training are vitalized by a high purpose. It is not more power that the world needs but better impulses to guide the possibilities already in advance of the racial fitness to use them.

The Eastern methods being taught by subtle, self-disciplined Orientals to the impetuous, materialistic Western world are not without danger. It is unsafe for the undisciplined and unprotected body to invoke forces which will injuriously revert back upon it when the selfish impulse arousing them is surfeited with external activities.

Much of the faith, mind and other metaphysical teachings are equally misleading in that the student is so hypnotized with picturesque cures that the underlying causes of disease and disability are overlooked and are thus kept potent for future harm.

There is urgent need to beware of false prophets. Only discrimination in seeking natural ways of growth will save the developing psychic sense of humanity from being victimized at the hands of the various fakers—either conscious agents or unsuspecting tools.

Since "light and darkness are the world's eternal ways," it is a question how many of these fantastic, evasive and unnatural methods are deliberate blinds to draw attention from evil and enslaving causes that they may remain undisturbed in pernicious activity. For the attainment of wisdom there is but one road; and "to live to benefit mankind" is the first step. R.

THE MYSTERY OF AMERGIN

(From the ancient Erse.)

I AM the wind which breathes upon the sea,
 I am the wave of the ocean,
 I am the murmur of the billows,
 I am the ox of the seven combats,
 I am the vulture upon the rocks,
 I am a beam of the sun,
 I am the fairest of plants,
 I am a wild boar in valor,
 I am a salmon in the water,
 I am a lake in the plain,
 I am a word of sciacc,
 I am the point of the lance of battle,
 I am the God who creates in the head (i. e., of Man), the fire (i. e., the thought).
 Who is it who throws light into the meeting on the mountain (if not I)?
 Who announces the ages of the moon (if not I)?
 Who teaches the place where couches the sun (if not I)?

In Europe

(From our special correspondent, November 16th)

AT the Academy of Science recently, M. Gaudry gave an account of the five expeditions of M. Andr e Tournou re in Patagonia. The fossil remains of numerous gigantic animals have been found—many of which are unknown to science. As a consequence of these discoveries, it is now possible to reconstruct the prehistoric fauna of Patagonia.

But alas! These gigantic remains are deposited in strata that according to the prevailing theory of evolution, ought to contain nothing of the kind! That is, judging from the records of similar strata in Europe. As the writer from whom I quote these statements says, the facts have aroused "a cruel emotion" among geologists. By students of Theosophy, however, these discoveries will, I fancy, be received with calmness.

Le Matin is to be congratulated. Its efforts to secure one day of rest in seven for the toilers of France, are practically crowned with success. For, the Municipal Council of Paris has un-

animously declared in favor of the reform, and has expressed its desire that: The Senate should confirm as soon as possible the law transmitted to it by the Chamber of Deputies, prohibiting the employment, for more than six days per week, of workers (les travailleurs et employ s), of both sexes.

Herein lies a new hope for France, who has wasted not a little vitality in striving to solve the problem of perpetual motion.

The dominion of Peace extends! I do not refer now to the various consultations of an official kind, of which Paris has been the center lately, but to a very significant item of news from Germany. Berlin has been captured by France; and has no wish, I understand, to regain its freedom. The storming party consisted of French actors and operatic singers.

Madame Sarah Bernhardt opened the theatrical season at Berlin and aroused the greatest enthusiasm. Calv 's performance of *Carmen* at the opera house has been a splendid success.

There are many ways of advancing the cause of Universal Brotherhood, but possibly none more effective than Music and the Drama.

English Notes

(By our London Correspondent)

LONDON, November 18th

YESTERDAY the King of Portugal, accompanied by his beautiful consort, was entertained by the Lord Mayor and Corporation of London. There was a big crowd to greet him as he drove from Paddington Station to the city, also a big fog. That so many people turned out into the streets under such circumstances was, in itself, a striking evidence of good will. Yet, probably, very few of those assembled had the slightest knowledge of Don Carlos a week before he came. But he was King Edward's guest, and also another *Symbol of Peace*. It was

intuition rather than reason that caused our London folk to brave the weather, and cheer the royal visitor so heartily.

At the banquet the Portuguese King made a sympathetic speech (delivered in English) and announced the signing, on the previous day, of a Treaty of Arbitration between this country and his own. What will evolutionists, of the modern type, make of this "stream of tendency" which we are witnessing just now? Chance?

That last word brings to my mind another question—which has been the subject of lengthy correspondence in *The Daily Chronicle* for some days past. It is: "Do we get our Deserts?" The discussion has arisen out of Mr. Hall Caine's latest novel, *The Prodigal Son*, and Mr. Caine himself yesterday contributed to it to the extent of three columns, without, I humbly venture to say, our getting "any forrader," as the saying goes.

And, save for a dozen lines contributed by an unknown writer, the whole of this correspondence is just a tangle of contradictions. Some of the stories of (apparently) unmerited suffering and calamity are extremely touching.

Yet, to explain the "happenings" of human life either chance must be accepted, or the law of Karma; a "fortuitous concourse of atoms," or, Eternal Justice. This very correspondence is a startling proof of the impossibility of any third explanation.

The knowledge of Theosophy makes life not a puzzle, but simply a problem: a problem, too, that I believe the simplest mind may solve once the real clue to it is obtained. That clue was first given to our times by H. P. Blavatsky. It was given also by Jesus the Christ, and wilfully hidden away, about the Fourth century of our era, by those who found it an inconvenient obstacle to ecclesiastical dominion. The clue is — *Reincarnation*. Yes, we do get our deserts. W. J.

The Universal Mind in Action

IF we should supply a scientist with all the factors connected with

the shooting of an arrow, he might conceivably, by enormous labor and voluminous figuring, tell us approximately where the arrow would strike. He would require to know the precise number of "foot pounds" exerted by the archer in bending the bow. He must know the bow's elasticity and the weight of the arrow, and also whether the shaft is polished or not, for even the smallest detail must be allowed for before he can determine the arrow's trajectory. The force and direction of the wind would also largely affect the final result. But now our archer has stepped up to the mark, and almost before we can complete our sentence the whizzing bolt has buried its head in yonder tree. The arrow, or something outside the arrow, has instantly solved this huge problem. It has described exactly the proper curve, has followed the exact course laid down by natural law, not varying by a hair's breadth, and now with unerring precision stands quivering in that exact spot which it will take our learned calculator hours of labor to determine. This is surely "mental arithmetic" of a very high order.

There is clearly some intelligence at work here, some guiding presence diffused throughout the field of this simple operation, that is responsible for such exact obedience to law, such perfect adjustment to an intricate combination of forces. To this Universal Mind it was that the teacher of Galilee referred when he said that the very hairs of our heads were numbered and that a sparrow's fall was noted.

This cosmic intelligence must pervade infinite space and direct the all-warming sunshine upon the evil and the good and send rain upon the just and the unjust. But being sexless and universally diffused, how can we call it "He" or limit its dwelling-place to "Heaven?" P. L.

book of the
Twentieth century*

Tells the story and the history of the Theosophical Movement Throughout the World; tells what it is and why it is — reveals the mystery of the Doctrine of the Heart.

The prices are \$2 in cloth and \$1.50 in paper, which barely cover the cost, for it is printed and bound, not gaudily, but with such carefulness and thoroughness of art and craft as to make it unique among modern edition books.

Retrospect and Forecast

AT the end of the recently closed century we took stock of the progress that the hundred years had witnessed. Science and invention, the arts, the mechanics of civilization—all came in for praise. Nor did we forget our better care of criminals, our improved poor-law systems, our humanelier conducted wars, our less drunken habits, and the other evidences of humanitarian advance.

The points are justly taken, and the great majority, whose thinking is within instead of all around what they read, are comforted accordingly. Let us look at some more of the picture.

Some figures are to-hand from England, which, since they apply in principle to this country and to some other European countries, will do very well. They can be compressed into a very few sentences.

In the thirty years following 1857 there were 8300 divorces and judicial separations. *In the solitary year of 1904 there are nearly 2000 more of these ruptured homes than in the whole of the thirty years we have indicated.*

The significance is deepened by the further fact that the number of undefended cases for 1904 is greater than all the cases of 1894.

Further, the birth-rate is steadily falling, and of the babies that are born no less than 300 die a day.

Deplorable Condition of Humanity Lastly, suicide is everywhere increasing; and in America crimes of violence are four times as numerous per thousand of the population as they were a few years ago.

Insanity is also increasing and premature mental decay.

Let us extend the line of both tendencies. On the one side our inventions become more wonderful. We travel faster, communicate at distances more easily, and the mechanics of life, together with the sciences that serve them, become more complicated. Is that civilization?

But on the other side, the birth-rate falls—why not finally below the death-rate?—and of the children born, more, despite the law's utmost, are murdered. For it cannot be supposed that 300 per day for one country died "from natural causes."

And the rising divorce-roll—and especially the "undefended" proportion—means an ever-slackening moral sense, a constant approach towards a condition one would have to call legalized popular "free-love."

With it all, intelligence seems to be decaying earlier; and those who have no interest in life becoming more numerous.

Converging Evidence of Decay Do not these lines of evidence converge towards proof of decay of civilization? It would seem that the only people entitled, while facing these facts, to remain optimistic and full of hope for humanity, are

those who think that some wholly new influence may appear upon the field. What will it be? Turning our eyes away from the existing forces of good that have done their best and are *failing*—what new one is there?

We hold that the new redemptive light is coming, and will come, from Theosophy. And particularly from the application of the principles of Theosophy to the training of children. Nor does this mean teaching them any special or peculiar doctrine. It means awakening in them a knowledge, a certainty, that they are divine. It can only be done by those who have themselves come to that consciousness. And it is the result of the method pursued at the schools at Point Loma, a result only fully appreciable by those who have seen for themselves. In no long time all peoples and countries will have the chance of watching them develop at similar schools in their own midst. But the like may be reached by any parents who will hold in clear light in their own hearts

An Eternal Guide of Action

the knowledge, the feeling, of their own essential divinity, till it has become permanent, an eternal guide of action; and from that standpoint treating their own children as alike souls and divine in essence; teaching them to find the triumphant pleasure in mastering the lower and selfish elements of their being, in refusing to themselves the self-indulgences which—often nothings in themselves—do yet collectively sap the foundations of will and strength of character.

Imagine a whole generation of children thus trained, and think whether it is impossible that in a very few years the whole picture of national and international life may become utterly transformed. It will be the crown of the work of the Universal Brotherhood—which is the "Theosophical Society" of H. P. Blavatsky. H. C.

Reincarnation in the Daily Papers

REINCARNATION is the topic of a paragraph in a London daily paper, which expresses wonder that this subject should be discussed in the popular magazines by well-known authors and divines. The paragraph, though still lacking in much from a Theosophical point of view, is a great improvement on the flippant jest of a few years ago. The writer deigns to know a little about his topic; and points out that the teaching was derived by the Greeks from the Egyptians, flourished among the Neo-Platonists, is common to most Oriental religions, and has appealed to poets as diverse as Wordsworth and Dante Gabriel Rossetti. The Bishop of London, it appears, inveighed

against it, "more from zeal for the faith delivered to the saints than from a true appreciation of its moral bearings."

Our writer admits that Reincarnation "tends to undermine none of our ethical standards;" but, for a reason, he gives a statement which is neither true nor proves his point. The doctrine is "a crude attempt to picture the Law of Causation operating as relentlessly in the spiritual as in the material world, and to reconcile the sense of moral responsibility with the cold Pantheism of the metaphysicians."

The Law of Causation does not operate *relentlessly* in either world; but, if it did, would that be a reason for saying that such a belief does not undermine any of our ethical standards?

As to cold Pantheism, see how the wisecracks have treated the ancient Wisdom. First they take away Reincarnation and so make the doctrine "cold pantheism;" and then they give back Reincarnation as "an attempt to vivify" that which was never dead. The old mistake of modern science, which first kills the universe by reducing it to dead matter, and then revivifies it with a life-principle.

The conclusion of our paragraphist is another sign of the changing times; for he says that *because* Reincarnation is based upon a moral rather than a "strict evidential" foundation, *therefore* we shall probably hear more of it! And one imagined the people demanded scientific proof for everything!

H. T. E.

Tempting Vesuvius

THE fertile sides of Vesuvius were once marked off by boundary stakes into proprietary lots. The eruptions great and small, swept all these away, and for long there was no attempt at the ownership of these perilous slopes. But popular memory is short, and they are now covered with hotels, restaurants, and places of rest. Their rising value gave the Mayor of Resina a brilliant idea. He sent for some boundary stakes and marked off large patches for his private ownership. Instant protest arrived from all the neighboring communes and there is now much legal pow-wow anent the sites of the ancient lots.

A more august authority than a law court may at any moment render a disastrous verdict. Vesuvius himself may decide to bring the dispute to an end. His mighty moods are quite unpredictable. In prehistoric times he once suddenly blew away several thousand feet of his apex, possibly drowning cities greater than was ever Pompeii. But for centuries before the Christian era he had slept peacefully and no one remembered his last awakening.

About 63 A. D. some tremblings began, of no great moment from the point of view of a volcano, merely enough to shake a temple (of Isis) into ruins and damage towns. These warnings—which nobody took—after seventeen years culminated in the vast eruptions of '79, which destroyed three cities.

The volcano then rested on its reputation for about 1500 years, only snoring occasionally, and people took to thinking that his bad temper was entirely cured. So in 1631 he broke out again and destroyed 18000 of them. Since then he has never been quite quiet and as lately as 1822 made some definite remarks on the folly of trusting him. Like all the others, they are quite in vain, and as we have said, his slopes are beginning to swarm with human life.

Nature has tried to make it quite clear to us that she regards Vesuvius as one of her permanent issues, and we cannot blame her for any amount of destruction of human life and property that she may from time to time effect.

C.

Bones of the "Missing Link" in Java

WITH reference to the claim put forward by some scientists that the "missing link" was discovered in 1894 by Eugène Du Bois in Java, a German pastor says that this find consists of three bones which probably never belonged together, as they were discovered within a circuit of fifteen meters; also that Virchow and Ranke say these are the remains of an ordinary ape.

This is very irreverent treatment of the Pithecoïd man on the part of Homo Sapiens. But we should not be much better off even should such a link between ape and man be found; for it would not prove that the man was descended from the link. For, apart from the possibility that the link might be descended from the man, there is very little evidence to show that one species turns into or is descended from another. In fact there are many missing links in the scheme of evolution.

H.

Commercial Honor Among Chinese Merchants

A CONTEMPORARY pays the following tribute to the Chinaman's sense of commercial honor:

"Any well-known reputable merchant in the Chinese quarter (of San Francisco) can borrow upon his word alone, from any bank in San Francisco, \$10,000, \$25,000, or more according to his solvency. Chinese consider it a reflection upon their honor for any one to demand a mortgage, or even a note of hand. . . . Their commercial business is conducted upon strict rules of integrity, fair dealing and honesty. Merchants are very lenient with debtors and never "push" them so long as they show a disposition to pay. There is no statute of limitations in debts—a debt remains a debt until it is paid. . . . If the debtor dies his children are expected to pay. Every child is expected to pay the debts of his father. . . . Their reputation with American merchants and bankers is better than that of any other nationality."

Nature Smiles in Syria

SYRIA is a country where nature is so beautiful it would well repay the artist. The climate is not severe; although there is snow and ice in winter and a fine dry heat in summer, the climate is not intense. There is little rain, but enough in the spring-time to afford water supply. The mountain-springs are rich and the seasons very regular. The productive power of the soil is among the finest on earth, and a watermelon is spoken of that was "large enough to be the burden of a camel." There is mineral wealth and plenty of oak, mahogany, and cedar; but the land remains undeveloped on account of a thoroughly retrograde and oppressive foreign yoke.

T.

A Novel Apostle of Progress

A CERTAIN potentate is about to issue a pronouncement against duelling, which he characterizes as a stupid anachronism and a relic of mediæval barbarism. This is a very good reform and a very good reason, but the reason is the very last one we should have expected from its author, who is no other than the Pope!

This is the same Pope, too, who has tried to reintroduce mediæval music into American churches. And there are a few other relics of mediæval barbarism being sedulously fostered that merely need to be let alone to die of their own accord.

E.

Progressive Cuba

THE campaign against yellow fever in Cuba has been absolutely successful. Not a single case now originates in the Island. Indeed, the sanitation of the whole of its towns and cities is about to be placed on a new basis, under the direct supervision of the Central Government. President Palma is only awaiting an appropriation by Congress. Under him Cuba is doing her utmost to clear away the disabilities entailed by long-enduring misgovernment and to place herself in close touch with all that is best in modern life.

STUDENT

Gold in Coal

GOLD and silver have been found occurring in small quantities in the coal of the Cambria coal-field of Wyoming. It is probably located in the iron-pyrites which is distributed through the coal. Coke made from this coal averages from one to two pennyweights per ton, which is sufficient gold to make up for loss from a high ash content. In South Africa too gold has been found in coal seams that ran through some quartzite ore.

E.

The Seven Languages of Britain

IT is not so very long ago that there were no less than seven languages spoken in Great Britain. There is Welsh in Wales, a variety of French in the Channel Islands, Erse in Ireland, and Gaelic in Scotland. There was Cornish in Cornwall and Goidelic in the Isle of Man. And lastly, English. Erse is regarded by some scholars as a language so old as to antedate even Sanskrit.

H. C.

Frontispiece --- William Quan Judge

THIS week's cover page of the NEW CENTURY PATH contains the face of Wm. Q. Judge, the second in the line of succession of the world's Theosophical Leaders. Mr. Judge succeeded to the Foundress of the Theosophical Society, Helena Petrovna Blavatsky. A successful lawyer, a brilliant writer, and a man of extraordinary insight into human nature, he was well fitted to carry on the great humanitarian and philosophic work of H.P. Blavatsky.

Some Views on XXth Century Problems

Science Lit by Religion

A RECENT book, exciting considerable attention, makes an attempt to illuminate science with religion which brings the author very close to Theosophy. He first goes to the root of the Evolutionary Hypothesis. Going a little beyond science, which merely studies the effects or process of the Power manifesting in universal evolution, he says of this Power that so far as we can see, it

Is omnipresent. It is resident in events. It is immanent in all departments of life and experience. It is self-consistent in its workings. It appears to be future-regarding and purposeful in a large and comprehensive sense. Its methods seem to be rational in that, as soon as discovered, they issue a direct and immediate challenge to the human intellect.

He then goes on:

We turn to the Christian religion to inquire if there be any corresponding principle of power, immanent, resident, future-regarding, purposeful and rational, working by means of imperfect instruments upon obdurate material for the attainment of large ends by means of a process of development. I believe that we find it . . . in the doctrine of the spirit.

In other words the Power postulated by science to account for evolution, is the Power taught of in religion as the Spirit.

To which we would add that we can turn not only to the Christian religion for teaching about this Spirit, but to many another great creed by whose light men have lived nobly and died peacefully and in faith. And further, that as Herbert Spencer pointed out, it is this Power which "wells up" in human consciousness. It works in us "by means of imperfect instruments upon obdurate material;" but the "obdurate material" may bethink itself of that which works within it, may look into the depths of its own consciousness and find (and henceforth work with) this Spirit. That is the only path to wisdom, the path trod by all humanity's greatest; and it is Theosophy because Theosophy is no other than the truths common to all religions. Theosophy has come to support, not undermine, Christianity rightly interpreted—the Christianity which is a thrill with the living Spirit of Christ. STUDENT

The Young Criminal

FOR some time in England, the prison authorities have been trying an excellent way with young criminals, the "juvenile adult" system.

A number of sentenced young men were taken from London prisons, and the ordinary purposeless prison tasks substituted by useful trades.

Their mien and conduct changed at once, many showed great desire for self-betterment, became enthusiastic readers and chess-players.

As a rule, the improvement was permanent. So far, of 122 discharged, 54 are leading usefully employed lives. Of the rest, 30 have been lost sight of, but only 24 have been reconvicted. Since more than 100 of them were what is called hardened criminals of more than one previous conviction, the result must be admitted as very good. The system is about to be extended to the whole of Great Britain.

People in other countries might do worse than think it over. We must take some newer kind of action upon our criminal record. In 1881 there was one murder for every 40,000 of the population. Last year there was one for every 9,000—more than four times the previous proportion. Nor are the proportional numbers highest in States where foreigners most do congregate.

Many causes have been assigned, and many remedies suggested. The most inspiring among the latter comes from a writer who wants to see a crusade started for "a new righteousness which shall become a new passion—the love of country." It will work infinite good or infinite harm according to the keynote of patriotism struck by the crusade, the blatant patriotism of the music halls and of too many of our journals, or the patriotism of some of the republics of old in their best days. In the one case "My Country" becomes but the background to "my" egotism. True patriotism is a love of country, of her honor, her repute, her righteousness, which blots out egotism. STUDENT

The Mean- ing of Culture

WRITERS in two important literary monthlies have lately been answering the question—Is Culture dead—by an elaborate Yes. The ordinarily moderately busy man will turn away from the discussion and the problem, with the feeling in various keys—defiant, regretful, humble, or indifferent—that "Culture" is not for him.

He is quite wrong, and his error lies in thinking of Culture as an affair of the classics, of universities, and of large leisure. He thinks of it as an outcome of learning.

Now, it is true that men of large leisure, at universities, have got their culture from "the classics." Yet the thing "cultured," in this sense, is the imagination. The imagination may be cultured by reading and entering into works of imagination in any language. If a man desires to read such works in Arabic, Chinese, and Sanskrit, it will naturally take him many years to get it from those tongues. But the years so spent must not be regarded as necessary time for the culture of his imagination. He could have got an equal culture from reading the imagination and poetry that is embodied in English, either originally written there, or transplanted by translators, notwithstanding the something that in the latter case is lost.

A very large amount of culture can be acquired in a very little time. The secret is to let the imagination be the first faculty set at work each day, and a very few minutes will suffice. Do not permit the mind, the instant it awakes, to rush out and fill itself with personal nothings or the contents of the newspaper. Read something that awakes imagination, a poem, anything that raises and spiritualizes. It will go on working all day, leavening and permeating; and its effects on the consciousness of later years, on old age, will be incalculable.

Culture is the habit of viewing life through the imagination. Imagination is larger sight, fuller view of reality, the entering more deeply into the real. It is not fancy, but a faculty. And just as the intellect may exercise itself for its own growth among problems that have no reality, and be the stronger when it is turned upon the real, so with imagination. When that faculty whose special work we erroneously think is to move among and create illusions and dreams, is trained to turn its gaze upon the problems of life, it shows itself as a power of real vision, and immediately sees facts and truths which intellect could never have got at. By training it, we prepare for a ripening instead of a withering at the touch of old age. STUDENT

Luxury and Disease

THE relation between modern life and disease is not often so clearly indicated as it is by some New York mortality statistics. Certain diseases have advanced *pari passu* with the quickening pace of city life, diseases rather of the wealthy than the poor—that is, of those who set the quickened pace.

In 1871, the death rate from Bright's disease and organic heart lesions was 17 per 10,000; in twelve years more it was 21. By 1893 it was 27 per 10,000. The diabetes figures tell about the same story.

It is probably told in vain. The wealthy will hardly alter their habits—except perhaps to visit their doctors a little oftener. OBSERVER

A New Pulpit Method

THE pastor of a New Jersey church proposes to carry out the injunction to "go out into the highways and compel them to come in." Not only will aged and infirm members be brought gratuitously in carriages to the services, but all persons in the city, will be similarly provided for if they only send in their names. Invalids living at a distance can thus get two pleasant carriage rides at the mere cost of listening to a sermon.

But of course it is obvious that this is no real way to solve the problem—How to fill the churches. Automobiles, magic lanterns, and other like means are but temporary expedients. There will be no lack of audience for the man whose soul is a-flame with the real message. S.

Brief Glimpses of the Prehistoric World

Archeology
Paleontology
Ethnology

The Zodiac

TWO Zodiacs were found in the ancient Egyptian temple at Denderah, the quadrangular and the circular. On one of them the sign Virgo is represented by three Virgins, indicating that the Egyptians had kept astronomical records for three great years or 77,000 years. There is also other information about chronology to be gotten out of the various pictures by those learned in such calculations. It may be appropriate just now to note that the sign after the Archer is that of a marine monster with a goat's head. Whence did the idea arise that this sign was represented by a goat? Modern "astrologers" even persist in assuming that the word *capricornus* means a goat, an error which the puniest gloss of scholarship would surely have saved them from.

Perhaps this travesty of the symbol indicates a similar travesty of the meaning, and has

some connection with the profanation of sacred mysteries. The Zodiac is the great book of the Wisdom-Religion. It has been a sore puzzle to scholars; for what theory of theirs will account for the discovery of Zodiacs, with the same twelve signs (apparently quite arbitrary) among all the nations of antiquity, from China to Guatemala, and from Scandinavia to India? Even the theory of copying, one from another, fails; so universal is the symbolism and so unvarying in spite of its seeming arbitrariness. Why have not different nations successively altered and adapted the signs out of all resemblance to their original state, as would surely have happened in so many millenniums?

The Zodiac is not arbitrary. Its symbols are the exact and faithful records of sacred truths revealed in the course of initiation; and therefore, being facts, they do not change.

Many books have been written on the meaning of the Zodiac. But it is a study in which, more than any other, one may lose oneself utterly in the mazes of speculation and calculation, and emerge at the end exhausted and empty-handed. Its secrets are not for the curious or the selfish. "To live to benefit mankind is the first step." E.

Genghis Khan

GENGHIS KHAN was the greatest conqueror in historical record, if we measure by the extent of territory subjugated and ruled over. His empire was greater than that of Cæsar or that of Napoleon, and was the empire of Alexander with more added thereto. His career was much longer than those of the other three, and was strenuous and bloody throughout. To the dash and impetuosity of an Alexander he added the endurance of a Frederic the Great. He is credited with the destruction of a total of five millions of people.

The history of the warlike nomads who threatened the northern border of China from the earliest recorded times is long and complicated, but in the Eleventh century A. D. a tribe called Mongols, or "the Brave," was in power. Temouchin, who afterwards took the title of Genghis Khan, or "Very Mighty Chief," was born about 1162 on the banks of the river Onon in Mongolia. He conquered all the Mongol

THE ZODIAC OF DENDERAH

tribes around him, but was defeated in a great battle with another tribe and left with only a few followers. But his energy raised him again, and he made himself master of all the steppes and then of China. In 1218 he invaded Central Asia, conquered the oases, and destroyed Samarcand, Bokhara and many other cities.

Finally he ruled over all Asia and European Russia, and established a splendid seat of power in the far East from which he sent and received envoys to and from the other European powers. He died at the age of sixty-five, and his successors soon dissipated his empire until not a vestige remained; although the presence of the Ottoman Turks in Europe, whither they were driven, remains as a sign.

Such a terrible protracted career of devastation as his destroyed countless memorials of antiquity, for he burnt cities and destroyed monuments and

libraries. But there have always been those who, unknown to the world, have guarded against such catastrophes by carrying off and concealing in safety such records as it is necessary to preserve. STUDENT

Druidism and the Wisdom-Religion

THAT the Druids were at one time among the preservers of the ancient Wisdom-Religion is certain. Cæsar says all men of any rank and dignity in Gaul were included either among the nobles or Druids; and that the Druids were not only the religious guides of the people, but also the chief expounders and upholders of the law. This points back to times when kings and sages were one and the same, when the Wisdom-Religion had not split into Church and State, and when knowledge conferred the right to lead in matters both temporal and spiritual. Admission to the Druidic order was by training, lasting as much as twenty years, and all instruction was oral, though for special purposes written Greek characters were used. They taught the immortality of the soul, astrology, geography and physical science. Briton was their headquarters. Diodorus Siculus hints at a connection between the Druid philosophy and that of Pythagoras, and Ammianus Marcellinus says that the Druids were formed into unions in accordance with the precepts of Pythagoras. H. P. Blavatsky says:

The Druid priests were the descendants of the lost Atlanteans, and what is known of them is sufficient to allow the inference that they were Eastern priests, akin to the Chaldeans and Indians, though little more. It may be inferred that they symbolized their deity as the Hindûs do their Vishnu, as the Egyptians did their Mystery God, and as the builders of the Ohio great Serpent Mounds worshipped theirs—namely under the form of the "Mighty Serpent," the emblem of the eternal deity Time—the Hindû Kâla. Pliny called them the "Magi of the Gauls and Britons." But they were more than that. The author of *Indian Antiquities* finds much affinity between Druids and the Brâhmins of India. Dr. Borlase points to a close analogy between them and the Magi of Persia; others will see an identity between them and the Orphic priesthood of Thrace—simply because they were connected, in their Esoteric Teachings, with the universal Wisdom-Religion, and thus presented affinities with the esoteric worship of all. Like the Hindûs, the Greeks, and the Romans—we speak of the Initiates—the Chaldees and the Egyptians, the Druids believed in the doctrine of a succession of worlds, as also in that of seven creations (of new continents) and transformations of the face of the earth. . . . Wherever the serpent with the egg is found, there this tenet was surely present. Their Dracontia are a proof of it. STUDENT

The Trend of Twentieth Century Science

The Fall of Leaves

THE autumnal fall of leaves is generally referred to by poets as if it were a calamity to the tree. This is quite wrong. The tree indulges in no sentiment whatever about the matter. On the contrary, it has itself arranged the fall to suit its own convenience. In some cases the leaves are worn out and have become as superfluous as the on-growing margin of a finger-nail. But, in addition, the tree gets rid of them in winter for two reasons: first, because it desires to rest, not to grow and breathe; secondly, because the leaves would afford a dangerous purchase to high winter winds and snow.

So the tree lops them off in this way: at the point where the fibers of the twig pass into the stalk of the leaf, the tree deposits a disk of small round cells, which breaks the continuity of the fibers. The leaf thereupon falls off at this point, the fibers having been eaten through, leaving the disk as a cap to the end of the twig.

Nor has the tree lost anything. For before it began to make the disk, it withdrew into the twig all that was *living* in the leaf, all the sap and chlorophyll, and carried it back into the storehouse of the trunk and roots for safe keeping in the winter. The entirely dead leaf now falls on the ground, to decay into soil, to be used by the surface root fibrils, to re-enter the tree and reappear as leaf and twig. The tree knows what it is about, and wastes nothing.

The colors of autumn leaves are due to various causes. Sometimes they were in the leaf all the time, and are merely *revealed* by the tree's withdrawal of the intensely green chlorophyll. Some leaves that are not shed turn purple or more purple in the autumn, for example those of the copper beech. In this case the tree purples its leaves to prevent them absorbing so much sunshine. It does not need so much in the autumn.

The yellow tinge of some autumn leaves is due to the presence of the same coloring matter as the carrot shows. Its use to the latter is not known. The red pigment in the geranium leaf is the same as that of the red flower, and the turnip leaf's purple is that of the garden stock.

STUDENT

Preventing Earthquakes

TO prevent earthquakes would seem to be a hopeless ideal, but if some of the modern theories of their cause are true, it may be possible. These theories are mainly drawn from electrical science.

Thus M. Dary thinks that the earth's strata, by their different degrees of permeability to electricity, form natural condensers—the more permeable ones gradually condensing the current because surrounded with insulators in the shape of the less permeable. At last the accumulation is so great that a discharge occurs, rupturing everything in the neighborhood.

If this view is correct, earthquakes could sometimes be checked by connecting the condensing strata by conductors; and M. Dary thinks that our network of iron rails may often effect this, preventing dangerous accumulations.

M. Plante thinks that highly charged clouds may attract the nearest area of the earth's crust, as a rubbed glass rod attracts a pith ball. If the charge in the cloud is potent enough, the neighboring spot on the earth might be torn as it were a little from its setting and a wide-spread tremor started. A remedy for this, on the principle of the lightning-rod, would not seem impossible.

M. Guarini speculates that earth-currents, in passing through resisting strata may heat them. Water percolating through to the heated bed would be raised into steam. Or the earth-currents passing through subterranean water may electrolyse it into its constituent gases. In either case there would be heavy upheavals and motions in the crust.

Lastly is a theory that beds of calcium carbide form in the depths of the crust. When water reaches these there would be large formations of acetylene gas.

Astronomers are beginning to connect terrestrial magnetic and electric conditions with those of the sun. May not the other planets, and even remote constellations, have something to do with the matter? Do we have our storms, earthquakes and volcanic eruptions all to ourselves; or does the whole solar system, and even the whole cosmos, sympathetically share? We shall feel less lonely on our little planet when we know that the answer is *yes*. The thought is ennobling in itself. STUDENT

Remarkable Achievement in Celestial Photography

ABOUT the middle of the last century, in the early days of photography, successful pictures were taken through telescopes, of the Moon, which, when placed in the stereoscope, gave a startling impression of solidity and roundness. There was needed an interval of time between the exposing of the two plates which were ultimately combined in the stereoscope, during which the earth moved sufficiently for an observer to see a little "round the corner," so to speak, of the Moon. A new development of the same principle has just been successfully tried by Professors Barnard and Sullivan of the Yerkes Observatory. Photographs were taken simultaneously with the great forty-inch telescope and with one of the smaller instruments of the shooting stars of November 15, the Leonid Meteors. When developed, it was found that the displacement of the images of the meteors in front of the starry background was sufficient, owing to their comparative proximity to the earth, to produce the stereoscopic effect of relief. Such records will be of great service in determining the true direction of their flight, and the heights of their first appearance and extinction, etc. Our knowledge of these mysterious bodies is very limited. It is highly probable that they travel in the wake of comets, or perhaps they are disintegrated comets themselves; but it is not yet proved that all the shooting stars seen are of the same nature as the lumps of meteoric iron that occasionally fall to earth.

R

Radio-Activity of Living Things

M. TOMMASINA has discovered that leaves, grasses, flowers and fruits, when fresh cut, are radio-active, the radiations being probably N-Rays. As their life leaves them, and they dry, the radiations disappear.

May not some subtle and indefinable perception of these radiations give rise to part of our pleasure at the neighborhood of fresh plant life, supplementing that which we get from the color, scent and form?

Animals are also radio-active, and especially birds; and it seems that the radiation varies with health and with activity. Thus sitting birds generate less than active ones. It would be interesting to test the radio-activity of persons with fever. In that condition, all waste products of the body are increased, and the various radiations may be the highest of these.

STUDENT

The Sense of Smell

FEW of us realize the extreme delicacy of the sense of smell. Some recent experiments show that it is almost beyond belief. A particle of iodoform one hundred-billionth of a gramme in weight can be recognized. (A gramme is about fifteen grains.) This indicates that the nose is as delicate an instrument as the spectroscope. It suggests moreover that scents may be of the same nature as colors, orders of etheric vibration too low or too high for the octave to which the eye is adjusted. The theory that we only smell when actual physical particles of the odorous substance fall upon the nerve-endings in the nose, may be quite wrong. Smell may be *seeing with the nose*.

STUDENT

Alcohol and Target-Shooting

THE Swiss government recently performed a scientific experiment on a large scale in order to test the effect of alcohol on reflex action. More strictly, they wanted to know its effect on the power of accurate shooting. They experimented on a large scale—with 500 men. The results decisively showed that the men shot worse and worse in proportion to the dose of alcohol they had taken.

This is of course in line with the results of the experiments of Richardson, Ridge, Parkes, and others on the effects of alcohol on the various senses and the power of work.

PHYSICIAN

The Insomnia of Thinkers

A GERMAN physician has been studying the cause and cure of the insomnia of intellectual persons. He thinks that in the majority of cases it is due to stagnation of the brain's blood system, and the constant accumulation of waste products.

The remedy is to flush the brain with blood, not empty it. For this purpose the pillow should be gradually discarded. The head should be on the same plane as the body, and the feet even a little raised.

STUDENT

Intelligence and Conscious Motion of Plants

It has not been so very long since people generally looked upon plants as having no voluntary motion, conscious sensation or intelligence; but such ideas are passing away. Plants show these qualities in many ways.

They exercise choice. Some love the cooling shade of trees with only glints of sunshine, some love the sunny plains and hill-tops, some the borders of lakes and streams, and others a home in the water. But all green plants love the sunlight, though some want it tempered with shade. They will turn their leaves toward it and make strenuous efforts to reach it when placed too much within shadow. House plants in a window turn their leaves outward and will continue to do so as often as their position is changed. Plants know when night comes, and many of them close their leaves and blossoms and droop their stems for sleep, while others keep open house, proclaiming the same by a display of light petals, sending invitations broadcast, in the incense of fragrance, to their wandering winged helpers of the night.

A vine coming up out of the ground at a distance from any support will direct its growth towards one. An American Ivy came up at a distance of six feet from any support, a tree at that distance being the nearest, and straight toward that tree it grew and climbed its trunk. It must have known the tree was there, in whatever way it knew it.

Indoor vines placed too far within the shadow have unwound from their supports and straightened themselves out to reach the sunlight, crawling along on such support as they might find until the desired object was attained. While all plants do not show their sensation of touch, yet the sensitive plant and some others do.

It seems almost as if plants were conscious of the loving care of human beings, and grew better for one who loves them than for one who loves them not even though he cares for them. Does not the Loving Life at the heart of all things respond to its own? STUDENT

The Grandfather of Banana Trees

In the garden of the Raja Yoga Academy last summer an Abyssinian banana blossomed. For the five or six years of its life it had produced leaves and nothing else; it was getting ready. But even its leaves were marvelous things; like corn-leaves fifteen feet long and two feet wide, and no thicker than paper. But the midrib was as large at the base as a strong man's arm, though hollow like the leaves of cat-tails and all full of irregular air-chambers.

At last there came up out of the heart of the tree a mighty seed-stem, six inches in diameter, bearing something formed like a combination of pine-cone and willow-catkin, only that each of its soft, purplish leaves was as large as a dinner plate. One after another, one every day, the great leaves loosened and opened, allowing the double row of flowers beneath to bloom. The flowers were like very thin snap-dragon blossoms, standing in a closely-

SYLVAN SCENE, BEEKHUISEN, NEAR ARNHEM, HOLLAND

packed double row under each leaf. They exuded such quantities of sweet liquid that the bees and flies came in swarms while the leaf was up. After a few days the leaf withered and closed down to protect the young fruit. So it continued for three months or more until the flower-cone was six or eight feet long. This flowering ends the plant's life, for it dies as soon as the process is complete.

Some of the bananas ripened. They were of a beautiful orange-gold color, and about the size of a man's thumb. But the curious thing was that they were full of hard flat seeds. This seemed very strange until it was remembered that the tree was from Abyssinia, near the ancient Lemurian coast. Then one felt sure that it was the original stock from which our American bananas and plantains were developed in old Atlantis. Nevertheless these little bananas are edible and are used to boil with rice, etc., for a seasoning, or are eaten raw. There is another tree in the garden which will bloom next year and it will be watched with added interest, now that something is known of its prehistoric connections. Y.

City-Made Honey

SOME years ago a man kept a hive of bees next door to Charing Cross Railway Station during the flowering season the parks would afford ample supplies, for horticulture is carried on to an elaborate extent in them. But these bees continued to work when there were no flowers, and in all probability they made long flights to the suburbs. Bees, too, can make honey, at a pinch, from other things besides flowers—sugar for example. E.

Animals That Live without Water—Or at Least without Drinking

MANY instances are given of animals which live, as far as can be ascertained, without water; or which, at all events, drink but at rare intervals. There is said to be a certain breed of gazelles which never drink (!) and the llamas of Patagonia live for years without taking water. Near Losère in France is a breed of cattle which rarely touches water, but nevertheless gives rich milk.

Of course the heavy night-dews, so common a feature of arid climates, must provide the source of water in many cases. Then again, the juicy herbage that forms the food of rabbits, etc., contains a very large proportion of water. One might also bear in mind that water, in its gaseous state, is always present in enormous quantities in the air, especially in hot weather; and that we do not know enough about the possibilities of animal functions to be able to assert that even this might not be availed of by animals provided with special

organs. We know that the living organism is a wonderful chemical laboratory which builds up and decomposes materials in a way that mocks chemistry.

Why then might not water, in common with other compounds, be built up in the body, as it can be in the laboratory, from its elements? E.

THE MIGHTY SEA

CAMPBELL

MIGHTY sea!
 Chameleon-like thou changeest, but there's love
 In all thy change, and constant sympathy
 With yonder Sky---thy mistress; from her brow
 Thou tak'st thy moods and wear'st her colors on
 Thy faithful bosom; moraing's milky white,
 Noon's sapphire, or the saffron glow of eve;
 And all thy balmy hours, fair Element,
 Have such divine complexion---crisp'd smiles
 Luxuriant heavings, and sweet whisperings,
 That little is the wonder Love's own Queen
 From thee of old was fabled to have sprung---
 Creation's common! which no human power
 Can parcel or enclose; the lordliest floods
 And cataracts that the tiny hands of man
 Can tame, conduct, or bound, are drops of dew
 To thee that could'st subdue the Earth itself,
 And brook'st commandment from the heavens alone
 For marshalling thy waves.

Those who are united are fortified a thousand-fold.
Such as these cannot know what failure means.—KATHERINE TINGLEY

"And gray-eyed Athena rejoiced that he prayed to her. And she gave him strength in his shoulders and in his limbs and she gave him of her courage."

✻ Pallas Athena, Warrior ✻

THIS is only one of many pictures that Homer gives us of Athena, the warrior-maiden of compassion. Throughout Greek mythology she is pictured as the woman compassionate, the maiden-goddess who helps those who are in need of help, who gives courage to the disheartened, insight to the stupid, compassion to the heartless, and the light of whose countenance shone upon all things.

It was Athena who spread her courage throughout the whole Greek army and helped it in its siege against Troy. It was Athena who helped Perseus and the Argonauts through all the vicissitudes of their dangerous expeditions. It was Athena who bridled Pegasus for Bellerophon. Except for her help, Hercules would have failed, and Theseus would not have returned victorious. It was she who caused the olive to grow on arid Acropolis, and who for this was chosen Patron-Goddess of the young city, Athens.

In her title "Glaucopis," the "owl-eyed," or "owl-headed," is there not hinted some analogy to the Egyptian deities?

All compassionate, resistless in her power, infinite in her devices, practically without limit to her sagacity—her practical, hard-headed common-sense—the wisdom of Athena stood to the Greeks as a fountain stands to those who are athirst, or as light stands to those who are weary of dwelling in darkness. It was in honor of this maiden-goddess that the most sacred of the Greek festivals were held. One, the ceremony of "The Ploughs," was the signal for seed-time, for it was Athena who taught the Greeks the first principles of agriculture.

In Athens, too, was held in her honor, the Procharisteria, a Thanksgiving festival offered by the magistrates at the close of harvest. Then there came the festivals of the vintage season, with races and processions and songs of praise. Most wonderful of all came the Pan-Athenaic festival, when the new robes, brodered for her statue by young maidens of the city, were carried in sacred and joyous procession through the streets.

To the Greeks Athena represented life's dawn, life's sun-light. The sign of her presence among any people was that they must become warriors. The warrior-call was the call she sounded to the old Greeks.

But to balance and compensate, it was Athena, the maiden-goddess, who taught the industrial arts. "Fight and weave," she is recorded as saying, "I myself will answer for the course of the lance and the colors of the loom."

The solar-myth theory swept into its own domain, a few years ago, well-nigh all our critics. Athena was the first to suffer. But, let those who wish, believe Athena to be merely personified nature-attributes. Let those who wish think of her merely as a greater Eolus, as a more sagacious Poseidon, as a somewhat less vulnerable Mars. To those who know that the pleadings of the human heart for help have never, in any age, been left unanswered, it is impossible not to see that Pallas Athena-Parthenos, the maiden-goddess, is but the legend-picture of some great Teacher, some mighty warrior-soul who came with wisdom and help in ages past. Time was when the gods did walk and talk with men and in that day Athena walked among her own. STUDENT

MY call is the call of battle,
He going with me must go well arm'd,
He going with me goes often with spare
diet, poverty, angry enemies, desertions.

Allons! the road is before us!
It is safe—I have tried it—my own feet have
tried it well—be not detain'd!

—Walt Whitman

DR. LYMAN ABBOTT, than whom no American divine is better known, said recently:

In religion, I think what is safe for a man is safe for a woman—if anything—safer, for woman is more conservative. Women must trust themselves in these matters, for men trust women. Too long we men have tried to decide women's sphere. I am weary of hearing intellectual men talk about women's sphere. I am patiently waiting for some woman to determine

man's sphere.

When the question was first raised of the higher education of women, scientific men said that they could not study or comprehend what men learn because their brain was smaller and lighter. But they have disproved all these theories by carrying off the highest honors in Oxford and Cambridge, and they would have the highest in Harvard, but the highest honors are not given to women there. A woman must prove herself the equal of man by doing the things he does. Woman is to be her own standard, and she is not to accept man's measure.

A YOUNG Jewish woman has recently announced herself as intending to take the difficult training of a Rabbi. She is the first woman to take this course of studies in America, including as it does the regular studies prescribed for men who become Rabbis. But the young woman, although she will be allowed to complete the course, will not receive a diploma. So much for tradition and prejudice!

The Domestic Problem

A CLERGYMAN has undertaken, at last, to solve the servant-girl problem. His remedy is simple. It is merely this, that mistress and maid shall change places for a month or two, in various homes. The lessons that each would thus learn must solve this problem immediately and for all time.

Must we forever keep trying experiments? Will we never learn that the trouble is with the foundation? And our foundation is a twisted, perverted, selfish view of life. Small wonder that the domestic super-structure, never overstrong, threatens to tumble about our heads should unexpected company be announced or the baby come down with measles.

When will we learn that no nation ever yet was saved by its soldiers deserting their posts; that no one of the many problems of duty was ever yet solved by those who saw no harm in doing the duty of another? In one of the most ancient of our sacred writings, we read: "It is better to die in the performance of one's own duty, even though it be devoid of excellence. The duty of another is full of danger." If, by some strange Karmic cause, one woman is placed in a household as its mistress and another as the servant, be sure this is no accident. There will be problems for each to solve, of course; where are there not problems today? But the solution will come through each doing her full duty in the position in which circumstances have placed her—not out of it. The servant may, perchance, deserve to be mistress—yet the Law makes no mistakes. If she is better fitted to fill some other place, by the doing of her simple duty she will gravitate toward that place which is her own, as easily as the star slips into its orbit. Nor will anyone ever find his true place by any other method or at the end of any other road. The doing of the duty of another never brought anything yet but chaos.

By the way, it is a poor rule that refuses to work in divers situations. The difficulty of getting people to go to church is one of the problems of the modern age. It makes as much stir, to judge by the comments and statistics in our newspapers, as the domestic problem. Why does not our clergyman try his remedy on this? Why should he not exchange places with various members of his flock? If the mistress needs the cook's point of view, no less does she need the point of view of all her servants; of the housemaid, the butler, the coachman, "the butcher, the baker, the candle-stick maker." According to this clergyman's view, she could scarcely be expected to do her duty without having taken her turn at each of these occupations. Transferring this method to the pulpit, we would see the minister preaching one Sunday, perhaps, in the year and listening on each of the other Sundays to a sermon by one of his congregation. In this way he would get the point of view from which the banker sees things, the saloon-keeper, the retired capitalist, the grocer, the man whose business is not mentioned in the directory, and the man who has no business at all. Strangely enough, no one seems to have thought of this! STUDENT

The Other Point of View

A HUNDRED years ago a knowledge of housekeeping—by which is not exactly meant home-making—was considered to be the one necessity of a young woman's education. The result was a generation of men who undervalued the household work of their mothers and their wives because its gain was to the body, not to the soul. From the sheer bitterness of that position women flew to the other extreme and a generation ago, instead of being expected to understand domestic economy, young women were almost expected not to. By this time the pendulum is swinging back from the latter extreme and bids fair to halt, for a time at least, somewhere near middle lines.

And how a few of our self-styled reformers have taken the credit for this upon themselves; and how they love to discourse on the platform about poor Jonas who just *had* to take to drink, you know, because Mary made such poor coffee; of how a husband *naturally* steps into debauchery if his table is underfurnished, his bread half-baked or his pancakes sour! and so on. There is more or less logic in this, from one (and that a very limited) point of view. But there is another view point. Where one man—other things such as temperament, general morality and early training being equal,—is inspired to take liquor because of a cup of poor coffee, ten will be more enthusiastically inspired to do the same by a well-selected, perfectly broiled and *gluttonously-eaten* porterhouse or tenderloin. Where one man visits the saloon from sheer hunger, twenty today just go "behind the counter for a moment" after over-eating say at the Sunday dinner, at Thanksgiving, Christmas or New Years. This is not a theory, it is an easily verified fact. And how much of this sort of thing have some of our best intentioned housewives been responsible for? That is the real issue, after all.

Oh, if men only realized the unconscious estimate made of them by the wives whose sole aim is to cater to a husband's appetite, —methinks wounded vanity, if no higher motive, would make them hasten to do *their* share to keep the domestic pendulum close to a higher morality and to middle lines! STUDENT

PALLAS ATHENA (From an Ancient Statue)

IN Shakespeare's time the wife, as a person, did not exist. She belonged to her husband, as did also her goods, her chattels, her services. The very presents which he gave her were still his property. He could beat her if he thought she needed it and he could even deprive her of the privilege of caring for her children. It was not until near the close of the Seventeenth century that the law gave to the English wife a right to the separate use of her property, and it was not until the middle of the Nineteenth century that the lawmakers recognized and protected the wife as a person, entitled to work and receive wages and to have an equal share with her husband in the guardianship of their children.

It was a woman, the good Queen Philippa, who saved from death the historic "Six Citizens of Calais." Froissart, the historian, was her secretary.

OUR YOUNG FOLK

IT was the day before New Year's. Mr. Stevens looked kindly at the new office boy as after, "Excuse

me, sir, I think I see a half sovereign in that crack," the boy returned to his side with the money in his hand.

"Well, well," said the merchant, "the last boy was supposed to have stolen that money! Did you know that?"

"No, sir," replied Jack.

"Well, he was—an unfortunate mistake," he added, testily.

Just before the closing hour, Jack knocked at the door of the private office. "What do you want?" said Mr. Stevens, as Jack stood there, twirling his cap in his hands.

"Please, sir, may I go tell James Foster that the money is found, so he may come back to work for you in the morning?"

Mr. Stevens was genuinely surprised. "Who said anything about his coming back?" he asked brusquely. "I shall see he hears about the money being found—of course—but he was a lazy young scamp and his dismissal served him right."

It had caused Jack some effort to make that request, for he knew that if the other boy returned he would be homeless and unemployed. His aunt and uncle, who had given him a grudging shelter since the death of his parents, had that very week moved to another town, washing their hands of him as far as the future was concerned. But to rise to fortune upon the misfortune of another was more than Jack could think of doing.

"Poor chap," he said to himself as he went on home, "how it must seem to be thought a thief!" Jack knew what it was to be cold, hungry and friendless and he turned and went back to the office. His employer had not yet left. "If you please, sir, I'd sooner you took him back. I will manage."

Jack was unconquerable in his good opinion of others and he thought the merchant's reluctance to reinstate James must rise principally from an unwillingness to turn him adrift. "You suit me and James didn't. We will not re-open the subject." And Mr. Stevens turned to his letters again.

Jack Barton had never met James Foster, but he had heard a white-faced boy give that name at a place where they both had tried unsuccessfully the day before Jack had obtained his present position with Mr. Stevens. No one knew better than he did how difficult it was to obtain work, even under most favorable circumstances, in those hard times.

"He seemed half starved, too," said Jack to himself and then a brilliant idea floated into his mind. For, while he had been thinking about James, he had forgotten himself and had left some little door in his heart wide open.

"Yes, James Foster lives here," said a sad-looking woman who opened the door. "You can see him while I go across to the shop, but don't be worrying him about anything, for he is ill enough as it is."

"It is all right, ma'am," said Jack, with a cheery smile, "perhaps I can brighten him up." Mrs. Foster went out, closing the door behind her, and Jack turned toward the slender, pale-faced boy lying upon the

What One Boy Did

couch. Then he said brightly, "I say, I am the boy who's got your place.

It don't seem fair, but the boss won't

take you back—I asked him." "He said I stole," cried Jim, with flaming cheeks. "I never told mother, but he sent Mr. James down today to say I could have the money. Mother sent it back to him quick enough."

"I wonder," said Jack awkwardly, "could your mother find me a bed here? The people I used to live with have moved away from town and I'd sooner go where I know a chap."

James' eyes brightened. "May be she could," he said. And when Mrs. Foster returned the matter was settled and Jack went after his little bundle.

Jack worked so well that when, a year later, one of the clerks above him left, he was promoted to the position and the office boy's place was again vacant.

"Do you know of any boy who would suit, Jack?" asked Mr. Stevens one day.

"I think James Foster would suit, sir, if you tried him again," said

Jack quickly, his cheeks flushing.

"Hm," said Mr. Stevens; then, after a pause, "If I take him I shall hold you responsible for his behavior."

"All right, sir," said Jack cheerfully, and once or twice that day he caught himself whistling at his work.

At first James was not quite willing to return. "Let by-gones be by-gones, old chap," said Jack. "Live this dislike down. I know Mr. Stevens is sorry for his mistake. It simply is not his way to go tell you of it. And then, James, I might as well be frank, you didn't use to be any too careful about things anyway, did you?" which impeachment James allowed.

The Foster home had come to be a very different place, for Jack's cheery influence had left its mark. Mrs. Foster, with her motherliness, soon made him feel that he was more than welcome, and before long Jack felt he was indeed a son of the

house and his earnings, as well as those of James, went to make things comfortable for the three. When Mrs. Foster would remonstrate, Jack would always reply, "Now, it wouldn't seem like home unless I did. And James would do as much for me any day. I don't want to feel just like a boarder, Mrs. Foster, it would be just like turning me adrift again."

James returned to work determined to be a credit to Jack, and he succeeded. His gratitude toward Jack was so much greater than his dislike of Mr. Stevens that after a time all difficulties were solved.

It was New Year's Eve, a year later. The old merchant had come home late from the office and was sitting thoughtfully by his study fire. It was evening and before him came the picture of the two lads' affection for each other. It had been before his eyes day after day during the last few weeks.

"Guess I will take a new start, myself," he said, determinedly, to himself, "and New Year's Day is a good time to begin." STUDENT

CHRISTMAS LAST YEAR IN ONE OF THE RAJA YOGA DAY SCHOOLS ESTABLISHED BY KATHERINE TINGLEY

THE CHILDREN'S HOUR

"I heard the bells on Christmas Day
Their old, familiar carols play
And wild and sweet
The words repeat
Of peace on earth, good-will to men."

The Raja Yoga Christmas

And then came our turn and our surprise. We had been busy, too, making presents for our teachers and planning delightful surprises for them. After all that came more songs, a story, and good-will greetings and then a splendid march home under the stars. As we left the big Lecture Hall, I believe everyone of us must have been wishing that the Buds and Blossoms all over the world could know what a Raja Yoga Christmas is like.

WHAT New Year's greeting can we give you, Buds and Blossoms all over the world? Surely nothing could sound out clearer the sweet pure note of Brotherhood, than a story of how we Raja Yogas spent Christmas. I cannot believe that Christmas came and went a whole week ago. Sometimes it seems just like yesterday and other times it seems like some beautiful memory of a far away golden time when everybody was kind and loving and helpful; when heart light shone out of every face and when Raja Yoga love was in every heart.

Well, to begin with, Santa Claus paid us a visit Christmas eve, as usual. Not long after the stars came out, the Raja Yoga children marched, two by two, to the big Raja Yoga Lecture Hall, where there was, Oh! such a blaze of brightness! And right in the center of it all were beautiful Christmas gifts. Well, last year it was so lovely, but this year—how I wish you could have it, Buds and Blossoms! Down through the chimney came Santa Claus, of course. What did I say, Santa Claus? Well, to be exact, there were two Santas; dear old Father Santa Claus and his son.

What a cheering welcome we gave them! Then we sang a Raja Yoga song, a real heart song of greeting and after that, came Santa Claus' speech.

After greeting us, Santa Claus visited all of the children and all of the grown-ups too, giving to each a present from his great big pack,—or rather his son did—that task fell to young Santa Claus. To be honest, we Raja Yogas could hardly tell them apart and we only knew young Santa by his spry step. It is needless to say that we enjoyed our presents, for everything was such a lovely surprise. Bless me! We Raja

Yogas have so much more than other children that I do not see how Santa Claus could think of anything more for Christmas time! But he did.

air will make us bright and happy. If we educate our bodies to be strong, and keep our hearts right, we will have bright, alert minds. A RAJA YOGA BOY

JUST GOING DOWN THE CHIMNEY! SANTA CLAUS IN LOMALAND

"At Christmas play and make good cheer,
For Christmas comes but once a year."

OUR TWO LOMALAND SANTAS AND THEIR EMPTY PACKS

You see, it is not like the old-fashioned kind of Christmas. We never think about getting things. We like to receive presents, of course, but we think deeper than that and we find a deeper joy, too, than the joy of just receiving. It is the joy of giving that I mean, and helping and sharing, for that is Brotherhood, you know.

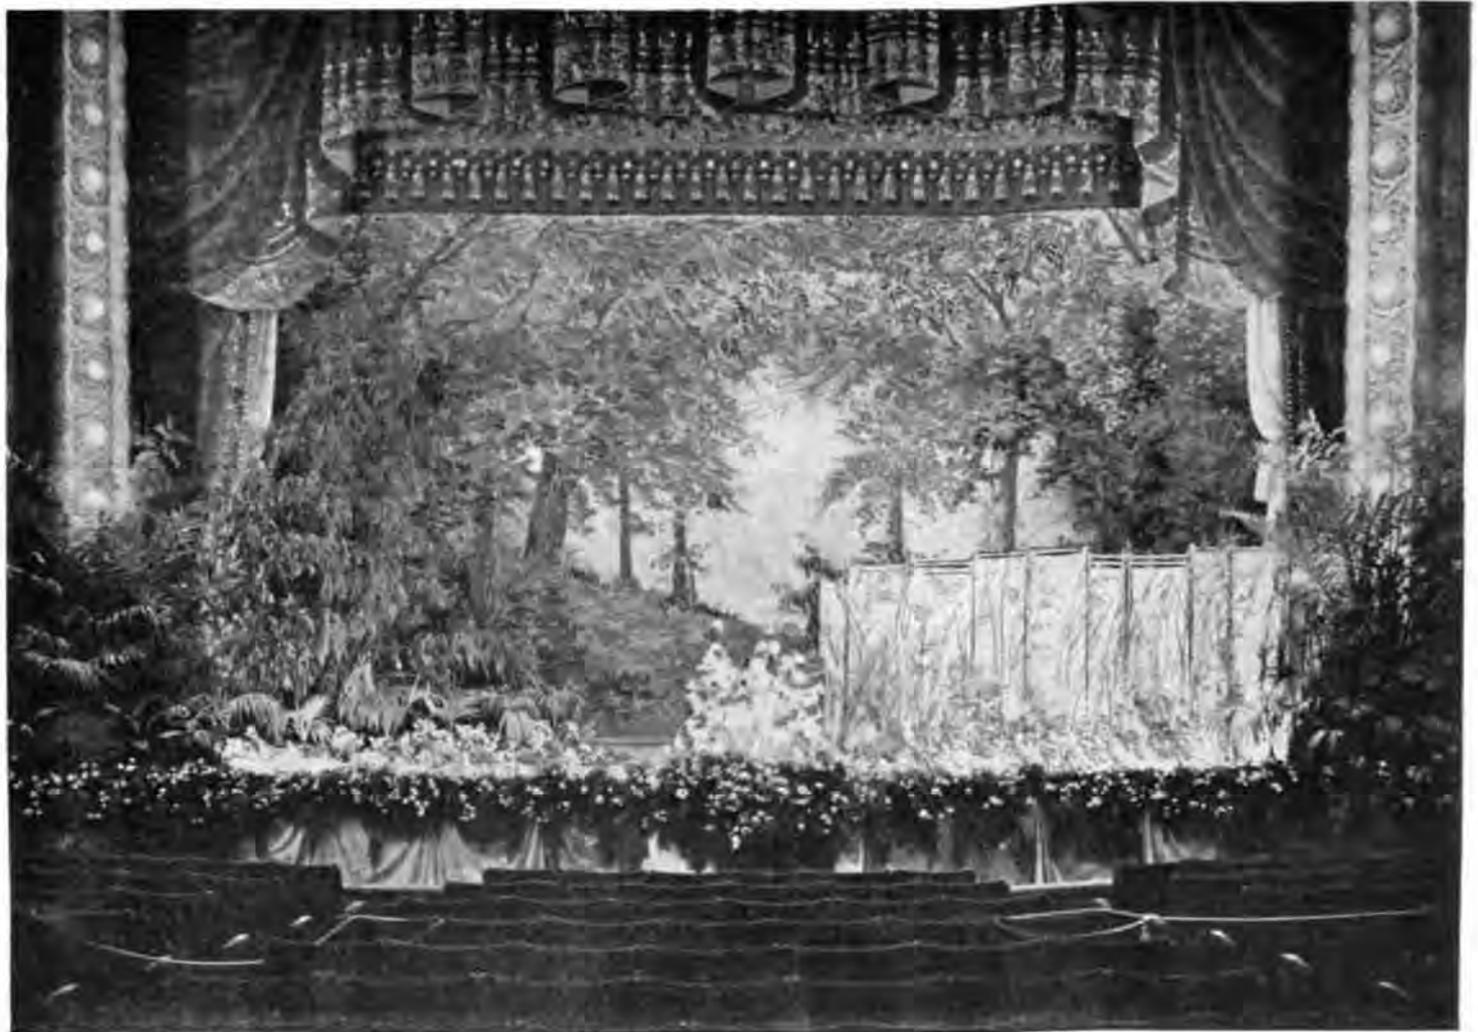

Now, about New Year's. Did I say that the story of our Christmas time would sound like the key note for the New Year? Well, it does, for I think the key note is "joyful giving." Why not make your heart song and mine, for next year, right on that key,—joyful giving? Why, the poorest child can give something, a smile, a cheery word, a little loving help at the right time. The poorest child can follow the example of the Master whose birthday we celebrate on Christmas eve, for the poorest child can "let his light shine."

Happy New Year, Buds and Blossoms! Happy New Year!
A RAJA YOGA GIRL

EDUCATION is a word that is very much misunderstood. It is generally connected only with books and the mind. But the body and heart should be educated as well. All of us know a great many people who have book learning but, alas, how many of them are selfish or sickly. When people spend the whole day studying books to gain knowledge for themselves, what can be more selfish? We should go out into the happy sunshine and help others, as well as learn lessons. For the sun and fresh

Diego
California

LOMALAND STUDENTS AT ISIS THEATRE

THE Christmas entertainment presented by the Raja Yoga children of Lomaland at Isis Theatre Sunday night, was as delightful as it was artistic, or perhaps delightful because it was artistic, as that which is harmonious and beautiful is always the most delightful. Before the entertainment began every seat in the Theatre was occupied. The audience was appreciative, every number on the program being cordially applauded.

A piano solo, "Murmuring Spring," and a song, "Snowflakes," were both delightfully rendered by little Margaret Hanson.

A most artistic and charming feature of the evening's entertainment was the recitation of a Christmas selection from *Ben Hur*, by Miss Ruth Westerlund, a little Raja Yoga girl, whose elocution has several times been the delight of Isis Theatre audiences.

Master Charles Savage read a timely paper on "The Spirit of Christmas." In part he said: "Christmas is supposed to be a happy time for all children—but we know there are many who have very sad and unhappy Christmas times. Is it not a fact that ignorance and poverty are found in every crowded city? Where these are, there we find the children huddled together, suffering, hungry. This fact should make those who have a happy Christmas grateful, and thoughtful for those less privileged. True sympathy begets unselfish thoughts. The unselfish work follows, and at this Christmas time we should take a stand, willing ourselves in the future to be helpers to all the children of the world.

"Christ and other great Teachers have set us the example by their tender service. Simply they lived and lovingly they worked, forgetful of self in giving knowledge and happiness to others. We are told we are our brother's keeper, and we know it is so. Good friend, what a joyous Yuletide this would be if each of God's children had heeded these words in the past and done his duty. Tonight we could then count not one unhappy child in the world. Our lesson tonight is that the Christos love is in our hearts. It pleads for all to be kind, noble, just, Christlike and pure, and thus honor the age in which we live."

A string quartet composed of Raja Yoga boys rendered two selections most delightfully.

Mrs. W. T. Hanson read an interesting paper entitled, "Our Boys

and Girls; the Hope of the Ages." She pointed out the difficulty of straightening a tree when it had grown old. "So with us," she said. "We look at each other and see in each countenance the signs of a struggle that has robbed us of all the beauty and sweetness of life. One face expresses the bitter disappointment of frustrated hopes; another brutal determination to have his own way—carry his point at the expense of any suffering to others. Others still a hopeless despondency as though the battle had been too hard and the tired body was ready to lay down its burden and pray for the end to come. It is so pathetic to think how much life should hold in store for us and how little we seem to get. Whose fault is it? What knows the tortured soul and suffering mind and body of peace and content? What could they say of the joy of life? And yet joy and peace are our rightful heritage and we could have them if we would.

"To Theosophists generally and to those who live at Point Loma especially there comes as a brightening ray the thought of the boys and girls who are in reality the hope of the ages. Set your imagination at work and try and get a glimpse of what this earth can and will be when the girls and boys who have been started in the right direction grow up to womanhood and manhood. When there will actually be 'Peace on earth; good will toward men.'"

The opening and closing numbers of the program were rendered by students of the Point Loma Conservatory of Music. They were Wagner's "Rhein Journey," and "Theme and Variations," from the "Traut Quintet" by Schubert. The latter, which was played the preceding Sunday, was repeated by special request.—*San Diego News*.

It is certain that, in one point, all nations of the earth and all religions agree: all believe in a God. The things in which they disagree are the redundancies annexed to that belief; and, therefore, if ever a universal religion should prevail, it will not be by believing anything new, but in getting rid of redundancies, and believing as man believed at first.—*Thomas Paine*

"THERE is always plenty of good work to be done. If you can't do what you want to do, do what you can do. Under the beneficence of the divine law there is never an excuse for inaction in well-doing."

WHEN THE WESTERN SUN CASTS A SHEEN OF GLORY ON SEA AND SKY AT LOMALAND

It is in and through symbols that man consciously lives, moves, and has his being. Those ages moreover, are accounted the noblest which can best recognize symbolic worth and prize it at the highest.—*Carlyle*

A Vision in Purple

IN the year one thousand eight hundred ninety-seven, I, the Friend of the "Chief," had a dream and the visions of my head troubled me. I was weary and sick unto death, for that I did uphold the law by day and by night, and some of the people hearkened not unto me. I was weary and sick at heart, yet was the fire unquenched within me. They who saw only darkness went astray after strange gods, for the prophets of Mammon were strong in the land; and their followers hearkened not unto my words, for the false prophets did blind their eyes, that they saw not.

I saw in my vision by night, and behold! a mighty temple. The height thereof was as the mountains, and it was girt about with mighty pillars. On the pillars were fine paintings of holy symbols; and great beasts of hewn stone crouched before the doors. And the beasts had the heads of men and the wings of eagles, and the claws of lions; and their body was the body of a bull.

And behold the whole was overshadowed with a glowing radiance of purple, and I went into the temple, and lo! a tomb of graven stone, set round with the figures of strange beasts, and men having the heads of birds. And I went unto the tomb and looked in; and I was astonished. For, as I gazed, behold! there I saw mine own image in the tomb, and I looked in the face of the image, and it was the face of one dead, even myself. And round about stood the false prophet and his disciples, exultant, awaiting the closing of the tomb that they might go out and preach their false doctrines to the people. And my heart grieved for those that were blinded and for those that should follow them.

And I looked again into the tomb and behold, I was alive, and the face was radiant. It was the face of a warrior, young and strong, and yet it was mine own image in the tomb, and the face was the face of one that conquereth in battle. And my heart was filled with joy unspeakable, and I said: Surely right shall conquer and the work of the Master shall prosper.

And feeling the glow of a great compassion in my heart, and my being full of strength to battle, I arose and with the power that was in the middle region between mine eyes, I looked afar out over all lands and I saw the whole world and all the peoples therein; and all nations and kingdoms of the earth were unfolded before mine eyes. And mine ears were unsealed, that I did hear strange and fearful music, like unto the wailing of troubled spirits in hell. And the strange and terrible music was swallowed up in the sound of many trumpets and the music of a glorious harmony. And again my heart was filled with gladness, for the sounds were as the trumpeting of an army that conquereth in battle of Light.

And I looked again, and lo! the tomb was no more seen. But there was a great light, and in the light there stood a shining one, and his face was as the face of a god. And the shining one gave me a scroll and

spake unto me, saying, Take the scroll and read what is written therein, and give it to thy people. And I took the scroll and did read. And my heart was filled with joy for that I did read therein. "Verily, thy work shall be done." And then came the Peace of Silence—Silence—Silence.

And I opened my eyes and looked again, and lo! a mighty concourse of people approaching the temple! And the light shone out from within the temple upon the people. And the people were glad because of the light. The people were filled with joy, because of the light; for the false prophets had sought to blind their eyes, and had told them falsely, saying: There is no light for you. The false prophets had told them falsely, saying: Thou shalt worship these fires, for there is none other light. And the people came up to the temple singing.

The truth shall live among the people; they that speak falsely shall be utterly confounded.

The light shall shine forth in the dark places of the earth; darkness shall cease.

All the nations of the earth shall be free; the yoke of bondage shall be cast off.

Let us therefore minister unto all that lives; for the Law hath triumphed.

The Law of Truth hath triumphed; the deceitful shall perish.

The Law of Light hath triumphed; darkness is swallowed up.

The Law of Freedom hath triumphed; bondage shall be no more.

And I looked again, and I heard a voice saying: That thou seest is that which shall come to pass near to the middle years of the coming century. And I saw the shining one standing at the head of the people. And the shining one led the people on to the temple. And the people said, Who is he? Surely we know this Master? And the people came on into the light from the temple; and the light shone on every man and on all and divers races of men, and on the lowly and the proud, and on the learned and the unlearned; and all manner of men and all creatures were in that light.

And I awoke; and I was no more sick and weary. For I saw that the people were tired of the false prophets, and the light shone on them though they knew it not yet. And I said, of a surety I did err in that I was sick and weary. For the Law worketh in silence. The great day of Light cometh suddenly, when no man knoweth. Verily, the night is far spent, and the blackness that cometh before the dawn is well-nigh ended. And I said, I will write my vision that the people may be comforted.

THE OMNIPRESENT MIND

COLERIDGE

THERE is one mind, one omnipresent Mind,
 Omnic. His most holy name is Love.
 Truth of subliming import! with the which
 Who feeds and saturates his constant soul,
 He from his small particular orbit flies,
 With blest outstarting! From Himself he flies,
 Stands in the sun, and with no partial gaze
 Views all creation; and he loves it all,
 And blesses it, and calls it very good!
 This is indeed to dwell with the most High!
 Cherubs and rapture-trembling Seraphim
 Can press no nearer to the Almighty Throne.

Character Building

“CHARACTER” is generally understood to comprehend the sum total of all the qualities which make up the man. The aphorism “As a man thinketh so is he,” indicates the kind of activity which is chiefest in the building of character; it is mental life more than physical, which is concerned in character building.

In music of a high order, we have choice combinations of sounds, some high, some low and others intermediate in pitch, and of various and changing qualities, blended, shaded, accentuated, in such a way as to form a beautiful sound picture, which is capable of appealing to the sentiments and affecting the emotions of the listener, and producing certain effects as may be desired by the composer; such music has character.

In painting there must be a subject, with its setting or surroundings, perspective, lights and shadows, and a blending of colors and tints, all of which go to make up the character of the painting, and represent the sentiment of the artist who did it. And so it seems as though the character in man must consist, not of any one single quality but an aggregation of qualities, which if inclined in one direction we say is a good, or if in the opposite direction, a bad character.

Every child is born with a particular set of tendencies which in the course of its growth and development we recognize as character, and which is the outcome of its own past. Ordinarily, owing to lapse of memory, and the ignorance of parents, no definite trend is given to these tendencies and so the child grows up, stumbling along in the dark with the real object of existence obscured and its life heavily handicapped. For instance, one child, having a fertile and perhaps unbalanced imagination may easily fall into the habit of fabricating monstrous tales, which, seeming clever and harmless at the time, affording amusement, may even be encouraged by the parents; such a tendency may easily grow into the habit of lying, and, if not corrected, in later years be the cause of much mischief and trouble; or if partially corrected, there still remains the tendency to exaggerate, which gives that tone to the character. This is so common in people of a young country rich in projects, vast in resources, and great in area, where the imagination is as fertile and productive as the soil, that it may become a part of the national character.

Another child is born, which in time, manifests lack of originality, shows a tendency to imitate or copy, which, if coupled with disinclination or lack of application, will, if uncorrected, constitute the weak character of one who follows after, and is incapable of making a decision when thrown upon his own resources; or if recognized and over corrected may go to the other extreme of obstinacy and hard-headedness.

An architect and builder must have creative power to design and practical ability to carry out his design. He must stand on his own feet in these respects. And so in character building, we, as children, started life with certain qualities or powers, as a stock-in-trade so to say—yet if we would fulfil the object of life, which is a continual progression towards perfection, we must at some time take ourselves consciously and

deliberately in hand, and taking account of our stock, select that course which will conform to our ideals and positively follow that design which will lead to the desired result. We must recognize the inadvisability, indeed the positive harm, of harboring such things as vanity, conceit, jealousy, envy, etc., and proceed to get rid of them. Recognizing the value of, and having respect for, truth, honor, integrity and all the virtues, we should consciously try to make them a permanent part of our character.

In the first example of a child given to exaggeration, if a time arrives when its condition is realized and the child learns something of its own nature and powers the riotous imagination may be checked and turned into a proper direction. In the second example the tendency to imitate or copy, may be checked by deliberate effort and the power of originating cultivated by persistently refusing to follow others, and by inventing its own ways and means and carrying them out—and so becoming strong and self-reliant. All such efforts are concerned in character building. But extremes are to be avoided in this as in all else and middle lines followed, that the harvest of a lifetime may be as well rounded and carefully balanced as the harmonies of divine music.

The future is rich in prospect for humanity, for with the increasing knowledge of the laws of life, with the establishment of schools throughout the world in which the “kingly way” of Raja Yoga is being taught to the children of all nations, they will be put on the right path, and in fact be the precursors of the future royal family of Humanity.
 H. P. P.

The Nature of Truth

TRUTH is an indwelling spirit and its nature is divine. It is one aspect of the Christ Spirit in the world. Jesus, speaking as the Christ, the divine in man, said, “I am the way, the truth and the life.”

It is in the nature of truth to clarify and make free from all impurities. It frees the soul that knows it from the bondage of error. It is analogous to light and makes plain the way. It is eternal and sure, a steadfast anchor and source of strength.

Much that goes by the name of truth is not truth at all, but a distorted, partial image, or reflection which is false and misleading. The mind is a mirror which reflects gleams of truth coming from the inner divine center, but it does so very imperfectly, owing to its own imperfections. There are as many of these distorted images of the real as there are undeveloped and clouded minds to reflect, and each is apt to think its own a perfect revelation of truth. The selfish and unscrupulous also have wilfully misrepresented or suppressed such truth as has been plainly given to the world, because it stood in the way of the fulfilment of their own selfish ends. So the world is filled with erroneous teachings under the name of truth, and these have been leading humanity into dark and sorrowful ways. These teachings have been kept alive solely because under all incrustations and back of all distortions there has been some portion of the ever-living truth, from which they have drawn such vitality as they have; for truth is undying and “crushed to earth will rise again.” But the day of error is doomed. The bright star of truth will yet shine forth to bless the world, undimmed by selfishness and wrong, and hungering souls in bondage will know the truth and the truth will make them free. And in this glorious consummation it is our blessed privilege to have a part. If we fight the good fight and put down and out forever the powers of darkness that assail us—each one of us shall have opened the way for a great flood of light to pour upon the world, and have made easier the struggle and the conquest for the souls that come after. The day of truth is close upon us. B. W.

IN the matter of friendship, I have observed that disappointment arises chiefly, not from liking our friends too well, or thinking of them too highly, but rather from an over-estimate of their liking for and opinion of us, and that if we guard ourselves with sufficient scrupulousness of care from error in this direction, and can be content, and even happy to give more affection than we receive—can make just comparison of circumstances, and be severely accurate in drawing inferences, and never let self-love blind our eyes—then I think we can manage to get through life with consistency and constancy, unembittered by that misanthropy which springs from revulsion of feeling. The moral is, that if we would build on a sure foundation in friendship, we must love our friends for their sakes rather than for our own.—Charlotte Bronte

MAN IS HIS OWN STAR

BEAUMONT AND FLETCHER

MAN is his own star, and the soul that can
Render an honest and a perfect man.
Commands all light, all influence, all fate,—
Nothing to him falls early or too late.
Our acts our angels are, or good or ill,
Our fatal shadows that walk by us still.

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question Is competition a law in Nature?

Answer I In the lower kingdoms of Nature, the only thing that might be taken as an indication that competition is a law is the fact that in the struggle for existence, only *some* of the species take the modification that enables them to survive and the rest perish. Among human beings, it would seem that competition is an error into which the human mind falls when the prevalence of lower desires has blinded men to the knowledge that they are souls, and that brotherhood is a fact in Nature. For what advantage or real growth for the whole can come from individuals or firms or nations underselling one another and depriving one another of their occupations?

It is evident that every person, or group of persons, or nation, is peculiarly fitted for some employment, or to carry on certain manufactures; and that the true method is to help each to find this, and encourage any effort made to fill the proper place in the general scheme. Besides, to thinking minds, any system that is the means of introducing adulterations so generally, thus degrading material, must fall into line with error and irresponsibility about work—both of which lead mankind into mazes of unlawful living.

When human beings have given the soul freedom of expression in action, there will be no competition, taken in the sense of strife for a common object. There is never competition among the great; Shakespeare and Dante do not compete. But ever where the soul is not free are there those who seek to wrest from others that which they only have the power to give unto themselves.

M. T.

Answer II While competition may appear to exist in some instances in the animal kingdom, and while it does exist in human life as at present constituted, it does not follow that it is a law of nature or a law of true human nature. Indeed it appears to be rather an evidence of a nature which is not human, but below the human, partaking of the animal—that which seeks for itself alone regardless of other selves.

In a state of Society truly human—and that implies a recognition of the divinity of man, a recognition of the soul—in the place of competition will be mutual helpfulness. Instead of each one seeking to get ahead of his fellows, each will seek the light, the good of all, and to share that light and that good with all.

What, then, will be the incentive to progress? For has not all our great advance in modern times come about through competition? To the latter question, No; but, on the contrary, whatever advance nations or individuals have made, has come about in spite of competition, and indeed has been retarded by it. And for incentive there will be the same incentive as makes the seed life of a plant to push up through the earth into the free air and sunlight. The incentive will be the divine urge to put forth one's highest effort for the good of all and the attainment of a divine life. So far from competition being the incentive to progress, we cannot know what true progress is so long as it governs the main portion of our lives. The full powers of the human race will never be unfolded until, in place of competition, Brotherhood becomes the rule and guide of our lives, because then, instead of every one trying to hold every one back, each will try to help his fellows forward. What a glorious destiny awaits humanity when it shall have learned to live in Brotherhood and mutual helpfulness instead of this condition of constant warfare and strife!

STUDENT

Question In reading over the objects of the International Brotherhood League, which I understand is the department of the Universal Brotherhood for practical Humanitarian work, I notice that one of its objects

is, "To endeavor to abolish capital punishment." Please tell me why Theosophists hold that capital punishment is wrong? Is it not necessary as an example and a deterrent?

Answer For an answer on this question, the writer is referred to an article on the subject in the *Mysteries of the Heart Doctrine*. The only other point to be mentioned here is, "Does capital punishment act as is claimed by its advocates, viz., as an example and deterrent?" And in answer to this we would refer to the statistics of crime, and especially of capital offenses in those States in which capital punishment is inflicted, and ask the writer to compare them with the statistics from those States in which it has been abolished. Further argument should not be necessary.

The following is from an article by E. L. Renford, D. D., ex-president of Buchtel College, which appeared in the magazine *Theosophy*, formerly *The Path*:

The researches of such men as O'Sullivan and Spear and Santoul and Victor Hugo fail to discover a single instance where the executions of men have checked the tendencies to crime. These researches reveal precisely the reverse of this, and show as plainly that public executions have been the occasions of multiplied crimes. Prison cells out of which men have been led to execution in the morning have been filled at night by men who had committed crimes in the very shadows of the gallows during the fatal day. Public executions instead of restraining crime have stimulated it, or at least public executions have broken down the public regard for the value and inviolability of life, upon which considerations a large part of the safety of life must forever depend.

The argument has been relied upon for years in behalf of this barbarous custom, that a public hanging must exert a salutary restraint, but the abolishing of these public scandals is a virtual surrender of the argument itself. If the old argument of restraint is good, then all the people ought to be urged to witness every execution, but the simple and significant fact is that the better classes of people shrink from such scenes, while the most reckless and lawless people will gather with the greatest eagerness to witness them when permitted. Here is a circumstance that ought to invite our lawmakers to pause and consider. A legal custom that invites the enthusiasm of the worst elements in a community and revolts and horrifies the best element is a custom that ought to be abolished.

When the State is seen to hold life cheap the people will do so too. If the State in its judicial calm can take life, men in their frenzy will take it all the more readily. Judicial murder in the lists of a high civilization will yet be seen, I believe to be more culpable and less pardonable than murder by the infuriated or crazed individual. A man, under an uncontrollable frenzy of anger takes a life and certainly should be punished; but what shall we say of a State which, in its wisest and least excited moods, in its calmest deliberation, proceeds to take the life of a man whose average line of intention may be much farther removed from the murderous borders than the habitual moods of many others, who may never have met with the momentary temptation to violence?

It ought to be a principle in criminal administration that no government should place one of its subjects beyond its power to benefit him, if the changed spirit and mood should permit a benefit. Who can doubt that multitudes of men, the moment after committing a murder, would have given the world if they could, to recall the life destroyed and the act that destroyed it? Vast numbers of men have committed crimes who have not been criminal in their common daily moods. By the force of extraordinary influence, acting perhaps but the fatal once in a whole lifetime, they have failed. The statement needs no argument. It is manifestly true. And is it an enlightened policy, is it humane, is it just that a life so failing of its manhood for the moment shall be destroyed by the combined power of a great and enlightened State? It is barbaric to the last limit of its destruction.

The infliction of the death penalty clashes with the humanity of our times. It is an incongruous presence. To add to its incongruity we associate *religion* and religious ceremonies with the gallows and chair. The "Spiritual advisers" pray and read Scriptures with the doomed man—secure his repentance, pronounce him "saved," "a child of grace," prepared to take his seat in Paradise, and then the signal is given and the "Christian" is sent to Heaven with a black cap over his face! This business of hanging Christians is a gruesome one. Either the rope or the Chaplain ought to be abolished. The Chaplain at the gallows is an anomaly. If a man has become a Christian and is prepared for the society of Heaven, we ought to tolerate him on earth, especially if we have the privilege of keeping him within prison restraints, as in general we ought, no doubt.

The poorest use we can make of a man is to hang him. What have we done? Have we benefited the man? So far as we know, not at all. And are we permitted to deal with men with no thought of doing them good? Who gave us that barbaric liberty? Shall a State assume that it may deal with its subjects with no purpose to benefit them? The thought is criminal itself. The murderous class are generally of the ignorant class, of those generally who are physically organized on a low basis. Shall the State execute those whom it has failed to educate? Shall it kill, or restrain? Civilization can have but one answer to this question.

STUDENT

English Notes

(By our London Correspondent)

LONDON, November 25th

IT is bitterly cold here. A great deal of snow has fallen, especially in the north. The papers are discussing the problems of poverty—as they always do in cold weather.

But whatever may be said on the subject, it is evident enough that in London alone the struggle for subsistence will be an exceedingly bitter one this winter. Those who have worked for years among the poor of East London are beginning to despair, so fearful does the outlook seem to them. Hints of an uprising of the workless and starving are freely given, not by popular agitators, but by practical philanthropists.

What is to be done? I have the keenest sympathy with those who are striving to remove the causes of poverty by mending our laws. In due season they shall reap, if they faint not.

And yet the only complete answer to that question, "What is to be done?" is, I say with all earnestness, "Spread the light of Theosophy!" No man, no woman, will sink beneath despair who realizes the imperishable dignity of the soul. Says Krishna, in the *Gita*, addressing a man overwhelmed by trouble:

I, myself, never was not, nor thou, nor all the princes of the earth; nor shall we ever hereafter cease to be. As the lord of this mortal frame experienceth therein infancy, youth and old age, so in future incarnations will it meet the same. One who is confirmed in this belief is not disturbed by anything that may come to pass.

Any one, in East London or elsewhere, thus realizing the nobility of his calling and his true position in life, will count it a trifling thing to have endured hard times this winter. He will look upon the people of London as his brothers, and will be sorry, not savage, that so many of them have not his knowledge of this *Eternal Fact*.

It is curious how the subject of Reincarnation is stirring the minds of the people. The Christmas number of "The London," a magazine of immense circulation, "a magazine of human interest," to quote its own sub-title, contains a symposium contributed to by Dr. Alfred Russell Wallace, H. Rider Haggard, Mr. T. Stead and the Rev. John Clifford, M. A., D. D. Their theme is, "Have we lived on Earth before? Shall we live on Earth again?"

I cannot at the moment consider their arguments in detail. But, briefly: Dr. Wallace strikes me as the least logical and the most dogmatic of the writers. Strange position for an eminent scientist! His answer is "No." Mr. Haggard says "Yes," emphatically and lucidly. Mr. Stead "wobbles." Dr. Clifford—well, may I say that his heart is with us, even while his head says "No?" W. J.

In Europe

(By our special correspondent, November 22nd)

THE following is from a telegram to *Le Petit Journal*, sent last night:

The Arbitration Committee empowered to decide the differences between Japan on the one part, and France, England and Germany on the other, held its first sitting today at the Hague. The President, M. Gfam, a Norwegian, felicitated the governments who, "in consenting to submit their differences to an International jurisdiction, had given a new proof of their attachment to a great and noble cause."

"He remarked with regret that the forward march of Humanity was full of obstacles. Happily the number of these conventions constituted new bonds between the Nations which were augmenting every day."

And nearer home the cause of peace still advances.

Our Italian friends, who were vastly delighted with all they saw, re-

turned to Paris to receive an important deputation of French peacemakers.

Then, I learn later, of the signing of yet another arbitration treaty between England and Italy. *Vive l'Italie!*

That enterprising paper, *Le Matin*, has hit upon a very clever plan for effecting reforms. As every one knows, in the matter of postal charges, France is somewhat antiquated. Well, *Le Matin* has organized a huge petition to the Chamber of Deputies urging the adoption of a penny postage. The means adopted is to issue postal cards to its readers, showing in color the stamps of other countries, and their carrying power, so to say. Readers are invited to use these cards practically, by showering them on the Chamber of Deputies! One hundred and fifty thousand petitions have already been thus sent in; and *Le Matin* is sanguine of ultimate success. This may seem a trifling matter to record, but when we remember how the Epoch of Universal Brotherhood has been made possible through the linking together of peoples by rapid and cheap means of intercommunication, there is significance in this little fact before us. Especially for France.

EFFECT OF A CANNON BALL ON PALM TREE NEAR SAN JUAN, CUBA

Missionaries in China

THE missionary said he had come to China to preach the gospel of Jesus. "Is not Jesus the sage of your native land?" "More than that, He is the Saviour of the whole world. All men are sinners, and Jesus is their only redeemer; no matter whether you are Chinese or of another race, you must believe in him to be saved." "But permit me one objection," said the Chinaman. "In my humble opinion our Confucius suffices perfectly for our nation. We do not know the holy man of the Occident whom you call Jesus; but our people have only to conform with the precepts of Confucius to attain to perfection." The missionary replied that Confucius could not be compared with Jesus. "Confucius," said the missionary, "with all his beautiful precepts, can be considered only a teacher of men, but never their Redeemer, because he was not without sin."

"The Chinaman seemed on the point of making a vigorous reply, but controlled himself and dropped the subject."—*From a Missionary Book*

Properties of Numbers

THE following table shows an interesting persistence of the numbers 8, 9, and 10, resulting from the addition of the digits of the cubes of numbers:

2 ³ equals 8	equals 8
3 ³ equals 27 and 2+7 equals 9	9
4 ³ equals 64 and 6+4 equals 10	10
5 ³ equals 125 and 1+2+5 equals 8	8
6 ³ equals 216 and 2+1+6 equals 9	9
7 ³ equals 343 and 3+4+3 equals 10	10
8 ³ equals 512 and 5+1+2 equals 8	8
9 ³ equals 729 and 7+2+9 equals 18 or 9	18 or 9
10 ³ equals 1000 and etc.	10
11 ³ equals 1331	8
12 ³ equals 1728	9
13 ³ equals 2197	10
14 ³ equals 2744	8
15 ³ equals 3375	9
16 ³ equals 4096	10

It is also interesting to note that:
 2³ equals 8
 and if reversed, then 3² equals 9
 and if these be added 5⁶ equals 15625 equals 19 or 10

Prejudice

Prejudice may be compared to a misty morning in October. A man goes forth to an eminence, and he sees on the summit of a neighboring hill a figure of gigantic stature, for such the imperfect medium through which he is seen would make him appear; he goes forward a few steps, and the figure advances towards him; his size lessens as they approach; they draw still nearer, and the extraordinary appearance is gradually but sensibly diminishing. At last they meet, and, perhaps, the man that I had taken for a monster proves to be my own brother.—*Dr. Price, 1750*

Creed & Decision of House of Lords

THE decision some time ago of the House of Lords (the highest court of appeal in the British Empire), in the matter of Creeds and the Free Church of Scotland, is regarded as "One of the most serious religious crises in British history."

The matter of dispute is this: Scotland is nearly all Presbyterian, and this Presbyterian community is divided into three churches, differing very little in creed, only in form of government. The Established church is, in form of government, similar to the Episcopal church of England. The U. P. (United Presbyterian), and the Free church are not under "Patronage," or State control. These two churches raise their revenues by voluntary contributions, and choose their own ministers. Being so much alike, these two churches, the United Presbyterian,

and the Free Church, almost unanimously agreed to combine. This was done four years ago; but a minority of twenty-five Free Church ministers, as against about 1100, refused to unite. They appealed against the union, but lost their case in the Scottish courts. They carried their appeal to the House of Lords, and the case was heard before what is described as one of the most powerful benches which ever sat to consider an appeal case:—"the Lord Chief Justice, Lord James of Hereford, Lord Halsbury, and Lord Robertson being some of its members." This high appeal court decided in favor of the twenty-five ministers and therefore against the decision of nearly two-thirds of the population of Scotland. And by this decision over five million dollars in money, and over sixty million dollars worth of property is taken from nearly half a million of Free Church people and handed over to the twenty-five Highland ministers. The great interest shown in the case was evidenced by the learned audience which, from day to day sat and listened to the case, the Archbishop of Canterbury being one of this interested audience.

The Minority Wins Over the Majority

The vast amount of property affected is not the only, or even the chief, point in this decision. The decision holds that "if a church changes its creed, it forfeits its title, its identity, its personality." Professor E. Charlton Black, of Boston University, writing in the *Boston Transcript* recently, says this is a decision which will "tend to turn back the fingers on the dial of progress, and will result most disastrously in all matters of church union, creed revision and religious liberty."

If the above decision is sound law there is perhaps not a church in the world which will not be affected. All churches have changed their creeds, more or less, in the course of time, as they have altered their form of discipline or government. Have they, in doing so, lost their identity? Can the body of people who make a creed not change their creed? They can, but in the face of this decision they thereby cease to be what they were, and become something else; in so doing lose the title they had to the property held by them—it being given to them on condition of their holding a certain creed.

The above decision will either hamper very much the cause of liberty, or it will produce a widespread upheaval which, in the end, will break all these bonds.

Does a man who changes his creed lose his personal identity?

As English and American law rest on much the same basis, and as important legal decisions in the one country affect the other country, we may expect that people on both sides of the Atlantic will be deeply interested by the late decision of the House of Lords.

REV. S. J. NEILL

Belated Wreaths --- France and Joan of Arc

IT is a curious spectacle, now to be seen in Paris, about the statue of Joan of Arc. The Catholic students place wreaths there because she is now an officially diploma-ed saint, and they may therefore lawfully give way to their chivalrous instincts of conduct towards a martyred maiden. That their own church effected the martyrdom is an irrelevant and impertinent fact which shall henceforth not be permitted to exist.

On the other hand, the infidel students also come piously wreath-bearing, "because she was abandoned by her king and the nobles, and burned by the church."

Joan herself—according to Mark Twain, "easily and by far the most extraordinary person the human race has ever produced"—would probably have deprecated the wreath-laying altogether. But it is nevertheless a good sign and helps to bring nearer the day when the meaning of her life, and its mystery, shall be understood. C.

A More Human View of History

ALL honor and thanks to any one who has tried to make history interesting and living. It is so often, in spite of all attempts at reform, a mere list of dates, kings, and battles. Then, too, what a marvelous faculty modern historians seem to have of picking out the unpleasant events and exalting them into overpowering prominence over the pleasing aspect. One would think all antiquity was occupied in building up empires by the sword and losing them again by the drinking cup; that nations consisted of kings, nobles, and common people, all squab-

bling together; and that a few futile attempts at literature and learning were made. That is the kind of general notion one gets from reading a manual of history.

And it is pitiable to see the eagerness with which young students will seize upon any little incident of living human interest that may by chance find its way into such a history (as a foot-note in apologetic small print.) Alexander's generosity, Aristides' integrity, Pericles' nobility of character, and so on.

How one longs for some historian with the human nature of a Dickens, the graphic power of a Macaulay, and a generosity of mind superior to either, to give our children a history of humanity as it has always lived and loved and enjoyed life; a history of things that have succeeded, of fine characters and noble aims; a history of the "small" events that go to make up real life.

STUDENT

The Nile Dam

THE soil of lower Egypt, near the Nile, is extraordinarily fertile, being entirely composed of a rich assortment of fine materials collected by the mighty Nile and deposited at the rate of about 5 inches a century. It only needs water, and then, as has been said, "tickle it with a hoe and it will laugh with a harvest." And this luxuriant fertility exists side by side with the barrenness of the desert.

The year is divided for the Egyptian into three seasons: Summer, when the Nile dwindles to its lowest level; Flood-time, during which the melting snows of Abyssinia and the incessant tropical rains of the Nyanza basin, thousands of miles away, roll in increasing volume down the valley, laden with the rich red silt of the Atbara; and Winter, when green crops come up as if by magic on the sinking of the flood, and the corn crops are sown for the harvest in March.

The ordinary rise at Cairo is about 24 feet. . . . A rise of 18 or 20 feet spells famine; a flood of 30 feet means ruin.

During the rest of the year the water has hitherto had to be ladled up in shadoofs or pole-buckets from level to level until the irrigating channels are reached. But the great Nile Dam has done away with that incessant toil and changed the whole agricultural character and prospects of Egypt.

The ancient Pharaohs, it will be remembered, made various canals and reservoirs with the same object as has led the modern engineers to construct the Nile Dam, that is, the attempt to rescue some of the surplus water and save it for dry seasons.

Mengel Bey, a Frenchman, first achieved this object by constructing a barrage below Cairo, crossing the Rosetta and Damietta branches. This contains 132 acres which are closed by iron sluices. It saved the cotton crop harvest in 1900, and has, according to Lord Cromer, doubled the cotton crop of Egypt.

250 miles above this is the barrage recently erected at Assiout. It is more than half a mile long and has 111 arched openings with sluice-gates. It is 50 feet thick, and rests upon a platform of concrete and masonry protected by iron-work. This barrage, begun in 1898 and finished in 1902, will bring under cultivation an additional 300,000 acres.

The third and greatest dam is at Aswan, 350 miles above Assiout. It is the ancient Syene, at what was the first cataract, near Philæ, but the dam has been built across the cataract. It is a mile and a quarter long, 120 feet maximum height, and a breadth of 16 feet at the top and 100 at the bottom. It contains over a million tons of masonry, and has 180 sluices. "When open these will pass the entire volume of the Nile in full flood at the rate of 15,000 tons per second."

STUDENT

California Gems

CALIFORNIA may claim to have notably enriched the world's bouquet of gems by its newly discovered yield of transparent lilac-tinted spodumene. This is also quite a novelty, since spodumene, as found elsewhere, has been pale greenish-gray or white to apple-green, and translucent. This mineral is rare, and is one of the forms in which the comparatively rare metal lithium occurs. It is a silicate of aluminium and lithium, and is in large oblique prisms terminated pyramidally. It belongs to the class of mineral-gems, not jewels proper. This new variety of spodumene, called Kunzite from the discoverer, is not only a notable discovery and a purely Californian product, but possesses interest from its peculiar action with Roentgen and radium rays. It was first obtained in 1903, a mile and a half north-east of Pala in San Diego County; a locality which also produces tourmaline, the

transparent crystal which has such remarkable properties in connection with polarised light.

E.

Protest of Filipino "Savages"

THE use of the words barbarian, savage, gentile, and the like, reflects more discredit on the users than on any one else, as it is indicative of a narrow, ignorant pride as uncomely as it is ludicrous. Those who assume such an attitude are to be pitied, for they bar themselves out from those oceans of knowledge, interest, and affection which are the natural right of the open mind and the kindly heart.

One's sympathies are all with the writers of the following letter, which is a protest made by the Visayan pupils of the Philippine Model School, against being called, on a World's Fair circular, "little barbarians." These pupils had refused to attend the school, and one of them wrote the letter in explanation of this action.

In reading over your Philippine Exposition book I noticed you say that all the pupils that go to the Model school are savages. But not all, I think, because as I have seen the Visayan people are more polite sometimes than some of the Americans that come around. I think if you will come here in our little village and see our market, church and theater, and also see the Americans when we sing the "Star-Spangled Banner," you would not be able to say those words. For myself, the Visayans can do much more fancy work than some of your people here, like our Jusi Pina Sinamay and embroidery, manufactured hats, mats and some objects that are carved by hand you say is wonderful work. I say this because some of your people that had been here in our place, they said every time these words, "Did you ever;" so I know that some of the Americans can't beat the Visayan people. At this time I will mention that most of the people ask so many foolish questions, and I'll say that they are very ignorant people, because they will ask you some questions, and after you have answered all they will turn their backs without saying "good-by" or "thank you." And I will say also that all the Filipinos in our village are very angry to be called savages, and ask me to have you change it. Some are so mad they won't go to school any more.

Noah's Ark---A German View

GERMAN Professor (Von Ihering) has been studying what he regards as the original record of Noah's Ark in old Babylonian annals. He thinks that at a very early date that people had a large maritime commerce; and that Noah's Ark was no other than one of the mercantile fleet which was driven by a storm wave up the valley of the Tigris, finally lodging among the mountains. The sailors of that time, he says, always carried doves on board. When they wanted to learn the distance and direction of land they released one and watched its flight and return.

A vessel has just been built in Denmark of the exact type described in Genesis, but of one-tenth the size. To the builder's surprise she has been found seaworthy.

STUDENT

Preservation of Scenery---An English Trust

ENGLAND has a National Trust for the acquisition of beautiful scenery, to prevent it from being alienated from the people and passing into hands that would build factories or electric installations on it. Gowbarrow Fell and Aira Force are being purchased by subscription to the Trust. Already it has acquired, for the perpetual enjoyment of the public, the beautiful woods between Cat Bells and Derwentwater. It is certainly encouraging to find, in these days of desecration, that there is enough public spirit to fight for the preservation of some of Nature's sublimest beauties; and that there are a few people who have a better use for their money than giving birthday parties to pet dogs.

T.

Cotton-Growing in India

THE Bombay Agricultural Society, has successfully grown, in the Haidarabad district, Sind, every variety of Egyptian cotton and the chief kinds of American. The area is watered by perennial irrigation and the conditions closely resemble those prevailing in Egypt. The crops equal those obtained in the Nile Valley, both in quality and quantity; and equally good results were obtained from the American seeds. It is expected that 300,000 bales can eventually be got from the present area, and the area can be extended.

E.

Frontispiece---William Quan Judge

THIS week's cover page of the NEW CENTURY PATH contains the face of Wm. Q. Judge, the second in the line of succession of the world's Theosophical Leaders. Mr. Judge succeeded to the Foundress of the Theosophical Society, Helena Petrovna Blavatsky. A successful lawyer, a brilliant writer, and a man of extraordinary insight into human nature, he was well fitted to carry on the great humanitarian and philosophic work of H.P. Blavatsky.

Some Views on XXth Century Problems

Simplifying the Bible

ACCORDING to a new translation of the Bible—*The Bible in Modern English*—Jonah was not swallowed by a whale when cast overboard. The right translation is to the effect that he was picked up by a ship named "The Great Fish."

The author of this version says: "'Great Fish' was the name of the ship mistranslated 'whale' in the version of the Greek translators, whose blunder has been repeated by all subsequent translators, in all languages, to the perplexity of their readers, until I decided to go back to the original of the prophet in his own language."

He seems to think that our version of the Old Testament is from the Greek! The Hebrew word translated 'fish' is *Dag*; it has no other meaning, and there is no indication that it was intended for the name of a ship.

Nor does the difficulty exist which our translator thinks he has escaped. He has on the contrary lost sight of an important bit of symbolism. In several mythologies "Fish" means Savior. It is so found in Indian legends, among the Chaldeans, Egyptians, Hebrews, and elsewhere. In India, Vishnu is shown allegorised as a Fish, guiding the Ark across the Waters of the Flood. St. Augustin says of Jesus: "He is a *Fish* that lives in the midst of waters." Christians called themselves "Little Fishes" in their sacred Mysteries.

Furthermore, in reading the Jonah story, it is evident that "the Lord" sent the Fish in its capacity of savior to Jonah. "The Lord" had cast Jonah "into the deep, in the midst of the seas." He complains that "the depth closed him round about, the weeds were wrapped about his head." The "seas" and "waters" are obviously the symbol for despair and confusion of soul. From this the "Fish" saved him, and after three days and nights brought him to "dry land" in safety. It was while in the belly of the Fish that he recounts his miseries, but his stay there was not one of them.

A portion of the universal symbolism of the Fish is not difficult to interpret. It comes to being in the troubled waters (of life). In the Mysteries, the candidate was the Fish, because he had gathered himself together, achieved "birth," attained spiritual wisdom through the experiences of life, in the waters of experience.

The Bible is full of ancient symbolism. It is one of our links with the thought of many other times and peoples. And we shall only come to understand it by studying it in this light, as one of the world-scriptures, equally explaining and explained by, all the rest: not by twisting it into correspondence with our own ignorance of symbolism.

STUDENT

Blind Historians

THE appearance of a new history of the United States, in no less than ten volumes, must rouse one's sense of proportion to an unfavorable comment. To expand the record of but 300 years of one nation to so great a bulk, merely means that the perspective

and balance of history has been totally lost sight of. The same comment applies to nearly all, or all, the histories of this country which we have yet seen.

The American nation is a new beginning. It is a bud thrown off from the life of the old world, destined to ripen into a wholly new kind of flower.

Now if the writers of the histories would develop this view, as well as merely state it—which most of them do—if they would show in what the newness consists, show its growth and forecast its future, there would be little objection to their lack of perspective. If you turn down a side lane you do lose sight of the long road by which you have come.

But they do not show any comprehension of the new flower of civilization which it will be the task of this nation to develop. They only depict America as reproducing—perhaps more vividly, in rapider flow, and with some small changes—the civilized life of the old world.

The reproduction should be depicted, of course; for we have reproduced it just as the embryo of any species, before attaining its own special marks, reproduces the marks of the embryonic life of all species below.

It makes a rapid résumé. The history-writers betray no consciousness that that résumé is not the whole of the matter. If they would make their histories real, they must make clear to us the present beginnings of that by which American life will come to differ as much in kind from the older life of Europe as ancient Greek life differed from ancient Egyptian.

The difference, we think, is a tuning of consciousness to respond to subtle forces of which the older life is quite unaware. This has its dangers as well as its promise, and its beginnings are the rich opportunity of imposters innumerable. The Universal Brotherhood and Theosophical Society, with its philosophy of common-sense touching life at every point, will in the end show itself the only antidote to the dangers; and for that reason is its headquarters in this country and in California—that State of all in which the awakening to new influences is proceeding most swiftly, geologically by far the oldest.

STUDENT

Athletics versus Pickaxe

AN English social reformer has been "going for" the practice of athletics as a path to health, with great energy. They are, he says, nothing but a spurious substitute for the natural bodily labor which is the true balance for mental work. "I could keep myself in perfectly good condition and temper if I might do a couple of hours work every day as a navy without 'doing a poor man out of his job.' As it is, I have to weary myself and waste my energy in bicycling and walking to places where I have no business, over roads which I have tramped till I am tired of them. Half the population lives miserably and breaks down prematurely from excess of bodily toil. The other half does the same because there is no bodily work left for it to do. That is what is called civilization."

This gentleman is very nearly right. But he might have gone further. Human nature is *threefold*—physical, mental, and spiritual; and there can be no absolute health in any of the three without full and right exercise of all.

And he is right about the navy's work. Throughout the two hours' work there would be the steady sense of the accomplishment of something that had to be done—that was in the scheme of things. And this sense, at the root of it, is spiritual. An aimless "constitutional" walk is quite another matter.

The real evil is the modern city, gardenless, almost parkless, and house-packed. Man has lost touch of nature, lost the secret of health; and his city is the outcome and picture of his mental condition. When he has learned more, learned the nature and purpose of his life, he will make short work of the cities.

Meantime he must walk; and use dumbbells, and parallel bars. There is more to be got out of these than the speaker quoted thinks. Let that exercise too be made a part of the scheme of things, fitted into the life-work for humanity, and it will yield a new kind of result.

STUDENT

Crime Against Humanity

AT a recent public hypnotic exhibition in Minnesota, it was suggested to the subject (a boy of 11!) that he was a rabbit. The suggestion "took" admirably, and the audience had a thoroughly good time watching the little victim's antics.

When the time came to awaken him, the exhibiting "Professor" went through the usual manipulations and—failed. He promptly decamped, pretending that he would presently return with a nerve-specialist from Minneapolis. Of course he is still decamped and the boy is still a rabbit—that is to say, he is a lunatic, and aged 11! He may or may not "recover;" but can any one suppose that the brain traces of such an outrage at such an age could ever be really wiped away?

It is time that the hypnotist, whether "scientific" or lay, should be regarded as a vivisector, a vivisector and distorter of the tissues of the living mind. The wounds he makes may or may not heal, and when they do, the scar remains, comparable in its degradation of type to any scar made by the cut of visible tissues by a visible instrument.

Brief Glimpses of the Prehistoric World

Archeology
Paleontology
Ethnology

Antiquity Had a Common Source of Knowledge

IT seems to be an axiom with some savants that things which are similar must have been derived one from the other. Thus in anthropology and biology, we are familiar with the application of this axiom in the theories of evolution and development. In ethnology it has given rise to what may be called theories of migration. No doubt races have migrated from one place to another, and some of these migrations can be traced; but the theory, like so many others, has been much overdone. This is doubtless largely due to the exigencies of the theories about the descent and evolution of mankind, which urge the ethnologist to try and trace back every race to the "primitive root-stock" or the cradle-land of its simple progenitors.

When a race is discovered the first step seems to be to find whence they migrated. Then we look about for some people who had the same word for "father" and ground their corn in the same way, and to whom an earlier date has been assigned, and our theory is about complete. A similarity in religious ideas and symbols clinches the argument; the chief objection being the obvious possibility of one or more rival theories being reached by the same method.

Similarity in ideas and customs does not necessarily imply copying; it may point to a common source of inspiration. Of course if all religion is a fable, it is almost obligatory to suppose that the fable was handed on from one people to another.

But if religion is true, why cannot different people in different places find out the same truths? If symbols, such as those of the Zodiac, are facts in nature, as discernible to the trained eye of a seer as facts in science are to the outward eye, then naturally different peoples would discover the same symbols.

As H. P. Blavatsky points out, various savants descry analogies everywhere, and simply because the Wisdom-Religion was formerly universal—the common privilege of mankind.

Research has been much too confined by shallow theories and narrow categories, but it is rapidly broadening. The main need is to get rid of the obsessing notion that research ought to lead us back to primitive barbarism of comparatively recent date; and to open our minds to the truth that is dawning—that research leads us back through epochs of glory to the time when the heroic pioneers of the Fifth Race first appeared on earth.

Varying Views of Historians About History

NEW discoveries will vindicate the claim of the Asiatic Philosophers, that sciences—Geology, Ethnology and History included—were pursued by the Antediluvian nations who lived untold ages ago. Future 'finds' will justify the correctness of the present observations of such acute minds as H. A. Taine and Renan. The former shows that the civilizations of such archaic nations as the Egyptians, Aryans of India, Chaldeans, Chinese and Assyrians, are the result of preceding civilizations lasting 'myriads of centuries;' and the latter

points to the fact that:

"Egypt at the beginning appears mature, old, and entirely without mythical and heroic ages, as if the country had never known youth. Its civilization has no infancy, and its art no archaic period. The civilization of the Old Monarchy did not begin with infancy. It was already mature."

To this Professor R. Owen adds that:

"Egypt is recorded to have been a civilized and governed community before the time of Menes."

And Winchell states that:

"At the epoch of Menes the Egyptians were already a civilized and numerous people. Manetho tells us that Athotis, the son of the first King Menes, built the palace of Memphis; that he was a physician, and left anatomical books."—H. P. Blavatsky in 1888

Contrast the above with some of the views expressed in modern history-books about very ancient races of whose remnants alone we have any knowledge, and even that very imperfect and prejudiced. Take this about the Chinese for instance:

In Eastern Asia the Chinese nation was built up, the principal achievement of the Mongol race. Its influence was restricted to neighboring peoples of kindred blood. Its civilization, having once attained to a certain stage of progress, remained for the most part stationary. China, in its isolation, exerted no power upon the general course of history. Not until a late age, when the civilization of the Caucasian race should be developed, was the culture of China to produce, in the mingling of European and Asiatic peoples, its full fruits, even for China herself.

This regards civilization entirely from the modern point of view, and amounts to saying that China showed no signs of modern civilization until modern civilization affected it. The utter inability to imagine even the possibility of any other kind of civilization than our familiar one, or

any other set of ideals and beliefs than those which make up our modern standard of measurement for progress, is remarkable.

The Mongolians represent the seventh sub-race of the Fourth Race, and their period of culmination must have been thousands of years before the epoch to which our history goes back.

As our present Fifth Race has not yet by any means reached its zenith, we are in many respects behind the ancient representatives of the Fourth Race, though destined eventually to reach a higher point than they did. But we have not yet attained a pinnacle of dignity and knowledge from which we could presume to look down upon the wisdom of the past. E.

Ancient Engineering Tools

REPORT says now that it has been discovered the pyramid builders used solid and tubular drills and lathe tools, and that the drills were set with jewels and cut into the rocks with keenness and accuracy. The ancients are progressing. There will not be so much need for them to have been cruel now, or for the whip and slave theory to be so overworked. Perhaps they had other appliances and powers and uses of such which we have not yet rediscovered. STUDENT

FAMOUS OLD BUDDHIST TEMPLE AT KYOTO, JAPAN

✧ The Trend of Twentieth Century Science ✧

Vital Metaphysics

EVERYBODY knows that a worm that has been unfortunate enough to lose his tail by accident, will grow another one. But some of them, change the result according to the point at which the accident occurred. If it did not occur at the middle, but nearer to the head end than that, both of the pieces grow a new head. If the accident was nearer to the tail, both pieces grow a new tail.

In other words, animating the cells of the head half, is an *idea of head*; animating the cells of the tail half, is an *idea of tail*. If the accident occur nearer to the tail than to the head, some of the cells possessed by the tail idea remain attached to the head end. They accordingly—and very properly—grow a new tail in the right place. But in the other—and smaller—half, the tail half, there are no cells possessed by the idea of head, but only of tail. So they do the only thing they can think of, and grow another tail. As a result of this accident two individuals have resulted: one with a properly related head and tail, and the other consisting of two tails!

But what is the "idea" according to which this program is carried out? May it not be something in the consciousness of the worm? Not, of course, an objective thought or picture of how he ought to *look*; but a *feeling of need* residing in each half, need of the complete apparatus with which it does its life work, awakened by the apparatus becoming incomplete, and guiding the newly forming cells somewhat in the same way as a painter's idea of the picture he wanted becomes the guide of his hand.

This may sound to the scientific student very metaphysical. But he will find, when he has made his own explanation of the phenomenon, that he has either stated the same thing in other words, or that in using such terms as "polarity," or "inherent force," he has become still more metaphysical and indeed incomprehensible. STUDENT

Solemn Scientific Twaddle

PSYCHOLOGY does not harmonize with physiology very well, judging from recent lucubrations of the former. In fact it would not be too much to say that the two are in violent mutual opposition at one point at any rate. One of them argues that the evolutions are caused by the processes that go in the body, and the other maintains that the processes are caused by the evolutions. This notable antagonism in the ranks of scientists has been produced by some very remarkable experiments on dogs by various professors. It has been found that,

- (1) The sight of food makes dogs' mouths water.
- (2) Different kinds of food produce different kinds of water.
- (3) Even if a dog *thinks* he is going to be fed, his mouth will water.
- (4) If given pebbles, or something he does not like, his mouth will not water.

The conclusion is stated in the following words:

The importance of these results must be acknowledged by everybody. They show how important it is to eat food that is agreeable, and to avoid what is unpleasant, in order that proper digestion may take place. E.

Solar Emanations

WE receive a good many more things than light, from the sun, and some of them seem to be quite slow travelers. Mr. Maunder of the Greenwich Observatory, has just announced that the magnetic storms which disturb the compass and telegraph wires, and produce the aurora, are not only caused by sun-spots, but recur regularly at intervals of twenty-seven days, eight hours—the time it takes the revolution of the sun to bring back the place of the sun-spot. The magnetic storm is repeated, even if the spot has disappeared, showing that an influence remains. The influence or emanation takes about twenty-six hours in transit from sun to earth. Its nature is not known. We are evidently in very close and constant correspondence with the sun.

Mr. Maunder's data were derived from a set of 260 magnetic storms occurring between 1882 and 1903. Sometimes there were three suc-

cessive storms separated by the interval of twenty-seven days, eight hours; sometimes four, and even six. Sometimes also there was a lapse of some multiple of the interval. C.

Duration of Human Life

IS there any essential reason why man should be so much shorter-lived than many of the forms of life below him? After a certain period of life he cannot replace worn-out tissues with their equivalent; after a further period he cannot replace them at all. That means death. And most of his tissues, if they are wounded or cut away, he cannot replace at all, or only with inactive scar-stuff.

But a lizard has been known to replace his severed tail no less than 175 times.

Some of the lower animals live to an enormous age, and so do some trees. A great Sequoia tree recently cut down in California was found to be 2170 years old, and there was no sign that it had worn out. It was born in 271 B. C. When it was 516 years old, a great forest fire burned a hole 3 feet wide in its trunk. Six hundred years later it received another severe burn, and the scar took 56 years to heal; and 300 years later a similarly caused scar took more than 100 years to heal.

Death does not seem to be any essential part of the program of living matter. Our own bodies must contain cells or parts of cells which were alive when "matter" first took "life" on earth—how many millions of years ago? For the living body has continuously branched and descended from them to now.

Living matter, *as nature views it*, may be unconditionally immortal. Living matter, from her standpoint, may not be that which is visible to us, but some hidden systems of almost infinitely minute and almost infinitely numerous monads within the visible, living particles comparable to the electric particles, the electrons, of the chemist, belonging to the realm of *radiant matter*. And these might be handed about in nature quite invisibly and at present untraceably. Without losing the characteristics, the mode of life, the consciousness if you will, acquired by having formed part of human or animal body, they might intermediately sojourn for long periods in vegetable or even mineral levels, and then again return where they belonged.

And the secret of enormously extended physical life may consist in the power (of will) to draw back into the body enough of these to replace those which have become temporarily "tired" and needed withdrawal for a while into some quieter sphere than man's.

This is an ancient doctrine, and it is the teaching of Theosophy. According to Theosophy, man does not live his life for himself alone, but also that he may raise in the scale of being the infinitely numerous living monads that make up his body on its invisible side. He is responsible for the "color" of consciousness with which he endows them. And according to Theosophy, it is the same monads, his own, which return to him life after life, as he reappears on earth. And possibly thus are some of his instinctive tendencies accounted for. For the monads, in their cyclic return to him, bring back with them the gleams of consciousness, low or high in quality, which reflect the state of *his* consciousness as they left him it may be ages before.

Some, either from malice or ignorance, say that Theosophy teaches transmigration. It *does* teach transmigration—for the atoms of man's body. But for man himself, no. Man reincarnates, time and again, always as man; the educator (for good or ill), and sovereign of the monads that throng about him as his body.

It is curious that the science of our day, in studying the radiations from the human body, the N-Rays, I-Rays, and what not, and the electric emanations, has not happened upon the sight of radiations *into* it, from nature. Yet there must be such. And one may suppose that it is in such ways, among others, that the monads, the humanized atoms, come and go in their cycles of rest and progress. Although for long yet, it may be impossible for physical science to detect any difference between the radiations of man and animal, or even plant, it will hardly at this day dogmatize that there *is* no difference. STUDENT

The Sixth Sense in Birds

IN the animal kingdom the birds seem to be really the class most highly favored by nature. Though they are not placed near the summit of the line of evolution, their ability to fly marks them off as having some advantages over nearly all the mammalia. Their mysterious power of changing their polarity or weight, in order to dive in water or soar in air has been discussed several times in "Nature Studies" (See vol. vii., Nos. 19 and 26); and the almost incredible velocity of their motion when migrating, sometimes amounting to four miles a minute for vast distances, has no parallel among other animals.

And now a series of careful trials with carrier pigeons are reported from France, showing, apparently without doubt their possession of a highly developed sense of direction. It was supposed that homing pigeons depended upon sight to find their way but these new experiments have been conducted between Ceremes and Roranne in the darkness of night. In twenty minutes the first bird, despatched at 10 P. M., reached its roost, a distance of seventeen miles being traversed. Half of the number arrived before midnight and the remainder followed in a few hours.

The French War Department is reported to attach great importance to the possibilities of using homing pigeons at night, hitherto thought to be impossible. Flying under cover of the darkness they would escape many dangers.

There are many stories of cats and dogs finding their way home across miles of unknown country and in Australia there is a fish that scrambles over the land to the nearest water when the pool or stream it is in dries up or food becomes scarce. But these are only occasional instances of a faculty so highly developed in homing pigeons, and, perhaps, in migratory birds. Some human beings claim to have a sense of Orientation; but compared with the acute senses of wild animals ours are blunt indeed, and they can hardly be expected to improve under present unnatural conditions of city life.

STUDENT

Cereus Emoryi

THE *Cereus Emoryi* is a native of Point Loma and is the only *Cereus* that is native to California. Its greenish yellow bloom is open in the daytime, is from an inch and a half to two inches and a half in diameter, and grows from one side of the top of the stem. The plant consists of thick cylindrical jointed stems, branching from the base, and having from sixteen to twenty ribs closely set with hemispheric protuberances bearing numerous slender, straight, yellow, interlocked spines without hooks at the end,

OLD MILL WHEEL—NORTH WALES

the central one being much stouter and longer than the rest.

The most curious and interesting thing about the plant is the fruit. When it becomes fully ripe it opens from the top a third of the way down by regular divisions, presenting the appearance of a half-open bud; and forth from this opening in a generous stream flows what appears like a delicious feast of fig marmalade, a thick violet-rose tinted syrup containing many shining black seeds and very pleasant to the taste. To this feast so lavishly offered the birds and insects come and doubtless help to carry forward Nature's purpose of seed dispersal. The *Cereus Emoryi* in its general appearance bears no resemblance to *Cereus Grandiflorus*, the night-blooming *Cereus* which is cultivated for the wonderful beauty of its short-lived flowers. STUDENT

Even Botany May be a Musical Science

A RECENT article in the NEW CENTURY PATH contains the remark that "we may yet learn to regard flowers as visible, living threads of harmonious sound." Why not learn the harmony and reconvert it into sound? Readers of the NEW CENTURY PATH probably recall the account of Mrs. Watts Hughes' experiments with the forms produced in sand by musical notes. Indeed the article was accompanied by "America" (or "God Save the Queen") written in the forms produced by the various notes. Her experiments have gone much further than this; she can cause entire plants or even groups of plants to appear in the sand upon the membrane by varied cadences and chords. Moreover we know that music is audible number, and that every plant has its characteristic system of numbers; so many petals; so many divisions of the leaves; so many branches in each group; so many flowers in a cluster; and its special colors, which are visible numbers. Now it certainly seems that a reasonable amount of study, based upon these two lines of investigation should render it possible to express the description of a plant by musical chords. It has been found that the chemical elements constitute a more or less regular and complete scale; and the chemists have thus been able to describe the nature and properties of elements they had never seen, and by knowing what to look for, find them the sooner. There seems ample reason to believe that the same is true of organic life and that the chords of the existing varieties of vegetation will likewise form a perfect scale, thus enabling botanists to place any species

with perfect accuracy, and to determine what is the really complete flora of a region and what species are missing from it, or are foreign to it. The same may be true of animals, and a knowledge of such things might open wholly new fields of possibility in the development of new forms. STUDENT

MUSIC OF THE SOUL

by J. KEBLE

THERE are, in this loud stunning tide
Of human care and crime,
With whom the melodies abide
Of th' everlasting clime:
Who carry music in their heart
Through dusky lane and wrangling mart,
And ply their daily task with busier feet
Because their hearts some holy strain repeat.

— Selected

Filipino Women Goldsmiths

DEAR to women of every land and age are gems and exquisitely wrought ornaments of gold and silver. In the simplest costume a clasp for the girdle or an ornament to bind the hair finds certain place. Abundant evidence remains for those who seek it, that, when the purse has permitted, women in all ages have gratified this taste, and have garnered to their own uses the treasures of the goldsmiths and gem-setters.

To the Filipino women, however, especially in the city of Manila, belongs the distinction of themselves being skilled in these art-crafts. They carry the rough gold in from the country, and submit it to all the processes of metal working in a thoroughly scientific manner; they choose their own designs and execute them in the precious stones and metals, and to complete the cycle of their relation to the products of their skill, they offer them for sale, in curious little dens of shops, or even on the streets of the city.

Fascinating is the description of these dainty wares, of mother of pearl set with green garnets, of beaten silver, brooches set with amethyst, or pins of enamelled silver wire and sapphires. A great variety of devices is used by these women metal workers, and of none can it be said that they are too conventionalized. A most artistic harmony of stone

and setting is the rule. We are glad that there is a guild of American women who are developing skill in this artistic handicraft. When skill in some art craft is not a pleasing exception, but a part of the life of many women, the wearing of ornaments, the mere possession of a beautiful jewel, will have a new significance. For the conscious bestowal of the skilled human touch upon these treasure-gifts of nature may draw from their sparkling depths some secrets of the fires of life and the joy of growing in beauty, secrets that have long evaded us in their iridescent gleams. STUDENT

“PUBLIC demonstration of affection is most repugnant to the good taste of the Japanese, and it is the absence of this which is so generally mistaken for a lack of genuine feeling,” says a writer in a contemporary. “I recall one man who was so devoted to his mother (though I doubt whether he could ever have been said to have ‘talked about’ her) that when she died, while he was abroad, his depression was so profound that my husband watched him with anxiety lest he should commit suicide. The stoical training may render more unsympathetic a coarse nature; but repression to the refined soul brings an exquisite capacity for pain scarcely conceivable by those who are free to give utterance to every emotion.

“Another man said to me, ‘I rarely speak of my mother, for a foreigner does not understand that a Japanese mother may be just as dear to her son as his to him and by the Japanese it is not expected that one should utter one’s deepest feeling.’ That same son fainted with grief when his mother died, and when consciousness returned rose to make light of a ‘little dizziness’ without reference to its cause. To this day, whenever he goes from home, he carries with him his mother’s letters, mounted on a beautiful roll of ivory and brocade, and on the anniversary of her passing beyond his mortal ken quietly devotes a portion of the day to meditation and special thought of her. Even to his wife, despite the closest bond of love, he says not, ‘This is the day of my mother’s death.’”

IN 1801 the Japanese woman had practically no rights, according to the law, that her husband was bound to respect. For instance, though he could divorce her at will, she could not obtain a divorce from him on any plea. In 1899, according to new codes which then went into effect, a woman can now become the head of a family and exercise authority as such. She can inherit property, and can manage it herself. She can exercise parental authority, can act as guardian or executor, and is entitled to a voice in family councils. E. H.

HALF the sorrows of women would be averted if they could repress the speech they know to be useless,—say, the speech they have resolved not to utter. . . . In this way poor women, whose power lies solely in their influence, make themselves like music out of tune, and only move men to run away.—George Eliot

The Real American Woman

THE abuse that American women have been subjected to by a certain man who happens to have been born in England, had, of course, little effect. It has probably not disconcerted a single woman; it has, however, interested many in a certain type of man with which the American woman on her own soil is, fortunately, unfamiliar. But now a sister woman has come to our rescue! Elizabeth Banks, in the *North American Review*, declares that one H. B. Marriott-Watson is not in the least acquainted with the real American woman. She says:

While the American Toy, the American Tyrant and the American Queen sip ice-cream sodas through a straw at Cecil courtyards, the American Drudge stays at home and keeps house and the English people do not know her at all. . . .

In no country in the world, except the United States, will one find a woman in checked gingham apron presiding at the wash tub and stopping between rubs to go into the parlor and help her daughter through a difficult part of Schubert or Wagner, at the piano! In no other country will one find the wife washing dishes, cooking, sweeping, dusting, scrubbing, putting on patch after patch and darn after darn for ten hours during the day, then spending her evenings helping her children with their lessons in geometry and physics. . . . That part of the country which has produced women capable of taking their hands from the wash tub to guide their children’s fingers over the piano keys, or add the finishing touch to a bit of charcoal drawing, will, one day, produce something very magnificent—or something very terrible—in the way of a Woman.

Comment were indeed superfluous!

E. H.

DR. ARABELLA KENEALY (England) said recently anent the much discussed problem of “woman’s sphere”:

Instead of an emancipation which should have given dignity and breadth and a noble freedom to the inherent qualities of woman, we have done and still are doing all we can to spoil and neutralize her special gifts by developing strains of masculinity and commercialism in her. We teach her that it is more creditable to produce a mediocre book or picture than to produce a fine baby, nobler to keep shop than to make a happy home; that it is greater to write novelettes than to tell fairy stories to her children; to sing in an artificial fashion in a public hall than to sing charming natural nursery ditties to her little ones at home.

A RESIDENT of the old town of Scituate, Mass., a Mrs. Trueworthy, has entered a new field of woman’s work. She is the daughter of a sea captain and the wife of a marine engineer, and her interest in her husband’s work led her to qualify herself to obtain an engineer’s license. Mrs. Trueworthy travels with her husband and assists him. She has proven herself capable of running a steamboat, and fearless amid the dangers of shipwreck.

A LOMALAND HOME

IT is reported that the Queen of Portugal, who has a scientific turn, was recently experimenting with an X-ray apparatus. Nothing would do but she must photograph through clothes and flesh the skeletons of some of her maids-of-honor. A horrible secret stood revealed. The gracefully slender waist turned out to mean a most gracelessly and health-killingly deformed skeleton. From that moment the fashion altered. Possibly the alteration may spread throughout fashionable Portuguese society. H. C.

MARGARET, Countess of Richmond, and the mother of Henry VII, was a justice of the peace. And that in Old England!

IN Old England women often sat in council with the Saxon Witas. Ladies often sat in council in the Witenagemote; and even as late as 694 A. D. in Wighfried’s great council at Becconceld, abbesses deliberated and signed documents along with the king, his bishops and nobles. H.

OUR YOUNG FOLK

A Dream of Old Atlantis

Read at Isis Theatre, San Diego by one of the young Cuban students of the Raja Yoga School

IF we could not look backward sometimes, life would not be worth living, for looking backward helps us and makes us wiser if we do it in the right way; but the right way does not mean to look backward with regret or fault-finding, but with a determination to better understand the past and to gain from that the knowledge that will help us to solve the problems we have today. In the same way we Raja Yogas often look back at the first chapters in the books we are studying, for we know that this helps us to understand those we are studying at present.

When I look out over the beautiful Pacific, I often wonder about the lands that lie beneath the waters. They tell us that San Clementi, which we can see on clear days in Lomaland, is the top of one of the mountain peaks of a great continent that lies under the sea; and they also tell us that it is slowly, slowly rising and that some day, if this keeps on, there may be a great continent where now we have only the sea. Now we Raja Yoga boys know that there are many traditions in ancient writings of great, great lands which many years ago became submerged. We all know the Bible story of the great deluge and the lands that passed under the sea; but there are other traditions, too, in other writings, which are even older. I often dream of these continents and particularly of old Atlantis. Some historians say that Atlantis did not exist. Madame Blavatsky gave many proofs that it did and she said also that year after year our scientists would prove this by the discoveries they would make, and this is happening year after year. Scientists are constantly making discoveries which show us that the old traditions which have come down to us from the writings of the ancients were really true, and that the wonderful facts which Madame Blavatsky gave us of the lost Atlantis were based on actual knowledge.

When I dream of the lost Atlantis, I see a mighty land and a mighty race of people, for the old Atlanteans were mighty. They were magicians, they were inventors, scientists, artists, craftsmen. They had a wonderful literature. Very much knowledge that is secret to us was not secret to them. If the sea could give up its secrets, we would quickly learn how true this is. Shall we say that Atlantis did not exist because we cannot see it? The writers of our histories never saw the ancient Egyptians and many of them a hundred years ago knew nothing about the mound-builders or the cliff-dwellers or the pre-historic people who lived in Peru.

What can we learn from old Atlantis? We can learn that those who say we are the wisest people who ever lived, are mistaken. We can learn that in America we are only beginning to travel on that long path which leads us to the secrets of science, the great secrets of art, and the wisdom that lay behind the architecture and the engineering and the wonderful mechanical inventions of the people who lived in Atlantis.

They understood many principles in mechanics and engineering which we do not. They understood many of nature's laws far better than we do, but they did not always obey them. That is what made all the trouble. Here is something we can learn in dreaming of old Atlantis. We can learn that knowledge which is used selfishly will bring destruction. Some of the people who lived in Atlantis were good and unselfish and very wise. They wanted to help and teach the others, but most of the others would not listen. Very many of them wanted to use their knowledge selfishly. Very many of them wanted power. They did not care to be

brotherly. They wanted to make others their servants. Very many of them had terrible vices, and today some of the things we suffer from perhaps could be traced back to the selfishness of that time and to the wicked things some of those people did. The Bible story of the flood is only one of the records we have of the great deluge that swept away the land of old Atlantis. Its civilization was so grand, so glorious, so beautiful, but selfishness had eaten away the heart life, as a worm hidden within a rose eats away its heart and kills it.

What else can we learn when we dream of Atlantis? Many things. We can learn that nations do not need to fail, as nations always have done. We can learn that this happens when men disobey nature's laws. We can learn that more nations, if they choose, might step into a greater life, instead of going to pieces, just as a noble boy steps at the right time into a noble manhood; but all boys do not do this because some want to be selfish and sow what you in America call "wild oats," and these boys, when they reach manhood, are wrecks. As you say, they go to pieces, but that is because they would not obey nature's laws.

It is not because they did not have knowledge. It is because they used their knowledge selfishly.

Raja Yoga gives us a knowledge of the laws that govern life and nature, and this law is one of them: that men reap what they sow; they never reap something else.

The people of old Atlantis sowed many good beautiful seeds of knowledge and of purity, but they also sowed the seeds of terrible evils and they reaped the fruit of these when the harvest time came. It makes one sad to dream of old Atlantis, but just the same it gives one a great hope. It helps us to understand better that great law that governs our lives; that law which Jesus taught is justice and which all great teachers have taught to those who wished to learn—that law of sowing and reaping. To dream of old Atlantis gives us courage, for we know that we can escape the doom that fell upon those people if we want to, and we also know that just as soon as we are worthy to receive more knowledge, we will receive it. The light is always shining. It is we who turn our faces away.

Facts Worth Knowing

THE United States is the only great power, except Japan, that actually fronts the Pacific. The European powers are all represented on the Pacific by dependencies or colonies.

THE Japanese are so skilful in shipbuilding that they construct vessels not only for their own navies, but for those of other nations as well. The foreign trade of Japan has increased twenty-fold in the last 25 years.

THE Japanese call their country "Dai Nippon," meaning "Great Japan." The name, however, "Nippon" or "Nihon," means, according to its Chinese derivation, "Sunrise." It was given to Japan because it lay east from China. The device upon the Imperial flag is merely a bright sun on a plain white background.

It is expected that the great bridge over the Zambesi river in Africa will be completed next May—fifty years after Livingston's first sight of the Victoria Falls, just above. It will be a single, enormous span, 500 feet long and 400 feet above the river. Not until after months of labor were foundations of solid rocks found and many years have been required to transport the material. The Victoria Falls are about 3000 feet wide and nearly 400 feet high—one of the noblest sights in the world.

WAITING

JOHN BURROUGHS

SERENE, I fold my hands and wait:
Nor care for wind, or tide, or sea;
I rave no more 'gainst time or fate,
For, lo! my own shall come to me.

I stay my haste, I make delays,
For what avails this eager pace?
I stand amid the eternal ways,
And what is mine shall know my face.

Asleep, awake, by night or day,
The friends I seek are seeking me;
No wind can drive my bark astray,
Nor change the tide of destiny.

THE CHILDREN'S HOUR

The Raja Yoga Question Box

PERSEVERANCE, careful and conscientious study, kindness and loving helpfulness to all—do children realize the magic of these things?

1 Who was Robert Schumann?

ANSWER—Robert Schumann was a great composer. He is perhaps best known for his beautiful songs. His childhood was happy, though his parents did not want him to be a musician. His wife, Clara Schumann, was his greatest helper. She, too, was a composer and a noble musician. Both loved Nature and the poets. Both were unselfish and kind.

The Lesson That Nellie Learned

DEAR CHILDREN: This little story was sent in to you by a dear old grandmother who loves little children and who knows, I am sure, a great deal about heart-light and joy.

Once upon a time there was a little girl whose name was Nellie Gray. One day she was left all alone by her parents to study her lesson, but after they left she began to grow weary of her task and, laying aside her books, she ran out into the garden to play. The first thing she saw was a sparrow upon one of the trees. "O, pretty sparrow," she said, "can't you come and play with me?" And this was what the sparrow replied:

"Dear, no, I can't come now,
I have no time to play,
With my little ones to feed,
And watch and love all day!"

Well, Nellie felt sorry, but soon she saw a honey-bee flitting from flower to flower and she said, "Can't you come and play with me just an hour?" And this is what the bee replied:

"Those must work who would thrive;
If I play, don't you see
They would quickly from the hive
Drive me out,—lazy bee!"

"Dear me," said Nellie, "isn't it queer?" Then she noticed an ant. "O, little ant, stop, stop, don't run off so fast! You're not too busy to play with me, I know." And this is what the ant replied:

"Why, little girl, my greatest joy is to labor,
If not for myself, then for some poor neighbor."

"Well, well," said Nellie, "if they're all busy, I am not going to be a dunce. I guess I'll get my lesson," and away she ran. GRANDMAMMA

Two hundred tourists recently had a narrow escape in the Swiss mountains. They had climbed very high when a storm broke, completely blocking their path. What was their surprise and delight, after hours of suffering, to see coming towards them a number of noble St. Bernard dogs.

These led them by a secret path down the mountain. Except for this help the travelers would have perished in the storm.

FROM Nevada comes the story of four miners, who were rescued from death through the devotion of their horse, which galloped many miles to a distant camp. The men there tried to capture him, but he seemed to be begging them to follow him. At last they did so and found the dying men. The horse itself was almost famished, but refused to take any food until after the men had been taken to camp and cared for. STUDENT

2 Who was Händel?

ANSWER—Händel was a great musician. He had a sorrowful childhood, for his father, who was a doctor, did not wish his little son to study music. He wanted him to be something else. Little George Frederick loved music. His mother was the only one who encouraged this love. There was an old spinet in the garret and the child used to practice there alone and at night so that his father could not hear him. Finally, after many years of sadness and persevering work, he became a famous musician and composer. He composed the oratorio of the "Messiah" and many other noble works.

The Banana Tree and the Humming-Bird

FROM the windows of my room in the Homestead (now the Raja Yoga Academy) I used to see many beautiful flowers and interesting trees, but the banana tree fascinated me more than all the rest. In my tropical home, Trinidad, which is also the real home of the banana, it does not grow into a tree but bears fruit, grows suckers and dies within the year. This one in Lomaland, on the contrary, must be six or seven years old and is about eighteen feet high. When I saw it first

the big brown flower bell was nearly closed at the end, but it gradually opened and revealed inside a crown of thousands of beautiful, small white flowers from which busy bees gathered honey all day long. By degrees the tongue, so to speak, formed and slowly, slowly, grew longer until it came away out beyond the petals of the great blossom; but O, how slowly it grew, and I feel very sure the banana wondered about that and must have become rather impatient. Perhaps it told the birds so. I wonder,—

At any rate, one day a dear little humming-bird came and sat on the wire which is fastened to the piazza and helps to support the tree, for both fruit and flower are very heavy. All day long the little bird sang away cheerily and happily and with all its

little strength, and although his song consisted of only two notes, he put his whole soul into it. I felt very sure he did all this to help the banana to grow, telling it not to grumble or despair, and no doubt the banana heard him and was happier and perhaps whispered a message back, although I could not hear that.

What a contrast there was between the two—the tall, strong, solid banana tree and the tiny, delicate, but energetic little bird. It reminded me of the old story of how the lion was helped by the mouse.

"Helping and sharing," you know, "is what brotherhood means." The little humming-bird came day after day and very often I saw him fly up, up, up, like a lark, far away into the blue sky, then suddenly, before I knew that he had come back, there he would be sitting again on the wire, singing and singing with all his little might. COUSIN BEATRICE

THERE are many people who are very strong and who have a good education in the ordinary sense. But perhaps they are cruel or have some other bad fault. In many instances where the heart is also supposed to have education, fear is planted in the child's mind. We all know that fear is the worst thing there is. Think how miserable it is to live a life of constant fear! A RAJA YOGA BOY

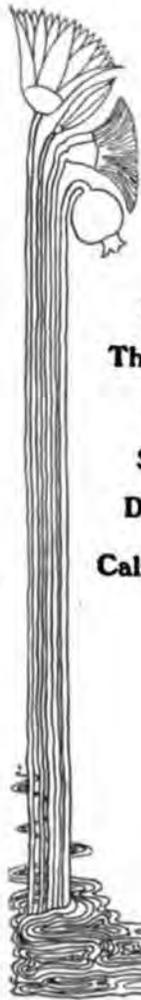

A WINTER'S DAY IN LOMALAND—RAJA YOGA CHILDREN OFF FOR A RIDE WITH THEIR COMRADE, MULITTA

FOR THE LIVING

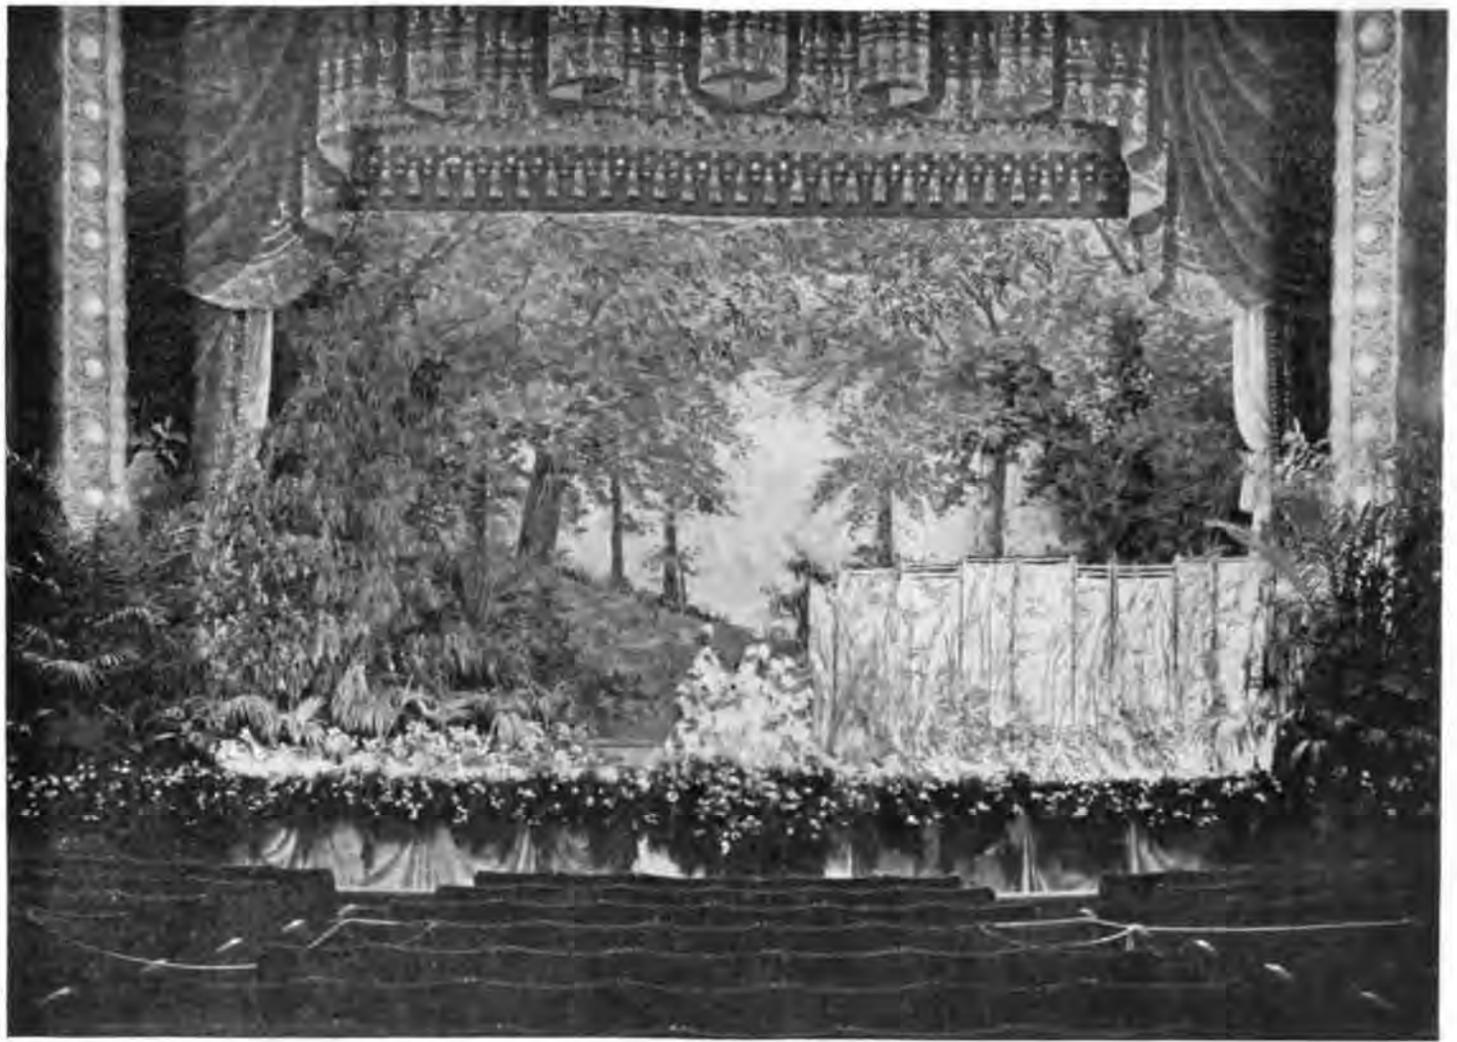

THE stars know a secret
They do not tell;
And morn brings a message
Hidden well.

There's a blush on the apple,
A tint on the wing,
And the bright wind whistles,
And the pulses sting.

Perish dark memories!
There's light ahead;
This world's for the living,
Not for the dead.—Selected

LOMALAND STUDENTS AT ISIS THEATRE

AN audience that filled every seat in Isis Theatre assembled last Sunday night in anticipation of listening to an address by Katherine Tingley. An announcement was made, however, that owing to the damp weather Mrs. Tingley's voice was so impaired that she could not have spoken if present. However, she sent her best wishes to all for a prosperous and happy year. The disappointment of the large audience was in some measure compensated for by the very excellent program which followed.

Aside from the delightful music, there was a recitation by one of the little Raja Yoga girls, representing "The Torch Bearer of the New Year," and two addresses appropriate to the season. The first of these, by one of the Lomaland boys, and entitled "The New Year," was as follows:

"The opening of the New Year is a golden opportunity for all of us, to start afresh and get something new and beautiful into our lives. It is a time when we have the opportunity to begin a new life, and cast off the selfish ways and bad habits of the past.

"By continual striving and fighting against our lower natures, we will find out that as each new year dawns, a greater joy is entering our lives, and that we really are beginning to realize what life should mean to us. If, in this coming year we strive to do our duty, to be unselfish and strive unceasingly against every discouragement, we should find that when the year is ended we will have gained a new strength and a greater courage for the next year.

"To those who have honestly striven against their lower natures, rising courageously against each defeat, New Year is truly a glorious time, a time of hope and encouragement.

"At the opening of the New Year we should all make a firm resolve that we will progress, and no matter what the difficulties, find ourselves at the opening of the year stronger in mind and body. By remembering that we are divine and always bearing in mind what we are here for, we will find our obstacles and stumbling blocks easier to surmount."

The closing address was by Rev. S. J. Neill, his subject being "The New Year, 1905." In part the speaker said: "In all countries and

ages the New Year has been regarded as an appropriate occasion for looking backward, and also for looking forward. It is a time to look around, and also to look within. It marks another mile on life's journey. It should mark a step higher in life's evolutionary progress.

"Standing at the beginning of the New Year, we realize that since the commencement of the journey of life many have passed from our side. Year by year one friend after another has entered the unknown. But in the consciousness of that divine life which is over all and in all—'in which we live and move and have our being,' we never lose any one. Those who have incarnated with us this time; and those who have not so incarnated—those who are coming after—are we not all members of the same divine family? At the beginning of the New Year—an All Souls' Day—we salute all our comrades around the world, and across the celestial spaces. Sons and daughters of the Highest, working for a time in different parts of the great vineyard, we shall have one day—one New Year's morn—a glad reunion, a real harvest home of which all earthly meetings and joys are but faint inklings, prophesyings and foreshadowings. For 'now are we the Sons of God, but it doth not yet appear what we shall be.'

"We can well believe that all over the world, at this Christmas and New Year's season, the hearts of men are more responsive to high influences. We can, and we do send forth to all nations and peoples this mighty hope, this divine consciousness of love and unity, and of the home-coming at last. May it arrest the hand of him who is about to strike his brother. May it turn into shame and repentance the purposes of the greedy and crafty who lay their snares for the unwary, and who live by theft. May it awake the rulers of men to a keen sense that they have duties to their brethren which cannot be neglected or laid aside. May it awaken in the hearts of all men a sense of unity, and love and peace."

EVERY man must patiently abide his time. He must wait. Not in listless idleness, not in useless pastime, not in querulous defection; but in constant, steady, cheerful endeavor, always willing, fulfilling and accomplishing his task, "that when the occasion comes he may be equal to the occasion."—*Longfellow*

Universal Brotherhood Organization

Central Office Point Loma California

WHEN THE WESTERN SUN CASTS A SHEEN OF GLORY ON SEA AND SKY AT LOMALAND

THE national and international interest and attention which the Point Loma

Community attracted at its inception, might ordinarily have been considered only the evidences of the modern appetite for some new sensation to tickle a morbid palate. Had there been the element of weakness there upon which sensation lives, the interest would have been of short duration and the attention would soon have been diverted to other channels. The fact that this interest was deeply rooted from the beginning up to the present time, and that it has been by no means confined to the members of The Universal Brotherhood Organization, indicates the presence of a something strong enough to hold and satisfy it.

When I came to Point Loma, I was ready to believe or disbelieve all I had heard of it, but more particularly to find out what the something was that made those I had seen from there, walk straight, look straight and act straight.

The physical environments I found such as to command the admiration of any observer. The outlook from any part is commanding and inspiring, and the buildings and grounds thoroughly in keeping with the natural beauties. All these combined with a bracing atmosphere and flooded with eternal sunshine, would seem all that was necessary to make a people strong and happy, but one soon finds that there must be a something behind all these to get the results that have been attained.

One is most forcibly impressed by the amount of work that is done and the manner in which it is accomplished. Every one is found attending to his own department with a definite purpose in view, and with that earnestness, without which, as Goethe tells us, "there is nothing to be done in life."

The work is made a joy and not a drudgery, and is done under that law and order which are absolutely necessary to the welfare of a people and which tend to the building of character, to the development of individuality and to the secret of right living. Mutual helpfulness is practised broadly, not in a sentimental way, but along wholesome, healthy, and vigorous lines that make each one strong and self-reliant and able to help his brother in the true way. And back of all this joy and dignity of labor, there is the high purpose and aim of life towards which these people are reaching, of creating a clean and pure manhood and womanhood, and of fitting themselves for real humanitarian work throughout the world. There is the determination to weed out, each in himself, all that is weak and false and to nourish and develop the divine nature and make it a living, powerful force for good.

But it is among the children that the spirit of Point Loma shows itself most clearly, and it is they who are building most swiftly and surely for the future. I have seen them under all conditions; at play, at work, in their homes and class-rooms, and to come in contact with them is to

The Spirit and Work of Point Loma

receive fresh inspiration each time. One needs but to look into their eyes to see that no

fear lurks there, that the little hearts and bodies are clean and strong and well fortified for the battle of life. They have learned well the lesson taught them that "Life is Joy," and they will never burden their souls with the petty fears and narrowing selfishness that are holding progress back today. They have a grip on themselves and a balance that cannot be overthrown; the false will not mislead them, for they are taught and shown the truth, and they are living in the Light where only truth can exist, and in a musical atmosphere which is but the outward expression of the inner harmony of their lives.

Is it unreasonable to believe that these children are forming the nucleus of a new race that will leaven all nations and all races? Not a race of intellectualism or philosophy alone; not a one-sided race, but one that is broad and many-sided, each side clear cut and true, and supporting the whole; a race that will work among us, dealing with every day life and by the force of example and the cleanliness of their lives, make us hold ourselves up to their standard; for, little as we realize it, they are already our teachers.

The life at Point Loma is ideal, but in no sense is it an abstract theory; on the contrary it is intensely practical, and all through it can be seen the underlying basis of common sense. Business principles are applied in every branch, and in many instances are a step ahead of modern methods. As it grows from day to day, new conditions arise to which it adjusts itself, and each day there is a new power to further progress and expansion.

And around and about it all is the spirit of Point Loma. A spirit of harmony and of active peace—a spirit of practical brotherhood—a spirit of hope born of success and of ideals that have been realized—a spirit of growth along healthy lines—a spirit and consciousness of strength to meet all conditions that may arise and to give to others the same power of right living—a spirit of Universal Brotherhood, with an unbounded and worthy faith in a Leader who has a heart to feel, the wisdom to foresee, and the courage to execute.

SOJOURNER

THE great antique heart; how like a child's in its simplicity, like a man's in its earnest solemnity and depth! Heaven lies over him wheresoever he goes or stands on the earth; making all the earth a mystic temple to him, the earth's business all a kind of worship. Glimpses of bright creatures flash in the common sunlight; angels yet hover, doing God's messages among men: that rainbow was set in the clouds by the hand of God! A great law of duty, high as the two infinitudes, dwarfing all else, annihilating all else—it was a reality, and it is one: the garment only of it is dead; the essence of it lives through all times and all eternity!—*Carlyle*

To Members of The Universal Brotherhood Organization Throughout the World: Your attention is called to your yearly dues, payable January 1st., 1905. These should be addressed to E. A. NERESHEIMER, Treasurer of The Universal Brotherhood Organization, Point Loma, California.

F. M. PIERCE, *Secretary General*

BREAD UPON THE WATERS

CAST forth thy bread upon the waters;
 Thy bread of Love, upon the sea of Time;
 Thy bread of Holiness, where naught but sin is found;
 Thy bread of Sacrifice, where selfish aims abound;
 Thy Bread of Hope, for the hearts that are sighing;
 Thy bread of Life, for a world that is dying.
 Doubt not, nor fear; it shall not be in vain.
 Rest, calm and sure, till Faith be changed to sight.
 Thy loving gift shall fill thy soul again
 With an ocean of Light.—*Selected*

A Glimpse into the Future

ALTHOUGH we are still engaged in seedsowing we are sometimes impatient that the longed-for harvest is not yet fully in sight, but why should we not by our imagination overleap the intervening years and join the reapers of the coming generations by an effort of the mind.

The fast maturing first fruits of this harvest are even now visible in the children, and as they develop day by day we can form some idea of what the masses will be like when the Raja Yoga system is diffused abroad. They will be strong and shapely, light of foot, with senses keen and bodies radiantly pure. Instead of being animated bodies merely, they will appear as embodied souls, encased in solid flesh it may be but utterly the masters of it; the body being but the lantern through which the indwelling divinity visibly glows. Their intellects will be swift and subtle, quick to grasp, tenacious to retain; but perfectly held in control by the higher nature and used as an instrument merely and not indulged or catered to as if they were beings with an independent life of their own. Too often in these days the intellect is exalted to almost divine honors. It rules the man and draws from his heart and body that life force to which it has no charm. It becomes an overgrown monstrosity and rules its owner, like a tyrant. Before many years are over pupils from our Academy will be met with among the crowded thoroughfares of great cities moving almost like beings from another planet. Tranquil amidst confusion, cheerful among the despairing, they will pass like benedictions, sweetening and purifying the atmosphere like moral oxygen, living embodiments of wisdom and compassion. Though they penetrate to the darkest corners of the earth they will never be in gloom for round about them a light will shine and though they mingle freely with the wretched, they will seldom see misery, for faces drawn and haggard will blossom out into smiles at their approach. Men will ask the secret of their peace and power and little by little the eyes of the nations will be fastened upon this place as the eyes of watchers for the morning are fastened on the eastern sky.

The pupils of the Academy will go forth as world workers, universal servers of men. They will be troubled by no feverish ambition to carve out great careers for themselves nor to acquire vast fortunes for their private purposes. Those whose sole desire it is to serve their fellows need never search for employment, and the intelligent forces that stand behind human life will see to it that the laborer worthy of his hire is suitably maintained.

Katherine Tingley has said that we cannot imagine the prospects of the coming days in colors too bright. Fill in the picture how we will and the reality will surpass our most audacious dreamings. **STUDENT**

Patience

PATIENCE sweet, that naught can ruffle" must be anchored in an abiding trust in the law by which all things move "to good, to better, best." It does not imply a condition of indifference, nor does it mean that we shall simply wait for the law to do it all and do nothing ourselves.

The farmer may plant his seeds and wait in patience for their fru-

ition, but he must at the same time vigorously destroy the weeds that would hinder their growth and make mellow the soil to promote it. So we should with all patience and vigor destroy the weeds that hinder the growth of whatever promotes the welfare of humanity. We must be wide awake and active, doing all in our power to help on the fulfillment of the true purpose of existence, and this cannot be done by thinking of ourselves alone, as all lives are linked together in one great purpose.

We may meet with failures and make mistakes, but if we have the true attitude of mind, instead of losing patience we will take to heart the lessons taught by our experience and put them into practice, turning to good account whatever comes. To become impatient is to give up the reins of self-control, to let go of one's strength and give way to weakness. We need all our strength in combating the evils that assail humanity, and it is possible to carry on this warfare with energy and at the same time with patience. "Again and again the battle must be fought and won," and for this we need ever-enduring patience.

If we think of the patience of the Higher Self with us throughout our many incarnations with their failures and follies, of the patience of the indwelling Spirit and Life of the universe through the long, slow processes of evolution by which the Eternal Pilgrim climbs from lowest to highest forms, we may well have patience while we work.

It is said that there is a point where patience ceases to be a virtue. This expression is generally used in reference to our bearing with the actions of others, and implies that there are times when we should enter a protest in some form. But do we have to lose patience in attempting to adjust matters in a better way? We accomplish more by keeping patience than by losing it,—for then we can see more clearly what to do and how to do it, while, at the same time, we shall have more power for its performance.

If we can leave out of account all selfish motives and act for what is simply right, and best for others as well as ourselves, we can work with patience, trusting the good Law. **B. W.**

"Patience"

TRUE patience has its basis in the Divinity of Man's nature, and finds expression through his strong faith in the Divine Law in and through all things. This quality of patience in the wide awake intelligent man, is indicative of a high order of Self-possession—a mastery over environment and the personal likes and dislikes. From a sublime faith, springs the power to meet with equanimity all events, whether pleasant or unpleasant to the senses, and it causes to blossom in the mind a fuller recognition of the Eternal Law operative in the spiritual domain as well as in the physical. With this understanding we may bear, with true patience and fortitude, the trials and misfortunes which may overtake us, without becoming slaves to the idea that we are being imposed upon or punished, and in need of uncalled-for sympathy.

The Theosophist has a great advantage in that he is equipped with a firm belief in man's divinity and immortality and in the doctrine of rebirth, on which he may build eternal hope and never want for an ideal.

There are those, no doubt, who exhibit a stoical patience, but that is because of the absence of an appreciation of the things which are vital and which enter so largely into life; because of dull sensibilities and an almost total indifference to man's duty and the higher purposes of life; in short, because the faculties of the soul are not awakened and the existence is merely that of one of the lower order of animals.

As students of the Divine Theosophy of Life in a very practical way, we should stand qualified to put into practice the true patience; and also to begin to learn when to exercise *impatience*. There are certainly occasions when patience ceases to be a virtue, and when it becomes necessary to take decisive action or positive attitude. There is no question about this, we need only to discriminate.

There is danger of regarding patience and submission as synonymous, which would be a mistake if viewed in the generally accepted meaning of those terms. Patience is submission to the Higher Law, but not a submission or resignation to that which man's own lower tendencies, and those of his neighbor, may suggest.

The more deeply we drink of the cup of Wisdom through rightly directed thought and experience, the better shall we be able to put into practice in all things this divine quality of true patience. **J. F. K.**

BLOTTED RECORDS AND WHITE PAGES

BUILD on resolve, and not upon regret,
The structure of thy future. Do not grope
Among the shadows of old sins, but let
Thine own soul's light shine on the path of hope.
And dissipate the darkness. Waste no tears
Upon the blotted record of lost years,
But turn the leaf and smile, oh, smile to see
The fair white pages that remain for thee.—*Selected*

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question Is it true, as I have heard it said, that in order to progress, a Theosophist has to renounce the ties of affection and duty to his family?
A CHRISTIAN ENQUIRER

Answer Listen to what H. P. Blavatsky said in reply to a similar question. She said:

It is a groundless calumny, like so many others. The first of all Theosophical duties is to do one's duty by ALL men, and especially by those to whom one's SPECIFIC responsibilities are due, because one has either voluntarily undertaken them, such as married ties, or because one's destiny has allied one to them; I mean those we owe to parents or next of kin.

The writer of the question being "A Christian Enquirer," it will perhaps be well to quote from the Christian Scriptures some of the words ascribed to the great Teacher whom the churches profess to follow. According to *St. Luke* (xiv-26), Jesus said:

If any man come to me, and hate not his father, and mother, and wife, and children, and brethren, and sisters, yea, and his own life also, he cannot be my disciple.

These words of Christ are at least worthy of consideration by those churchmen who, not taking the trouble to study Theosophy themselves, accept the statements of prejudiced persons or newspapers whose interest it is to misrepresent Theosophy. STUDENT

Question Can we ever relieve another of his Karma?

Answer It is most probable that the word Karma is here used in the sense of the results of action, and a little consideration will show that while it is possible to render real assistance—of which we will speak later—to another, and while it is apparently possible to remove some of the outermost effects of Karma and change external conditions, yet it does not follow necessarily that the deeper aspects of Karma are therefore modified. As an instance, it may be our opportunity of relieving a case of extreme poverty and of placing a person in a position of relative comfort compared with a previous condition. It would seem from this that we had changed what we may call the external Karma, but we know very well that the mere change of external conditions does not of itself change the character or inner nature, where the deeper effects of Karma are felt. And further, can we say that we were not simply agents of Karma in helping that person, and that the very change brought about was not in accordance with and a carrying out of that person's Karma?

Care should be taken not to materialize the idea of Karma. It is not a mere external debt, like a debt of money, which may be paid by another person, but it is rather, according to the aspect which we are considering, the result accruing to the character of the one in debt from the actions which have placed him in that position, and, as said, this result to character cannot be removed by the mere paying of the debt by another.

The question then arises, how far ought we to help another, or indeed ought we to try to help another at all?

I think the question is answered by the Golden Rule, "Do unto others as you would have them do unto you," and further it may be added that the very opportunity which we have of helping another is a part of our Karma—and surely good Karma, for what better Karma than to have the power and opportunity of helping another—as it is also part of the Karma of that one to be helped.

Theosophy does not advocate indiscriminate helping, or that any action should be done without due discrimination. Indeed, Theosophy,

as has been often said, is the essence of common sense. On the question of self-sacrifice, H. P. Blavatsky has said:

We say, however, that self-sacrifice has to be performed with discrimination; and such a self-abandonment, if made without justice or blindly, regardless of subsequent results, may often prove not only made in vain, but harmful. One of the fundamental rules of Theosophy is, justice to oneself—viewed as a unit of collective humanity, not as a personal self-justice, not more but not less than to others; unless, indeed, by the sacrifice of the *one* self we can benefit the many.

So, while in one sense, as said above, we cannot relieve another of his Karma, yet from the very fact of the solidarity of the human race, and hence that every act that we perform either helps or retards the progress of all our fellows, we are all the time either adding to or lightening the burden of their Karma. And more than this, we can give real help, by giving strength, encouragement, sympathy and moral support in all right endeavor. This real help we can give more by our own attitude and the faithful performance of our own duties, and the patience and fortitude with which we bear our own burdens and meet the difficulties of life. In this way we can truly do as St. Paul enjoined, help to bear one another's burdens, and so fulfil the law of Christ, that higher law of the divinity of our own being. STUDENT

Question How does the Theosophist's conception of Brotherhood differ from that held in the world?

Answer There are so many different conceptions of Brotherhood held in the world that it would be difficult to know to which the questioner refers. Indeed the world is distinguished rather by its lack of Brotherhood than by its realization. And this gives a clue to the answer, *viz.*, that the Theosophical conception of Brotherhood does not remain a conception merely, but becomes an actuality. Further, according to the teachings of Theosophy, Brotherhood is a fact in nature and not a mere sentiment, or connecting only those born in the same small family circle. We are brothers whether we recognize the fact or no, and this brotherhood can be to us either one of joy or one of pain and sorrow. We can if we will become co-workers with nature, recognizing brotherhood as a fact, and governing our lives in accordance with it, or if we refuse to do this, either wilfully or in ignorance, then nature forces upon us the fact of brotherhood through common suffering and common calamities, which in spite of themselves draw men together and make them feel their common origin or destiny.

And just as it is impossible for a man to do his best work unless he is in health, physically, mentally and morally, so until humanity is in health, perfect health, it cannot do the work that lies before it, and this perfect state of health can only be attained through the realization of Brotherhood. Brotherhood which depends on sentiment alone will never bring this about, for as today, and as in the past, and all through the historical periods, so long as men are united on this basis and through motives of self-interest, their minds will fluctuate from love to hate, swayed hither and thither by the love of self and personal gain. Brotherhood must be more than sentiment; we must realize that our fellow man is not someone aside or apart from us, but that he is in very truth, a part of ourselves and that his interests are ours. We all recognize this to a degree, or at least hold to it theoretically, but we do not live it, we do not make it a reality. Here then is the Theosophical position in regard to this question of Brotherhood, given in the words of H. P. Blavatsky:

Theosophy leads to *action*, enforced action, instead of mere intention and talk. . . . But no Theosophist has a right to this name unless he is thoroughly imbued with the correctness of Carlyle's truism: "The end of man is an action; and not a thought, though it were the noblest—and unless he sets and models his daily life upon this truth."

And further she says:

In sociology, as in all branches of true science, the law of universal causation holds good. But this causation necessarily implies, as its logical outcome, that human solidarity on which Theosophy so strongly insists.

If the action of one reacts on the lives of all, and this is the true scientific idea, then it is only by all men becoming brothers and all women sisters, and by all practising in their daily lives true brotherhood and true sisterhood, that the real human solidarity which lies at the root of the elevation of the race, can ever be attained. It is this action and interaction, this true brotherhood and sisterhood, in which each shall live for all and all for each, which is one of the fundamental Theosophical principles that every Theosophist should be bound not only to teach, but to carry out in his or her daily life. In Europe

(From our special correspondent, December 2, '04)

SPAIN is passing through a terrible ordeal just now. It is not one's business to discuss the political situation:—whether the Government of the day is or is not doing its duty. But Spain has freedom of the press, representative institutions, constitutional government in short; and besides this, abundant schemes of social reform.

In the industrial centres there have been strikes going on for a long time. Others must decide how far these are the cause or the effect of the hard times from which the masses of the Spanish people are suffering. There can be no question as to the reality of the suffering itself. Proof of this is to be seen in the records of emigration. It is stated that during the first six months of the present year no less than 38,000 Spaniards bade farewell for ever to their native land. They have left for America—the greater part shipping for Brazil. It is further stated that the emigration has increased considerably since last August, and is swelling still. Whole villages have been depopulated. From one provincial paper and another come reports of the hasty selling of furniture and other effects by peasants who seem stricken with the fear of death, should they delay escaping from their native land. And yet there are few among the peoples of Europe in whom the love of country is more strongly rooted.

The correspondent of *El Imparcial* at Málaga gave recently a vivid description of interviews with some of these luckless emigrants on board the S.S. "Nivernais." To cite one case will be sufficient. A widow with five children—the eldest but fourteen years—gave as her reason for emigrating that she had worked in the fields with the pick, from sunrise to sunset for a wage of three "reals" (fifteen cents) per day, and on some days had no work at all. And it seems that the price of necessaries in Spain has triplicated during the last twenty-five years!

These poor creatures are usually crowded together on board ship to a frightful extent. No matter how many there are of them—cargo comes first in point of value; so the emigrants must compress themselves somehow as the cargo grows.

In all cases reported by *El Imparcial* the answer was the same. They were flying from their country to escape death by starvation, for themselves and their little ones. The Spanish press is talking about the possible depopulation of Spain.

Yesterday was the sixtieth birthday of Queen Alexandra. I remember well the occasion of her arrival in England, forty-one years ago. The feeling of affection evoked then has steadily deepened as years have gone by. King Edward has been criticised by the public at various points in his career, although it is difficult to discover any criticism now. But his consort and comrade has held our hearts from first to last without question. She has the gift of showing sympathy with all ranks in

such dainty yet practical fashion. It is quite a domestic affection that the people have for her, although necessarily very few have come into personal touch with her. As everyone knows, her early life was not without hardships. There was something approaching to genteel poverty at one time, when the little girl who is now so exalted had to mend her own frocks. No doubt those experiences furnish part of the secret of her wide-spread sympathy. Long live the Queen!

The previous day (Nov. 30th) was the birthday of another public character who is attractive to many of us. I refer to Mr. Winston Churchill, who has just attained his thirtieth year. He has capacity and courage of no ordinary kind. Soldier, novelist, traveller and politician, Mr. Churchill bids fair to become a power among the next generation.

Some Large Bells

THE greatest bell in the world is that at Moscow, weighing 190 tons. But apparently there was some accident at its birth, for it is cracked, and there is no record of its ever having been rung. In England the greatest bells are "Great Paul" of London, made in 1881, and weighing nearly seventeen tons; "Big Ben" of Westminster, 1858, thirteen and one-half tons; and "Peter of York," 1845, ten

and three-fourths tons. "Big Ben" and "Great Peter" were both cast by the White-chapel Foundry. "Great Peter" cost about £2000, and is over eight feet across. It was cast at White-chapel, and allowed twelve days to cool. Even its clapper weighs a hundred weight. It took sixteen men to toll it. Now it is little used, but always rings the old year out on the night of December 31st. It is also sometimes used as a minute bell at deaths and funerals.—*Exchange.*

Ancient Leather and Modern

AN old proverb says, "Nothing like leather"; but it would seem that nowadays there are a good many substances which look exactly like leather, though scarcely qualified to use in a siege, like the leather in the old story.

A contemporary has been interviewing bookbinders and leather-merchants on the subject of cheap bindings. The public demands a showy article at a low price, and the trade has to supply it. One bookbinder said:

Look at this book; it is three centuries old, and yet the leather is as sound as on the day that it was cut from the hide. . . . We do not tan today as they tanned in olden days.

The atmosphere of modern cities is so full of gaseous fumes, which combine with water to form corrosive acids, and so many chemicals are used in bleaching and dyeing leather, that the material will only last a few years.

"Book-lovers'" sets, in "natural undyed pigskin", are bound in sheepskin with a pattern rolled in. It looks more natural than the genuine article and will last nearly five years. E.

The Neo-Platonists

IN an Ancient History, under the head of the Alexandrian Civilization, we find mentioned the philosophers Archimedes and Hero, the painter Apelles, the astronomers Hipparchus and Ptolemy, the geometer Euclid, the geographers Eratosthenes and Strabo, the historian Manetho, the rhetorician Aristophanes, the poet Apollinus, the ecclesiasts Origen and Athanasius; but never, ah! never, the faintest allusion to the celebrated Neo-Platonic school of philosophers. But perhaps this is better than libelling them or damning them with faint praise; for the silence is eloquent and the omission as glaring as the missing piece in a puzzle.

Vainly did these sages and their devoted students strive to keep alive in a declining cycle the light of the ancient wisdom. Yet not in vain;

for, though their school succumbed to the two-fold opposition of pagan licentiousness and profanity on the one hand, and Christian bigotry on the other, their beacon-lights have ever shone in the darkness for those who have searched in the heights, and their influence has been handed down through many a devious by-way. Some of their writings have survived to influence modern writers and mold the thought of today.

Though this school was one of pure Theosophy and its original teachers were men of surpassing character and wisdom,

Their Ethics its later followers did not succeed in adapting the philosophy to the spirit of the times. They made it too lofty and ideal for an age whose thoughts were material; and it resembles a glorious sunset, prophetic

of a future dawn, rather than a sunrise bringing immediate enlightenment.

Ordinary historians, knowing naught of the Wisdom-Religion, and viewing all ancient beliefs and systems from the narrow and conceited standpoint of modern culture, speak patronizingly of Neo-Platonism, as a praiseworthy but futile attempt to establish a religious philosophy on the mere intelligence of man, unaided by divine revelation, and so forth. But they confess that its ethics were the loftiest the world has ever known.

The essential teachings of Neo-Platonism are the same as those of Theosophy; in fact the word Theosophy was first used by the Neo-Platonists. They taught that the Soul was triple, consisting of a spiritual part, an animal part, and a human part; the human part having the power of choice between the divine and the carnal. Wisdom and emancipation were to be attained by aspiration towards the divine Soul. Purity of life would lead to a separation of the mind from the enthrallment of the senses, and to its union with its immortal counterpart. In speaking of illumination they were most careful to distinguish

Warned Against all Delusions

and warn against all delusions and superstitious practices such as would come under the head of spiritism, etc.

H. P. Blavatsky prefaces many of her writings with quotations from the Neo-Platonists, by which to introduce the teachings of Theosophy.

The Neo-Platonic school was founded by Ammonius Saccas (not the Christian Ammonius mentioned by Eusebius), who died in 241, A. D. This man was born of Christian parents. His object was to find a fundamental religion which should reconcile all religions by showing their common origin, and which should be based on eternal verities. Finding nothing in the Christian church which could help him specially, he left it and founded his school at Alexandria.

As a Platonist he wrote nothing, and his teachings were secret. He reconciled the opposing schools of Platonism and Aristotelism by showing the common kernel of truth in both. His life was so pure that he was called Theodidaktos, "the God-taught;" and his knowledge so vast that several church fathers were his secret disciples.

High Character of the Teacher

Plotinus, the greatest disciple of Ammonius, was born at Lycopolis in Egypt, 205, A. D. He went to the East with a Roman military expedition, and was instructed by the sages of Bactria and India. He set up a school of philosophy at Rome, and the Emperor Gallienus was one of his disciples. He also was renowned for his high character and learning; and he has left in his writings the bulk of what we know of Neo-Platonism.

Porphyry, a pupil of Plotinus, was born at Tyre in 233. Coming to Rome he joined the school of Plotinus. He has left writings on the philosophy, and was the author of fifteen books against the Christians of his day. He was a scholar of solid attainments and a passionate lover of purity in life and in thought, hating all false teaching and immorality.

Iamblichus was born at Chalcis in Coele-Syria, of a rich and illustrious family. He studied under Porphyry, and afterwards gathered together a band of disciples of numerous nationalities. He wrote books on the philosophy, the best known of which is *De Mysteriis Egyptorum*. He also wrote on Plato and Aristotle and on Chaldean philosophy, but these works are lost. He died in 333.

He was learned, and his character and attainments won for him the name of "the divine." The Emperor Julian regarded him as the equal of Plato. In view of the fact that the present age demands the deeper research, there is need to bring to the honest recognition of men, these grand examples of purity and wisdom. H. T. EDGE

Ruskin on the Civil War

RUSKIN'S correspondence with Professor C. E. Norton, just published by the latter, throws an almost pathetic light upon his nature. The Professor sums it up and at the same time shows why Ruskin could never have been a great teacher or leader outside the realm of art, in a few words:

His nature was in the highest degree complex; it was full of contradictory elements which he never succeeded in reconciling so as to obtain steady equilibrium and tranquillity of soul or persistent fixity of aim. His will was unstable, for in him reason was subject to sentiment and often to transient emotion.

There is the secret. His nature was, in not the best sense, *feminine*. He, apparently, could not understand the greater issues of his time. For example, of the nation-making struggle of the middle of the Nineteenth century, he says:

It is no use talking about your war. There is a religious phrensy on such of you as are good for anything, just as wild, foolish and fearful as St. Dominic's, and as obstinate as De Montfort's. Mahomet's was mild, Christian-like and rational in comparison. I have not, however, seen a single word, spoken or written, by any American, since the war began, which would justify me in assuming that there was any such noble phrensy in the matter; but as Lowell and you are in it, I am obliged to own the nobility, and only wish I could put both in straight waistcoats. The miserablest idiocy of the whole has been your mixing up a fight for dominion (the most insolent and tyrannical, and the worst conducted in all history) with a soi disant fight for liberty. . . . this fight is partly for money, partly for vanity, partly (as those wretched Irish whom you have inveigled into it show) for wild anarchy and the devil's cause and crown, everywhere. As for your precious proclamation—

A gift of that which is not to be given
By all the assembled powers of earth and heaven,

if I had it here—there's a fine north wind blowing, and I would give it to the first boy I met to fly it at his kite's tail. Not but that it may do mischief enough as idle words have done and will do to the end of time.

STUDENT

The Japanese Imperial Library --- A Side-Light on the Nation's Genius

A RECENT writer gives some interesting and significant facts with regard to the literary preferences of the Japanese. His remarks deal principally, it should be said, with the literary works most in demand in the Imperial Library of Japan.

Mathematics, science and medicine head the list of volumes called for. During the last year (1904) 166,677 books treating on the above three subjects were demanded, or 21.6 per cent. of the total number of books in the library.

Literature and language follow a close second with 153,711, or 20 per cent., while geography and history come third with 18 per cent.

Fiction, according to the above-mentioned writer, is remarkable by its absence, even in the classified table of books in demand by the public, this being "a curious contrast to the experience in most English public free libraries." The same remark applies equally well to the great majority of American public libraries.

Nor are the subjects named above the only ones asked for by the Japanese public. Engineering, industries, art, and military and naval science have a prominent place in the listed additions recently made to the contents of the Imperial Library.

The subject is very interesting, in that it throws a brilliant side-light on the mental genius of the Japanese. Scholarship in the ancient classics, in China, is the standard "open sesame" to all posts of public importance, and the same was true of Japan less than fifty years ago. Judging from the above, the same general idea of pure knowledge making fitness for posts of importance, seems still to obtain in the land of the Rising Sun, albeit that the national taste has changed to meet modern needs from a respect of hoary antiquity, with its profound wisdom, to the aggressive young scholarship of the west.

G. DE P.

Education in Porto Rico

IN Porto Rico the removal of the Spanish régime and its replacement by American protection, have resulted in a marvelous development of educational work. Six hundred Porto Rican school-teachers have been on a visit to the United States to study American school methods. Under Spain there were no public schools and only a few badly-conducted pay schools. During the past year 1200 free public

schools have been opened, with 70,000 scholars; and 25 per cent. of all the money raised in the island since American occupation has gone into the schools. A school of agriculture is being founded and will enable the Porto Ricans to take advantage of the wonderful resources of their island. For there, we are told, crops may be planted and harvested any time of the year.

Though one is naturally delighted to see a people taking so heartily to the opportunities now accorded to them for acquiring American culture, that sentiment will be mixed with no slight sense of responsibility when one considers the many real faults of American civilization. What are we introducing to these Porto Ricans? Let us hope not our soulless commercial competition, our civic misdemeanors, the degradation of our slum-life.

And will these islanders, like the Japanese, have the strength and wisdom to take from us only what is likely to help them, and reject the rest?

One realizes, in connection with such cases as this, the timeliness of Katherine Tingley's brotherhood crusade in Cuba; for through this America was enabled to offer to that newly-liberated land *the best* she had. That crusade brought something better than mere ordinary educational and industrial advantages, important though these may be; something the people could appreciate, something that touched the heart.

We want to help the Porto Ricans, but let us beware lest we merely gobble them up in a more modern and artistic way, or teach them to gobble each other up.

E.

Modern Education vs. Character Training

WHEN one hears of the careful attention that is paid to education in this country, and the great progress made in the planning and equipment of schools and curriculums, one cannot but hope and wish that the internal strength and virtue were commensurate with the external.

New York has the largest school building in the world. It houses 5184 pupils and 111 teachers. On the opening day the students cooked luncheon for themselves and their teachers. The building is utilized to the utmost by day and by night, for lectures, concerts, story-telling, gymnastics, manual training, and many other things.

All this is indeed excellent and encouraging. But in our land, machinery and external appliances are far ahead of internal conditions. Here lies the danger. All this machinery supplies opportunity, accomplishment, dexterity. But these are things which may be abused as well as used.

Will this huge school care for *character*? Will it train the pupils in that peaceful unselfish temper which alone gives happiness and secures the safe and right use of powers? Or will it add more to the armoury of fierce emulation and discontent?

Oh for more Raja Yoga Schools!

H.

Arbitration Treaties

SIXTEEN Arbitration Treaties had been signed between various countries up to the end of November of this year. In the main they are identical in terms with the first of the series—that between France and Great Britain. Twelve of them are between European Powers, and four between European Powers and the United States.

America has invited all Powers signatory to the Hague Convention to enter into Arbitration Treaties with her. It would be well were two countries now to come forward with courage enough to sign a Treaty between themselves from which "matters involving the honor" of the two are *not* excluded. The "Parliament of Nations" may not be so far away. The idea is in the air, with a silent strength born of all the tears and blood shed by every oppressed people for a thousand years.

C.

India or Manchuria?

THE Ameer of Afghanistan takes the utmost interest in the war between Japan and Russia. He has organized a special set of postal runners, so that he may get news every day. When it comes he reads it out in open durbar, giving a lecture on the points of special note. It appears that on the whole he would not view the defeat of Russia with entire satisfaction. For he thinks that in that case she would begin to compensate herself for the loss of Manchuria by a move in the direction of India. In that move she would pass straight through his kingdom.

Some Views on XXth Century Problems

The Emptying Pulpit

THERE have been two recent conferences, one in New York and one in Chicago, to discuss the question of the steady decline in candidates for the ministry. A great many reasons were offered, along with corresponding remedies. But neither reasons nor remedies appeared to get very far into the matter.

The truth is that any man who is conscious of any kind of message cannot help delivering it. If there is no message being given, the reason must be that no one is conscious of a message to give. And the incidental reasons, apart from that central one, that used to entice men into the ministry no longer weigh as much as they did—for which we may be thankful. Much better an empty pulpit than one filled by a man who took it to gain a social position closed to his tradesman father.

But why is there no real message—real as distinguished from the message which is merely egotism and ambition made vocal and even vociferous?

In every man lies a "message" of some kind for his fellows. And their interests suffer if it does not come so clearly into his consciousness that he has to deliver it. In the delivery of his "message" he may show himself as an inventor, as a musician, a writer, poet, painter, scientist, preacher, or anything else that permits his especial form of genius to play freely. The results are his donation to the world of his fellows. If his soul is awake in him it will make his message clear to him, and urgently compel him to deliver it.

The question why more men do not enter the ministry, is swallowed up in the larger one, why more men are not conscious of their special work and urgently impelled to the doing of it. Nature gave every man his task, but hardly one in a million knows what it is. If he did it would be as conspicuously his as music-making was conspicuously Beethoven's; and moreover his doing of it would be as conspicuously to the world's good as Beethoven's making of music or Columbus' finding of new lands. Nothing could stay either of them. The true, divine-given work of most men might not be so attention-compelling as these two men's; but who shall say that in the broadening of time its ultimate effects would not be just as great? The game of chess may hang as definitely on the move of a pawn as a queen.

The reason we are searching for is this: that men have forgotten that the soul would, if they had opened communion with it, inspire them to something more than piety, and impress them with closer directions for the conduct of life than the Ten Commandments. The soul is the real Genius whose gleams give "genius" to the men who have it, and would fain give it in some line to all men. Children are at best taught only of that function of the soul called conscience. They are not taught that the same power which, as conscience, warns them back from evil doing would, if it were permitted, become a constant councillor as it is witness; inspirer, revealer, teacher, opening their minds and consciousness to an undreamed-of beauty and perfection of life.

Consequently those of them whose work or message it would be to preach (the things of that same divine soul) do not come to any suspicion of it. And so, with the decline of adventitious allurements to pulpit occupancy, the candidates for "the ministry" grew yearly fewer. The remedy lies in the home and even the nursery, and nowhere else. C.

The Study of Literature

PROFESSOR TRENT, of Columbia University, has been expressing profound dissatisfaction with the present methods of teaching literature. Very naturally: one might almost say that literature is not taught at all. A manual is handed to the young student. It contains a list of names of great writers, their dates, their works, and a critical estimate. If he knows that, he can pass the examinations. For examination-passing, not the knowing of literature, is the real end in view.

In other cases some one great work is taken and laboriously dwelt on for a school term till every ray of its beauty has wearily departed.

Is it not obvious that all this is secondary to the real teaching of literature? For if literature as distinct from books may be defined as *writ-*

ings lit by feeling, then the beginning of the teaching of literature must be the awakening of the capacity to feel.

But our modern education is not so much as one-sided; it trains intellect (and mainly of that, the memory) only; the world of feeling—which is the substratum of character, and the inspirer of deeds and conduct—is left untouched at best; usually deadened.

A study of the lives of painters, and a learning of the lists of their pictures, is no study of art. The only real teaching of art is the awakening in the pupil of the faculty of response in feeling to the feeling contained in all great pictures. And the same is true of the teaching of literature. You cannot make a child respond to the beauty of Milton's *Lycidas* by making him learn it by heart, parse it, paraphrase it, or teaching him the names of Milton's other works.

The child who has been taught to feel has the only key to literature, one that will open all the doors. And the first chord of feeling that we can make vibrate is that of love. All the rest will take up the thrill. We can teach it love of all things that live, flowers, crystals, animals, the sky, the sea, its fellows. A child's love of a flower is its first perception of the beauty of the flower; it is its first step in art. Teach it botany before it loves flowers and their life, and knows them to be living—and you have well-nigh slain a possibility of its nature. So with all sciences. Awake first a *feeling with* the objects you are going in due time to teach of as science.

So modern education, beginning and continuing with merely mental training, does much to kill that by which literature is appreciated—feeling. But if the inner world of feeling were first opened with its master-key—love, and by the same kept open, no amount of intellectual training could hurt. And the child will grow up with an instrument of feeling ready for response to the harmonies which the masters of feeling who have written real literature will play upon it. It will seek out these masters, and take pleasure in that *external* learning about them and their works which we now call *study of literature*. STUDENT

An Index of Progress

A MOST extraordinary event has happened within the Presbyterian Body. The Rev. Dr. Samuel Carter, finding himself unable any longer to preach or tolerate certain fundamentals of the Westminster Confession, such as the Fall of Man and the Blood Atonement, wrote to the Presbytery of Nassau to say so, and to ask whether he ought to remain in the Church. The Presbytery thereupon promptly threw over the Westminster Confession, their ejection of it taking the form of a "request to our brother to continue his honored connection with the Presbyterian communion." Dr. Carter is naturally proud (in the best sense) of what he has done. He says:

I seem to myself to have done a service to my church. I have gone into the darkest room of the Presbyterian domicile, and into the darkest closet of that room, and the darkest corner of the closet, and opened the secret drawer, and thrown off the wrappings, and brought out into God's beautiful sunlight the system that is adopted—and not believed—and said: "See your system!" The conservatives at such a time have a sort of fit, and cry tremblingly: "Hush! Hush! Take it back and go away! Do go away yourself!"

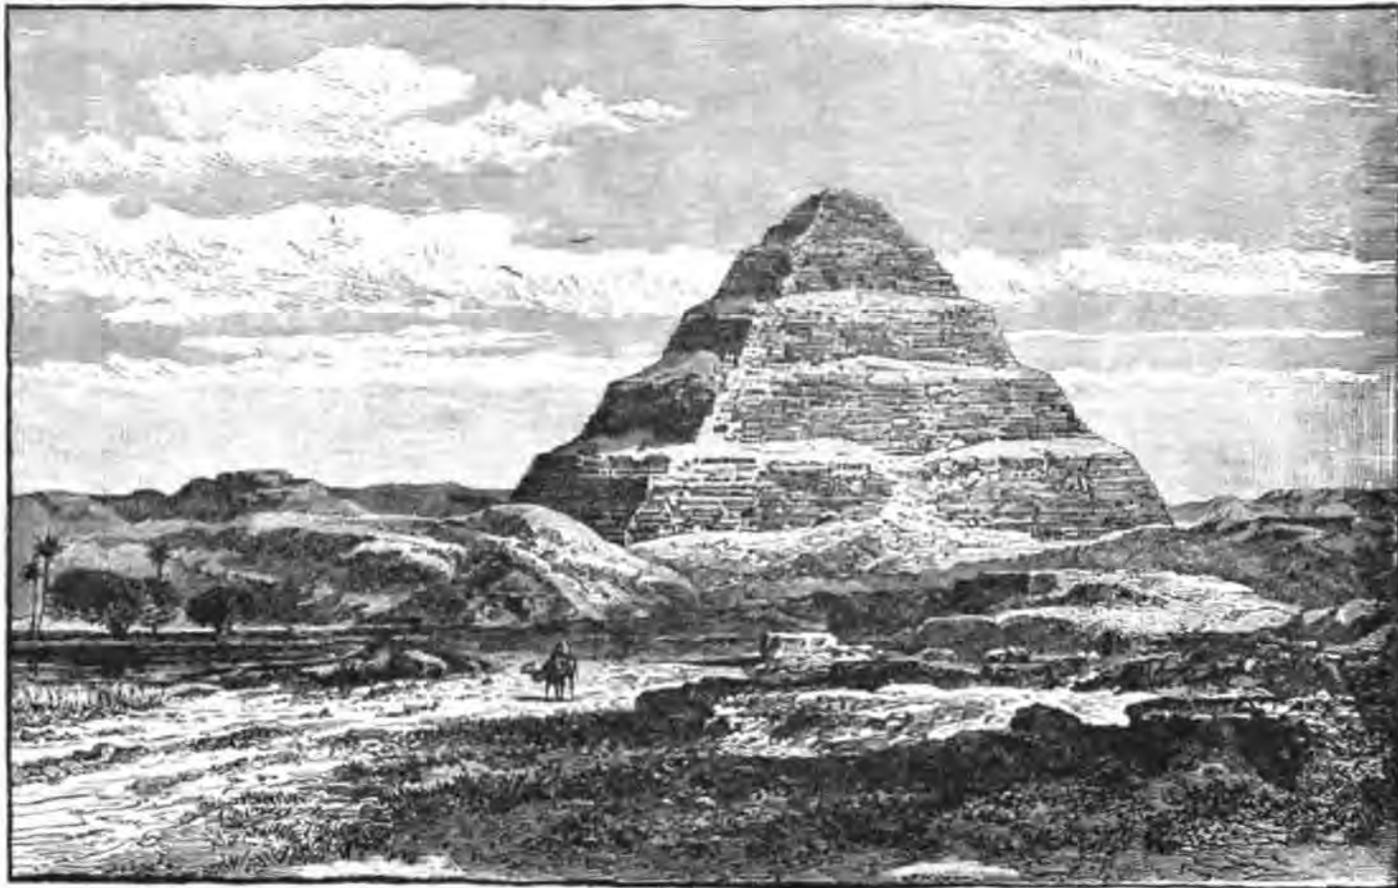

He sums it all up by saying: "There is no such world as the world of the Confession. There is no such eternity as the eternity of the Confession," and he speaks with deep feeling of the shadow cast for centuries upon the souls of the people by this hideous document.

One or two of the Presbyterian papers of course stand up for the Confession as if it were the Bread of Life.

But the world moves very fast lately. Five years ago such an official reply to an attitude like Dr. Carter's would have been inconceivable. That change, which we can measure, may serve as a barometric index of other progressions not so measurable. They mean that the consciousness of men is preparing for the reception of a new light. The old furniture is being cleared out. The pace of the changes, both of growth and decay, is ten-fold what it was a half century ago. Before another half century closes, a new era in human life will have opened. STUDENT

PYRAMID OF SAKKARAH

The Pyramids

THE Pyramid of Sakkarah, near Memphis, is supposed by archeologists to be older than the great Pyramid of Gizeh. It is not a pyramid in the strict geometrical sense, being composed of successive stages. The slope of the sides of these stages is nearer the vertical than in the true pyramids. When one such stage is found alone it is called a *mastaba*. Authorities seem to think the terraced form of this pyramid indicates that it was added to by successive builders. But the shape of these ancient structures was never casual, but full of meaning.

The pyramids are very much older than the earliest date hitherto grudgingly assigned to them. Orientalists admit that their shape, position, and dimensions have a profound mathematical and astronomical significance. But, because kings were buried in them, they have been supposed to be nothing but tombs; and the mighty Pharaoh is represented to our school-children as having squandered men, time, and riches wholesale in order to gratify his vanity by providing himself with a sepulchre.

But when our Orientalists have admitted that the pyramids were built on astronomical principles, they stick as fast in a new rut as they did in the old. For then there comes the theory that these structures were erected for *nothing but* astronomical reasons. Tardy indeed are the steps by which we win back fragments of that ancient Science whose last vestiges were well-nigh effaced in the time of Constantine.

H. P. Blavatsky, writing of the astronomical knowledge of the Pyramid-Builders, says:

They had it assuredly; and it is on this "knowledge" that the programme of the Mysteries and of the series of Initiations was based: hence the construction of the Pyramid, the everlasting record and the indestructible symbol of these Mysteries and Initiations on Earth, as the courses of the stars are in Heaven. The cycle of Initiation was a reproduction in miniature of that great series of cosmic changes to which astronomers have given the name of the Tropical or Sidereal year. STUDENT

Tardy Admissions of H. P. Blavatsky's Message

THE NEW CENTURY PATH does not quote the theories of modern scholars as authorities, but merely for the purpose of comparing them with the teachings of the ancient Wisdom-Religion as outlined by H. P. Blavatsky. Prophecies of H. P. Blavatsky have often

been given on this page, predicting how those teachings would receive confirmation and come to be admitted. Here are some more:

The day when much, if not all, of that which is here given from the Archaic Records will be found correct, is not far distant.

The days of Constantine were the last turning-point in history, the period of the supreme struggle, that ended in the Western world throttling the old religions in favour of the new one, built on their bodies. From thence the vista into the far distant past, beyond the Deluge and the Garden of Eden, began to be forcibly and relentlessly shut out by every fair and unfair means from the indiscreet gaze of posterity. Every issue was blocked up, every record upon which hands could be laid, destroyed. Yet there remains enough, even among such mutilated records, to warrant us in saying that there is in them every requisite evidence of the actual existence of a Parent Doctrine. Fragments have survived geological and political cataclysms, to tell the story; and every survival shows evidence that the now secret Wisdom was once the fountain head, the ever-flowing perennial source, from which were fed all the streamlets—the later religions of all nations—from the first down to the last. This period, beginning with Buddha and Pythagoras at the one end, and finishing with the Neo-Platonists and Gnostics at the other, is the only focus left in history wherein converge for the last time the bright rays of light streaming from the æons of times gone by, unobscured by the hands of bigotry and fanaticism.

Now we find Professor Sayce, in the introduction to *A Short History of Ancient People*, by Robinson Souttar, saying:

We can never return to the old complacent belief that Europe was the primal home and cradle of cultivated man, or that between the ancient Oriental world and the world of European thought and literature lies a deep and impassable gulf. If modern Oriental research has taught us nothing else, it has at least taught us that literary culture is immensely old in the valleys of the Euphrates and the Nile. It has shown us that the civilization and culture of today are not the first the world has seen; that in the days of Moses education and literary activity were as fully developed as they were in the days of our immediate forefathers, and that in still earlier ages books were read and written, the law codified, libraries established, and the arts and sciences studied and known. . . . The more we know of the civilizations of the past, the more are they seen to resemble our own; whatever progress we have made in certain branches of knowledge, and, above all, in their material application, in the general elements of culture, in the arts of life and the organization of society, we have made but little advance upon the educated classes of Egypt or Babylonia.

One wonders if Professor Sayce has considered it expedient to peruse H. P. Blavatsky's writings, as not a few eminent scholars have! STUDENT

THE SUN AND THE SEA

The Pacific

THE sea! The boundless sea! Old, yet ever new, ever with the freshness, vigor and gladness of youth and primal morn! The tides come in, and the tides go out, over and over again. Ever the foam-capped waves dash and spend themselves against the rocks, to be followed by more and yet more forever, singing always their song of "Life is Joy;" and the grand old sea never wearies of the singing of the same old song, never wearies of the eternal wave after wave, wave after wave; but each is as full of the bounding joy of life as if there had never been another.

The sympathetic beholder looks and listens and feels the ever-newness of it all, and wearies not of the motion nor the song; for the Indwelling Life of the sea is one with his own, and the waves of that Life break not on the rocks, but flow through all his being, stirring anew his own life currents, giving strength and gladness.

Wonderful sea! With all thy seeming sameness what infinite variety thou hast! What endless variation of light and shade and color! Now thou art wrapped in gray mists or covered with fleecy, sunlit clouds, and again thou wearest a garment of resplendent light, each wave a mirror of the sun or moon and stars, receiving and giving forth again the light of heaven with all the pearly tints of shells grown within thy liquid depths.

Wonderful sea! With all thy mighty power, what delicate creatures find their home in thee! What delicate, fairy-like mosses swing to and fro with the motion of thy waves! To how many creatures, great and small art thou a protective mother! Thou givest us in thy vastness a sense of the Infinite of which we are a part.

O sea, what mighty secrets lie buried within thy peaceful bosom! When wilt thou permit once more to rise above thy waves that which thou hast for so long hidden from the eyes of the degenerate races of today?

O thou keeper of secrets, to all our questions thou murmurest ever the same old answer, and we feel that all is well in thy keeping.

STUDENT

The Early Ant

THE observant individual who takes an early morning walk may see many little paths in the sand that appear very much as if an earth worm had been crawling there, but such is not the case. They are the paths of great companies of little ants that go on morning pilgrimages before sunrise. The early riser who sallies forth before the rising of the sun may have the pleasure and profit of seeing them.

Solomon may have known of them, and also of the value of an early morning walk, when he said, "Go to the ant, thou sluggard."

An uneven path is no discouragement to these ants, nor do they waste time or energy hunting around for an easier one, but they go ahead down into the deep places and up over the high places.

A Point Loma student found one of these paths as much as three hundred feet long, and he also found the pilgrims in the act of making their pilgrimage. The ant understands the value of united effort, and the path of each becomes much smoother because so many travel it.

We may learn a lesson here.

The ant has not wandered so far away from the One Source of all on the path of differentiation and separateness as has man, and so the united life in which each works for the good of all still obtains with them.

Man, on his return journey to the Infinite Source, taking with him all that he has gained by experience, is beginning to see the need of greater unity and the folly of a life of separateness for self alone; and there is dawning for humanity a great hope of a day when brotherhood shall reign supreme and the nations of the earth be at peace. Greater than stars or suns,

Bounding, O Soul, thou journeyest forth.—Walt Whitman

The Century of the Child

IT has been well said that "A child's hand is on the door-latch of the millenium." To a close student of the signs of the times there is a remarkable prophecy for the near future in the little children of today. The majority of babies show a higher order of consciousness than did those of even a few years ago. They begin to "take notice" of surroundings at an earlier age than formerly, and show a precocity which would be abnormal were it not usually fairly balanced. They have a way of "looking through" the personality which is rather disconcerting to their elders. Some of them have a look of purpose and expectation as if some important work had drawn them into earth-life again, and they had not forgotten the reason why they came.

The old-fashioned beady-eyed, putty-nosed cherubs are in the minority nowadays,—or so it seems,—though still plentiful enough to prove by comparison that it is not mere imagination which convinces one of the change in type. And so independent of social lines is this improvement that one may easily believe that more highly evolved souls are eager to incarnate whenever opportunity offers.

These little warriors have a clear-eyed unabashed way of looking things in the face that appears to have outgrown the timidity and constraint which used to mark the average child—as old family pictures commonly prove.

Though the first-born is apt to receive due credit and attention, still some mothers of a family note how much more alert the last baby was than were the elder children at the same age. Their little bodies seem to be the dwelling-places of more intensified centers of consciousness. At first this may sound metaphysical and mysterious, but on second thought it is simple and natural enough.

Nature is not deceived: she adjusts the most fitting forms to the life which seeks expression, whether it be vegetation or that of higher planes. Nature feels the needs of the future and provides for them in humanity, just as she leads the birds to migrate in advance of the changing seasons. That so many children are being born with greater possibilities is an open hint of the larger opportunities for human expression and advance which even the present generation will see. At this time we have reached a climax of materialistic endeavor from which the "little child shall lead" us into a day of higher purpose, and of soul resolve. Let us, as women, stand worthy and well-qualified, willing to be led, beholding in the present the promise of a golden future.

LYDIA ROSS, M. D.

Sacajawea, the "Bird Woman"

NEXT year will be celebrated at Portland, Oregon, the Lewis and Clark centennial, in honor of the two heroes who first discovered, beyond our great western slopes, the Pacific. Owing to the efforts of prominent western women, there will be recognized at this centennial the achievements of an Indian woman, hitherto little known. Next to the President who sent Lewis and Clark, it is this Indian girl who deserves to be eulogized with them. Sacajawea, or, as she was better known, the "Bird Woman," guided Lewis and Clark across the mountains and on several occasions saved the situation for them when they had given up all hope of seeing the ocean. This Indian woman belonged to the Shoshones. When a child of eleven she had been taken captive by the ancient enemies of her tribe, the Blackfeet, and at the age of fifteen she found herself sold as a slave to a common French *voyageur*. To this man the Indian girl was a faithful wife, and when

she became the guide of the Lewis and Clark expedition, her husband being taken along to act as interpreter, she was the mother of a babe two months old. Together all labored, the young Indian girl burdened with her babe at the time, until they worked their way to the Upper Missouri. It is said of Sacajawea, the only woman member of the expedition, that she conducted herself during the long and trying journey, with the same exquisite modesty and sense of propriety that the most cultured white woman could have shown.

Lewis and Clark gave the husband, a worthless man according to their own account, \$500 for his services, but to the Indian woman they gave nothing.

At the Western World's Fair of 1905 a bronze statue will be erected in honor of Sacajawea, to be later given a permanent place in one of the larger public parks of Portland.

STUDENT

THAT a good woman will command respect wherever she may be placed is shown by the history of one Harilena Karothiewitch.

Determined to join her husband, she entered Port Arthur in disguise and joined his regiment. She proved herself to be so fearless, so refined and so devoted in her services to the wounded, that when her identity was later discovered she was allowed to remain. She was killed by the explosion of a shell while carrying dispatches to the trenches. Both officers and men showed her the greatest respect, invariably refraining from the usual soldier's profanity while in her presence. H.

The Cause and the Cure

THE word "insane asylum" carries with it little of light or joy, while its sister word "insanity" speaks to us only of horror. And this is not strange, so terrible a memory have we inherited of the days when insane women were treated worse than the lowest criminals and when rational methods of care and of cure were undreamed of. Today things have changed, as, for instance, in a number of our State Hospitals for the insane, where the patients live their life among flowers, in the sunshine and in the most cheerful surroundings, with books, music and outdoor occupations. Some of them are formed into squads as women gardeners; others go in for athletic exercises, as, for instance, basket-ball. In one asylum they care for the plants in enormous conservatories throughout the winter. In another the callisthenic class is one of the favorite classes in all seasons of the year, and on May-day there is even a Maypole dance and a real festival among the patients. Think of that, in an insane asylum! But such treatment is remedial, and while the perfect cure must be one that touches the heart-life understandingly, and can only be given by those wise enough to diagnose each case perfectly and individually, still it is wonderful what out-of-door life and kind treatment has accomplished.

Of the causes which bring on insanity, the statistics of our hospitals are interesting. By far the greatest cause is sudden disappointment, such as the loss of money, loss of friends, etc. Intemperance is a strong factor. Mental strain and worry bring many to the insane ward, overwork a few, and heredity a few more.

The fact that disappointment is the prime cause is significant. Where would our asylums and our alienists find occupation if women,—and men, too,—had a philosophy of life which should lead them to understand every disappointment and to use each one as a stepping-stone to greater heights and fuller strength, no matter what its nature, no matter what may be the circumstances, no matter what may be the physical condition at the time that the blow comes. There is in every heart a capacity for that trust which bridgeth all abysses. There is in every heart the germ of that knowledge which leadeth one to wisdom and to a divine understanding of all events. The whole difficulty is that women do not understand their natures, and that the brain-mind, twisted around some theory or notion or desire, as a vine is twisted around a stick, leads them hither and yon. Some brain-mind notion governs their heart-life instead of the heart itself, the soul, governing the brain-mind. Could women realize their divinity, could they realize that, as the body is but an instrument for their use, so also is the brain,—a perfectly splendid servant, but a master most despotic and unjust—then were insanity impossible.

THE sister of the late Empress of Austria played a brilliant part at the siege of Goeta, Italy. Placing herself at the head of her husband's beleaguered army, she walked around the ramparts under a perfect hail of bullets, exhorting and inspiring the troops.

AND NOW a woman bull-fighter is advertised as the great attraction of an approaching *festa* in one of the smaller towns of Mexico. The turning of the tide—when will it come?

THE women of many countries are awake to the necessity of adopting good educational methods. We have noted the recent visit of an Italian lady, and now two Mexican teachers are about to visit the United States to inform themselves concerning commercial schools for women. They have been commissioned by the Department of Public Instruction of Mexico, to whom they will, on the conclusion of their visit submit a report.

A GLIMPSE WITHIN ONE OF THE STUDENT HOMES OF LOMALAND

"A GREAT soul draws and is drawn with a more fierce intensity than any small one. By every inch we grow in intellectual height our love strikes down its roots deeper, and spreads out its arms wider. It is for love's sake yet more than for any other that we look for that new time. . . . then when that time comes, when love is no more bought and sold, when it is not a means of making bread, when each woman's life is filled with earnest, independent labor, then love will come to her, a strange, sudden sweetness breaking in upon her earnest work; not sought for, but found. Then, but not now—"
OLIVE SCHAEFER

Woman's Mirror Sense

PROFESSOR OTIS T. MASON, in a recent article, declares that women have at least one sense that men do not possess, and he proves it. He calls it the "mirror sense." He says, among other things, that women are constantly working small miracles. "The girl who threads with ease the needle that has no eye that a man can find, is exercising a faculty that has been handed down to her for a thousand generations."

"Another marvel," he says, "is the cleverness of a woman who, sewing a bone button on a piece of cloth, hits the hole every time, with her needle, from the back. A man would strike the button and not the opening, three times out of four."

He also refers to the fact that a woman can put up her back hair without seeing it at all, a feat which no mere man could possibly accomplish! But the greatest of miracles, in the Professor's eyes, is the way in which a woman handles a hairpin. "It is to a woman," he says, "the master key to all mechanical problems; but where is the man that is able to use it? To him even the art of pinning hair with it is a puzzle!"

Virginia Dare

VIRGINIA DARE was the first English child born on American soil. Her birthplace was Roanoke Island, N. C. She was the granddaughter of John White, who took command, as governor, of a small company of colonists from Plymouth, Massachusetts, who settled upon this island in 1587.

Her burial place is uncared for, marked only by a weather-beaten wooden slab. Interest has been aroused in the plan to erect a suitable memorial to her.

It is expected that the island district will petition Congress for funds, covering the cost of a monument to be placed on the spot marking her grave.
R. B.

IT IS worthy of note that Madame Marchesi celebrated, not long since, her fiftieth anniversary as a teacher. This remarkable woman is known the world over as the teacher of a galaxy of operatic stars, the most famous of our day.

She has published nearly forty musical works and has received decorations from the Emperor of Austria, the Grand Duke of Saxe-Weimar, the King of Saxony, the King of Italy and the

Emperor of Germany. From the French government she received the brevet of "Officer of Public Instruction." Today, long after having passed her seventieth birthday, she is as active and busy as ever.

One incident in her career is significant. The end of her stay in Vienna, many years ago, was disheartening and she determined to begin in Paris. Baron Haussmann, whose plans had been the means of beautifying the French capitol, was her cousin, and he had strong local influence there. In addition, Auber, the composer, offered her a position at the Paris Conservatory. She was about to accept it, when she discovered that some of the principles of her method would have to be sacrificed. This she refused to do and went on alone through poverty and in the face of discouragement, in what time and results have since proven to have been the right way.

STUDENT

THE embroiderers of Japan are not women, but men. It is in that land considered an art closely allied to that of painting, governed by the same high principles; and the remarkable taste and ability as designers displayed by the embroiderers of that land has been for generations a source of wonder to foreigners.

IN Russia women have been recently granted the privilege of studying medicine on the same terms as men students. At the Military Medical Academy and at the Universities they can now both study for and receive medical degrees.

OUR YOUNG FOLK

Lessons From the Flowers

I SOMETIMES think that one can do as much good and teach as many lessons in touch with flower life as with human life. There is a simplicity and a peace and a harmony about flowers, and I often wish others might live as close to them as we do in Lomaland.

Point Loma reaches out from the mainland into the clear blue waters of the Pacific, like a warrior of light guarding the land of Peace and Good Will. The sun rises from behind the blue mountains, to make the day beautiful and leave in its path at sunset the promise of a glorious coming morn.

In Lomaland nature works out her highest ideal: and among her greatest gifts of joy are the plants and flowers. All over the great hill there is an abundance of eucalyptus, pepper, cypress and palm trees; these trees do their part in life by giving us health, shade and beauty. We Raja Yoga children have many gardens, where we study the plants. Some, like the ice plants, cling closely to mother earth, while others, like the Yerba Santa, stand straight and independent. They have their own characteristics as we have ours. Some people cling to others and are too timid to stand and face the winds and storms of life, and so, though trying bravely, these have to be helped kindly along; they have to be protected from the winds until they are stronger. Then there are those who meet life bravely. There are the morning-glory and the sweet honeysuckle that twine around ugly and bare things and make them beautiful. They remind us of people; wherever they go love and comradeship are, making the homely places beautiful and the lonely joyous.

The plants are reaching towards the sunlight, and sending their sweet blossoms forth with their pure little faces lifted toward the clear blue sky. So we Raja Yoga children live out in the open air, and with our hearts full of gratitude, strive more every day to be as pure and as brotherly as the flowers; for a flower, no matter of what kind, is a group of very small brotherhood helpers which have to work for the benefit of all. As the plant grows thus we find that plants are brotherly. The children here in Lomaland are Buds and Blossoms; we work together in our school, that some day all the children of the world (especially those in the cities) may have such opportunities as we have today.

So, living in the sunshine among the flowers and birds, being taught Raja Yoga by our patient teachers, we are trying to make our characters strong, that we may help all children to blossom forth like the flowers, beautiful and pure.

A RAJA YOGA STUDENT

From a Yuma Indian Legend

WHEN the people of the earth were created, each family was given its own home, language and color. The great Ko-Ko-Mat made all men, yet he did not wish them to live together. So he separated the tribes from one another by rivers, mountains, canyons, deserts and forests. Each family lived for many ages within its own limits. But gradually these were passed. Indians fought among themselves, and white men fought them all together. Then, the whites seized the Indian lands, and we were told that the Big Father at Washington was to be our Chief. We were few. You were many, and we had to do as we could."

A GROUP OF RAJA YOGA BOYS RECEIVING INSTRUCTION AT THE METEOROLOGICAL OBSERVATORY, POINT LOMA

SAID wise Marcus Aurelius, nearly 1800 years ago: "How stale and lasincere this sounds: 'I propose to treat you fairly and squarely!' Why this to-do? What is the need of protestation? The truth will soon be found out. Such a profession should be written on your forehead. One should see your honesty shining in your eyes."

A Word about Japan

ACCORDING to Japanese chronology, the present Empire of the Rising Sun was founded in 660 B. C. by Jimmu Tenno. It was at this time that Assyria, under Sardanapalus, was enjoying its palmiest days; not long after the tribes of Israel had been carried into captivity, and even before Medea had risen into prominence. The imperial family of Japan belongs to the oldest continuous dynasty in the entire world. It can boast of tracing an unbroken line through eighteen or twenty centuries. A writer once said, "Morals were invented when there came to be immoral people, but in Japan there has never been any need of a hard and fast code of morals, as every Japanese was certain to act rightly if he only consulted his own heart."

When the present Mikado of Japan, Mutsuhito, took the throne, he declared, "Henceforth we shall exercise supreme authority, both in the internal and the external affairs of the country." To this manifesto was

appended Mutsuhito's signature, this being the first occasion in Japanese history in which the name of an emperor has appeared during his lifetime. At that time, it will be remembered, Mutsuhito had overthrown the despotism of the Shoguns and had resumed his ancestral rights as actual ruler of the empire, and it is significant that when this was accomplished he took solemn oath that "A deliberative assembly should be formed; that all measures should be decided by public opinion; that uncivilized customs should be abolished; that the impartiality and justice displayed by Nature should be adopted as the basis of action; and that intellect and learning should be sought for throughout the world in order to establish the foundation of the empire."

In the same year a House of Commons was formally organized,

feudalism was soon abolished and a Senate was established. In 1875 the Emperor called a General Council, that the feelings of the people might be made known, and today the government is one of the wisest in the world.

STUDENT

Facts Worth Knowing

THE chief occupation of the Japanese is agriculture. The farms are nearly all small. There is a saying, "There are no farms in Japan; there are only gardens."

MAGNESITE, so valuable in making fire brick and other fire proof materials, has been discovered in large quantities in California. Hitherto it has been imported from Syria and Greece.

EVERY word spoken in the House of Representatives in Tokyo, from the day of its opening, has been taken down; making this Parliament the only one in the world which has a complete *verbatim* report of all of its proceedings.

THERE is near Chico, California, a national plant garden which has recently received from Japan a large shipment of plants and bulbs. Among these are the bamboo, the Japanese salad plant, many varieties of lily-seeds and bulbs, the Japanese paper plant, besides tiny Oriental cherry and orange trees. They will be experimented with for the purpose of ascertaining whether or not they can be grown successfully.

THE CHILDREN'S HOUR

The Raja Yoga Question Box

BY their swords great kings and leaders have won for nations times of peace when the arts could flourish. The world owes much to these warriors who brought law and order to their conquered foes.

1 Who was Julius Cæsar?

ANSWER—Julius Cæsar was one of the greatest of the Romans. As an orator, he once put down a rebellion by speaking to the people. As a general, a citizen, a writer, and a statesman, he made himself famous. Rome had conquered many of the savage tribes of Europe. But Cæsar brought law and order among them and helped to civilize their life. His work among these savages was the very beginning of Europe as we see it. Cæsar's greatness showed itself in his courage and energy. He caused many beautiful buildings to be erected in Rome. He reformed the courts of justice. He tried to teach the people to be less selfish. He was killed

B. C. 44, by those whom he thought were his friends. Cæsar's life and deeds were so powerful that ever since his death his name has been used to mean "a great emperor."

2 Who was Charlemagne?

ANSWER—Charlemagne came to the throne of France A. D. 771. France was larger then than it is now. Charlemagne had many wars with the savage wandering tribes near the border of his kingdom. He conquered them. When peace was secured he made many wise laws that helped to keep order in his kingdom. Then Charlemagne invited learned men to his court. They became his friends and advisers. The king founded an Academy in his own palace, where he himself studied with the great scholars of the day. He also taught his children and the members of his household. The fame of Charlemagne reached to distant countries. Great men came even from the far East to do him honor.

In the North Country

IN a north country, far away from Point Loma, the air is so cold and dry that these little girls in their blanket suits can play about in the snow without melting it. They pile the snow on their sled and make houses and men with it, just as if it were sand on the seashore. Their cheeks are like little rosy apples with running about in the crisp, cold air.

Now and then they hear the merry jingle of sleigh-bells. They peep through the fence to see a sleigh with people wrapped in furs, and gay red tufts floating as the horses dash along.

Soon the children will be called into the house. How their hands tingle when they take off their warm mittens! And they must stamp their feet hard to get off the high heels of snow sticking to their boots.

Next morning they run to the window. They rub off some of the silver fretwork Jack Frost has traced on it and look out. Behold! In the night the wind has blown all the snow into a high drift like a hill, away over in another corner of the garden. Out into the sunshine they go, and begin their play all over again.

AUNT MARJORIE

TWO LITTLE LOTUS BUDS OF THE NORTHLAND

DEAR CHILDREN: Perhaps you think a seal's home is very cold, being built right under the snow; but the snow acts as a sort of blanket and keeps it quite snug and warm—that is, for an Arctic Sea home. And who do you think is the builder of this home? Of course you will answer "the Father Seal," but no—it is the Mother Seal. After she has shovelled the snow down through the ice with her flippers, she shapes it into a little dome-like hut. Mama Seal is careful to build her home far enough down to be beyond the reach of hunters, so that Baby Seal may have a safe shelter. But although the hunter rarely finds the seal's home, yet the keen nose of the big white bear often guides him straight to the spot, much to the sorrow of both Mama and Baby Seal.

The seal keeps air-holes open about his home, not an easy matter where ice is often three feet thick and a new crust continually forming.

Seals travel a long way on the ice in search of their food—fish—and then find their way back through the water to their own breathing-holes. Don't you think they must have quite a love of home, just like humans, and that this guides them right back to their own? I think so. S. L.

Our Forest Brothers

DEAR CHILDREN: How would you like to see photographs of wild animals taken by themselves? The African explorer, Shillings, has a collection of this kind and this is how he obtained it.

He set up his camera in the forest ready to take a picture and then, to a piece of meat placed in front of the camera, he fastened an apparatus which, as soon as the meat was touched, would set off a flash-light. At night the meat, of course, attracted the forest animals, but as soon as it was touched, off would go the flash-light and Mr. Lion or Mr. Leopard would find himself caught by the camera before he could run away. Many rare species of animals have taken their own pictures in this manner.

How much more we can learn from such a collection as this, than from the caged animal which never acts naturally or contentedly, and which, in the narrow confines of the cage, is unable to assume the beautiful and graceful attitudes that are native to it in its own forests! And what a poor idea we get of how the beautiful animal really looks, from the skin, or teeth and claws brought home by hunters! Then, too, is it right to kill wild animals or deprive them of their liberty just for the sake of exhibiting them for money? I believe that Mr. Shillings must know something about that heart light which Raja Yoga children believe in.

Surely he has found a beautiful way to study and become familiar with these big brothers of the forest,—has'nt he? STUDENT

THE LITTLE ELF

Down where the lilies blow.
I asked him why he was so small
And why he didn't grow.
He lightly frowned and with his eye
He looked me through and through.
"I'm quite as big for me," said he,

DEAR LITTLE BUDS: We have such funny birds in Australia. I want to tell you about the Bower-bird; a brown, speckled fellow, something like a thrush. He has a patch of pink feathers on his head, which he lifts like a crest when he is surprised or frightened. He is called the "Bower-bird" because he builds a little bower, or playhouse, to play in. These bowers are always in very secret places, but I have seen two of them and, hidden behind big gum trees, I have watched the birds running up and down, playing with bright pieces of glass and beads which they had stored there for playthings.

They fasten a piece of tall grass over to make a sort of an arched roof, and these bowers remain for years in one bird family. One of those which I saw had been used, I was told, for twenty years.

In Australia we often call the Bower-bird a "Mocking-bird." F.

Art Music Literature and the Drama

Sainte-Beuve—Worthy Exemplar in the Higher Journalism

THE centenary of Charles Augustin Sainte-Beuve exalts the inspiration of his sincere and unprecedented work in the production of writings, which, though supplied with the unfailing regularity exacted of the weekly contributor to a periodical, exhibit the quality that makes of literary work a lasting contribution to the world of thought.

That Sainte-Beuve was able to draw upon his resources with such uniformly successful results was owing to his industry as a scholar and his hearty human interest in the subjects of his literary criticism. Sainte-Beuve said of himself:

I hold very little to literary opinions; literary opinions occupy very little place in my life and thoughts. What does occupy me seriously is life itself and the object of it.

This heart relation to the subjects of his essays, combined with the skill of a workman who loved his craft, and the scholarship of a true lover of knowledge, were the means of giving to the world the literary history that has been a guide to all subsequent critics, and has revealed the very genius of French literature.

What a reproach is work like Sainte-Beuve's to the inaccurate and careless work of many writers for periodicals, who have in view only the money to be earned, with no thought beyond the production of a mediocre mass of impressionistic statements, that can command remuneration only because of the ignorance of the public!

Sainte Beuve had gathered such a wealth of experience in his studies and his work, that his judgment gradually became mellowed, and his verdict has continued to appeal to earnest readers. Matthew Arnold says of him:

Certain spirits are of an excellence almost ideal in certain lines; the human race might willingly adopt them as its spokesmen, recognizing that on these lines their style and utterance may stand as those, not of bounded individuals, but of the human race. So Homer speaks for the human race, and with an excellence which is ideal, in epic narrative; Plato, in the treatment at once beautiful and profound of philosophical questions; Shakespeare, in the presentation of human character; Voltaire, in light verse and ironical discussion. A list of perfect ones, indeed, each in his own line! And we may almost venture to add to their number, in his line of literary criticism, Sainte-Beuve.

STUDENT

STRANGE and pitiful comment is it upon ignorant and vitiated mental conceptions of greatness, that a woman like Madame du Barry should be the subject of so many elaborate literary efforts, culminating recently in a play that strives to immortalize—what? A life devoid of purity, heroism, humane endeavor, of even decency; a life devoid of even that veneer of personal dignity sometimes successfully assumed by those who have achieved prominence in the intrigues of court life.

Only an ignorant, unthinking insensibility to the purest and noblest in human living, can account for the fascination this detailed presentation of a life like Mme. du Barry's holds for so large a public. It is a reproach to that public's taste and morals that from the history of a country that enrolls the names of so many illustrious women—from the divine Joan of Arc to the heroic Madame Roland—this ignoble life should be chosen for the subject of a play. God speed to the day when the effort now being made by Katherine Tingley to elevate the drama and give to it once more the purifying and ennobling influence of the soul, shall have spread over the world, and have lifted the people from the foul and materialistic ideas in which so many minds are at present drenched! STUDENT

The Musical Life of Our Forgotten Mountaineers

“THERE is hidden among the mountains of Kentucky, Tennessee and the Carolinas a people of whose inner nature and musical expression almost nothing has been said,” says a writer in *Harper's Magazine*. “The music of the Southern mountaineer is not only peculiar, but, like himself, peculiarly American. Nearly all mountaineers are singers. Their untrained voices are of good timbre, the women's being sweet and high and tremulous, and their sense of pitch and tone and harmony remarkably true. The fiddler or the banjo player is well treated and beloved among them, like the minstrel of feudal days.

“Romantic love as a motif is almost altogether absent throughout the mountaineer's music. It is a subject of which he is very shy. His passion is not a thing to be proclaimed from the housetops. Once married his affection is a beautiful thing, faithful to whatever end; but he does not sing of it. . . . The mountaineers sing many ballads of old England and Scotland. Their taste in music has no doubt been guided by these, which have come down from their ancestors. Indeed, so prone are they to cling to tradition that it is often difficult to distinguish

these from their own modern compositions, especially as many have been recast, words, names of localities and obsolete or unfamiliar phrases having been changed to fit their comprehension. . . . Some of the best instrumental music is of a descriptive nature, reflecting vividly the incidents of everyday life. Peculiar fingerings of the strings, close harmonies, curious snaps and slides and twangs, and the accurate observations of an ear attuned to all the sounds of nature, enter largely into the composition of these.

“The music, too, while usually minor, is not of a plaintive tendency; there are few laments; no sobbing and wailing. In this it differs radically from that of savage peoples. Neither has it any martial throb or clang. It is reflective, meditative, with a vein of genial and sunny philosophy; the tunes chuckle, not merrily, but in amused contemplation.

“Once touched by religious emotions, however, the mountaineer seems to lose his sense of the ridiculous entirely—the deeps of his nature are reached at last. The metaphors of Scripture, the natural expression of the Oriental mind, are taken with a literalness and seriousness against which one cannot help thinking a touch of humor might be a saving grace. The oddly changing keys, the endings that leave the ear in expectation of something to follow, the quavers and falsettos, become in recurrence a haunting hint of the spirit world; neither beneficent nor maleficent, neither devil nor angel, but something—something not to be understood, yet to be certainly apprehended. It is to the singer as if he stood within a sorcerer's circle, crowded upon by an invisible throng.”

ONE art essentially Japanese, is that of flower arrangement. In its origin it is said to be closely related to the tea ceremonial, itself founded on the cardinal virtues of Grace, Courtesy, Purity and Silence.

In a general way, the art consists in arranging flowers with regard to harmonious composition, both in color and in line, and in this art the principles of composition in painting find invariable application.

JAPANESE architecture impresses one as being not only peculiar but fitting. The whole archipelago is volcanic and earthquakes of greater or less violence are exceedingly common. On a more stable soil it is not unlikely that the Japanese would have built solid edifices of brick or stone, but in their own Japan such buildings would be absurd and useless. The question has been solved by building light, elastic structures of wood. Not a few, particularly among the temples, have withstood the earthquake shocks of well-nigh a dozen centuries.

The Japanese can teach us one all-important thing, however, which is that the architect should build with an eye not alone to the house, but to its place in the general landscape scheme. That is the main reason, perhaps, why Japanese landscape is so universally harmonious and beautiful, unmarred by unfitting and, therefore, inharmonious structures. E. W.

A MARBLE WELL OF OLD VENICE

FRAGMENT

SIDNEY LANIER

WHEN Nature from her far-off glea
Flutes her soft messages to men,
The flute can say them o'er again:
Yes, Nature, singing sweet and lone,
Breathes through life's strident polyphone
The flute-voice in the world of tone.

Sweet friends,
Man's love ascends
To finer and diviner ends
Than man's mere thought e'er comprehends.
For I, e'en I,
As here I lie,
A petal on a harmony,
Demand of Science whence and why
Man's tender pain, man's inward cry,
When he doth gaze on earth and sky.

WHEN THE WESTERN SUN CASTS A SHEEN OF GLORY ON SEA AND SKY AT LOMALAND

Withdrawal and Restitution of the True Teaching

THE results of modern archeological research are every day bringing forth new proofs which lead up to the verification of H. P. Blavatsky's claims regarding ancient civilizations. The ancient libraries unearthed, the new hieroglyphics deciphered, the subterranean buildings discovered—all tend to confirm the claim that—

The Secret Doctrine (Theosophy) was the universally diffused religion of the ancient and prehistoric world. . . . The Wisdom-Religion is the inheritance of all the nations, the world over.

This system included not only philosophical teachings but also the history of humanity from its beginning. But it became lost to the world—for a time—owing to two reasons.

First, as nations became more unspiritual, during the lapse of many ages, the essential teachings had to be withdrawn out of the reach of profaning hands.

Second, the priests of purely ecclesiastical religion and other destroyers moved heaven and earth in their efforts to blot out all traces of the existence of such a system.

Another declaration of H. P. Blavatsky's will, in the light of recent discoveries, receive more credit than when she first made it. This is that there are vast concealed libraries containing the missing links of history, the genuine texts of sacred books, and the keys to veiled writings.

We are beginning to realize the productive potentialities of deserts in this respect; and we know of numerous vast tracts to which tradition, what we know of history, and geographical circumstances, all point as likely spots for such concealments. It is therefore, at the present date, easy to believe that these repositories exist.

Another thing that is easy to believe is that, if any libraries are discovered, our orientalists will not be able to penetrate the real meaning of the inscriptions any more than they can in the case of those already extant.

H. P. Blavatsky enumerates, in support of her claim, the following facts:

The tradition of the thousands of ancient parchments saved when the Alexandrian library was destroyed; the thousands of Sanskrit works which disappeared in India in the reign of Akbar; the universal tradition in China and Japan that the true ancient texts with the commentaries, which alone make them comprehensible, amounting to many thousands of volumes, have long passed out of the reach of profane hands; the disappearance of the vast sacred and occult literature of Babylon; the loss of those keys which alone could solve the thousand riddles of the Egyptian hieroglyphic records; the tradition in India that the real secret commentaries which alone make the *Vedas* intelligible, though no longer visible to profane eyes, still remain for the Initiate, hidden in secret caves and crypts; and an identical belief among the Buddhists with regard to their secret books.

There is an undying belief in human hearts and minds that there does exist somewhere a system of thought which is, so to speak, the mother and source of all known religious and philosophical systems. This belief has persisted through all the dark ages humanity has traversed since

it lost this primal wisdom. As a corollary to this belief, there exists also another, which speaks in man's soul with no uncertain voice, to the effect that this glorious primitive Wisdom-Religion of the ages will once again be the common heritage of mankind. In that day, dark doubt and heresy shall flee away as a mist before the morning's sun, for men shall recognize their eternal and inseparable unity in Universal Brotherhood. STUDENT

FRIENDS IN COUNSEL

DEAR COMRADES: On looking out after rising in the morning nothing is visible but the deep blue vault of heaven thick sown with glittering points of light. A little later and we note an almost imperceptible lessening in the darkness of the eastern sky. By infinitely small degrees the stars grow faint until at last the rolling outline of the deep, rich purple hills stands silhouetted clear against the background of pale gold; above the gold a band of delicate green and over that a flush of lilac tint shading softly into blue, and so on to the deep blue of the Pacific horizon where Night still holds her sway. Presently with swiftly growing splendor comes the "false dawn," but still a deep hush of expectancy broods over land and sea broken by the occasional crash of a wave upon the rocks, or the faint chirp of an awakening bird. The daylight slowly broadens out. Dark, formless masses resolve themselves into palms with fronds clearly defined, and rose trees pink with blossom swaying in the breath of early dawn. Darkness has vanished, the sky is uniformly light, the roseate glow has faded in the light of common day when suddenly a sparkling ray shoots between the hilltops and the bright sun is rising with resistless force.

Our point of view is so limited and local that we are apt to imagine that the day has *now* begun. We forget that the sun is forever rising on some part of the earth's surface and that there are no barren intervals in his career of ceaseless beneficence. His bounty is so rich and so incessant that the mind is staggered by the effort to conceive of it. Yet the sun creates nothing, he is merely a center for generating and pouring forth the Divine Life pervading all things; too pure and too transcendent for our coarse senses it requires an intermediary to mitigate and lessen its force for our use.

Could we but cut loose from the Nineteenth century notion of the sun as a ball of incandescent slag in slow process of cooling off, we should gain immeasurably. We might then imagine it to be the visible body of a kindly, conscious power engaged in translating divine compassion into language we can understand, or as a living mirror who reflects the invisible glory of the Unmanifested that our dim eyes may see.

I think that we have human suns in process of development here in Lomaland, people who go about their work with the sole desire to push things on and keep the wheel in motion. Such students are always full of satisfaction. Life rises in them like a fountain and on its full and flowing tide they pass their happy days of growth and helpfulness. STUDENT

WHO ARE THE FREE?

PRINCE

WHO are the free?
 They who have scorn'd the tyrant and his rod,
 They who have made the conqueror's glory dim—
 Unchain'd in soul, though manacled in limb—
 Unwar'd by prejudice—unawed by wrong;
 Friends to the weak, and fearless of the strong.
 They who could change not with the changing hour,
 The self-same men in peril and in power;
 True to the law of right, as warmly prone
 To grant another's as maintain their own;
 Foes of oppression whereso'er it be—
 These are the proudly free!—*Selected*

The Keynote of Education

EDUCATION is a drawing out, or unfolding, of innate powers and potentialities. The pouring-in or cramming process, storing the intellect with a mass of so-called knowledge, much of which is intellectual rubbish, is often miscalled education; but so far from being education, it is in fact a hindrance to true education, which calls for a full, rounded, healthy development of the whole being, physical, mental, moral and spiritual. Such development can only be brought about through an understanding and recognition of the dual nature of man. Children can understand this duality as well as, if not better than older people, for their own experiences illustrate it and their intuitions and perceptions are not yet dulled. It is necessary that both the children and those who influence and guide them should understand it, cherishing all good tendencies and correcting and transforming all bad ones.

Where there is right education, there the higher nature rules and the lower serves, thus promoting the welfare of the whole being. Education should be begun in infancy. As Katherine Tingley has said, the first seven years of a child's life are most important in the work of education. Then is the time in which the soul should take its rightful place as master. If this is accomplished, the after work goes well. But if the lower nature during these years gains ascendancy, then there is much wrong to be undone before a harmonious development can be made, and much more time than seven years is lost to the work, while the difficulty of accomplishment is greatly increased; for the clear, shining soul has been clouded and its instrument dulled. The soul is in touch with the source of all knowledge, compassion, wisdom and power, and for these to find expression in the life of the individual, the soul must be free to act and have a fitting instrument through which to act, a pure, strong, healthy body and an intellect unclouded by selfishness. No education is complete which does not bring about this condition, and when it is brought about, then the mind can reflect the wisdom of the soul, then the whole being can act in unison with the soul and make Raja Yoga, the kingly union of all the principles, a realized fact. This union is kingly because that which is most royal in the nature of the being rules and guides the rest, giving willing service, thus promoting the highest well-being of all.

BANDUSIA WAKEFIELD

Silence

IN a strict sense, there is no such thing as silence. As long as motion exists there must be sound, but, of course, the limitations of the human organ of hearing make it impossible to hear sound above or below certain now thoroughly-established vibratory points in the scale. It should, however, be remembered that the faculty of hearing changes with every individual, for what may be perfect silence for one person may be shrill sound for another. So the point where silence begins and sound ends varies with the state of the person.

But silence, as generally understood, is of the greatest possible benefit.

This I think most of us are beginning to appreciate. It requires no undue exercise of the imaginative faculty to know that when the coarser physical operations of the body are stilled, the soul or higher nature may then begin to play through the body and get contact with the things below; and by this I mean also to get into unison or harmony with nature. What more inspiring, and uplifting, and strengthening, than to listen to the apparently "silent" song of nature? Those of us who have been privileged to stop for a moment in the heart of nature, away from the din of commercial life, know somewhat of her wonderfully sweet message.

The wise men of all times have urged the student of life, the seeker after happiness, to make the soul strong, through the inherent power of silence, which is the great panacea for all disturbances, whether they be engendered by passion, disappointment or sorrow.

"Silence is golden," and yet there is a time for speech and song, and the human being can possess no greater quality than a right discrimination to know when to utter word or song, and when to realize the golden moment of silence.

To speak when there is no occasion for it, is as much a waste of energy as to indulge in any other form of dissipation. Should we endeavor for one day to put into practice only right and necessary speech, the result would be astonishing both as to knowledge gained and energy conserved. Silence is the open gateway for the voice of the soul, and only to him who knows something of its divine blessings becomes manifest the song of nature and its intimate relation with our higher qualities. The jangling of human voices—words, useless words—creates inharmony and drowns the promptings of the soul.

J. F. K.

Eternal Vigilance

"ETERNAL vigilance" was a watchword much in use amongst us in the early days, and the old reminder is timely still. It conjures up the picture of a sleeping camp, a darkened landscape that conceals a foe, and a sentinel pacing his narrow path fully aware that the lives of his comrades depend upon his watchfulness. The word "vigilance" might almost stand alone, for it includes the idea of being eternally prepared. We could not call that sentinel vigilant who allowed the enemy to approach without sounding the alarm, and yet those few moments of neglected duty may have been the only lapses in a long un-sullied course of service.

The eye that never closes is the right symbol of eternal vigilance. Many a man would be ready to undertake the great enterprise of self-mastery could he succeed by a single fierce impetuous onslaught that should once for all put the lower nature under control. But those who know tell us that only a long continued, patient effort, unreleased and sustained from moment to moment, is of any use.

Thousands of men are aware that some great surrender is demanded of them, and to satisfy the divine urge they undertake to carry out some self-devised system of rules, or else they submit to an external authority whose discipline essays to guide the minutest details of life and conduct. But the strength of the personal idea survives the great renunciation and the devotee sadly realizes that though he lies tangled in a perfect net of rules and restrictions, his task is still before him. I suppose we should be far more earnest if we realized that upon our constant watchfulness hung the issues of life and death; yet this is absolutely so. To sink our consciousness into that of the bodily gratifications, or to be carried away by some tumultuous desire is actually to die to the higher life for the time being.

It sometimes happens that after weeks of careful living we have so purified the body and the mind that it seems as though something great was about to come down into our lives and illuminate our common days. And then in some unguarded moment a shadow falls upon us before we are aware; it deepens and expands. The dark cloud of some bygone evil mood has wrapped us round and suddenly we find ourselves groping along the gloomy foot-path of the personal life once more. Through lack of vigilance we have failed to mark the first insidious approach. It is the indolence in man that makes him shirk eternal vigilance, and yet in truth it is the easier way.

A Chinese sage has told us that the path of wisdom lies in "doing difficult things when they are easy." In other words watch for the first beginnings of things and deal with them in the germ.

NIGHT

LONGFELLOW

INTO the darkness and the hush of night
 Slowly the landscape sinks, and fades away,
 And with it fade the phantoms of the day,
 The ghosts of men and things, that haunt the light.
 The crowd, the clamor, the pursuit, the fight,
 The unprofitable splendor and display,
 The agitations, and the cares that prey
 Upon our hearts, all vanish out of sight.
 The better life begins; the world no more
 Molests us; all its records we erase
 From the dull common-place book of our lives,
 That like a palimpsest is written o'er
 With trivial incidents of time and place,
 And lo! the ideal, hidden beneath, revives.—*Selected*

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question Will you please give a brief statement of the distinctive teachings of Theosophy. I was told it was a new religion, with a lot of new teachings; but I find that the main teaching is Universal Brotherhood, and that certainly is not new. Will the Forum please explain?

Answer First, it should be stated that Theosophy is not a religion, in the sense in which we speak of Christianity, Mohammedanism, Confucianism, as religions, but it is the very essence of religion itself; it is Religion, it is Science, it is Philosophy. It will be seen therefore that Theosophy is not new, although the presentation of it in this age may be and is new; and so many of the truths of life have been forgotten that when retaught to the world they appear new.

H. P. Blavatsky enumerates the chief Theosophical principles as follows: "Universal Unity and Causation; Human solidarity; the Law of Karma; Reincarnation. These," she declares, "are the four links of the golden chain which should bind humanity into one family, one Universal Brotherhood."

Now, as said by the enquirer, the teaching of Universal Brotherhood is not new. No, it is taught in all the churches, in the words of Christ and his followers; but what about the practice? And the teaching of Theosophy, at least in this day, is distinctive, that Universal Brotherhood is a *fact in nature*, and not a mere sentiment, not depending on the state of our feeling brotherly, or our being born in the same family, but because of being a part of the great human family, and that our brotherhood extends even to the birds and animals and the whole of nature.

Nor are the teachings of Karma and Reincarnation new, however strange they may sound in the ears of some. Christians who read their Bible, must know that Christ said, "With whatsoever measure ye mete it shall be measured to you again," and that Paul wrote, "Be not deceived, God is not mocked, for whatsoever a man soweth that shall he also reap." These are statements of the law of Karma, but how many Christians today act upon them, how many Christians of today act upon the other words, the positive injunctions of the Teacher whom they profess to follow? How many do deceive themselves, that the harvest will somehow be different from the sowing? Thus Theosophy is again distinctive in this, it shows the whole of life based upon this law, and that from it springs man's great opportunity to make the future what he will, to sow seeds now which shall bring in the future a harvest of joy, a harvest of wisdom and strength to help the world.

But, it may be said, the teaching of Reincarnation is certainly new. Again, the same answer may be given, viz., that it may be new to most people in this day, but let us look at a few facts. How much has our boasted education availed us when we are so ignorant of our fellow beings upon the earth, when we do not know that more than one half of the people of the earth hold this teaching as one of the great facts of existence, and govern their lives accordingly. And further how is it that Christians are so ignorant of history, and of their own religion, that they are unaware that the teaching of Reincarnation was a common belief among the Jews at the time of Christ, and is held by many of them today, and that it was even held and taught by many of the early Christians and some of the most noted of the Church Fathers, until the Council of Constantinople in the beginning of the Sixth century, at which it was declared that anyone who should teach this doctrine, "let him be

anathema." Would it not be well for thinking Christians to ask themselves, Why? Why was this doctrine, so full of hope, and affording as it does an explanation for the inequalities and seeming injustices of life, why was it forbidden to be taught and its expounders anathematized? But it is here again in the world and the "lost chord of the teachings of the Christ" has again been sounded.

Other teachings of Theosophy, which nevertheless are not new, but are distinctive in so far as it is due to the repromulgation of Theosophy by H. P. Blavatsky, William Q. Judge, and now by Katherine Tingley, that they are again made known to the world in a clear light and are being made under their guidance, actual factors in the life of the world—are: the teaching of the dual nature of man and of the innate divinity of the soul; the perfectibility of man; cyclic evolution of man and the whole of nature, and that the law of cycles rules throughout the whole universe.

All the above are simple vital teachings, but when it is considered that, as stated, Theosophy includes all religion, all philosophy, all science, it is obviously clear that its distinctive teachings cannot be even enumerated in a brief answer such as this must necessarily be. And so the enquirer is referred to our literature; and especially to *The Mysteries of the Heart Doctrine*, for a general statement of the teachings of Theosophy, and also to this publication, the NEW CENTURY PATH, for the light which Theosophy throws upon the progress of the world, upon history, archeology, social problems, and education and the welfare of the home. STUDENT

Question In the *Bhagavad Gita*, a book which I see often quoted from by Theosophists, occurs the following: "Regret nothing and cut all doubts with the sword of spiritual knowledge." How can we help regretting, and if we have done wrong, is it not right to regret it and seek to atone for it? What are the consequences of regret? Please answer.

Answer First, what does it mean to regret? On consulting *Webster's International Dictionary*, I find, under the word regret, "pain of mind on account of something done in the past, with a wish it had been different; a looking back with dissatisfaction and longing; grief; sorrow; especially a mourning on account of loss of some joy, advantage, or satisfaction." Now, what does all this imply? Does it not mean a living over again in the mind things which are past? Does it not mean an expenditure of energy on what we cannot change; and if this is so, should we not realize that such expenditure of energy is waste of energy? And does not this mean that we have less energy to give to present duty? In fact it is not uncommon, unfortunately, to meet with cases where regret has gone so far as to cause utter incapacity to fulfill the present duties of life. This surely shows the tendency and the consequences of regret.

If we have done wrong, what should be our attitude, should we not seek to atone? Certainly it is only right for us to recognize the wrong which we may have done and to seek to repair the wrong; but we have the choice of looking forward or backward; the one means hope, new energy, new opportunity; the other means loss of energy, regret, and ultimately, if indulged in, despair. What has passed is past, gone, we cannot recall it; but the present is ours, though soon it too will become the past, so let us make of it a stepping stone to higher things.

As Tennyson so beautifully puts it:

I held it truth, with him who sings
 To one clear harp in divers tones,
 That men may rise on stepping stones
 Of their dead selves, to higher things.

We cannot do this if we regret. Regret weighs us down, making it impossible to rise, it is only as we conquer it that we can mount higher.

But how, the questioner asks, can we help regretting? I recollect at a meeting in New York in the old days, a question was asked of William Q. Judge, "how to develop the intuition," and in reply he said, "Well, just develop it." And I think that in answer to the question, how can we help regretting, we may say, "Well, don't regret." Nothing can be done without trying, and at least it is worth trying. STUDENT

THE future, then, for each will come from each present moment. As we use the moment, so we shift the future up or down for good or ill; for the future being only a word for the present—not yet come—we have to see to the present more than all. If the present is full of doubt or vacillation, so will be the future; if full of confidence, calmness, hope, courage and intelligence, thus also will be the future. WILLIAM Q. JUDGE

English Notes

(By our London Correspondent)

LONDON, December 16th, 1904

I FANCY there is a growing uneasiness in the public mind as to the infallibility of our criminal system in England. Not to speak of the shock experienced through the revelations of the famous Beck case, where an innocent man was proved to have been for two years the victim of official *woodenness*—to use no harsher term; nearly every day in the papers something is said about the rough-shod fashion in which "Justice" tramples on her victims.

Side by side with this is to be noticed a keener interest in the fate of those who are or have been in prison. Today, in two separate papers, I read accounts of the organized efforts being made to help men and women immediately they leave our prisons.

Now it seems unkind to be critical of such efforts. Yet one cannot wonder that an undercurrent of despair seems to exist in the minds of those very excellent people who devote themselves to this work. There seems to be such a terrible waste of labour after all! I think that the secret of failure lies in the simple fact that those who try to help the criminal never for an instant realize how very much society (which includes themselves) is responsible for crime. If they really believed the Bible statement that we are members one of another, they would be as tender and sympathetic with the victims of our general ill-doing as they would be with, say, a broken leg of their own!

If that broken leg had a sort of free-will and consciousness of its own, the proprietor might scold it a bit for getting into trouble. Still he would never be able to ignore the feeling that it was *part of himself*, physically, and therefore, that there was no particular *act of charity* on his part to get it mended as quickly and as surely as possible.

It is the false and misleading sense of separateness that "Respectability" exhibits towards the "criminal" which explains our failure to reform the latter.

On the other hand, the Theosophist, who identifies himself with the Race, for weal or woe, has thereby a power for helping that is never the victim of a diseased social sentiment. "To assist those who are or have been in prisons to establish themselves in honorable positions in life" is just among his natural duties, and not a thing to make a fuss about. Will prison authorities in England and elsewhere give the Theosophist a chance to prove his claims? W. J.

In Europe

(From our special correspondent, December 13, 1904)

PARIS still claims attention for the various remarkable acts of "Unification" of which it is the centre.

The Scandinavian parliamentary delegates have been and gone. They had a delightful reception at the hands of their confrères in Paris, and the messages of good will that they bear home with them to the North cannot but have a lasting effect upon the welfare of Europe. For the North-folk, although standing outside the ordinary political life of today, are and have been in various ways a powerful influence in the cause of Freedom. In their ancient race originated the representative institutions of the modern world. Now they are doing much to liberate humanity from vain traditions of one kind and another.

The King and Queen of Portugal are in Paris, and the French people have entered upon a friendly competition with their English neighbors

in the matter of entertainment. Later, there may be something to report on the subject. At present the King is out *shopping*. I understand that royal personages cannot do this sort of thing in their own countries. Hence their keenness for the pastime when abroad!

Germany is still interesting the Parisians. Last week the monument to Beethoven was mentioned. This week, Wagner is creating enthusiasm. "Tristan and Isolde" was produced on Sunday at the Opera and is regarded as one of the greatest triumphs ever achieved there. Selections from other works of the Great Master were given at the Nouveau Théâtre. With such musical accompaniment Europe may well climb the hills of Peace!

There is to be the advent of *new* Italian opera in Paris sometime during the spring. According to M. Camille Saint-Saëns, Italian music is in process of rebirth. The influence of Wagner has at last triumphed over the conventions of Italian opera, and French musical thought has not been without its effects, also! That simple phrase, "Helping and sharing is what Brotherhood means," can surely have no more beautiful expression than in the blending of the Harmonies of three Great Nations!

I hear that the prize given by the members of the Goncourt Academy to the writer of the best novel of the year has been awarded to M. Léon Frappé for his work, "La Maternelle."

A last word. There is every reason to hope that a measure abolishing capital punishment in France will shortly be carried in the Chamber of Deputies. So the world *moves!*

Real Life Insurance

ON the pages of a contemporary there are three items which bear a significant relation to one another. They are: (1) an article on the decline in the ministry; (2) an article on the huge growth of insurance business; and (3) a picture, appended to the latter article, representing a city church completely eclipsed by a gigantic insurance building, which reaches nearly to the top of the spire and turns the church itself into a diminutive outhouse of the business block.

Is not this a pregnant symbol of the spirit of the times, that such ample and elaborate means for insuring the treasure that moth and rust doth corrupt should be provided, and such scanty apparatus for laying up in heaven the premiums that will insure the soul's eternal welfare? It is of no use for conventional moralists and revivalists

to try and *drive* people into the churches that already exist; what is wanted is better churches.

People do believe in money and worldly treasure, but they do not believe as they should in the reality and value of the wealth of the soul. A man with a message can always, it is universally agreed, draw huge audiences. But where is he?

We need some one who can make people realize that there *is* a soul-life, so wealthy that all else dwindles to insignificance in comparison, that is eternal where all else is transient, and that is of the here and now—not of the dim imagined futurity.

To show the reality of soul-life is the message of the Universal Brotherhood; to illustrate it practically in every sphere of human interest and activity, and prove that it is what the wisdom of the ages proclaims it to be. To cultivate the essential Life is to insure lasting riches and eternal life. This does not mean any sudden and sensational renunciation of life and retirement into spiritual seclusion, but a gradual weaning of the people away from the gross and trivial toward the refined and real essence of life. E.

Competition Has Reached Its Limit

"NO Compromise" is the word of today, and the stirring spirit of the times forces all issues and brings all tendencies to a climax. In bygone days merchants could get along on a compromise between the demands of gain and the obligations of social and moral decency; the boundary between the two was not exactly defined, but there were certain limits which were not passed. Nowadays such compromise is becoming daily more impossible. We see that the principle of making profit at the expense of others, pushed to a logical extreme, has resulted in enormities which are without parallel, beyond belief, and make us shudder.

The trouble is that the gigantic Moloch, whose burning stomach and grasping talons have been revealed to our horrified gaze, is of our own

making. He lives on the smoke of a million daily and hourly sacrifices made to him on a million altars, wherever obligation and love and honor are sacrificed to gain. Others have done on a large scale what we daily do on a small, that is all. They have profited by the advice we give our sons in youth's magazines and advertising pages; they have become pushful; they know that time is money, brains is money, magnetism is money, all is money. They have all the virtues, and, like little pussy, they will not hurt you if you do their business no harm.

There Will Be no Neutral Ground

Soon we shall all—every man, woman and child—have to ask ourselves which side we are on. There will be two great hostile camps, one of grasp, and one of fraternity. There will be no neutral ground. The great good-hearted successful business man will have to join one or the other, and give up either his principles or his methods. The great public is being educated to the truth of the fact that the whole system of competition and individualism is unsound, destructive; unsound in the nursery, the school, the market, and the forum.

There is only one solid foundation for life, that can hold up such a vast structure as our modern civilization, and that is Altruism.

STUDENT

Man Lives Eternally in His Deeds

I 'VE reared a monument, my own,
More durable than brass;
Yea, kingly pyramids of stone
In height it doth surpass.

Rain shall not sap, nor driving blast
Disturb its settled base,
Nor countless ages rolling past
Its symmetry deface.

I shall not wholly die. Some part,
Nor that a little, shall
Escape the dark Destroyer's dart,
And his grim festival.

SO sings Horace; and thus far the ode would make a fitting introduction to a final stanza on the immortality of the Soul. But the last stanza is disappointing:

For long as with his Vestals mute
Rome's Pontifex shall climb
The Capitol, my fame shall shoot
Fresh buds through future time.

Disappointing, unless it is understood that the poet lives, in more than a figurative sense, in his fame. And this must have been the thought at the back of the singer's mind, even though his skeptical views might not permit him more definite expression. It is thus that poets often voice the truth felt in the heart, making poesy the apology for an unorthodox but importunate conviction.

There is indeed a part of man that shall survive, and it is not a little part, but the essential part, in fact the Man himself.

Individuality and personality were the words used by H. P. Blavatsky to denote the vital distinction between the perishable man and the imperishable. Much of our life—perhaps in many cases most of it—consists of ideas and sentiments which are narrow, personal, and trivial. They make up the personality, which is ever changing, and cannot endure. But there are aspirations and deeds that are sublime and impersonal, and these go to make up a kind of higher personality, as it were, which lasts. It is a real eternal existence, but we cannot call it personality without investing it with some of the impure and impermanent qualities included in the meaning of that word. Hence the word Individuality has been used.

Death, from this point of view, appears as the benign purifier of undesirable elements—not the "grim destroyer."

This eternal consciousness shines like a perpetual lamp in the inner shrine of our being, but our minds are at present too weak and impure for that light to emerge into the outer courts. We are prescient of our immortality, but how could we hope to bring into the petty field of view of our mind's eye the vast memories of the Soul's eternal history?

The Soul lives on, and it is our destiny that the Mind should one day blend with the Soul, so that we become fully conscious of our immortality.

This will come about as we learn to live in noble thoughts and grand

impersonal work. Death is an hourly process; it means the killing of that private bugbear of vanity and covetousness and disquietude that we carry on our shoulders.

There is no need to worry much over exact particulars as to *post mortem* prospects and conditions. We obviously could not form a just idea or opinion of them in the present limited state of our intelligence. Illumination will come through steady culture of our immortal faculties by unselfish aspiration and work. Did not Christ so promise?

But what a sorry hash conventional religion has made of this sublime promise and teaching. May we live again in minds made better by our presence, live—

In pulses stirred to generosity,
In deeds of daring rectitude, in scorn
For miserable aims that end with self,
In thoughts sublime that pierce the night like stars.

London Fog Diminishing

LONDON fogs have been decreasing, both in duration and intensity, since 1890, though they increased up to that date. This abatement is due to the action of the County Council against factory chimneys, inflicting fines for using smoke-producing fuel or furnaces; to the increased use of gas stoves, and to better means of illumination. The railway engines, however, still continue to smoke, and the reason is not far to seek when we hear that one company, which was fined over 100 times in a year, paid £400 in fines, and saved £30,000 by using soft coal instead of hard. Also the countless household fires continue to add their cumulative effect to the smokiness of the atmosphere; for it is impossible to forbid the householder to send his smoke up his chimney or compel him to buy expensive coal. But he can be gradually educated to the advantages of patent grates.

Water-vapor condenses around minute solid particles in the air; so that these particles both increase the fog and at the same time become entangled in it and darken it. It is the peculiar combination of smokiness and a damp situation at the river mouth that makes London subject in winter to these fogs.

It is this, too, that has given rise to the strange delusion, fostered by visitors who visit London only, that England is a foggy country. STUDENT

Farming in Japan

ONLY 16 per cent of Japan consists of arable land. This is divided into very small farms, more than half of which are under two acres. Yet every farm supports a family. The Japanese is very much more economical than the American, both in his standard of living and his methods of working. Besides this he increases his income by silk and other industries, and—O American farmer—working for wages in the intervals of farm work!

No horse or ox is used and the tools are primitive; but the cultivation and fertilization are very thorough. In the warmer regions four successive crops in the year are grown, namely barley, indigo, beans and rape.

The government aids with irrigation and forestry laws, and has established experimental farms where all the sciences bearing on agriculture are studied. Thus it is able to supply the very best information as to fertilizers, pest-destroyers, selection of seeds, etc.

Sheep and swine raising, however, do not seem to suit the genius of the people, though the conditions therefor are favorable. Finally the government maintains special agricultural banks for making loans to those in need of initial capital. STUDENT

Nearing the South Magnetic Pole

CAPTAIN SCOTT, of the "Discovery," has been lecturing in England on some of the incidents of his famous voyage. The most painful and continuous of these must have been the cold. The temperature was often below minus 50, and once reached 100 degrees of frost. The great ice wall, 250 feet in height and 400 miles wide, which barred their way, is composed of many conjoined glaciers. Behind it the snow stretches upward and upward indefinitely. One of the most interesting discoveries was that of quantities of fossil plants, of such a character as to prove that in some period in the world's history these regions enjoyed a temperate climate, had contained forests, and been watered by rivers. Will it ever be found that man also was there, and attained a great height of civilization? Such at any rate is the belief of many students of Theosophy. C.

Glimpse of Early Christian Centuries

DR. GRENFELL has been lecturing picturesquely on his exploring work at Oxyrhynchus in Egypt, and his finding of the "Logia of Jesus." The labor of digging is done by 120 workmen, and every shovelful of earth has to be examined. The stream of papyri is continuous, and the rolls, which relate to all subjects, throw a flood of light on the primitive life of the early Christian centuries. One of them is a contract between a parent and a shorthand teacher, providing that there shall be no pay till the boy is proficient. Another writer desires a certificate that he has duly made certain sacrifices and libations, and thus proved himself no Christian—for there was a punitive edict in force against Christianity.

Dr. Grenfell concludes that the two sets of Logia are from the same collection, that they are genuine, and that the collection was made during the ministry of Jesus. They indicate the materials from which the Gospels were constructed and show that independent collections of sayings were in existence, much of them of a mystical character, like the fourth Gospel. For this reason he regards it as possible that John's work was composed at a much earlier date than is usually allowed to it. Such doctrines as the pre-existence of Jesus are seen to have been current during the times of that Teacher, which accounts for their presence in the writings of some of the Fathers.

One wonders whether they may not have been actual parts of the teachings of Jesus himself? STUDENT

Some Recently-Discovered Gems

FROM a report made to the United States Geological Survey we learn that remarkable green and blue beryls have been obtained in the province of Minas Geraes, Brazil. One of the green ones weighed 18 2/3 pounds, more than twice the weight of the great beryl at St. Petersburg, which is valued at \$13,000. In 1903 blue beryls were found at Rio de Janeiro. The characteristic constituent of the beryl and emerald is the rare metal glucinum.

The transparent green gem known to the ancients as smaragdus, and supposed to have included the emerald, beryl, jasper, malachite, etc., is also identified with compact green fuchsite; for the fragments of a Roman statuette of this mineral have been studied.

Much of that mineral of which so many ancient relics are made, jade or greenstone, has been discovered, chiefly in Austria, Silesia, New Guinea and New Zealand. In Laramie county, Wyoming, has been found a new and beautiful decorative stone consisting of a brilliant coating of quartz crystals over a blue or greenish-blue copper silicate.

Agate and chalcedony in pieces two to five inches long and four across, from Texas; moss-agate from Wyoming, turquoise in Mexico and New Mexico are some of the precious stones discovered on this continent: and it is interesting from an archeological point of view to note that remarkable discoveries of prehistoric jewelry have been made near Anan, in Russian Turkestan. E.

Can Humanity Be Sterilized into Happiness?

AN optimistic British physician prophesies that in another hundred years man will be able to live for a century, and that he will die suddenly and painlessly from collapse of all the organs at once, for they will wear out evenly like the parts of the "one-horse shay." All this is to come about through the prevention of all infection by the total destruction of all germs. The bacteria and bacilli will succumb to X-rays, radium, and other things which will be discovered. But supposing people do live to a hundred and have no diseases—what then? Will it be a happy world? One fancied there were other troubles incident to human life in its present conditions, troubles which often make life a burden, short as it is.

Perhaps, however, these other drawbacks—poverty, strife, crime, hatred, and so on—will yield to the influence of the sterilized bodies which we shall inhabit? Then we should have a race reformed all through by drugs and medical treatment—an absurdity, which has however occasionally been seriously entertained. A clean body would be of no use to an impure tenant; it would be such a painful misfit that he would speedily vitiate it again, thus creating again the bacteria of disease. He would refuse the treatment. Such remedies are admirable as accessories to a general reform; but they cannot minister to a mind diseased. STUDENT

THIS week's cover-page of the NEW CENTURY PATH, contains the picture of W. Q. Judge, the second Leader of the World's Theosophical Movement.

Some Views on XXth Century Problems

The Spirit of Christ

A LEADER of religious thought in Germany has been deploring the tendency of Christianity to found itself on the writings of Paul instead of the life of Christ. To him, the teachings of Paul and of Christ are wholly dissimilar. Christ preached an act; Paul a belief. "Paul could never see in man any power to awaken new moral forces in and of himself. To him it was more necessary to regard man as a spiritual wreck, with no way of salvation except through faith. . . . In Christ we find courage, joy, the consciousness of power, full health of soul. As he himself does the will of God, so he asks others to do it. In Paul, on the other hand, we find the picture of a broken-down humanity . . ."

Without undertaking the task of a defense of Paul, we may venture an opinion that his writings have never been understood by the Christian Church, and that they need the light which Theosophy alone can now throw upon them. But it is certain that between the teachings of Christ and the world that so much needed them, a dark lens was gradually interposed, and certain influences at work in the world saw to it that it only got the light of Christ through that lens. An essential pessimism as to the possibilities of human nature was inculcated in substitute for, or as a gloss on, Christ's teaching. The "miserable worm" theory developed. No one can now estimate how much of spiritual abasement of himself by man has thence resulted.

The keynote of the life of Christ was *service*. Following him meant and means a self-consecration to service. No man cometh otherwise than in that way to the "Father." The product of "Paul's" profound teaching was a partial *withdrawal* from the world of its best. For centuries some of the subtlest and most spiritualized of human intellects thus perforce absented themselves from the arenas of human life.

The situation has partially altered of late; but only partially. For though there are many admirable Christians who try to follow Christ in the right way—by service—they limit their idea of service to what is usually meant by philanthropy. That is good work; but the burden and darkness of the world will not be lifted till there are musicians who compose music *as an act of service*; poets who write, inventors who design, dramatists who produce plays, *as acts of service* and for no other reason. Nor will the highest music and poetry and art and invention ever get themselves into being till they are worked at in this way, unsoiled by ambition or selfishness. And the world's life will only reach the grandeur of its possibilities when *all* work is done in that spirit. For that is the spirit of Christ. His time was short; his day held but twenty-four hours; he could but deal with the *then* necessities of men as he found them. He could but strike the keynote—service; it is for us to apply that keynote to all the departments of modern life. To do that is strictly the aim of the Universal Brotherhood. For that reason do its departments of work multiply every year. It aims at the elevation of every kind of human activity in the spirit of the life of Christ.

STUDENT

A New Race

AFTER we have considered, and duly rejoiced at, all the blessings which science promises us, one doubt remains and increases—whether, after some short period, anybody will be alive to enjoy them. At a recent largely attended meeting of the London Medico-Legal Society, the rapid increase of the numbers of degenerates was the subject of discussion. Or rather, the *remedy* was the subject; the *fact* is too much a fact for discussion. Whereas the population of London increased between 1889 and 1903 at the rate of 12½ per cent, the increase in pauper lunacy was 50 per cent. Many of these cases, under asylum treatment "recover"; assume or resume married life, have children; relapse, and are readmitted. The record of these children is noteworthy. In nearly all cases they are degenerates, physical, mental, or moral. Those that live breed other degenerates. Dr. Rentoul's tables, read at the meeting in question, showed that taking all sorts of degenerates together, including idiots, lunatics, inebriates and epileptics, the

population contained one in five of them, and that the proportion was rising. He estimated their cost to the nation as 225 millions of dollars, annually.

Other speakers followed, accepting Dr. Rentoul's figures, and either accepting his remedy or suggesting some other. His remedy was the sterilization of the unfit; which, as it will never be adopted, we will not comment on further than to say that its serious discussion is itself a mark of degeneracy.

These figures apply of course to other countries, and even in degree to this, which, though the newest of all, runs its elders close in many evil things it might have avoided if it had stood true to its primal spirit.

The outlook seems black enough—degenerates breeding degenerates till all the population is streaked with the mark. And if the laws of heredity were what they are thought, it would indeed be obvious that our civilization was doomed.

But they are not: a new race from the old is possible. And that, among many other things, is what has been demonstrated at Katherine Tingley's schools. It is the corrective system there pursued which alone can and will save the race. Among the many children whom she has helped there are some which have shown marks of degeneracy, been stamped with the seal of bad heredity, needing a refashioning of all the elements of their make-up, physical, mental, and moral. In *no* case did benefit fail to result; in nearly *all* cases the lapse of two or three years was sufficient for a complete transformation.

And if to the possibilities thus opened up, we add those of proper *pre-natal* care—a problem almost unworked at, but of infinite promise—we do not hesitate to reiterate our view that from the midst of our race as we see it, thronged with degenerates, a new one, glorious in its ripening potentialities, may arise. That will be the work of the Universal Brotherhood. That is its promise and its real work.

H. C.

A Gospel of Death

TOLSTOY is, like Ruskin, but the half of a prophet and seer, after all. He has written a letter to the Zemstvo congress, deprecating the agitation for reform because no reform is possible except that of the individual. "It puts before the nation and before individuals the pernicious belief that social improvements can be wrought by mere change of forms."

He argues, from the condition of France, England and America, that Constitutional Government is no cure for the evils that afflict mankind. It certainly is not; but it is a cure for that enormous margin of them that lies between the condition of the Russian peasant and the countrymen of those three nations—a margin which, spread out in time, would cover some centuries.

What kind of reform would he have individuals work upon themselves? Doubtless he would say, a spiritual elevation of character. In our view, the first and final mark of spiritual elevation is *care for the welfare of others*. That virtue includes all the rest, and in no long time brings all the rest into manifestation.

It is some degree of that kind of elevation of character that Prince Mirsky and his associates have attained. They have effected the *individual* reform that Tolstoy requires; and its first manifestation is desire for the betterment of their oppressed *fellows*. They desire for them education, justice, and a free press.

Is education a good thing or not? Is it a good thing for peasants to grow up in total ignorance of the past of humanity, of the existence and condition of other nations, of the whole mechanism of society, of all humanity's teachers and workers except one?

Is it a good thing that millions of children should begin to understand with their first breath that injustice, outrage and oppression are parts of the scheme of things; that it is wrong to attempt to protect each other against them, and that only in another world is anything different to be hoped for?

And finally, is it a good thing *for evil-doers themselves* to understand that the path of cruelty and spoliation is unresistingly open to them? To all these questions, Tolstoy, by implication, answers—Yes. Does he not place his whole teaching outside the pale of serious consideration? STUDENT

Brief Glimpses of the Prehistoric World

Archeology
Paleontology
Ethnology

Who Were the Hittites?

RECENT researches are throwing new light on that mysterious ancient nation, the Hittites. Hitherto we have known of them through the Old Testament, the Egyptian inscriptions, and Assyrian and Babylonian records; but there is such a discrepancy between their characteristics as represented in the Biblical narratives and those depicted by the other sources, that archeologists have doubted whether the Bible Hittites were the same people or whether they existed at all. The Egyptians called them Khita; they were a powerful, warlike, and civilized people, whose center was between the Euphrates and the Orontes, and whose capital was Carchemish, on the Euphrates. Seti I defeated them about 1400 B. C. Rameses II defeated them, but, failing to destroy their power, afterwards entered into an alliance with them.

The Assyrians called them Khatti, and their monarchs fought and had dealings with these powerful neighbors.

This powerful and ancient race evidently played a great part in the preservation and diffusion of civilized arts, though just what link they formed in the chain of nations it is difficult to determine as yet.

But recently Hittite inscriptions have been found, and to some extent deciphered, which show the Hittites as a Shemitic race, such as they are represented to be in the Bible, rather than as a non-Shemitic race, as we gather from Egyptian pictures and accounts.

Were there then two distinct races which have been confounded, or did the Egyptians represent the Hittites anachronistically, as a mediæval painter might represent the apostles?

The Germans have worked at Senjirli, in northern Syria, the English at Jerabis and the French in other spots. The writing found is described as a pictorial script very different from known tongues. There are heads of men and animals, hands, feet, claws, birds, hares, etc.; and the relation of sign to syllable and word is a complex one. The pictorial representations of the Hittites show marked Shemitic signs—large hook nose, beards, dark eyes. The armies are shown in detail, infantry and chariots, bows and arrows, lance, club and ax. Hunting scenes, in which the lion, the deer and the hare occur, are depicted. In short, we are evidently on the threshold of interesting revelations concerning this people, which will enlarge as we learn the key to their hieroglyphics.

STUDENT

Fore-shortening History

THE various Egyptian chronologies given by modern writers yield very remarkable results if one looks at them all together. A book of some note, published in 1888, gives all that had been advanced up to 1878, beginning at 1840.

Taking for example the era of Menes, we find Champollion-Figeac giving it as 5867 B. C. This was in 1840. In 1845 we see that Böckh gives it as 5702. Henry, in 1846 names 5305, and Hincks in 1851 3895. Then, passing on to 1878 we find Strong's estimate as 2515. There are of course other writers who disturb the beauty and symmetry of the list a little, but the result is a steady nearing of the date of Menes the nearer the estimator is to our day.

One falls to calculating. In 1840 the date of that prehistoric law-giver of Egypt was 5867. By 1878, thirty-eight years, it had become 2515—a loss of eighty-eight years per annum! At the same rate of progress in "scientific" history, by 1908 it will turn out that Menes and Christ were contemporaries; and in another score (or thereabouts) of years, Menes will have moved up into the Twentieth century! One day some cruel person will write the history of "scientific" chronology, and amid the general laughter people will actually turn to the traditional records of the nations concerned, for *real* chronologies and facts.

STUDENT

The Mound-Builders

THE "Mounds" of America are at once the greatest puzzle to archeologists and the greatest vindication of the scheme of human history outlined by H. P. Blavatsky as being that which is preserved in the archaic records of the Wisdom-Religion. These structures are found in all parts of the world, and their characteristic property is their gigantic size, which has everywhere caused them to be described by tradition as the work of giants. Thus there are the stones of Carnac in Brittany, and those of Stonehenge; the menhir of Champ Dolent, which rises thirty feet above ground and sinks fifteen feet below; similar monuments in the Mediterranean Basin, in Denmark, and in Shetland; Ganggriften (tombs with corridors) in Sweden; Hünengräben (giant tombs) in Germany; Spain, Africa, Palestine, Algeria, Sardinia (Sepolture dei Giganti), Malabar, India (tombs of the Daityas and Rakshasas), Russia, Siberia, Peru, Bolivia, etc.

But it is those of America that are specially under consideration here. Brief mention was made of them in the *NEW CENTURY PATH*, Vol. III, No. 49. They are classified as burial mounds, fortifications, sacred enclosures, temple mounds, altars, animal mounds, and miscellaneous or unidentified. What cannot be classified as for burial or defense is

usually put as connected with religion or religious superstition, in accordance with the supposed limited range of intelligence of the people; and the words temple and sacred enclosure cover a large and undefined gap in our conjectures. Some of the mounds, however, cannot even be included in this loose category and are marked unidentified. The sacred enclosures are accurately circular, oval, or polygonal, and contain small geometrical mounds called altars. At Newark, Ohio, one group consists of an octagon of fifty acres, a square of twenty acres and two circles of twenty and thirty acres. These are accompanied by ditches and joined by avenues, and the whole covers over four square miles. The walls of the larger circle are still twelve feet high and fifty feet thick at the base, with an internal trench seven feet deep and thirty-five wide. The temple mounds are artificial hills varying greatly in size and shape. They may be only a few feet high and several acres in extent, or huge pyramidal structures. These latter are sometimes terraced and always have

a flat space on the top. Most remarkable are the animal mounds of some Northwestern States, chiefly Wisconsin, very low and having the forms of various animals. The snake mound in Ohio extends for 700 feet along a hill and represents a serpent swallowing an egg.

The poverty of imagination of our archeologists, and the narrowness of their view of human history, are very apparent in their conjectures as to the origin and purpose of these structures. Bones are found in many of them, and along with them kitchen utensils, necklaces and so on—the usual paraphernalia of a funeral. This proves that the places were used as sepulchres by somebody, but not that they were originally built for sepulchres. In the case of those which were evidently intended for sepulchres, however, there is an absurd disparity between the size of the tombs and that of the contained relics. This proves that the bones found therein are not those of the original tenants or builders. To quote from H. P. Blavatsky:

Because remains of "Paleolithic man" were, as it is thought, found in some of them, and because, in the funeral mounds of America, bodies of later races were discovered with the usual paraphernalia, of bone necklaces, weapons, stone and copper urns, etc., they are therefore ancient *tombs!*

But surely the two famous mounds—one in the Mississippi valley and the other in Ohio—known respectively as the "Alligator Mound" and the "Great Serpent Mound," were never meant for tombs. [CONCLUDED IN FOLLOWING ISSUE]

THOUGHTS FROM W. Q. JUDGE

JUST as the ancients taught, so does Theosophy: that the course of evolution is the drama of the soul.

It is under cyclic law, during a dark period in the history of mind, that the true philosophy disappears for a time, but the same law causes it to reappear as surely as the sun rises and the human mind is present to see it.

There is a habit of belittling the ideas of the ancients which is itself belittling to the people of today.

Peripatetics and microscopic critics may affect to see in the prevalence of universal tradition naught but evidence of the gullibility of men and their power to imitate, but the true student of human nature and life knows that the universal tradition is true and arises from the facts in the history of man.

The Trend of Twentieth Century Science

An Explanation That Does Not Explain

SOME scientists have been facing the profound problem: Why do moths fly towards the light? The ordinary person's answer will be, Because they like the light. There is a touch of something in that explanation that the scientific mind seems to be in great fear of. It ascribes consciousness to the moth, an ascription which can never be permitted.

Here is the true answer, contributed by a celebrated biologist in a California university: The light from a candle flame, striking a moth sideways, causes the muscles on that side of his body to contract. This brings his head round, so that it points to the light, which now falls equally on both sides of him. The muscles on both sides are now equally active, and so he can only fly direct towards the flame. When he gets near enough, the heat drives him away.

And all that nonsense is gravely advanced in order that the moth's action may be explained on mechanical grounds, and consciousness excluded as a factor! And it isn't excluded after all! For why should heat "drive the insect away" except that it does not like the heat? And if its *not* liking the heat is reason enough for its retreat, why should not its *liking* the light be reason enough for its advance?

The explanation is criticised by a French biologist on other grounds. He points out in the first place that light is not known to have any such action on the muscles as Dr. Loeb requires; secondly that it is not true that insects fly straight to the light, then back again, and so on through the evening till they are burned; but that they approach obliquely, make a circle or two, and then, if they have not been burned, go and do something else for awhile; and thirdly he asks why, if the explanation is true, do not insects keep flying towards the sun and moon till their wings will not beat any more?

The study of science seems to drive some minds backward rather than forward. The Greek peasant is traditionally said to have been perplexed as to what held the earth up, but he was quite satisfied when they told him that it sat on the broad shoulders of Atlas. No better than that are some of the mechanical explanations of vital phenomena which completely satisfy certain "scientific" minds.

The common man's explanation of the moth's conduct doubtless contains, if it is a little expanded, the truth. The moth feels an accession of life from the light and flies towards it to get more and more. The true problem is the relation of light and life. STUDENT

A Geological Treatise in an Egg

THAT egg which has just been loaned to the University of California, so old that it almost constitutes in itself a treatise in geology, incidentally helps to solve a point in chemistry. A prospector, it will be remembered, examining stones in the Gila river in Arizona, came across a rounded pebble 4 or 5 inches in diameter. This, on being cracked open with a pick, revealed itself to contain a fossil egg. The pebble was rounded by ages of rolling about in a river. It had fallen into the river after ages of residence on a mountain where it had formed part of the limestone of which the mountain was composed, and from whence it had been broken off by the long action of rain and ice. The mountain had once been part of the floor of some lake, inland sea, or river, and had been suddenly upheaved by some volcano or earthquake, or more slowly in the calm ways that nature also uses. But before that, the mud floor of the lake, in which the egg had been laid, had had time to harden through yet other ages into hard limestone. How many years does all that amount to?

The contents of the egg had become bitumen or asphalt, showing that animal remains are at least one source of that substance. Asphalt is the last of the series of changes in organic matter which begin with naphtha and pass through petroleum and "mineral" tar. Here and there in the world, asphalt is found in immense quantities. Thus in Trinidad there is a lake of it 100 acres in extent and of unknown depth. We cannot at present conceive of the causes that could have brought such a mass into being. Asphalt is also found in the interstices of old rocks, and oc-

asionally projects in sheets and tongues into the sea. STUDENT

The Lessons of a Fire

A RECENT fire at a small village in France was noted to have produced a very curious result. It raged for about four hours, and destroyed half of an orchard. As it occurred well in the autumn, none of the trees were in bloom. Beyond the ranges of trees that were burned were others that were only heated. It was these that displayed the phenomenon in question—apple trees, plum trees, and a lilac tree. In the course of the next month, all of them had covered themselves with new bloom. The bloom was an anticipation of that which was due the following season, a ripening of buds which would otherwise have waited in winter hiding for months. The shrivelling of the leaves in the intense heat of the fire seems to have been the stimulus; for it has recently been noticed in the South of France that lilacs, whose leaves have been destroyed by green-fly or other pests, bloom much earlier and better than any others. But the real relation of the heat to the phenomenon is not yet known. It may be that it loosens sap, or it may call out the plant's latent vitality. Gardeners have been wondering whether a short strong heating of flowering plants, in imitation of the work of this fire, might not be a better way of forcing their bloom than the ordinary hot-house method. A combination of both might do better yet. STUDENT

Microscopic Cooks

IT appears from some recent experiments in France that plants grown in an atmosphere containing an excess of Carbonic Acid come to maturity sooner, and are about 60 per cent. larger than their normal. Their bloom is richer and more abundant.

As most people know, plants seize and build their tissues up from the Carbon of the Carbonic Acid. Whether in this work they require help from microscopic intermediate forms of life is not known. None such have yet been discovered. But it is only quite recently that the bacteria which purvey nitrogen to the root fibrils of plants have become known. It seems reasonable to suppose that if intermediates are required to "cook" a plant's nitrogen for it, there should be others who do the same for carbon.

It is quite possible that some intermediary forms of life are within the plant cell, working for the cell and dwelling within it, leading their own life yet serving the plant's higher life whilst they do so. And animal cells may contain the same. Biology of the future may have to classify another kingdom of living beings, one between the lowest plant and the mineral, and yet not separated by a sharp line from either; occupying a space below the bacteria and above the crystals. STUDENT

Inebriety and Eyesight

AN American physician who has made a special study of alcoholism and of defects of eyesight, has found that the two "always" go together. As he is reported, he claims that no case of habitual inebriety which has come under his care has failed to show signs of more or less abnormal vision. The latter he regards as cause of the former, and says he finds that if the eye defect can be cured, the craving for alcohol departs.

There is no question that unsuspected abnormalities of the eye, and the slight but continuous strain resulting, are answerable for many conditions that would appear to be totally unrelated. And it is not difficult to understand that a dose of alcohol, temporarily relieving the obscure and unlocated sense of discomfort, might prove perniciously grateful enough to lead to a habit.

But to say that *all* cases of drunkenness have this cause and can be cured by its removal is surely going too far. Other organs, slightly out of gear, also give rise to vague sense of discomfort to which alcohol is equally (and equally dangerously) grateful.

And there are some unhappy temperaments in which without (so far as we know) any physical defect whatever, all sorts of narcotics are almost irresistibly attractive, an increasingly numerous class. PHYSICIAN

The Calimyrna Fig

THIS fig, like its name, owes its superior excellence to being a hybrid. In the *NEW CENTURY PATH*, Vol. vii, No. 45, it was pointed out that California fig-growers had discovered the secret of the Smyrna fig to be a small wasp which fertilizes it; and that the introduction of this wasp in California had enabled them to grow a Smyrna, or as it has been called, a Calimyrna fig. This shows the importance of attending to insects. But there is more in the mystery than this. The wasp, it appears, obtains its pollen from the wild or Capri fig. So the commercial fig is a mixed product, combining the culture of the orchard with the rough strength of the open country. Thus plants would seem to need reinforcement from the hardy wild stock, like over-civilized human beings.

The wild Capri fig has been brought over along with the wasp, and is planted among the orchard fig-trees. The California product is even an improvement on the old Smyrna fig, if a larger percentage of sugar and a

And everywhere we find interrelation, brotherhood, unity in diversity, a binding together in mutual dependence, every organism being a community of lives working together for the common good. We find myriad variations of a common plan with one law of growth, which is ever from within without.

Each organism has its center of life, from which activities proceed, and back of the visible center is the invisible, controlling, propelling life—eternal, though it may sleep for ages.

Think of grains of wheat preserved for thousands of years in Egyptian mummy wrappings and the spark of life within still vital and the minute organism, with its wondrous possibilities, still intact, needing but the damp warm soil, with the sunshine and air above, to awaken the sleeping spark of eternal life to unfoldment of root and stem with blade and flower and seed for future plants; needing but the touch of the waking life without to arouse the sleeping life within, both parts of One Great Life.

It is the living drama of the "Sleeping Beauty" locked for so many years within a castle, but wakened and liberated by the kiss of the prince royal of princes, the sun. **B.**

Cultivation of Wild Flowers and Herbs

THE "scientific culture of wild plants" sounds like a contradiction in terms, yet it is an industry that is said to offer a good opening as an employment. It seems there is a demand for wild flowers, and that some of them threaten to become extinct. They are wanted for "nature study," which, again, is a curious commentary on our times; the students pay other people to cultivate nature for them to study.

Of course this industry is more one of preserving than of cultivation, since the plants must not be allowed to develop into garden varieties. It seems a healthy and reasonable industry, though one could wish that the ideas of profit and love of nature were not so incongruously mingled in it.

The cultivation of medicinal herbs is another pursuit, which seems more sincere since it is more frankly commercial. The demand for herbal remedies is considerable, and no harm will be done if it is increased. This is an industry, too, which cannot be systematized into a slave-labor machine in which the manufacturer plays no part; for the herbs demand great expert

knowledge and personal care and each one requires different and varying treatment. It promises an occupation that would call into play many excellent qualities, and be healthy and sufficiently lucrative. But, unless carried on as Brotherhood workers would carry it on, it is certain to go the way of other industries and turn into a soulless and mechanical system. **E.**

Carnivorous Plants

CARNIVOROUS plants form a curious anomaly in the general order of Nature. That certain members of the vegetable kingdom should add to their food obtained from the ground supplies drawn from the animal kingdom seems a reversal of the ordinary course of things. These plants are numerous and belong to a variety of different families, and the means by which they capture and absorb the insect or small animal are also various. Venus' fly-trap, or *Dionaea*, is perhaps the kind most often described. The leaves shut up like the wings of a rat-trap, and are armed with tentacles at the outer edges which interlock when the trap closes. It goes off at the slightest touch of a fly, but water or wind will not affect it. It can also be fed upon meat. **STUDENT**

THE LILY POND, CENTRAL PARK, NEW YORK CITY

lacking of the slight acidity are to be considered points of excellence. **S.**

Soul in Nature

THE closer we come to nature in sympathetic study and the more we learn of her ways in all things, the more we feel the touch of a Universal Soul and see evidence of Universal Intelligence,—one common Conscious Life in all.

As we come to know more of the wondrous structure, habits, life and work of plants, we feel more their kinship to ourselves and revere that Universal Conscious Creative Life which dwells and works in all, from the tiniest microscopic cell composed of a brotherhood of still lesser lives, to the vastest system of worlds in the immensities of space. The infinitely small and the infinitely great are alike marvelous and fill us with wonder and awe. **But**

"There is nothing great or small
To the soul that maketh all;
Where it cometh all things are,
And it cometh everywhere."

Raja Yoga and the Home

WHAT is Raja Yoga and what has it to do with the home? It has everything to do with it. Raja Yoga, which is the balance of all the faculties, spiritual, intellectual and physical, where can it be better demonstrated than in the home itself? The tourists who visit Lomaland and witness the ideally perfect home life of the children on the Hill, often contrast it with the best that the world affords and always to the advantage of Raja Yoga. Yet the marvelous system is not alone the reason. As a seed cannot grow without the proper soil, so this Science of Sane and Joyful Living, which is Raja Yoga, could not express itself if the basis of the whole system were not the home life. What other environment permits, or even makes possible, so complete a balancing of all the forces and faculties, the physical, intellectual and spiritual?

It is in the home that the little child learns the gospel of cleanliness and the science of garmenting his body so that beauty and use clasp hands. He learns, too, that food should be taken for nourishment's sake, not for relish alone. And it is in the home environment that the mind can be most easily awakened, the mind that is so eager, waiting, and trustful; and here, too, in the home nest, can the soul be quickest reached and helped—the soul pushing its way upward to the sunlight.

Blessed indeed are mothers and blessed indeed is their privilege, to be the very sun in the horizon of some child's pure, opening life.

The home is not a new topic, as topics go. In fact we are almost weary of it, so much weak harping has been done on this great theme. Its greatness has been obscured by too much familiarity. It has been buried beneath a certain unconscious neglect. Homes are so common that, these days, we are fairly psychologized with the idea that the topic itself must be commonplace. Never was there a greater mistake. It is time that women awakened. Let the making of an ideal home become the passion of their lives, and to do this requires very much more than most women have to give. It requires wisdom and self-control. It requires altruism of the highest order. It requires continuity, continuity of thought and of action, for that conditions all evolution. It requires that sweet knowledge that the path of duty and the path of love are one, not two. It requires a blend of compassion and majesty, the knowledge that an ideal evolveth swiftest when garmented with love and trust. STUDENT

Serum vs. Common Sense

THE physicians of the Rockefeller Institute, after experimenting for two years with a serum for the treatment of summer complaints in children, have decided that the best cure is prevention. The doctors accordingly recommend the establishment of milk distributing stations during the summer at which poor mothers can get good milk for their children.

Coming at this time of rather unwholesome search for new serums with which to beg the question of disease, it is refreshing to note a method of treatment which goes to the root of the subject matter with scientific simplicity. As the deaths under five years of age form over one-third of the total mortality, and the majority of the fatal cases are due to digestive maladies, the importance of proper food supplies for children is at once apparent.

Among the intelligent and comfortable classes a better knowledge of infantile diet and hygiene has distinctly modified the amount of summer sickness in the young. To also provide proper food for the children of the poor and ignorant would not only be a practical charity, but a paying municipal investment. Means to lessen the prevailing amount of sickness and suffering would increase the town's immediate health and happiness and favorably influence the social future.

The cases of cholera infantum are most frequent in bottle-fed infants and originate largely in faulty milk supplies. Aside from the infants who succumb to the disease, many recover with a damaged digestive and nutritive capacity, which results in rickets or other weakness. The rachitic child is not only a source of great care and anxiety, but the defective bones are liable to establish conditions of disability which mar the child's future health and usefulness. The quality of development in the young has a marked influence upon the standard of health which is later maintained by adult growth.

Educators are also recognizing the need of better nourished bodies to obtain the best mental results among the children of the poor. The nutrition of the brain is dependent upon the physical condition and mental progress is unsatisfactory in the underfed. In connection with this the Superintendent of the New York schools recently advocated the giving, by the school authorities, of a good midday meal to school children.

The questions of pure food for the young, of successful educational results, and of the public expense of caring for the chronically diseased and disabled poor, bear a close relation to each other. LYDIA ROSS, M. D.

FROM ANCIENT EGYPTIAN HYMN TO ISIS

"THOU fillest every land with thy beauty.
Thy beams encompass all lands which thou hast made.
Thou bindest them all with thy love."

OUR YOUNG FOLK

The Art of Seeing

IN one of the few books which children in religious households were allowed to read fifty years ago (I think it was "Sandford and Mer-ton") was a chapter entitled "Eyes and No Eyes or the Art of Seeing." It related how two boys went out for a walk with their tutor, and how one of them forgot himself and observed every incident which occurred, so as to have a most interesting time. The other boy was self-absorbed, saw nothing and came home discontented and moody. Doubtless there have been many young boys and girls who read this story with profit, but there was at least one who, after reading it, resolved that he would carefully observe all that came under his notice whenever he took a walk. And surely this idea lies at the basis of much of the good which may come to us in our intercourse with nature. To forget (if only for a time) our own petty personal thoughts and interests, and to keep our eyes alert for the message which comes from all nature are what we need to learn. If we take a walk outside "the busy haunts of men," how many of us note the plants and flowers, the birds and insects, so that each one seems like a friend whose name we know? If we can believe it, all have messages for us, could we but read them. Sometimes, too, we find a new friend and it is added to the list and watched for again.

The breezes which blow, now softly with gentle caress, now masterfully, in their freedom, seem to bring us a lesson too. We know not "whence they come or whither they go," but they are part of the life of the nature which surrounds us and whether they intoxicate us with the freshness of early morning, or soothe us at sundown with the repose of evening's rest, we should miss them sorely if they ceased to visit us. The placid ocean which lies at our feet bids us ever note its calm depths, its power of conscious strength, receiving and supplying all waters of the earth, in the endless cycle of vapor and cloud and rain. The ever changing panorama of color on hill and valley, on heaped up cloud and shimmering sea, tell each its story also, if we will but learn to understand. And yet there are so many who walk with eyes downcast, always thinking about some personal happening! They are blind to the beauty which is everywhere about them. STUDENT

Phidias

Essay by a Raja Yoga girl who is a student in the Art Department of the Raja Yoga Academy.

OF all Greek sculptors Phidias is the most famous. He was the son of Charmides and was born in Athens 500 B. C. He did his greatest work at the time when Pericles was ruler of Athens. Pericles made him overseer of all the public works, and Phidias and his students built and decorated many temples and other public buildings.

He was the architect and also the sculptor of the Parthenon, all of the wonderful sculptures of that Temple being done by himself and his pupils. Phidias was also the sculptor of the wonderful statue of Athena, which was placed in the large chamber of the Parthenon. He also made the great statue of the Olympian Zeus.

Like all great teachers, Phidias was persecuted. There were some who were jealous of him and for a long time he suffered very much.

Singing-Fish

THERE is something about the water that calls forth song. The legendary sprites and sirens that lure men with beautiful music seem to be in keeping with the watery element to which they belong. Is it so strange, then, to hear that fish can sing?

Travelers have told many stories to that effect. Humboldt tells of a strange noise like the beating of drums being heard alongside the ship, which he believed came from a shoal of fish. Lieutenant John White reports that when in the Cambodia River he heard a whole chorus of sounds, some deep bass, some guttural, and some like the ringing of bells; which an interpreter told him were made by singing-fish.

At another time an explorer, while in the bay of Pailon, in the northern part of the republic of Ecuador, was startled by a strange humming in the water, which the oarsmen told him came from a fish. The humming developed into a regular concert, with tones like those of a distant church organ, and continued after sunset for several hours. Le Mosle tells of a fish with a large flat head and of a greenish color, which gives out a long, full musical tone. He describes the music as seeming to arise everywhere, around and in the boat, and as taking a very peculiar quality from the water.

Several kinds of fish emit sounds. The John Dory makes a clucking that has given it the name of "water-chicken," and the tunny is said to lift its head to cry like an infant. M.H.

RAJA YOGA BOYS ON THE SEASHORE AT LOMALAND—LOW TIDE

OPPORTUNITY

by JOHN JAMES INGALLS

MASTER of human destinies am I
Fame, love and fortune on my footsteps wait.
Cities and fields I walk; I penetrate
Deserts and seas remote, and passing by
Hovel and mart and palace—soon or late
I knock unbidden, yes, at every gate!
If sleeping, wake—-if feasting, rise before
I turn away. It is the hour of fate.
And they who follow me reach every state
Mortals desire, and conquer every foe
Save death; but those who doubt or hesitate,
Condemned to failure, penury and woe,
Seek me in vain and uselessly implore.
I answer not, and I return no more!

Facts Worth Knowing

THE Japanese have made wonderful strides in inventions. Many of their inventions have secured letters patent in Europe and in the United States.

PRINCE HARU, the son of the Mikado of Japan, is highly educated and a man of liberal views. He will be the first Japanese Emperor who received any education in public schools.

PLUTARCH tells us that Aristides, who was made General Receiver of Greece to collect the tribute which each state furnished against the barbarian, "was poor when he set about this work, but poorer when he finished it." Of how many citizens could this be said, then or now?

NEAR the site of old Nineveh ancient bells have been found, the alloy of which they were formed being three parts of copper to one of tin. The same composition is used to this day in making bells, as the tone produced by it is more musical than that of any other metal.

EVEN travelers who are merely passing through Japan today feel as if only one heart were beating in that land and that heart beats with a common purpose and a common interest. Over every house hangs a flag, and it is remarkable to see how many United States flags, too, are among the decorations.

THE United States has a longer coast line on the Pacific than any other country in the world. Its coast line is also better adapted for commercial and other interests than that of any other country. The United States is the only power in the world that has possessions on both sides of the Pacific, with convenient stopping places in between.

THE CHILDREN'S HOUR

The Raja Yoga Question Box

THE world needs great warriors and rulers to unite and civilize the people. In China there were many great warriors.

1 Who was Hwange-te?

ANSWER — Che-Hwange-te came to the throne of China in 246 B. C., when he was a boy of thirteen. He became the national hero of China. At that time the feudal lords were at war with one another, and with the king. Hwange-te subdued them all and founded the Chinese Empire. He next conquered the Tartars who had invaded China. Then he began to build the Great Wall to protect the border provinces. Hwange-te ordered good roads to be built throughout the country. These roads are used today. The emperor believed that the Chinese thought too much about the past. He ordered all the books telling the glory of the

past to be destroyed. This was the "burning of the books" described in history.

2 Who was Taitsung?

ANSWER — Taitsung the Great was a warrior king of China in the Seventh century. He saw that the Chinese army needed better discipline. He set to work to train his soldiers, and did it well. Taitsung was noted for the merciful treatment of his captives.

3 Who was Changsungchi?

ANSWER — Changsungchi was the wife of Taitsung the Great. She was famous for her talent and virtue. It was her good advice that led the Emperor Taitsung to found the Imperial Library and the great college, and to relieve the people of heavy taxes. Changsungchi was so revered and beloved that, at her death, she received honors usually paid only to the emperor.

A Lomaland Parliament of Birds

"WHY cannot human beings sing?" chirped the Linnet.
 "Because they have lost their wings," sang the Swallow.
 "Imagine us without wings, unable to fly in the sweet, blue sky, to float on the breeze, to soar and soar! Imagine us without wings—could we sing?"
 "Oh, don't!" wailed the birds, covering their little heads with their wings and almost weeping.

"Imagine," continued the Swallow, relentlessly, "Imagine us unable to fly, doomed to hop forever on the cold, hard ground, a prey to every cat—to every enemy. How could we sing?"

"We couldn't," sobbed the birds. "Neither can human beings, for since they lost their wings they, too, are a prey to every enemy."

The flat rocks, half way between the Raja Yoga Academy and Ocean Bay, were on the twenty-first of December, 1904, literally alive with birds of all sorts and sizes—Pelicans, Sea Gulls, Thrushes, Larks, Quail, Bluebirds, Linnets, Orioles, Humming-birds, Robins, Canaries, and many others, who had assembled from all parts of the surrounding country for the meeting of their Parliament. And when

I arrived (by special invitation, being a correspondent of the Children's Page in the NEW CENTURY PATH) the birds had already settled their own affairs, for social economy in the bird-world is based on law and order.

"Now in their Parliaments," said a Robin-red-breast, with ruffled feathers, taking up the thread of the discourse, "human beings never begin to get to the end of their problems. They have come to think they can't. Their little ones go on shivering for want of sufficient feathers"—"Clothes," corrected an Owl—

"And many have not enough crumbs, and many are sick, and many are sorry. And all because human beings have lost their wings."

"But did they ever have wings?" queried a skeptical sparrow.

"Long ago, in what they call their Golden Age, they had wings," explained a sweet-voiced Dove, "or rather what in human beings correspond to our wings. Their wings were in their hearts. They called their wings 'love.' And love did for them what our wings do for us. It bore them aloft into highest heaven, out of reach of all their enemies, making them free and joyous!"

"The children in Lomaland can sing," exclaimed a chorus of birds. "We hear them every day, and they sing just as we do!"

"That is because Raja Yoga has given them back their wings," re-

joined a wise little Thrush, "so that the joy of their lives is to help others without ceasing."

"What is Raja Yoga?" inquired a Bluebird, who had only lately arrived from a distance.

"Listen," replied a Lark, and with that he rose into the air, higher, ever higher, flooding sky and ocean with the divine rapture of his song! "Raja Yoga!" he seemed to sing. "Raja Yoga! Raja Yoga! Raja Yoga! Raja Yoga!"

M. V. H.

In a Fish Hospital

DEAR CHILDREN: I was in one of the queerest places the other day,—a hospital. Now, "hospital" is a rather sad word. It always makes us think of bandages, iodoform, crutches and similar things; but this hospital was the pleasantest place you could imagine and the patients were having a perfectly splendid time. They were swimming about in big glass tanks. A new kind of medical treatment? Yes, and a new kind of patients. It was a fish hospital. Of course, fish sometimes are sick just as humans are and one kind man decided that they ought to be taken care of and helped to get well, so he studied them and has brought many of them through serious illnesses. Sometimes fish have accidents, for they do not always know about Brotherhood. I saw one which had gotten into serious difficulty by fighting with his brother. Both were surgeon fish and both were wounded. Another bumped his nose badly because he was so greedy. He hurried to get his dinner before it was his turn and he had to be doctored just as a little child would be who had tumbled down and hurt his head!

I learned one curious fact there, too, and that is that one great secret of cure is changing the environment of the fishes. Salt water fish which are ill this wise man places in fresh water and it is surprising what the change does for them. On the other hand, ailing fresh water fish, such as white fish and trout, are placed in big tanks of salt water and there they swim and swim and get well without any medicine at all. They are the happiest little patients I ever saw and the hospital is, I do believe, the most attractive in the world,

with its cool, clear water, the long leaved, handsome water-plants and the exquisite bright anemones here and there.

UNCLE FRED

DEAR CHILDREN:—I read about the Bower-bird in the last "Children's Hour." I saw one once. I was passing a big tree and thought an army of cats must be near by, when suddenly I discovered that all the sounds came from one little Bower-bird. At another time I thought some one was sawing wood, and again it was only a Bower-bird. B.

A CORNER OF THE RECREATION GROUNDS OF THE RAJA YOGA ACADEMY AT POINT LOMA

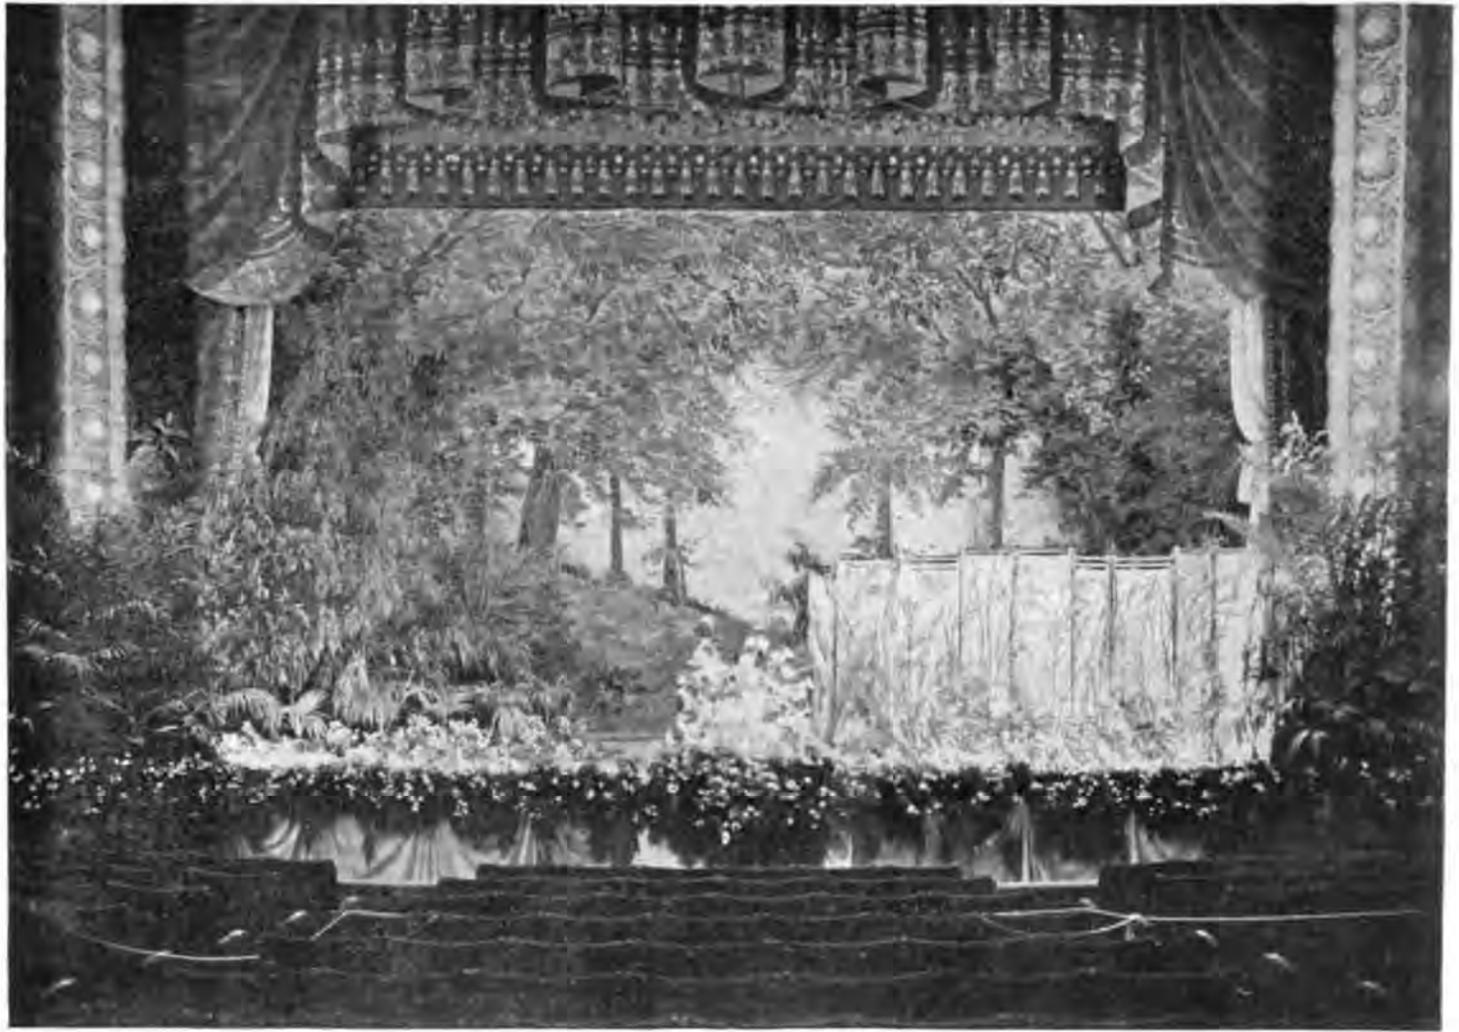

THE ROSE'S CUP

DOWN in a garden olden,---
 Just where, I do not know,---
 A buttercup all golden
 Chanced near a rose to grow;
 And every morning early,
 Before the birds were up,
 A tiny dewdrop pearly
 Fell in this little cup.

This was the drink of water
 The rose had every day;
 But no one yet has caught her
 While drinking in this way.
 Surely, it is no treason
 To say she drinks so yet,
 For that may be the reason
 Her lips with dew are wet.—Selected

LOMALAND STUDENTS AT ISIS THEATRE

THE meeting at Isis Theatre last Sunday evening, conducted by students from Point Loma, was one of unusual interest. Besides the musical program, rendered by students of the Point Loma Conservatory of Music, there were two interesting papers read.

The first paper of the evening was by Miss Edith White, and entitled: "Women and the Higher Criticism." After discussing the important part women occupy in the religious thought of every age, the speaker said: "What of the new religion? Learned doctors of divinity, speaking of the Christian religion, and the effects upon it of the higher criticism and of the teachings of modern science, state that the position to which the Christian religion is entitled, can only be achieved if it can be rid of the extraneous growths that obscure the truths at its heart and be restored once more to its primitive form. Only thus, they tell us, can Christianity hope to be brought in touch with the culture of the age. There has been one and that one is H. P. Blavatsky, who has brought the Christian teachings not only in touch with the culture of this age, but of the ages. In her writings she has performed for the Christian teachings the constructive criticism of showing them in their relation to the Theosophia, the divine wisdom, that is the foundation of every religion, and is manifested in the successive religions of the world. She has shown how superstition and theories evolved in the brain minds of men have gradually been added to the pure teachings of Christ. In her works is the key to the symbolic teachings of all the sacred books in the world, the key the Christians will have to find and use in order to obtain from the teachings of Christ the science of life they contain.

"H. P. Blavatsky not only rescued the Christian Bible, but she founded the movement that holds for the world the new religion. The keynote struck by her life and work will throb and swell in the hearts of humanity until the bonds of superstition and dogma have burst, and humanity steps forth into the light of the new religion which fears no criticism for it is Truth itself, and no scientific research, for it is science and religion in one."

Dr. Herbert Coryn read an exceedingly interesting paper on "California and the Orient." In part he said: "Westward the march of em-

pire takes its way.' Have we fully considered how true that is, and the consequences of its truth? The curtain of history rises on the great empires of Western Asia, the Assyrian, Babylonian, Phœnician, Medo-Persian and Egyptian. Then a move westward. Greece arose, and under Alexander of Macedonia the Persian glory was extinguished. Still further westward. Rome takes the sceptre from the hand of Greece. The mighty Roman Empire came gradually into being. As gradually it broke to pieces. The great republics of Italy, Florence and Venice arose; there was the German Empire. The steady westering reached the very west of Europe, Spain, France, and England. The current, still westering, pushed across the Atlantic. Then America arose on her own account. New England became established. The current continued to push west, now very fast. Fifty years ago its first thrills touched this State. California awoke. Nor is it stopping; witness Alaska, and the Philippines now in American hands.

"The current has now nearly circled the entire globe. On one side of the Pacific is the beacon light of California; on the other, that of Japan; the beginning and the end of the great journey, the earliest and the latest lights. Has it now no significance for us that the light of Japan has suddenly blazed up in such heroic splendor? A great cycle in human history is now completing itself, full of unimaginable possibilities. What kind of a civilization are we going to make here?

"Does it not seem as if there were two countries, the beginning and the end of the great march, California and Japan, preparing to be the field of a new trial? Two lands that are the termini of a now sunken continent that once bridged the Pacific.

"Now it is possible for us to see in part why the Universal Brotherhood made its headquarters at Point Loma in California, and what it is doing. Let us daily try to feel in our hearts the swift rising of the tide of new life, bearing promise of so grand a future. Swift surely, for in fifty years we have summed up 2000, and the pace increases. We ourselves shall live to see the new thing. And let us try daily and vigilantly to keep from our minds all the clouds, all the bitternesses and quarrels and failings which alone can dim our view, our hopes, and our certainties."

Art Music Literature and the Drama

Art and the Automobile

THE distinguished London artist, Professor von Herkomer, boldly declares that he finds beauty in the latest types of automobiles, and to encourage their development he is making a trophy of bronze, enamel and silver for the winner of the next International contest. This sounds curious, but if we consider the graceful form into which the bicycle has evolved, it seems possible that the automobile may soon arrive at the beauty inherent in perfect fitness.

Machinery and machine-made goods, steel-frame buildings, steel bridges and steamships, electric cars and automobiles, have come to stay; flying machines are "in the air," and lovers of the beautiful, instead of cursing fate, must frankly accept the new conditions, meanwhile demanding that the æsthetic claims be not overlooked.

We are not able to conceive of beauty in the abstract, but the beauty evoked by perfect fitness is the first step attainable. There is no reason why automobiles or steamships should not display as much nobility of form, within their limits, as the antique chariot or a Cremona violin. The picturesque armor, chariots, weapons and utensils of former periods were the natural outcome, in artistic ages, of the satisfactory meeting of practical needs. Dress too, in the best periods, was designed primarily for use, and did not depend for its beauty upon needless appendages or embroideries. In the great buildings of antiquity, and most of the Gothic structures, suitability for the end in view was the first consideration, the decoration never being "stuck on" to fill up uncomfortable blanks, but being judiciously used as auxiliary to the main design.

Each new invention for the utilization of some force in nature, should, when perfected, be beautiful, i. e., harmonious with other things, for all nature's forces are manifestations of one basic force: a Unity.

The finest example of pure beauty of man's evoking, arising solely out of the intelligent control of the elements, and totally irrespective of artistic aim, is found in a boat. Ruskin, in one of his eloquent passages says:

But one object there is still, which I never pass by without the renewed wonder of childhood, and that is the bow of a boat. . . . I know nothing else that man does which is perfect, but that. All his other things have some sign of weakness, affectation, or ignorance about them. They are over-finished or underfinished, they do not quite answer their end or they show a mean vanity in answering it too well. But the boat's bow is naively perfect. The man who made it knew not he was making anything beautiful, as he bent its planks into those mysterious, ever changing curves. It grows under his hand like the image of a sea-shell, the seal, as it were, of the flowing of the great tides of ocean stamped on its delicate rounding.

There is a false ideal of beauty characteristic of this age, which is the love of neatness or mechanical finish for its own sake. It is easily attained without much thought and needs no feeling. It resembles outward semblance of respectability concealing an aimless, narrow and selfish life. We have a constant example of this perverted ideal in our coinage, entirely respectable, irreproachably "correct," mechanically perfect, but—soulless. Compare a modern coin with an antique, what a contrast, a revelation! The ancient one is rich and boldly simple, unconventional, the lettering freely treated as a part of the design, and the whole showing that the artist had feeling for the essential, and, moreover, that the spirit of the age demanded truly artistic work; while ours, unhappily, is indifferent to it, losing the substance for the shadow.

At the same time we have to avoid the extreme of a forced quaintness, an artificial carelessness, an imitation of spontaneous work. Beauty is truly from the soul and cannot be reasoned about. It cannot be put into anything, but we may hope that without straining for it, without self-

conscious analysis, but by steady improvement in methods of living, and by keeping the higher ideals of conduct active, an atmosphere will be evolved in which art will no longer be a curious exotic, foreign to the "man in the street," but a part of his daily life, as it was in Greece and as it is in Japan today. A higher art-life than the world has yet seen will be the outcome of the triumph of Universal Brotherhood in daily life.

IDRONE

THE death, in Chicago, of Theodore Thomas has brought to the attention of musical America as well as musical Europe the career of a most remarkable man. More than any other one person, Theodore Thomas educated the general American public to understand and like classical music, and he was practically the creator of the orchestra in America. He believed that certain classical compositions had especial value in educating musical taste and he used these, as it were, as keys to unlock to the public unusual musical resources.

Among the compositions most frequently presented by the great Chicago Orchestra, under Thomas' leadership, were Beethoven's *Fifth Symphony*; Liszt's *Les Preludes*; Mozart's *C Major Symphony*; Schubert's *Unfinished Symphony*; the second movement from Beethoven's *Second Symphony*; Saint-Saëns' *Symphonic Poems*; and, of course, many selections from Wagner's music, such as the *Vorspiel* of the *Meistersinger*, and the *Ride of the Valkyries*.

Beyond a doubt, Thomas was one of our greatest modern interpreters of Beethoven's orchestral works, possibly, also, of Wagner's. Recently he added to the repertory of his orchestra Richard Strauss' *Death and Transfiguration*. His death is almost an irreparable loss to the musical world, for a rare sincerity and simplicity marked his life. No consideration was strong enough to make him deviate from what he felt to be the highest musical ideals.

It is not generally known that Theodore Thomas was born in Hanover, Germany; that he received his first musical instruction from his father who was a violinist and that at the age of ten years he came with his parents to the United States as a professional violin soloist. Before his thirtieth year he had inaugurated a series of orchestral concerts beginning what proved to be his real life work. His work was in many respects a revelation.

STUDENT

PORTRAIT OF HIMSELF BY VANDYCK

NO one could tell me where my soul might be.
I searched for God, but God eluded me.
I sought my Brother out, and found all three.
— Selected

In Tune With Nature

SITUATED on a promontory south of the Raja Yoga Academy, in Lomaland, is a little bungalow house, used by one of the music students for a practice and study-room. A more ideal spot than this, with its view of rugged cañons and vast expanse of ocean, could scarcely be imagined, especially to one who believes in the native touch in music.

A curious fact in connection with the interior of this room is that in certain conditions of wind and tide (most noticeable when the ocean is quite active), the column of air inside the building picks up two partials or over-tones, from the "ground tone" of the ocean, so that very often the tones of middle C, and its fifth above, G, are distinctly audible. R.

THE theatre is one of the most important of Japanese institutions. It is not unusual for plays to begin at four in the afternoon and last almost without interruption until midnight. The orchestra plays an important part in Japanese drama. It consists of the *samisen*, which is a sort of guitar having three strings; the *fue*, or flute, and the *taiko*, a kind of drum. The Japanese orchestra plays, like the ancient Greek chorus, during the scene, and its purpose is not, as with us, to divert the spectators during the intermissions between acts, but to accompany and explain the drama itself. Japanese dramas are largely historical. The fact is not without interest that last year an adapted translation of "Othello" was put on the Japanese stage and was well received. STUDENT

WHEN THE WESTERN SUN CASTS A SHEEN OF GLORY ON SEA AND SKY AT LOMALAND

A Craze of the Day

IT is dreadful to think how the holy teachings of Buddhism and other religions can be perverted, and the perversions used to promote the cause of the trade in human vanity and petty selfishness. Fortunately, however, the vanity and ignorance of the dupes and the cynical effrontery of the charlatan are so great that the whole business speedily damns itself by its own vulgarity.

We read in the papers of yet another of those oleaginous and plausible "swamis," who are sent over here to collect dollars from the plentiful crop of gullibles in this country, but this time he is a "Buddhist" and his lingo is purloined from Buddhist Scriptures. There were too many Brahmins in the field perhaps, and Buddhism was a more fashionable word just now.

Buddha taught that love of self and vanity must be overcome first, as they are the great causes of human woe and the foes to happiness. But this individual lets you off all that. You may keep your selfishness, you may have your vanity for a mainspring, and use the other teachings as feeders to it.

Learn to concentrate. This is what concentration does for you. It clears your mind. It improves your voice and your speech. It makes you fascinating. It makes you clear-eyed and beautiful. It takes away all the twitchery and nervousness for which women, and particularly American women, are remarkable.

It makes you calm and pretty, sweet and delightful, and it kills all wrong desire.

The only difference we can see between this and other kinds of concentration is that it is not sold in bottles but in lessons.

New York women constitute Mr. —'s disciples—men are not mentioned—and he prefers dark-eyed ones because he can make their eyes sparkle. His chief recommendation is his remarkable gaze—fascinating, and he is of course good-looking.

Red is the color he recommends for furnishings because it is warm and makes you "feel good." Blue, white and yellow he has no use for.

And his teachings? Any one can guess them, they are monotonously similar to the usual rigmarole:

Learn that it is easy to be good. . . . Learn to concentrate. . . .
Take a crystal and suspend it in front of your face. Fasten your eyes upon it and think. Think of nothing else but this one crystal. . . . Let it fill your mind full. That is concentration.

And much is thrown in about love and sympathy and cheerfulness. Some of it reads just like a patent medicine advertisement:

If you feel savage, ugly, cross, unreasonable.
If you do not enjoy life and your food.
If your head aches and you feel ill in body.

"Send for a trial bottle at once!" we add.

Buddha taught the path of emancipation from the wheel of human passions and desires, by following which men may achieve the real Life, which is loving service and freedom from the cares of self. But he did

not offer to make society women fascinating, nor did he say that his path was so easy as to require no effort. He did not recommend sending in your horoscope and photo, or sitting down with a swami and fixing your mind on his crystal. Such practices are useless and dangerous. They can at best feed the already overgrown vanity, and invariably intensify and aggravate the nervous diseases and habits to which people—and "especially American women" are so liable.

And what will be the result? Most of the fools no doubt, will speedily tire of the fad and turn to another; a few will receive lasting nervous or mental injury; the swami will go back with his dollars to the still fatter and slier swamis who employ him. The sacred names will have been dragged in the mud; but luckily things have gone so far that there is no longer sufficient plausibility in these concerns to fool any one who is sane enough to discriminate between what is good and useful for him and what is idiotic and pernicious in its influence. H. T. E.

The European Crusade

WHEREVER the seeds of Theosophical teachings have been sown, there they have taken root. These seeds have been broadcast over the earth. To-day, therefore, a demand is plainly apparent everywhere for further knowledge on the subject of Theosophy.

The month of January marks an important event in our Theosophical history. On the 12th of this month begins an European Crusade for special Theosophical work, conducted by Herbert Crooke, President of the Universal Brotherhood and Theosophical Society in England, and Frederick J. Dick, Director of one of our branches in Dublin, Ireland.

These two faithful Comrades will tour England, visiting many of the centers there, giving public lectures, etc., after which they will go to Germany, Holland, and through Denmark to Sweden, carrying their message of hope, not only to members of our great organization, but also to those who are earnestly striving for the knowledge that is necessary to make human life valuable and helpful.

Helpers sent out for this special kind of work must of necessity be well informed as to the fundamental teachings of Theosophy. Moreover, they must have the discrimination to adapt these teachings to the conditions of each country they visit. Were this not so, little could be accomplished in a short stay in any one of the cities where they go.

This crusade work of 1905 will open a more extensive field for an enlargement of the different Theosophical activities of our movement. One of the most important of these will be the establishment of Raja Yoga Schools in different places. Through this special line of work homes will be reached and new life infused into the people.

To Members of The Universal Brotherhood Organization Throughout the World: Your attention is called to your yearly dues, payable January 1st., 1905. These should be addressed to E. A. NERESHEIMER, Treasurer of The Universal Brotherhood Organization, Point Loma, California.
F. M. PIERCE, Secretary General

THE SONG OF THE BRAVE SOUL

by KATHLEEN A. BALBERNIE (age 15 years)

“RISE!” saith the soul, “be stirring in the morning!
The sun is risen high---the day is young---
Life is a song! A song of hope---or warning---
Ye make and mar the music ye have sung.”

“Fight!” saith the soul, “where there be wrong and sorrow
Bring right and truth---O ye whom God hath made---
Today is sure, though dim the unknown morrow;
Life is a sword---but sheathing rusts the blade!”

“Ah, have ye wept the tears of a heart’s grieving?
Have ye come face to face with bitter pain?
Hope on---Hope on! And be ye strong, believing
There is some hidden cad, no grief is vain.”

“The earth is fair in blossom, hill and meadow;---
So ye are true and pure, in joy or strife,
What need to fear the misty realm of shadow
That men call Death---which is the gate of Life.”

17th October, 1904

Practical Theosophy

TO any person of common-sense, acquainted at the present day with the Theosophical movement, it must be apparent that Theosophical work can be divided into two classes: One, dreamy, theorizing and impractical, whose sole aim seems to be the dissemination of literature bearing upon the wonderful and uncanny in life; and the other, a healthy, active and practical working body, trying to carry into every-day life the high ideals of true Theosophy.

Now, what does practical Theosophy consist of? Does the mere writing and lecturing on even practical Theosophical subjects make Theosophy practical? It is true that we must have the theoretical as well as the practical, but it is better to be without the first than to neglect the latter. The better way is to prove our theories correct by living up to them, by making them a living power in our lives. This is the only practical Theosophy.

What value is all the knowledge of the world, if it is unapplied in our daily life? Of what value are our grand and ennobling words if our listeners know that we are making no endeavor to carry them out ourselves? How can one expect to enlighten the world, until he himself is enlightened?

The greatest educational factor we have is the power of example. Mankind as a whole is influenced to a tremendous degree by the examples held up before them, modeling themselves unconsciously to conform to those that they find the strongest in power to influence. If the example is good, the influence is good; if bad, the effect is bad.

Now what appeals to humanity the strongest is something practical. This is a practical age, people are too busy to talk, they are too busy to listen; they are too busy to wrestle with volumes of metaphysical philosophizing in order to obtain a possible kernel of practical worth. They can, however, be reached by an object lesson such as is presented at Point Loma, an object lesson that needs no words to describe it, one that can be understood and appreciated by anyone, because it is a practical fact.

So whatever we do to reach the heart of mankind, the first thing to remember is that our work will be gauged by its practical ability to do what is claimed for it.

We have claimed much for Theosophy; we have talked and talked, written and written, read and read, theory has had its opportunity, and it must now make way for the practical.

But a word of caution: let us not in our enthusiasm fly too much to the other extreme. That tendency is always present. A more impractical person cannot be found than some of those enthusiasts who are so fond of calling themselves “practical workers”; for they go too far and let

their enthusiasm get so far ahead of the possibilities of the day, that their work becomes more of a hindrance. Let us always keep before our minds the needs of the day. What humanity needs now—not what it will need a century hence.

Let us remember that in our work, in every word, action, or thought, we must think of the result on a mind who may not think exactly as we do, a mind, who on account of the position we place ourselves in, will naturally be a critical one.

If we do this we are well on the road to make Theosophy a practical power in the lives of the world. T.

Compassion

Compassion is no attribute. It is the LAW of LAWS—eternal harmony, Alaya’s SELF; a shoreless universal essence, the light of everlasting right, and fitness of all things, the law of Love eternal. —Voice of the Silence

COMPASSION is the very essence of the Divine Life in all, and the more we realize in ourselves our divine nature and the more it rules in us, the more compassion we shall have.

To form the habit of thinking of ourselves as one with all beings, as bound together by the same indwelling Divine Life, whether veiled and clouded or shining like the noonday sun, is to open the way for compassion to dwell in our hearts and rule in our lives. How can we be uncharitable or unkind to any one or anything when we realize that we are doing this to the Divine Self of the world. Jesus, speaking as the Christ, recognized this unity when he said, “Inasmuch as ye have done it unto one of the least of these my brethren, ye have done it unto me.”

It is because we dwell too much on the separateness and too little on the unity of all life that we are so often without compassion. Separateness, which is the root of selfishness, is the great heresy, and we need to rid ourselves so thoroughly of this heresy that it shall no longer affect our thoughts, feelings and actions towards others.

We are not to suppose, however, that to act with compassion toward another is always to do what will be gratifying to the personality. Such action might be the farthest removed from true compassion, because gratification of the personal desires and likings might only serve to strengthen the bondage already imposed upon the soul. Such kindly action as would help to break the bonds already existing would be the most compassionate.

So compassion is more than sentimentality, it is as said, “the light of everlasting right and fitness of all things.” It can never then conflict with the highest justice, and therefore the exercise of compassion may imply giving pain.

At first sight, to the one whom we desire to help, it may often seem that this is not compassion, but we know that the wise physician does not hesitate to perform a painful operation when he knows it means the saving of a life. He looks beyond the pain and can see the joy of increased health and usefulness. And we have a key to the exercise of true compassion; it must come from the heart and its aim is not an immediate release from sorrow and pain, but the eternal welfare of the real man, the soul. But it does not disregard even the smallest sorrow or the slightest pain, it feels and suffers with the one suffering and seeks to give strength to bear the suffering and learn the meaning of the lesson of pain.

There is no greater need in the world today than for compassion, for the true heart life, which, feeling for and suffering with all who suffer, yet does not fear to point out the evil in humanity and in the individual life. A truly compassionate man or woman is no weakling, but firm and strong, self-conquered and therefore able to help others to attain to the same state. STUDENT

The Great Man

THE great man does, in good truth, belong to his own age; nay, more so than any other man; being properly the synopsis and epitome of such age with its interests and influences; but belongs likewise to all ages, otherwise he is not great.

What was transitory in him passes away; and an immortal part remains, the significance of which is in strict speech inexhaustible,—as that of every real object is. Aloft, conspicuous, on his enduring basis, he stands there, serene, unaltering; silently addresses to every new generation a new lesson and monition. Well is his life worth writing,—worth interpreting. THOMAS CARLYLE (Biographical Essays)

WHENCE ALL PROCEEDETH

SIR WILLIAM JONES

THE heavens are a point from the pen of His perfection;
 The world is a rosebud from the bower of His beauty;
 The sun is a spark from the light of His wisdom;
 And the sky a bubble on the sea of His power.
 His beauty is free from stain of sin,
 Hidden in a veil of thick darkness.
 He formed mirrors of the atoms of the world,
 And He cast a reflection from his own face on every atom!
 To thy clear-seeing eye whatsoever is fair
 When thou regardest it aright, is a reflection from His face.

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question I have been reading some Theosophical literature and much appeals to me as being very beautiful, and as giving an entirely new meaning to life; but—how do you know that it is true?

Answer How can we judge of anything being true? There appear to be two ways, in general, in which we may know what is true; 1st, by an interior perception of the truth, without experience, and 2nd, by a perception of the truth based on experience. The former faculty is latent in all, but through education and the false standards of life to which we have all, more or less, given adherence for so long, it has become practically inoperative. We do, however, find it active to some extent in children. Who that has had the inestimable privilege of being associated with children, has not remarked instances of their direct perception of truth, without any process of reasoning or experience, and to such degree that it is impossible to shake them out of their position? How often will not children judge accurately the character of a person whom they meet for the first time, when their elders are deceived by appearances or by fair words? In most of us, however, who are grown, this faculty has become atrophied, and so we require to reason about things or to have direct experience of them before we are willing to admit their truth.

Let us for a moment look at the statement made in the question, viz., that "much of Theosophical literature appeals to me as being very beautiful and as giving an entirely new meaning to life." Just so far as this statement is made in absolute sincerity, just so far is it evidence of the truth of Theosophy, and the questioner to that extent can answer his own question, as to how Theosophy may be known to be true. And this is nothing more than less than a step towards the realization of the teaching of Christ, that whosoever will do the will of the Father shall know of the doctrine, or, live the life and you shall know the truth. We need an entirely new standard of truth; too long have we relied on the mind alone, and on our faulty methods of reasoning; we need to learn that the only test of truth is the life and the heart. Taking this as a basis, then the mind may be used as an aid in the full perception of truth, and so the following may be a help to enquirers. Before we go on, however, let it be thoroughly understood that whoever desires really to know the truth of Theosophy must endeavor to make his life conform to it, and actually to live it. The following, therefore, are only aids, and do not of themselves constitute proof.

An examination, impartial and openminded, of the teachings of Theosophy, reveals this fact, that they give a rational basis for our life and experiences; that they give a satisfactory explanation for the inequalities and seeming injustices of life; that they present before man a destiny and a future which satisfy alike the reason and the heart, and show how man may with certainty attain this future. They explain to man his own nature with all its complexities, and his relation to the rest of humanity and to the whole of Nature and the universe. They give a key to the mysteries of life and death, of good and evil, and provide an unerring basis for morals and right action.

But finally, it may be said to those who desire to know whether Theosophy is true, study and read, by all means, but the realization of its truth will come in no other way than by living it. And if you really desire to know about Theosophy, it will not be necessary to tell you this, for you will already have begun to try it.

STUDENT

Question If the purpose of Reincarnation be for the development of the Ego, or for punishment of sins committed in a former incarnation, why should there be so many infants who die after living only a few days or

weeks? Surely they have no opportunity to advance, nor do they suffer in many cases.

Answer A similar question was answered in the Forum a short time ago, but we here take the opportunity of quoting from W. Q. Judge on this same question. He said:

Mysteries will deepen for the questioner if he lays down definitely that any one statement of a part of a Theosophical doctrine is necessarily the whole doctrine. In the question it is assumed we are incarnated only for better development or for punishment, whereas this is only a partial view of the matter. We are reincarnated as a result of causes set in motion. Thus we may be here for reward, or punishment, or by choice, or merely to work again, or for punishment or discipline, or for a thousand purposes. The race evolution compels us to reincarnate, and we do so according to law. Looked at from the side of the parents, the birth and early death of the infant are at once a pleasure, a discipline, and a punishment. If the loss is properly accepted, then discipline results; if rebelled against then only punishment is felt; the pleasure and reward came with the child's birth, and though soon the cause of that pleasure disappeared, its possible effect on father and mother was not destroyed. Then, again, the Ego that attempted to begin life in that family only quickly to fall out of it may have either made a short step toward better environment than it had before, or escaped from a family where nothing save obstacles and evils would have surrounded it. By such reflections as these the difficulties of the question will be made plain.

Perhaps the best answer to the question, as to the purpose of Incarnation and Reincarnation, is that it is for the purposes of the soul, and the soul's evolution and growth. To understand the meaning and purposes of life we must endeavor to rise above the narrow limits of our personal concerns and try to realize something of our relations with the rest of humanity as a whole, and realize, too, something of the nature of the soul.

Regarding the question of infant mortality, is not perhaps one of the great reasons for this the fact that we do not provide the best conditions for the soul's Reincarnation? And this does not only apply to parents, though to them especially, but to all alike, for we all have a share in making the conditions of life as they are, and we are therefore responsible and accountable even to the unborn for those conditions. And as Katherine Tingley has said, "we have a great responsibility in righting them."

STUDENT

Question How to study Theosophy?

Answer Theosophy is defined by William Q. Judge as an "ocean of divine knowledge," and as such it can be navigated only by divine beings to depths varying in proportion to the intensity of the divine spark illuminating such beings. Even the most ordinary of men have some of the divine within them, and to the extent that they feed this spark of divinity do they contact divine knowledge or Theosophy. It is in this way that Theosophy must be studied.

It is one thing to study the essence of the fruit, and quite another thing to consider only the rind. It is within the power of the spiritually depraved, the moral lepers of the race, to attain to a degree of intellectual knowledge, but it is impossible for them to attain true Wisdom, or for anyone to know, understand, and practically apply Theosophy, unless the heart center is also active. This involves a constant purifying of the heart and constant altruistic effort, and only the fearless warrior who fights for man's liberation can attain the final goal.

It is one of the time-honored precepts that the learner can climb to the temple of divine Wisdom only by "a clean life, an open mind, a pure heart, an unveiled spiritual perception, a readiness to give and receive advice and instruction, and a constant eye to the ideal of human progression and perfection." Thus is indicated the need of cultivating all the pure and moral faculties in man, and excluding even the most refined and well-trained intellect that is not illumined from the heart.

The light must ever be kept burning in the heart, the mind must be aflame in response to the heart-light, and the hands ever ready to perform the most trivial service that presents itself in the line of duty. Thus illumined and alert one can really study Divine Wisdom—Theosophy—and the time and place of beginning are here and now.

The key to it all is given in the words of William Q. Judge as follows: "True knowledge does not come from book study nor from mere philosophy, but mostly from the actual practice of altruism, in word, deed and thought, for that practice purifies the covers of the soul, and permits that light to shine down into the brain mind."

If we would know the doctrine we must live the life. STUDENT

The Passing of the Navajo

THE history of the Navajo Indians is a marked one. We have seen both a rise and a fall of this tribe.

From the valley of San Juan they peopled large areas of New Mexico and Arizona; partly nomadic, but in recent times constructing permanent rectangular dwellings of stone. Now these are rarely built, but some of the older were not unlike the abodes of the cliff-dwellers, and indeed it is not easy to distinguish in some cases, although the typical Navajo "hogan" was located on bottom land or on some river terrace. The ruined structures of the cliff-men furnished them with stone, and the better preserved "outlooks" of that old race were used by them as burial places.

The Navajo's door-opening always faced to the east. Across the top of the opening, set in the masonry, was a pole from which hung a curtain, just as we use a portière. Formerly this fabric was made of cotton with an admixture of leather thongs and plant fibres, but wool came into use after Coronado introduced sheep in the year 1540, and the Franciscan Fathers taught its use. Still later the Turkish vayeta, costing \$6 per pound, was furnished the Navajo weavers, and then was born the famous blanket,—only to die in infancy, for a quarter of a century has passed since this industry waned.

Imitation Navajo blankets are now made by hundreds to supply the ever increasing demand, but they lack the coloring and individuality of the originals. A real blanket was the expression of the weaver's ideal.

It is said that the Navajo blanket is the best in the world, "neither Ottoman fingers nor British machines have produced its peer. The only fabric I know to surpass it is to be found among the astounding prehistoric fabrics of the mummy-mines of Peru."

When the Navajo passed from this world his blanket went with him as a burial shroud. His upper world was represented by the color blue, and the lower world by white and black in spots. Red signifies sunlight. As with many other races and tribes, colors were assigned to the cardinals: white to the east; yellow to the west; blue to the south; black to the north. Not bad symbology from a Masonic standpoint. A blue ceiling, a tessellated floor, light coming from the east, and darkness in the north.

How to Avoid Old Age

IT is natural that people who have no settled belief in immortality should fear death, and that those who have no riches of the soul to fall back upon should dread old age. Hence the discussion on how to put off the one and avoid the other is of constant interest.

A medical writer, offering advice to this end, sets out by giving his definition of old age; in which, with the fallacious reasoning peculiar to scientific materialism, he identifies the thing with its effects. Old age, he says, is a hardening of the bones, a drying up of the oil in the joints, etc. Therefore we must keep our bones soft and our joints oiled, and the thing is done.

To effect this he prescribes moderation in food and sleep, exercise of body and mind, and the usual average hygienic regimen. This prevents the joints from getting clogged.

But the real efficacy of the mental work is that it develops a more re-

finer and more lasting part of our nature. If we cultivated Soul, we should develop a still more lasting part of our nature. The secret of perpetual youth is to live in the ever-young ever-fresh part of our nature, and avoid the gross and perishable.

January

AMONG the Romans, January 1st, New Year's day, was dedicated to Janus, the curious two-faced deity, the patron of gateways and all beginnings in action. He was a solar god of light, and keys were among his attributes. Standing at the parting of the ways, he looks back into the old year with one face, while the other pierces into the coming time. He had no regular temples; but an arched gallery in the Forum, with doors at each end and containing his image, was his chief sanctuary. The gates were dedicated to Mars, the god of battles, and were never closed except during times of peace—very rare occasions in Rome.

Janus is a perfect symbol of humanity, with its dual mind: the lower longing, regretting, and living in sensations and desires kept alive by the memory of past experiences; while the higher keeps a steady gaze upon the coming days, building a great picture of joy and progress which is to be realized in time.

Out of the open doors of the shrine of Janus the ancients believed that strength came to them to inspire their arms; we must keep the avenues of our inner Spiritual Temple open while we wage war against the lower in ourselves and the darkness of evil and suffering without.

The light of Brotherhood in our hearts is the ray shining out to strengthen us.

Now is the time to fight to hasten the day of the great peace, when the trophies of victory can be hung on the walls and the gates be closed again. C. J. R.

The Integrity of the Whole

ACCEPT everything which happens, even if it seem disagreeable, because it leads to this, to the health of the universe, and to the prosperity and felicity of Zeus (the universe.) For he would not have brought it, if it were not useful for the whole. Neither does the nature of anything, whatever it may be, cause anything which is not suitable to that which is directed by it. For two reasons, then, it is right to be content with that which happens to thee; the one, because it was done for thee and prescribed for thee, and in a manner had reference to thee, originally from the most ancient causes spun with thy destiny; and the other, because even that which comes severally to every man is the power which administers the universe, a cause of felicity and perfection, nay, even of its very continuance.—*Marcus Aurelius*

LET a stoic arise who shall reveal the resources of man and tell men they are not leaning willows, but can and must detach themselves; that with the exercise of self-trust new powers shall appear; that a man is the word made flesh, born to shed healing to the nations; that he should be ashamed of our compassion, and that the moment he acts from himself, tossing the laws, the books, idolatries and customs out of the window, we pity him no more, but thank and revere him, and that teacher shall restore the life of man to splendor and make his name dear to all history.—*Emerson*

Doomed Venice

ACCORDING to one of the best living geological authorities of northern Italy, Venice is sinking and doomed to disappear into the mud. She rests, he says, on water pillows, layers of earth, mud, and seaweed, formed during thousands of years. They are from thirty to one hundred feet thick, but under them is deep water. Into these layers, the original builders, knowing nothing of the water, drove piles, and on these put their churches and palaces.

Judging by the fall of the Campanile, he is right; but his account differs utterly from the usual one. Borings for Artesian wells to a depth of 1500 feet have shown an uninterrupted succession of layers of clay, gravel, and peat, one below another. The old builders dug down to the first clay and then sank piles of white poplar. On the tops of these they put a platform of oak. Twenty years ago both oak and poplar were found still sound. It would appear, however, that since the end of the Fifteenth century, there has been a more or less general sinkage of about twenty inches. The level of the Square of St. Mark had to be raised by that much. If the recent geological verdict is right, the "clay" is mud, the "gravel" is earth, the "peat" is seaweed; and it is a wonder that the piles did not sink faster.

Venice can hardly be said to date back further than the Ninth century. There is a tradition that she stands on the site of more than one pre-historic predecessor, but research has never yet been undertaken to determine the point. No one knows why the early settlers selected such a place—except perhaps as a temporary retreat from barbarian invasion. Says M. Charles Yriarte: "The physical conditions with which the earliest inhabitants had to deal were such as might seem singularly unpropitious to the growth of a large and prosperous city. Their untillable and salt-encrusted soil possessed no kind of mineral wealth; the thickets which here and there diversified the surface of the barren marshes produced no serviceable timber; and even drinkable water was hardly obtainable; yet it was here that the Venetians, by their inventiveness, their energy, their industry, and their genius for commerce succeeded in establishing themselves on a firm soil and maintaining their independence, in making their neighbors their tributaries, in sending their fleets to distant shores, in controlling the destiny of empires, and consolidating a naval power that is unique in the history of the world."

The tide of civilization wanted to achieve another of its cyclic high-water marks, and a geological difficulty went for nothing. STUDENT

Ship to Steam 600 miles an Hour

REPORTS have been the rounds lately to the effect that a Frenchman has constructed a model of a ship which is to make 600 miles in the hour, thus crossing the Atlantic in six hours and enabling week-enders to spend a day on the other side. It is called a Typhonoid, and depends upon suction; that is, a vacuum is created in front of the ship by a "suction-cone" working on a horizontal shaft. It is rash to attempt to assert that anything is impossible until it has been tried; but, the first difficulty that strikes one is that of the air-pressure. To travel at 600 miles an hour, even on land, would introduce altogether novel conditions in this respect. A reliable scientific observation of a destructive tornado gives the velocity of the wind at from 12 to 60 miles an hour; so some idea may be formed of the energy needed to drive a ship in the teeth of a 600 mile wind. T.

The Russian Exodus

IT appears that Russian refugees are swarming to England to escape the conscription. On one day 800 arrived. One of these got into a police court and was questioned by the magistrate. He said that he tramped to the South German frontier, and then paid a smuggling agent 60 roubles (about 30 dollars) to get him through to England. This amount he obtained by the help of his relatives and by selling his furniture.

The arrivals are mostly young men, and many go on to other countries, America, Australia, or South Africa. The Russian war statistics should include these young men among the "losses." STUDENT

U. S. Commissioner Sargent Cares for Aliens

IMMIGRATION Commissioner F. P. Sargent, who keeps a watchful eye on the interests of immigrants and on the doings of those who try to exploit them, is working for the establishment of a bureau at Ellis Island which will give the immigrants reliable information as to employment and

destination. This will enable them to decide where to go and prevent the accumulation of an undesirable alien colony in New York. It is also hoped by this means to divert some of the stream of immigration to the South. E.

India and the Salt Tax

ENGLISH rule in India is a curious combination of justice, generosity, protection—and extortion. A recent volume by a well-informed writer gives a vivid picture of the latter. He says:

You would think that a man who was too poor to hold land under the conditions described would be too poor to tax. Excise cannot reach him; it would be positively indecent to demand tribute from his dress, although if in his vanity he demands English cotton goods he has to pay duty on them. But the Government of India in its infinite wisdom has discovered a method of bleeding stones. In the economy of nature, man is an animal who cannot avoid eating salt, and that necessary article of diet has been put into contribution, whereby even the beggars of the empire pay their tribute to Cæsar. The salt tax is one of the soundest fiscal resources in India.

Here, from the same book, is a picture of Indian peasant life:

It is a country where everybody habitually sits on the ground and eats off the floor, and throws away the food that cannot be eaten at a meal, and often the crockery-ware after once using it; where it is forbidden to eat with the shoes on, and customary, in not a few castes, to strip naked for dinner; where three men out of four consider beef-eating worse than cannibalism; and the fourth is morally convinced that a ham sandwich could send him to hell; where vegetarianism is the rule, and never an egg used in cooking; where there are a hundred sweetmeat shops to one public-house, and a native restaurant is an absolutely unknown thing; where everyone smokes, but the same pipe travels from mouth to mouth; where everyone washes, but no one uses soap; where not one man in ten, and not one woman in a hundred and fifty, can read. STUDENT

The Spirit of the Fighting Nations

A WELL-INFORMED writer, contributing an article to a well-known monthly, says that the Russian people are essentially peaceful and inaggressive. They bear no ill-will toward the Japanese, whom indeed large numbers of them till recently thought were a species of bacteria; and they do not want Manchuria or Korea. Their attitude towards enlistment is exactly the opposite to that of the Japanese. The latter march in triumph to the enlisting station, accompanied by bands, and cheered by crowds of their relatives. But the Russian meets his conscription with the utmost reluctance. Hundreds who were summoned deserted; others committed suicide, and great numbers either maimed themselves or by means of some offence against the law got themselves a term of imprisonment.

It is true that when in action, there seems to be nothing to choose between the fighting courage exhibited by the two; that can hardly be called the human side of the matter. The real force which Russia has to face is the spirit of the opposing nation.

A nation that is fighting for its very existence needs a great deal of conquering. Its soldiers bring to the battle-field a far higher energy than the mere bull-dog will to win a victory. STUDENT

Patriotism Defies Death

A CONTEMPORARY tells this story in illustration of the Japanese belief that the souls of dead patriots continue to watch over their country's welfare:

Three hundred years ago one of the Tokugawa clan received from his father the province of Owari, and a number of little statues of horses cast in gold, with direction to preserve them until some national emergency arose.

Although feudalism fell in 1874, and the house of Owari became quite poor, its successive heads strictly obeyed the injunction of their ancestor until a short time ago.

Then the family, believing that a national emergency had arisen, transferred the secret hoard, amounting to half a million dollars of American money, to the national treasury, and afterward publicly informed the spirit of their ancestor that the trust had been faithfully performed. C.

Frontispiece --- William Quan Judge

THIS week's cover page of the NEW CENTURY PATH contains the face of Wm. Q. Judge, the second in the line of succession of the world's Theosophical Leaders. Mr. Judge succeeded to the Foundress of the Theosophical Society, Helena Petrovna Blavatsky. A successful lawyer, a brilliant writer, and a man of extraordinary insight into human nature, he was well fitted to carry on the great humanitarian and philosophic work of H. P. Blavatsky.

Some Views on XXth Century Problems

Pious Hypnotism

SOME "revival services" of an exceptionally acute character have just been held in Wales. We use the word "acute" advisedly. A daily paper gives the following, among other similar pictures of the scenes:

A little after midnight the scene about the pulpit was one of the maddest hysteria. Bent double over the railing, Evan Roberts was clasping the upstretched hand of a convert who sprawled on the floor and screamed wildly. Eight men were praying passionately at one time, while a band of colliers sang a hymn.

The din was deafening, and the uproar grew wilder when the man on the floor swooned from sheer exhaustion. One convert, who rose to confess, literally and actually tore his hair in the fervour of his prayer.

Of late years these hypnotic orgies have fallen somewhat out of fashion. Not, in the main, because of the recognition of their harmfulness, but because—except in certain country districts—of their impossibility. People no longer fear the fiery hell and furiously avenging God upon which they depend for their motive power.

We have called them hypnotic orgies. Is that unfair? Affecting mostly young people and even children, they produce a sudden change of consciousness leading to a changed mode of life. The operating energy is *fear*. The hearers' past is made to present itself to them in hideous caricature as a picture black with sin. An avenging God awaits their death to welcome them on the other side with unimaginable penalties beyond anything that an Alva or a Torquemada ever devised. Imaginations take fire over the hall, blend and inflame each other. The meeting becomes a chaos of wild fear.

Then comes the opposite picture. A figure is presented as capable of holding back the storm of vengeance. And then with a gasp of relief the whole meeting is swept up into an equally irrational reaction. Joy-tears and hymns replace the wailings of contrition.

What have this terror and the relief from it to do with religion, with "the wisdom that is from above," "first pure, then peaceable, gentle and easy to be entreated?" The scar of the fear remains; it is reproduced at the thought of "sin," and therefore, and not for love of the Light, the "wisdom from above," is sin avoided. Will, and mind, and the power of getting Light, and self-reliance, have been killed or maimed. On the deeper matters of life, thought is henceforth at an end. The subject knows only of his fear and its relief, and of the phantasmal beings with which he connects the two states. The pictures of the Avenging God and the Stayer of the Vengeance, replacing each other in consciousness, do duty for thought. Was the human mind evolved by nature and called to new powers and light by the soul that humanized it and would fain divinize it—only that it should thus be brought to naught?

For one thing we may thank the incredulity of the age, that it has taken away the weapon of fear from the hands of the revivalists and thus saved the children from hypnotism masquerading as "conversion." C.

A New Way to Kill Time

"SOCIETY" in an Ohio town has at length found a way to entice the weary hours of life to pass more quickly. It has organised a gymkana at which races will take place between ducks, geese, turtles, parrots, sheep, rabbits, white mice, monkeys, canaries, and other animals. The competitors will be driven by ladies, who will drive them with silken reins.

In very charity one is grateful for H. P. Blavatsky's remark that those who are born with the silver spoon, born to a life shielded from all the rougher winds and from the sterner calls of duty, are often "baby-egos," occupants of kindly nature's nursery. The rough paths are for the stronger and older limbs.

But the wind-shielded places are often also the *test* of those whose duty and opportunity it is to come out and take up voluntarily some of the world's crushing burden.

It is a burden that will not be lifted by the negative virtues. It needs the strong arms of those who can respond to the test, sacrifice something, and act from the inner urge of compassion alone. STUDENT

Christ and the Jews

A LONDON preacher of considerable note traces the reason for the incarnating of Christ when and where he did to the persecutions of the Jews by Antiochus Epiphanes. Losing something of their national feeling, and "discovering their peculiar bent for commerce, they settled in cities far from home. Thus, in Christ's advent in the 'fulness of time' there was for the first time, a milieu eminently suited for the dissemination of the truths he came to teach the world."

The lecturer has discovered a key which fits many locks; but he only puts it into one. He justly attributes to the Teacher of whom he is speaking, the power of selecting the time and place of his birth, so that the spiritual lever he is going to use shall have the best fulcrum. Why not go further and see whether the same key will not unlock the secret of the time and place of birth of other of the great world-teachers? Some day human history will be written with the aid of that key. For when a great Teacher appears in the midst of an apparently insignificant people, it means either that the people is not really insignificant; that it is about to be scattered, or to play some important part on the world-stage; or that it has some peculiar genius, rendering it a fit soil for the teaching. The ancient message is always sown in the best available soil. *Why* it is the best, is for us—if we would understand the hidden springs of history—to discover.

But there were other reasons than the dispersion of an instinctively commercial people that must have made Christ's incarnation Jewish. They constituted a focal point with many connections. In their successive dominations by Persia, Alexander of Greece, the Ptolemies of Egypt, and Rome, they had come into quick touch—through only five and a half centuries—with all the forms of faith and religious culture. From the Babylonians onward they had mixed with a long succession of great nations.

There were Jews at all the great centres of ancient culture, blending it with Judaism and blending Judaism into it. They afforded, therefore, a great chance for the dissemination of light among many nations whose own lights were fading. National ambition, their demand for a conquering king to appear among them, instead of a Teacher, caused them to miss the recognition of the Teacher who did come. How much of the darkness and blood of subsequent centuries of history might have been avoided if they had opened their eyes to what was in their midst? STUDENT

Brotherhood and Journalism

A LITTLE noticed International Congress of Journalists was recently held in London. Whilst most of its proceedings were mostly interesting to the profession it concerned, there was one suggestion, coming from a Russian editor, eminently deserving of public attention. This was that editors, in their supervision of the news they publish, should make it *their conscious aim to promote international friendship* instead of enmity. There is for example no need, he thought, to publish in English journals venomous things said of England in Russian journals; and *vice versa*. He was in fact pleading against Yellow Journalism in its international aspects. In their home dealings, yellow journals libel individuals, publish interviews that were never held, persecute, misrepresent, make flaring capital of crimes and divorces; and in general reflect the lowest aspects and activities and interests of the minds who read them. That is an affair for each country to deal with. But when the same methods are applied to international relations, they become of much more menacing moment. They are dealing with inflammable materials on a vast scale.

It is all true; but what remedy is there? None, save that which lies with the people themselves. The whole methods of Yellow Journalism are a sin against the principle of human brotherhood. It is only by the growing recognition of that principle that these methods can be discredited and their employers silenced. And of late years progress in this direction is very rapid, nor does it bid fair to stop. STUDENT

The Mound-Builders

(CONCLUDED)

But what became of the bones of the original proprietors of these tombs?

That no gigantic skeletons have hitherto been found in the tombs is no reason for saying that the remains of giants were never in them. Cremation was universal till a comparatively recent period—some 80,000 or 100,000 years ago. The real giants, moreover, were nearly all drowned with Atlantis. Nevertheless classical writers, as we have shown elsewhere, often speak of giant skeletons being excavated in their day. Moreover, human fossils may be counted on the fingers, as yet.

The gigantic character of some of the mounds connects them with the race of giants whose relics are found everywhere, and of which frequent mention has been made on this page, as, for instance, in connection with the Easter Island and Bamian statues, and the Pelasgic architecture. This opens up a very large question. There have been more than one race of giants on the earth, and their history and place in the chronology of the human races is elaborately discussed by H. P. Blavatsky, who cites a wealth of testimony and evidence from every possible source. Some of these giants were degenerate descendants of that early race that "sinned" or "fell" by prostituting its divine powers to sensuality. Of them we have traditions in our own Bible, among innumerable other writings. Others of the giants were not fallen, but simply members of the human family at a time before its stature had diminished—"heroes," in short. The evidence for the existence of such giants is already overwhelming, and daily grows, and nothing but a revival of worn-out Biblical cosmogony, and of history based on scientific materialism, prevents its recognition.

The pyramidal mounds of Central America combine with the ruins of Guatemala, etc., to connect America with Egypt—a subject which has also been discussed on this page. There was a time when the two formed parts of one civilization derived from Atlantis, and when the Egyptian priests visited America, returning to Egypt with their lore, which the prehistoric Egyptians preserved with great conservatism after the separation of the continents. To quote again:

The Archaic Records show the Initiates of the second sub-race of the Aryan family moving from one land to the other for the purpose of supervising the building of menhirs and dolmens of colossal Zodiacs in stone and places of sepulchre to serve as receptacles for the ashes of generations to come.

This was when, according to M. Joly, author of *Man Before Metals*,

The level of the Baltic and of the North Sea was 400 feet higher than it is at the present day. The valley of the Somme was not hollowed to the depth it has now attained; Sicily was joined to Africa, Barbary to Spain. Carthage, the Pyramids of Egypt, the palaces of Uxmal and Palenque, were not yet in existence.

As for the symbolic mounds, they connect the builders with the symbolism of the Wisdom-Religion, once universally diffused, now fled to the earth's secret places, eventually to become known once more.

The serpent with the egg is a universal symbol, found in Druidism, among the Mazdeans, Hindus, Greeks, Latins, and even among the old Jews and early Christians—says H. P. Blavatsky. It typifies the succession of the cycles of time and the accompanying transformations of the face of the globe. Considered by itself, the meaning of this serpent mound is a mystery; but to one who has studied the snake symbol in all its forms in many ancient systems, it is seen to be a recognized formula of the anciently-universal Wisdom-Religion.

There is a close similarity between some of the mounds in America and the tumuli in Norway, and this has been explained by the theory that Norwegians discovered America a thousand years ago. But, though Norsemen may have visited America at that time, this is not the true explanation of the mounds, which are far older.

These few scattered remarks about the Mounds will perhaps help to show how impossible it is to make facts fit into musty old theories, and how on the contrary they support the old traditions. To look upon the ancient peoples of America as a race of Buriers, who moved heaven and earth to provide fitting receptacles for their wretched bones and pots; or who built fortifications to prevent other primitive peoples from steal-

ing their bones, or who had absurd religious superstitions requiring the building of a strange variety of structures;—all this will have to be abandoned, in favor of views more generous and worthy of the human heart and imagination and intellect. STUDENT

Symbolism of the Creation Story

THE stories narrated in the early chapters of *Genesis* were for long centuries understood literally by western peoples not accustomed to the symbolic language of ancient and oriental peoples. It was therefore supposed that the world was actually created in seven days, that the human race sprang from a single pair, and that there was a definite garden with snake and tree, and so forth. A certain Archbishop Usher, further, by adding up the ages of the patriarchs, arrived at the date 4004 B. C., which was accepted as that of the creation of the world. Later on the growth of knowledge, scientific and antiquarian, introduced discrepancies and cleared some of the cobwebs out of men's minds. The next step was to reject the whole Bible story as a fable—a mere childish attempt made by some primitive people to account for the origins of things.

Still later many earnest theologians have tried, and are still trying, to reconcile the Bible record with modern knowledge, and find some ground on which they can base both their veneration and their convictions. But the key to the problem is lacking.

To the student of antiquity, however, who regards human history from the broad and enlightened standpoint of Theosophy, the Adamic legend is merely one out of many similar allegories which record in concise symbolical language the story of the races of mankind. Archeologists are now finding these same allegories in the ancient libraries of the Assyrians, and scholars trace them in the sacred literature of the Hindus, the Norsemen and the ancient Americans.

The Deluge is known to be matter of tradition absolutely universal, being spoken of among Pacific islanders as well as recorded in the scriptures of continental peoples. Science identifies it with a geological cataclysm, the latest of many periodical cataclysms.

The story of the Fall shows how an early race, represented by Adam, was tempted by the Serpent—the human intellect and faculties—into prostituting its divine powers to sensual and material pleasure and gain. This act condemned man to be banished from a pure and innocent state, and to live a life of material and sensual experiences, until such time as he should by the undying power of his divine spark succeed in *redeeming* the lower nature, purifying it, and bringing it under control.

Hence we find that, after the Fall, humanity grows gradually grosser and more sensual, and cruel and ignorant; but that the experience which he gains through this long pilgrimage enlarges his knowledge and heralds the winning of a more perfect future Eden.

If such an explanation should seem forced or fanciful, it is only from lack of a fuller acquaintance with the allegory of man's past and future, and with the symbolism of the serpent, tree, etc.

The coming of the Messiah or Redeemer means the manifestation in humanity of its divine nature; for the divine spark remains hidden and guides man's destinies from afar, until the time when it gains complete mastery and coalesces with the mind. Then there is no longer enmity between the divine and the human wills, for they are made one.

Such an interpretation of the Bible story adds to our reverence and to our knowledge. It shows us man is still a divinely-inspired being and that he will win out in the task he has undertaken. The old literal interpretation was degrading and childish, and the wholesale rejection of the story is a running to the opposite extreme. Both these old views were too narrow, unworthy of our intelligence, inconsistent with the extent of our information in other directions. Atheistic negation may scoff at the Bible myth, but how about the similar and almost identical myths universally found?

The churches are in a state of great unrest on the question of Biblical authority and interpretation; and soon it must disrupt them completely. Then, since atheistic negation offers no basis on which to ground anything, the only sure foundation will be recognized to be the ancient Wisdom-Religion, Theosophy, founded on eternal verities. STUDENT

The Trend of Twentieth Century Science

The Universe of Stars

THE great thinkers of the latter part of the Eighteenth and the main portion of the Nineteenth centuries, such as Laplace and Sir W. Herschel, were considered very daring when they used their vivid imagination in the endeavor to trace the probable origin and development of the solar system from the primeval nebular fire-mist. But now the investigation of problems of the birth, life-history and disappearance of the "fixed stars," the constitution and grouping of the nebulae, and the very structure of the heavenly vault itself, have become a regular department of astronomical work. The possibility of getting any light at all upon these colossal themes is largely due to that scientific magic mirror, the spectroscope, which has greatly increased our knowledge of the conditions prevailing in the heavenly bodies. While accepting, in the main, the current interpretations of the spectrum and its lines, H. P. Blavatsky warns us that our atmosphere profoundly modifies the nature of the light passing through it, and that we need not think certainty has been attained. Tomorrow some new discovery may change existing theories of light as much as the recognition of radio-activity is transforming our ideas of matter. As well as the demonstration of the existence of many hitherto unsuspected double, treble, or quadruple groups of suns, which appear in the largest telescopes but as single stars, the spectroscope is giving us valuable data for the classification of the stars in an orderly system.

The stars fall into the following classification: First, the White Helian stars, showing the predominance of the lines of helium and hydrogen, and in which the violet part of the spectrum, the most active, is very intense and prolonged.

Then comes the solar type, in which the lines of the metals are fully developed, indicating, it is supposed, dense metallic vapors enclosing an unknown brilliant centre. This type is of a yellowish color, and represents the fully-matured period; it includes our sun and Capella. The next division is orange or red, and is supposed to be more advanced in life and less active than the afore-mentioned groups, or than some others to which we have not space to refer.

Astronomers are strongly inclined to believe that the stars proceed from primeval, chaotic nebulae, condense into the dazzling brilliancy of the helium and hydrogen stage, then into the denser condition of our sun, and ultimately fade into darkness after passing through the orange stage and the deep red decrepitude.

Whether the revelations of the spectroscope have been correctly interpreted or not, there is no doubt that the cosmic history runs through a series of progressive changes. In Eastern philosophy the cyclic periods of activity are called "Manvantaras" and include many minor periods. Theosophy teaches that the Universe is eternal and will never entirely "run down," but that after each period of "Pralaya," to use the Sanscrit word, or resting, the process of manifestation recommences on a higher scale. The great Dawn breaks and a grander cycle begins. In this connection it is significant that the recent discoveries of the properties of radium show the breaking up of matter into the simpler form of helium. It has been suggested by some scientific authorities that possibly the helian type of white stars, or many of them at least, instead of being in the primitive state, may have nearly completed the cycle of changes and be rapidly transforming their substance back through helium to the original fire-mist. Writing in "Knowledge," Miss A. M. Clerke admits that "the electronic theory of matter supplies no genuine explanation of the source of energy in the Universe. What is given out when the atoms go to pieces must have been stored up when they were put together. Whence was it derived? That is the fundamental question which underlies every discussion concerning the maintenance of the life of suns. It is unanswered, and possibly unanswerable."

It is not unanswerable, as the study of Theosophy soon demonstrates. This energy is the One Life, the Divine Intelligence, manifesting in form. Leibnitz, the great German philosopher, expressed this. To his penetrating mind everything was living activity, living energy. His dis-

covery that an active energy forms the essence of substance is a principle that places him in direct relationship with the truest ancient scientific thought. Everywhere there is transformation, building up and pulling down. As the Oversoul reincarnates periodically in new Universes, so our lives, the sparks of the Divine Life, obey the same law, working in physical matter and retiring when the cycle of life changes has been passed through, for rest and recuperation before again taking up the cross. The most advanced philosophy of today but repeats the teaching of Patanjali, an Indian thinker who flourished many thousand years ago, that "nature energises for the sake of the soul." C. J. R.

Our Real Hard Work

PROFESSOR CHITTENDON, of Yale, has been making a series of careful experiments in the region of dietetics. They relate to the immense amount of energy which we tie up in ourselves by overeating. The excess has to be as elaborately digested as if it were going to be put to a legitimate purpose. Then, having been digested, it must be as carefully broken down into a condition in which it can be eliminated. All this is hard work, and there is nothing useful to show for it. Moreover if a hitch occurs at any point in the long program—and many always do occur—there is immediately disease. Does anyone suppose it to be a normal or necessary state of body that is ready to develop into a cold lasting ten days because of five minutes' exposure to a draught, or a drop of rain slipping down the back of the neck? Possibly there is such a thing as inherited disease; but if all that which we ourselves acquire by conscious sins against the body were eliminated, we should have very little trouble in dealing with the other. And in about two generations it would deal with itself.

Professor Chittendon finds that when what may be called merely "normal" overeating is stopped, the energy thus liberated for real work often amounts to an increase of 70 per cent! An English physician commenting on this, points to the extraordinary vitality of the Japanese soldiers as examples of the value of spare eating. For England, the moral might be compressed into the sentence that it was not *because of* but *in spite of* her "roast beef" that she made her Empire.

Diet reformers abound today; but the thing to remember is that it is not so much the whatness as the how-muchness of the diet that matters. That principle may serve as something of an explanation of the good results attained by such diverse diet systems, at any rate those of them which cut out some of the ingredients of the usual modern mixture.

PHYSICIAN

Amending Nature

IN several works on the development of the brain one notices the usual scientific inversion of cause and effect; and now a writer to *Nature* makes a proposition resting on that inversion.

The brain of the anthropoid ape does not develop beyond the first year. At that point its mind ceases to grow, and therefore *requires* no more brain. And since the brain is not to grow any more, the sutures of the skull do not need to remain open; and close accordingly.

Any non-scientific mind which possesses a fair amount of common-sense will see that that is the real sequence of cause and effect.

But in science this is inverted, and the order stands thus: At the end of the first year the sutures close; *therefore* the brain cannot grow; therefore the mind cannot.

The proposition is this, possibly promoted by compassionate enthusiasm for the evolution of the ape: That vivisectional means should be taken to keep the sutures open in order that the brain might go on growing. Nature does not know her business and can have her education improved—with a knife. She will then see that the ape has not as much mind as his place in her scheme warrants, and will take the hint. Does it not remind one of the process of wagging a dog's tail for him, to put him in a good temper? Surely the ape intelligence has its place in the natural scale, and as it develops according to law, so will the brain which it uses, so will the skull that envelopes the brain. STUDENT

Eccentricities of Sub-Tropical Fruit-Growing

THE rains have come, and already there are millions of green leaves showing where only ten days ago was bare dusty earth. It does not trouble them that they are nearly four months ahead of their brothers upon the mountains, as in more northern latitudes. *They* take Springtime whenever it comes, and start growing right away, but the apple, peach, plum, and other northern fruit trees have to keep their wits about them and remember that whatever the silly weather-spirits may do *they* are not to blossom before April. Of course it is unpleasant to be so warm and wet during one's winter nap, but one must take what comes in a strange land, though at home, where one is acquainted with the weather-clerk one is allowed some rights and is not disturbed until it is time to grow.

And some of these Southern trees have the most atrociously bad habits of keeping late seasons that are as annoying as people coming in at midnight. The guava begins to ripen his fruit in October, which is all right, but he keeps steadily at it until March or April, which is out of all reason. But worst of all is the loquat; his great spiky panicles of flowers, which smell like wet bran spiced with cinnamon and cloves, do not appear until November or December; and about April he is loaded down with sour yellow plums with bitter chestnuts in place of pits. Isn't that a scandalous performance, to make believe the season is over when it's hardly time to begin blooming? How can the others keep their proper dates under such conditions? Of course they have the best almanacs, but sometimes they forget to consult them and blossom in February; which means, of course, no fruit that year; all because of this absurdly warm winter and these foolish neighbors. N. L.

SOME students in Cuba were much interested in watching the proceedings of a chameleon. When he wanted to change his color, he worked some gland or organ near the throat. But, strangely enough, he never could manage, work as hard as he would, to turn blue. Probably, as this was an unaccustomed color in nature, or at least in his part of it, he lacked practice in that particular evolution.

NIAGARA FALLS

Nature's Children Know

THE One Indwelling Life in all Nature forms the basis of a sort of common understanding by which her children seem to know her ways and sense her moods and purposes. Plants and animals live so close to Nature's heart that they feel within her bosom the stir of coming things even more than man, whose artificial life has dulled his sensibility to Nature's touch.

Both plants and animals prepare beforehand for change of season and change of weather; and some people who have observed their ways read in what they do the nature of the coming season and coming weather, whether it will be unusually warm or cold, wet or dry.

Chickens oil their feathers before a rain, and some plants close their leaves and flowers. When the robins and blue-birds return to the north after their southern winter, spring is known to be near even though the ground is covered with snow, and the cold winds are blowing. It is a lesson in faith and trust to see the happy birds build-

ing their nests amid the falling snow,—singing and building with never a fear, their trust rewarded with the early coming of the bright warm days so near at hand. And on the trees and under the soil the sleeping buds awaken and begin their growth.

On the day of the first heavy rain of the season, December 2d, 1904, on the top of a Point Loma hill, the bloom of an Indian Pink greeted the falling shower. It crowned the top of a young green stem four inches high on which were new green leaves and buds for other blossoms. How venturesome this bright newcomer was to make a start amidst the drought long enough beforehand to open its first bloom in greeting to the first genuine downpour of rain! What sensation stirred within the heart of the sleeping germ to awaken it to early growth? What sense of cooling moisture, or music of falling drops enticed it from the underworld when all was dry and parched above? Surely, somehow in some way it felt the coming rains and knew 'twas safe to grow. Possibly it is only the working of our mechanical intellects that prevents us doing likewise.

Whom Zeus loveth is a
match for many.—Homer

WERE it not for an innate belief in the old adage that "things must get worse in

✧ "How to Systematize" ✧

The house-keeping problem has been tied up in a hard knot for so long that now the only method of

order to get better," a glance over current magazines and periodicals would discourage the average house-keeping woman. One writer exhausts herself over the servant-girl problem, minutely instructing the reader how to "handle help," so that "lobster à la Newburg" or broiled quail may be served at midnight with no danger of Bridget's giving notice.

Another writer waxes eloquent over how a woman may "get on" alone; that is how she may do her housework without the help of a servant. How easy it all looks as one peruses the pages of minute directions! How easy, in the light of these directions, it must be to get up in the morning long before the family is astir and, after dressing baby and Johnny and getting Susie settled at her practise, prepare, cook and serve a five-course breakfast, in the meantime utilizing the vacant space on the stove for canned fruit, or the left over five minutes in getting the clothes into the first suds! It is so easy if one will only follow directions, just one—two—three—four! The husband, after a five-course breakfast will, of course, leave in a good humor. And then, after the children have gone to school, how easily dishes can be washed if "put to soak" in the meantime. (What are "meantimes" anyway? All disagreeable work seems to be done in the "meantime," according to the average writer on house-wifely topics.)

And then, how easy it must be to get the house cleaned and more fruit put away for winter, or perhaps the clothing rinsed and blued and starched and hung on the line, and then—a mere turning over of the hand, of course—there is prepared a six-course luncheon for unexpected company. It is a mere nothing "if one will only systematize." Of course one must serve a luncheon such as the average housekeeper would not be ashamed of—for instance, grapefruit and pineapple minced to begin with, blue-points and then consommé, chicken in the chafing dish with a bit of broiled bacon, or,—if the grocer boy appears at just the right time—perhaps creamed crab meat, green peppers and jelly, French fried potatoes and French peas and sherbet and warm cup cake, or a hot sweet soufflé—that can be prepared in the "meantime," you know, as can the coffee, etc., etc. How simple, how easy this all is "if one will only systematize!" Of course all this is necessary; even unexpected company could not get on with less, and a woman with no servant can so easily serve it herself with a side-table here and an extra platter there, and—shades of Athena! were these among the industries taught to men and women in the days of old by Pallas? Never! It were impossible.

untying it is plainly a radical one, a single stroke, after seeing that the sword is sharp.

Of course, it is true that if work be done systematically, everything coolly planned beforehand, a great deal can be accomplished and with comparatively little expenditure of energy. But it is equally certain that no woman who carries on her shoulders—as not a few writers advise the housekeeper to do and as some housekeepers are forced to do—the housework of a family requiring a five-course breakfast and a four-course luncheon and, at all odds, a four-course dinner, will lead a slave's existence. The following of just such advice as this has turned many a woman into a nagging termagant, for there is a limit to human endurance. It is just such wives as these whom husbands lose interest in, and it is mothers who occupy their whole time in a perpetual oscillation between kitchen and dining-room that children forget. The solution is not to systematize, but to simplify.

Why should American women, even of wealth, find it necessary to serve meat three times a day? Why should a woman who has no servant find it necessary to serve seven-course luncheons to guests, expected or unexpected? Why should we be psychologized with the idea that bread and cake and jelly—or even meat and potatoes—*must* be cooked or baked in the house; that washing and ironing and sewing *must* be done at home? This idea is clipped from the same piece as the notion that psychologized our grandmothers, the notion that soap and candles, homespun and linsey-woolsey, *must* be made at home or the housewife would be marked a slattern.

The average American woman so conscientiously siezes the thousand and one little opportunities that housekeeping affords her to expend her energy, that she is in danger of losing the Great Opportunity. By the conscientious chasing-up of *useless* detail more than one woman has killed the larger life and the real happiness of every member of her family. What women need is the profound conviction that home life at present is too complex; that while we need better system it is true, we need still more simplicity—and the courage to bid good-bye to the notions that psychologized our grandmothers. The idea that the home life of the future will be merely something a little better than that of the present, merely a new edition, is a false idea. The home life of the future will be better than the old mainly because it will in so few ways resemble the old. *It will be something different.* STUDENT

Where Is the Lost Eden?

Earth's crammed with heaven
 And every common bush afire with God!
 But only he who sees takes off his shoes.
 —Elizabeth Barrett Browning

OUR earth, according to the traditions of ancient lore, must have been the home of many Edens, every race of humanity from the earliest dawn of time laying claim to some blissful and sacred spot—the abode of the Gods.

One of these Edens tradition locates in a semi-tropical land, “touching the walls of the sky,” in the now frozen regions of the North Pole, stretching from the Caucasus to Nova Zembla and Spitzbergen, including the British Isles, Greenland and the Behring straits, and forming a part of the vast continent of ancient Lemuria, which existed where now roll the waters of the Indian, Atlantic and Pacific oceans; this at the time when most of Europe was still at the bottom of the sea. Here were those “Fortunate Isles” so often referred to in myth and legend, “where from the beginning of life on earth, bubbled the fountain of life.” Also associated with Lemuria is that world-famed, sacred mountain of Meru, called the Mount of the Gods.

The Lemurians—the “sons of Will and Yoga,” were governed, we read in the *Secret Doctrine*, by divine dynasties of kings and rulers, “beings from spheres higher and more celestial than ours will be, long manvantaras hence.” Long ages later, after the destruction of the greater portion of Lemuria, we hear of Atala or Atlantis, with its “Seven sacred islands,” or the “Islands of the Blest;” and, still later, there is the Eden of the Euphrates and its many branches.

These fair gardens, however, are but the symbolic setting of the jewel—the real Eden being, as ever, in the soul of humanity, in the hearts of men, in the life of love and service. And at the gate of this Eden stands, as of yore, the angel with the flaming sword, guarding the Tree of Life and the Tree of Knowledge. But to us, children of a mighty past, has been given anew, by Helena P. Blavatsky and her successors, the teachings of the ancient Wisdom-Religion, with their message of Truth, Light and Liberation; to us, again, has been given the opportunity to learn the eternal and immutable laws of life which, as a key, shall open for us the gates leading into a diviner Eden than the world has yet known. M. V. H.

MRS. CREIGHTON, wife of the late Bishop of London, said recently, in an address delivered at the annual conference of Women Workers of Great Britain and Ireland:

“The trumpet call to women is to rise up and be a bit more efficient, to do more work and to do it better. We cannot all serve on public bodies, but we ought to know more about the work of public bodies in our neighborhood. There is no doubt that in the last few years there has been a sort of setback to our interests. We ought all to consider the cause of this setback very carefully, and I cannot feel it could have come without some fault on the part of women themselves. I do not think it is all due to the iniquity of man. One great fault is that we are too fussy.

“Then, too, we need not lose all our charm when we take to work. I do not believe any individual can bring to another working individual in this busy world a greater help than a sense of repose and leisure. What splendid work we could do if we only left the restlessness and the rush to Society women! And the time for this has come.”

Home Keeping in Japan

IT is said that the habitual sweetness and serenity of the women of Japan is due to the fact that they are not weighted with small worries. For one thing, the fashion of their dress remains always the same. Needless anxiety are they saved on that subject alone. Then, too, all housekeeping processes in Japan are immensely simplified. There is almost entire absence of draperies; and of that chaos of ornaments called bric-a-brac, which American homes usually shelter, the Japanese home is guiltless. Besides this, the custom of always leaving the shoes worn in the street outside of the house upon entering, keeps out no end of dust, mud and filth. What might not be the result if American housekeepers could eliminate from their homes some of the unnecessaries and from their lives some of the needless anxieties which the unnecessaries bring? Concerning this a writer in a recent issue of the *New York Independent* says:

There is hardly a house in America that would not be improved in “livableness,” in substantial comfort, and especially in attractiveness, if some evening the good man and his wife should sit down and make up a list of exactly one-half of their possessions to be consigned next morning to the bonfire. The American house of the family that has a love of rare and curious things, as so many Americans have, is a museum, and the exhibits are everywhere in sight. The Japanese gentleman who boasts a fine collection of rare vases keeps them in a fire-proof cellar under the little garden. One beautiful object stands on a low table in the living room. From time to time it goes back to storage and another takes its place. This practice is typical of the Japanese method of securing the simple life. W.

“LITTLE WOMEN OF LOMALAND”—STUDENTS OF THE RAJA YOGA SCHOOL AND ACADEMY IN A LOMALAND FIG ORCHARD

ANGELS

by GERTRUDE HALL

HOW shall we tell an angel
 From another guest?
 How, from the common worldly herd,
 One of the blest?

Hiss of suppressed halo,
 Rustle of hidden wings,
 Wafture of heavenly frankincense,—
 Which of these things?

The old Sphinx smiles so subtly:
 “I give no golden rule.—
 Yet would I warn thee, World: treat well
 Whom thou call'st fool.”—Selected

THERE is a certain freedom allowed to the women of American and English nations which is not allowed the women of the Orient, for it is a lamentable fact, that the women in “the unchanging East” have for centuries past been held in the very lowest depths of subjection and baleful inactivity.

But it was not always thus. All civilizations have had their rise and fall. While at their height the women of these past great civilizations stood immeasurably superior. From their ranks came law-givers, orators, teachers and divinely-inspired helpers of the people.

And why? Because their spiritual teachers and gifted elders created an atmosphere in which the talent of the nation's childhood was cradled. Souls received true training from their first breath, which continued while they grew, nurtured by study, experience, precept and example, until they became superb types of womanhood, worthy of ancient India, Egypt and Japan.

When our boasted Western civilization shall rise to its destined spiritual heights, the question of sex shall be solved. The hour for the women of “the unchanging East” shall have struck. This shall herald for them a new day of liberty and with it shall arise within their hearts the courage to claim their rightful heritage. STUDENT

In a recent essay by Helen Keller, entitled “A Chat About the Hand,” she says:

My hand is to me what your hearing and sight together are to you. In large measure, we travel the same highways, read the same books, speak the same language; yet our experiences are different. All my comings and goings turn on the hand as on a pivot. It binds me to the world of men and women.

Is it by the hand, too, that this gifted woman has gained her conception of the Soul's eternal truths? Where are our physiological-psychologists, anyway, and how do they explain Helen Keller's rich inner life? W.

OUR YOUNG FOLK

Christopher Columbus

WHEN Christopher Columbus, eager to sail westward in search of land, had appealed for the support necessary for his expedition first to the senate of Genoa, his native town, and afterwards to the King of Portugal, and had been refused, he went to Spain.

There he followed the court from place to place, confident that he could secure the interest and support of Ferdinand and Isabella. But the king and queen were busily occupied in maintaining order in their kingdom. The scientific men of Spain, however, were assembled, and Columbus laid his plans before them. But they were prejudiced by their religious views, and did not believe that Columbus could discover land.

Columbus found many who would listen to him, but none that would help him to set sail. The years of disappointment and delay did not diminish his faith or his energy or his determination to accomplish his purpose. He decided to leave Spain.

There was one man, however, Luis de Sant Angel—Chancellor of the Exchequer, and receiver of church revenues at the court of Isabella—who had been inspired by Columbus' words, and had become his friend. Sant Angel was able to draw the Queen's attention to Columbus' plan, and he entreated her to give his friend the necessary assistance. It is said that Sant Angel himself offered to advance a sum of money.

The Queen granted Sant Angel's request, and after Columbus had actually set out for France, he was recalled by a messenger and his expedition was equipped.

Think then, when Columbus was sailing back to Spain how eager he would be to tell this friend, Sant Angel, of his success and to describe his adventures.

And when Columbus was just off the Canary Islands, near Spain, he *did* write a letter to Luis Sant Angel. A copy of this very letter, long hidden away, has been found. So that we can read in Columbus' own words the story of the discovery of the New World.

Every line reveals the noble character of Columbus. It is clear that his high purpose supported him in all the difficulties of the voyage, and that his courage and faith never faltered.

The feeling of personal triumph he might have expressed to this friend, who had shared his beliefs, falls into second place beside his hearty loyalty to the King and Queen who had helped him; and his great joy at being able to increase the land under the dominion of Castile, leaves him no words to write of any personal gain, for of this there is no word throughout the whole letter. Of the mutinous crews that caused him such anxiety, he says only, "And, indeed, I might have accomplished much more had the crews served me as they ought to have done."

Columbus' description of the manner in which he won the confidence of the natives, shows that, besides having tact, he could show great firmness and find means to master every difficulty in his path.

From the first moment he was always just and humane, and often generous to the natives of the islands he discovered. He would not allow his sailors to take advantage of the ignorance of these people by exchanging worthless things for the gold or spun cotton so freely offered by the natives.

Columbus praises highly the gentleness and generous hospitality shown by the natives, especially on the island of Juana (the name given to

what is now Cuba), when once their timidity had been overcome. He says, "Then all, both men and women, as soon as they were reassured about us, came, both small and great, all bringing something to eat and to drink, which they presented with marvellous kindness."

Columbus had a quick eye for the beauty of the new country. "*Es maravilla!*" he says, speaking of the hills, and rivers, and the trees "that never lose their foliage." The letter to Sant Angel is short. But did ever letter tell such great news before?

Hidden away in the libraries of old Castile or Northern Italy may be many more documents, from which we may still, some day, learn more of the great man who discovered America, and who signed his modest manly letter to Sant Angel: "Yours to command, THE ADMIRAL."

Self-Control

SELF-CONTROL means to be able to refrain from evil thoughts and actions and to be able to think good and noble thoughts and do kind deeds all the time. Self-control means to be always

alert and on guard. It means to be ready for anything that may happen. It is one of the great objects of the Raja Yoga teachers to teach self-control to the children. If children do not gain the power to act right in emergencies, they will have to gain this power when they are older, or make very serious mistakes. Much suffering is saved when one gains this power of self-control in childhood.

We all know how a seed grows. If it is taken care of lovingly and regularly, it grows to be a beautiful, strong plant. It is the same with little children. All of the great men that history tells us about had a great amount of self-control. They had also self-respect and many noble qualities.

The people who are able to control their tempers, and adjust themselves to all the conditions of life today are more useful than those who cannot. Such persons are always unselfish, for those who are selfish never have control of their own lower natures.

Those who have self-control work unceasingly, and for the good and the welfare of others. You know a man who possesses self-control by his carriage and by what he says in very exciting times. He never becomes excited himself, but always acts quietly and with precision, knowing that if he listens to his heart he can manage any condition that may arise.

The man who has real self-control knows how to do the right thing in the right place and at the right time. That is the kind of a man that a

Raja Yoga boy wants to become. We Raja Yoga boys try with every day's lessons to gain more self-control. We know that it will be a good thing for this nation now, as well as when we are men.

A RAJA YOGA BOY

Facts Worth Knowing

THERE are two distinct types in Japan, the oval-faced, small, refined, aristocratic class, and the round-faced, heavy-eyed, common people.

THE silk industry in Japan is on the increase, and the exports of silk for a single year amount to thirty or forty millions of dollars.

AMONG the trees most common in Japan are the maple, oak, camphor, camellia, lacquer, pine, peach, plum and cherry. The last three are grown for their flowers rather than for their fruit or wood. The bamboo, which is not properly a tree, is perhaps the most generally useful plant in the island.

PORTRAIT OF CHRISTOPHER COLUMBUS

From "Portraits of Illustrious Men," sketched by J. J. Boissard, bronze bas-relief by Theodore de Bry, 1597.

The Latin inscriptions read as follows:

"Christopher Columbus of Liguria, the first discoverer of the Indies, A. D. 1492.

The first to reach

In wing'd bark the isles of Western Ind

And American lands proclaim.

Skilled in the stars, enabled by his daring deeds,

Such was the face of Christopher Columbus."

THE CHILDREN'S HOUR

The Raja Yoga Question Box

OUR brave discoverers! One found for us a new land, the other found for us the beauty of nature and the loveliness of the human heart.

1 Who was William Cullen Bryant?

ANSWER—William Cullen Bryant was born in Massachusetts in 1794. He was the first American to become famous throughout Europe as a poet. He lived to be very old. His poems are all uplifting and beautiful. They will be read in time to come. "Thanatopsis" is sometimes said to be his greatest poem. This was

written when he was only a young student, eighteen years of age.

2 Who was Americus Vespuccius?

ANSWER—Americus Vespuccius was a great explorer. He was born at Florence 1451, and went to Spain shortly before Columbus sailed on his first voyage. He visited America three or four times and built a fort on the coast of what is now Brazil. He also left there a little colony of people, the first in that part of America.

Transparent Wings

IT was late and dark when they arrived, and they were tired and sleepy, and glad to go to bed. Now it was early morning and the sun was shining brightly, and Alex, May and little Johnny stood on the broad veranda, full of delight and animation over the beauties of their new home.

"Look! look!" said Johnny, in an excited whisper, with his eyes fixed on some tall, yellow flowers. "It's got 'sparent wings, and is eatin' ze f'owers."

"Hush!" said May, below her breath, and they stood fascinated, watching a humming-bird, poised over one of the blossoms. Suddenly it made a dart and alighted on a shrub quite near to them.

"They isn't 'sparent!" exclaimed Johnny, and the tiny creature, startled by the sound, flew away, and in a moment was out of sight.

"Johnny, why couldn't you keep quiet?" said Alex in vexed tones. But Johnny was relieving his feelings in a blissful sigh. "Boo'tiful 'itty bird," he murmured. "Boo'tiful 'itty bird, with 'sparent wings and *not* 'sparent wings—has *two* fings for *one*."

Alex looked thoughtful and walked down the steps and along the footpath to the yellow flowers, Johnny and May following closely at his heels.

"It was drinking honey," said he.

"Boo'tiful 'itty bird, with 'sparent wings," murmured Johnny.

"No," replied Alex, with an air of superior wisdom, "it fluttered them so quickly, they *seemed* transparent, that was all.

"I could see fru' zem," returned Johnny, confidently.

"I wonder," said May, "could people see through us, if we fluttered fast enough. Perhaps we could flutter out of sight."

Johnny's eyes sparkled.

"But we have no wings to start with," remarked Alex.

"Angels have wings," chimed in Johnny; "good angels."

"We do disappear and become angels," said May thoughtfully, "but we don't flutter out. I wonder," she continued, "if it could have anything to do with how we think and feel. Perhaps, if we could always have the same thoughts now as we do after we are angels, we might be different. Because after I've been naughty and then done something good, I just feel light enough to fly! And if we could only go on feeling lighter and lighter, and more like real

angels, we might disappear—not really disappear, you know, but only fade out to people who weren't feeling quite as light as we were. Don't you remember, Alex, in Bible days some men used to change before the eyes of the people?"

"Yes, but the *people* couldn't change," said Alex.

"That was because they were 'stiff-necked generations'—the Bible says so—and selfish, and didn't follow the teachings given them."

"That's all right," said Alex, hastily, in conciliatory tones. "I think you're pretty often right," he added, sturdily.

"Children, come to breakfast," said a pleasant voice.

"Come along, Johnny," said May, as she and Alex stepped on to the veranda.

Johnny was still standing by the flowers, his pretty lips parted in a smile. "Boo'tiful 'itty bird," he murmured. "Boo'tiful 'itty bird, with 'sparent wings and *not* 'sparent wings!"

ANNIE P. DICK.

RAJA YOGA CHILDREN GATHERING GUAVAS AT LOMALANDA

"TINY BUDS"

TINY buds are we,
You can scarcely see,
Our wee faces looking towards the sky.
But our hearts are strong,
And the days are long,
And we'll grow to blossoms by and by.
Breezes passing low,
Whisper that they know,
We are buds of promise sweet and shy,
So we drink the air,
Free from thought or care,
For we'll grow to blossoms by and by.
All our little power
Goes to make the hour,
Full of hope, of purpose glad and high,
Though we may not rise,
Bird-like, to the skies,
Yet we'll grow to blossoms by and by.

—Selected

Play, Better than Petting

ONE morning the gray Home-stead cat mounted the stairs to the third story and went wandering through the corridors crying, evidently longing for something that seemed not to be had. Finally it came to an open window where sat a student writing for the NEW CENTURY PATH.

The cat received no invitation to enter, but climbed in without it, still crying and asking to be comforted. The student rubbed its head and stroked its back, which was very satisfactory to the cat while it lasted, but no longer, as it only created a desire for more.

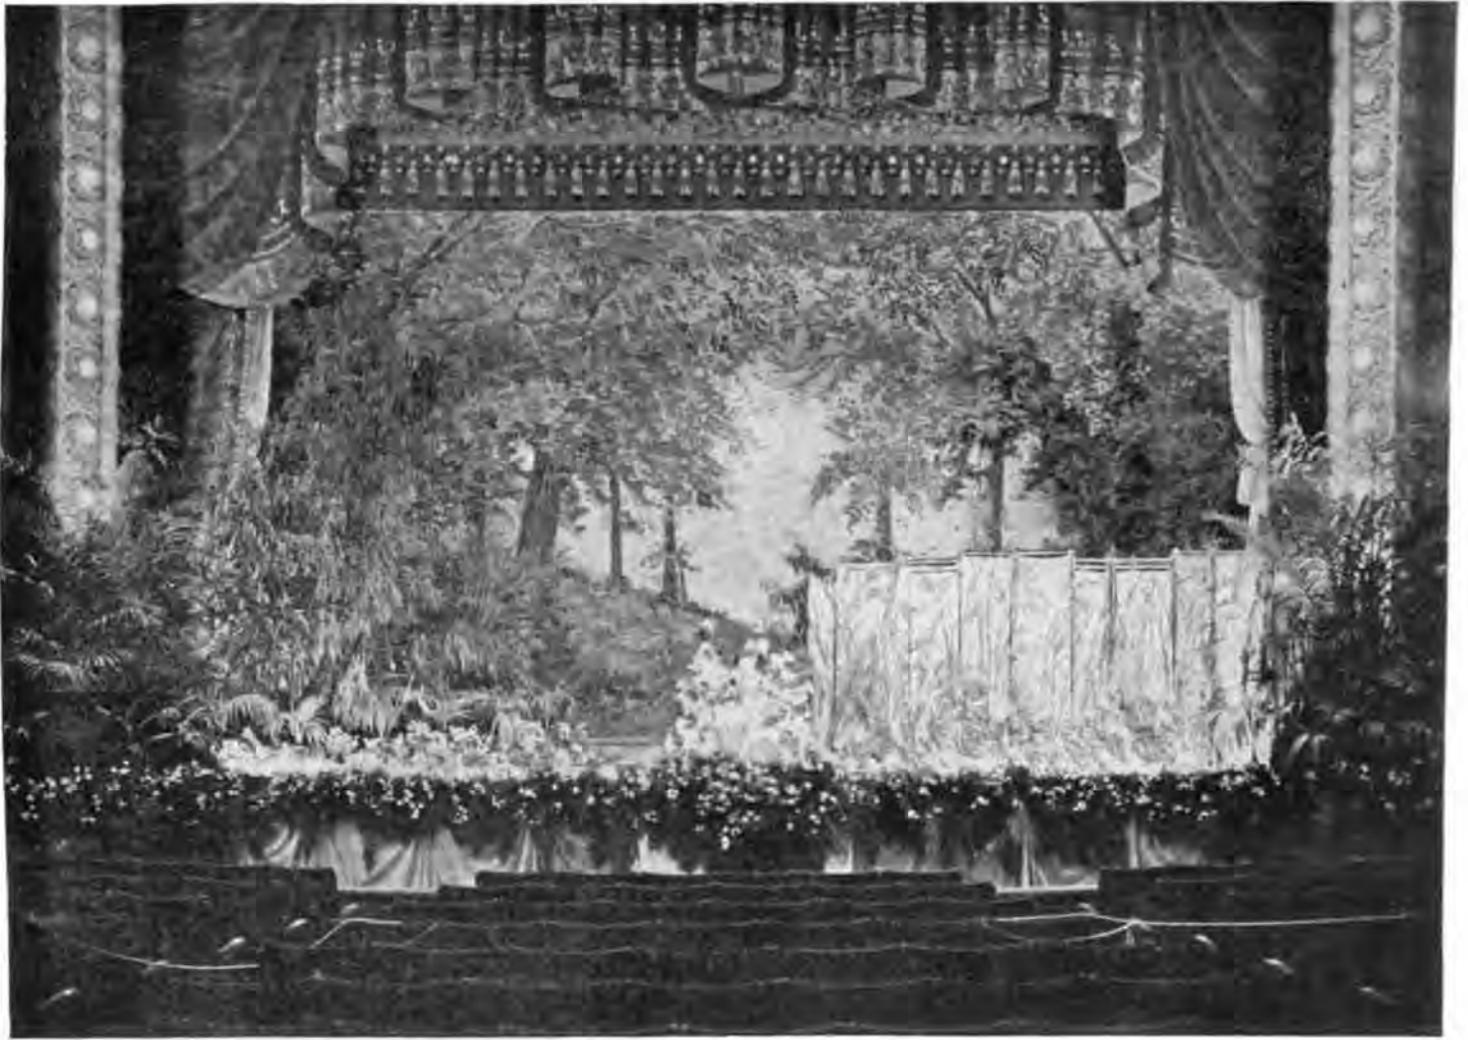

Time being too valuable for continuance of this, the student gently shoved the cat out of the window and drew the blinds sufficiently near together to prevent its return, and then poked a small object through the crack towards it. The cat immediately brightened up and tried to catch the object. This play continued for a little while, when the student stopped and let the cat go, which it did. It went away happy, its griefs forgotten, and no more cries were heard.

Then the student thought how much better was the play than the petting, even for a cat; for the play awakened its own activity and its brighter, happier nature, driving away its troubles as sunshine scatters clouds, while the petting made it more morbid and more dependent.

The little experience was a real lesson in Raja Yoga. It is not petting, or gratifying every desire, that brings happiness. B. H.

Isis
Theatre
San
Diego
California

LOMALAND STUDENTS AT ISIS THEATRE

THE Universal Brotherhood meeting at Isis Theatre last Sunday evening included a musical program of unusual excellence. Among the selections were: *Overture to Rienzi* (Wagner), variations from the *Traut Quintet* (Schubert), *Fantasia Lyrique* for violin solo (De Beriot), rendered by Mr. Reginald Bland; an *Andante* for two violins (Guido Papini). The program was most cordially received by the large audience present.

Short and impressive extracts from the writings of each of the three leaders of the Theosophical Society were read.

From H. P. Blavatsky: "There is but one eternal truth, one universal, infinite and changeless spirit of Love, Truth and Wisdom, impersonal, therefore, bearing a different name in every nation, one light for all, in which the whole humanity lives and moves and has its being. Like the spectrum in optics giving multicolored and various rays, which are yet caused by one and the same sun, so theologized and sacerdotal systems are many. But the universal religion can only be one if we accept the real primitive meaning of the root of that word. We Theosophists so accept it; and we therefore say we are all brothers—by the law of nature, of birth, of death, as also by the laws of our utter helplessness from birth to death in this world of sorrow and deceptive illusions. Let us then love, help and mutually defend each other against the spirit of deception; and while holding to that which each of us accepts as his ideal of truth and unity—i. e., to the religion which suits each of us best—let us unite to form a practical nucleus of a Universal Brotherhood of humanity without distinction of race, creed or color."

From William Q. Judge: "Our philosophy of life is one grand whole, every part necessary and fitting into every other part. Every one of its doctrines must be carried to its ultimate conclusion. Its ethical application must proceed similarly. If it conflict with old opinions those must be cast off. It can never conflict with true morality. The spirit of Theosophy must be sought for; a sincere application of its principles to life and act should be made. Thus mechanical Theosophy, which inevitably leads—as in many cases it already has—to a negation of brotherhood, will be impossible, and instead there will be a living, actual The-

osophy. This will then raise in our hearts the hope that at least a small nucleus of Universal Brotherhood may be formed before we of this generation are all dead."

From Katherine Tingley: "Universal Brotherhood has no creeds or dogmas; it is built on the basis of common sense. It teaches that man is divine, that the soul of man is imperishable, and that Brotherhood is a fact in nature, and consequently takes in all humanity.

"Men must rid themselves of fear, and reach a point where they realize that they are souls, and where they will strive to live as souls, with a sense of their duty to their fellows.

"Unbrotherliness is the insanity of the age. It menaces, to no small degree, the progress of our civilization. Its power cannot be broken or destroyed until man has ingrained into his heart and mind the fact that he is divine in nature, until he realizes that he possesses the immortal potentiality of good, that true freedom exists only where the Higher Law holds in subjection the lower nature.

"Not until he seeks to gain the ascendancy over his lower nature can man do his highest duty to his fellowmen, or be a brother in the truest sense of the word, or live in the freedom of Freedom.

"Let us hope with that grander hope of the soul, the energy of right action, that the day is not far distant when the great sweeping force of love—of true brotherliness, shall encompass humanity, when the knowledge of right living shall be in the grasp of all, and shall be lived in the truest sense of the word, when children shall be conceived and educated in the atmosphere of purest thought and grander action; then and not until then shall humanity commence to build the solid foundations of a golden age and work in the Kingdom of Freedom.

"Preach Brotherhood, live it by sacrificing all selfish desires and working unceasingly for humanity. . . . And this is really the keynote—the recognition of the soul in men, whether they be black or white, despairing or hopeful. It is in all men even though our civilization, our desires, our reason may seem to choke it; even though science in its blindness may not see it—yet it stands majestic, the core and heart of each man's life—the dictator of his being, the director of his destiny."

Art Music Literature and the Drama

Edgar Allan Poe as the Subject of a French University Thesis

IT is interesting to recall that much of the work of our least understood author, Edgar Allan Poe, was written for newspapers and magazines, and that he was successful as a punctual contributor of articles and critical notices that showed keen analysis and careful study. Pity it is that for many of the poems and prose tales which have given him lasting fame in European countries, and which established him as the most popular writer of his generation in America, Poe received nothing more than the small sum paid by the periodicals in which they first appeared.

This is, in fact, particularly sad, considering the circumstances of Poe's life, the later enquiries into which reveal that he was not an habitual drunkard who impulsively threw off his fantastic creations during sober intervals, but that he was a regular and painstaking workman, doing over-conscientiously the very journalistic work which is often done by others with an easy-going-lack of thoroughness.

Any suggestion is of value to us that can throw light on the life problem of Poe, whose fame grows not less but greater as the years pass, and cannot be ignored, however determined the prejudice against him, caused mainly by the inaccuracy of his first biographer.

It is significant that a professor at the Lycée Charlemagne in Paris, M. Émile Lauvrière, recently chose for the subject of his university thesis, "Edgar Allan Poe: His Life and His Work—a Study in Pathological Psychology." M. Lauvrière regards Poe as the victim of a fatal heredity in the form of an ill-balanced constitution and uneven development of the brain, that predisposed him to flights of genius, and made possible the lapses of his life. He attributes Poe's craving for intoxicants not to the habit of drinking—it is a fact that Poe's drinking was not subject to the periodical outbreaks so common among cases of alcoholism—but to a form of constitutional mental degeneracy. M. Lauvrière also notes, in commendable justice to the author whose writings dealt with the weird and horrible without suggestion of impurity, that in Poe's dipsomania there was no trace of the licentiousness that is so inseparably connected with periodical outbreaks of the drinking habit, as it exists today among men, from college students to gray-haired fathers of families.

The French professor's impartial and sincere essay on Poe's life, and the expressions called forth by its publication, indicate that the study of Poe's writings must include an understanding of his philosophical speculations, and the keen analysis of the workings of his own mind, that Poe described in the characters represented in his writings. Pathological Psychology will not suffice, however, to explain the extremes exhibited by Poe's life. Only the Science of the Soul can throw the light needed upon the relation of man's higher nature, ever seeking to dominate the erring mind and body, at times free to take command, but often hampered and driven back by conditions of physical heredity imposed by past mistakes and failures. That a soul struggles and intermittently attains is a promise that the full light will yet pierce the darkness, and at last emit the steady shining of a balanced character.

STUDENT

CHIEF among Japanese musical instruments are the *koto*, a kind of lyre; the *samisen*, a three-stringed guitar; the *kokyū*, a kind of violin; the lute, fife, drum and flute. There are also a number of others.

A Literary sign of the Times

ONE of the signs of the times is the awakening interest in animal stories and natural history. Books which tell of the habits and haunts of our animal friends are becoming more and more popular with both young and old, and every week adds to the list of excellent stories on these subjects. It takes but a straw on the water to show in which direction the river is flowing. And this is a straw which is a hopeful indication that we are drawing closer to Nature and to nature's own law of brotherliness.

More vital than the valuable information gained from this form of literature is the fact that good animal stories serve to arouse, in the reader, a deeper sympathy and a greater love for our dumb friends; the imagination is stimulated by tales of their possible or probable emotions, likes, dislikes and conversations, and a new world is opened up by glimpses of their haunts and of their ways. It marks a step in the right direction.

It is time that men learned that they are the natural protectors and champions of all creatures weaker than themselves—not, as too often now, their persecutors—and through the medium of good animal stories, the reader will learn to hold all life more sacred, and one great blot on our civilization, the necessity for societies "for the prevention of cruelty to animals," will be wiped out.

"GOING TO WORK"—A STUDY OF PEASANT LIFE—by Jean Francois Millet

THE GENIUS

by EDGAR ALLAN POE

BECAUSE universal or even versatile geniuses have rarely or never been known, therefore, thinks the world, none such can ever be. . . . But what is the fact? Simply, that the highest genius—that the genius which all men instantaneously acknowledge as such—which acts upon individuals, as well as upon the mass, by a species of magnetism incomprehensible but irresistible and NEVER resisted—that this genius which demonstrates itself in the simplest gesture or even by the absence of all—this genius which speaks without a voice and flashes from the unopened eye—is but the result of generally large mental power existing in a state of ABSOLUTE PROPORTION, so that no one faculty has undue predominance. That factitious "genius"—that genius, in the popular sense, which is but the manifestation of the abnormal predominance of some one faculty over all the others, and, of course, at the expense and to the detriment of all the others—is a result of mental disease, or, rather, of organic malformation of mind. . . . Such "genius" will fail, if turned aside from the path indicated by its predominant faculty; true genius, on the other hand, is necessarily, if not universal in its manifestations, at least capable of universality.

"WOOD engraving has been known in Japan from the earliest times and the method of cutting has always been very much the same as that employed in Europe until a hundred years ago. The wood chosen was usually that of the cherry tree and was cut along the grain instead of across the end.

Though no press was used for printing, marvelous sheets were turned out by the primitive substitute. The process, until very recently, was the simplest possible. A sheet of damp paper was laid on the block and the back was then rubbed until an impression was transferred. At first, all coloring was done by hand, but early in the Eighteenth century the discovery of printing colors from a second block was made by one Kiyonobu. Today the color prints of Japan are the marvel of the entire artistic world, and have been the means of widespread education in art. While the nobles and the wealthy have the paintings of great artists upon their walls, color prints innumerable are hung in the houses of the poor."

—Extract from Tokyo Correspondence.

THE organ is surely entitled to the name, "King of Instruments," for its reign dates back in our musical history further than that of almost any instrument. The book of *Genesis* speaks of the harp and the organ.

The development of the organ may be traced from the first effort at producing a musical tone by blowing across a broken reed, to such examples of modern organ building as that mammoth instrument in New South Wales, Australia, which was erected at a cost of \$60,000, has five manuals, 126 speaking stops and 10,000 pipes, which include a set of 64-foot reed pedal pipes.

In 1407 an organ was erected in the cathedral at Ely, England, at the great cost of \$18.75. There is still a record of items of the cost of construction. Among them are, "Fetching the organ builder and his board, 13 weeks, 40s. Carpenter 8 days making the bellows, 2s 8d," etc. Carpenters at eight cents a day were certainly not expensive, and organs costing \$18.75 would scarcely be classed as luxuries today. W. R.

Universal Brotherhood Organization

Central Office Point Loma California

WHEN THE WESTERN SUN CASTS A SHEEN OF GLORY ON SEA AND SKY AT LOMALAND

A Mystic Birthday --- The Seventh Anniversary of the Formation of The Universal Brotherhood Organization

THE students at Lomaland, on January the thirteenth, commemorated the close of the seventh, and the opening of the eighth year of work of The Universal Brotherhood Organization. In the year of 1898, on the night of January the thirteenth, this great organization was founded by Katherine Tingley. On February the eighteenth, of the same year, at the Convention held in Chicago, the Theosophical Society merged itself into this larger body.

The afternoon and evening were devoted to paying tribute to the day as one of the brightest in the history of the Theosophical Movement. The students assembled in the Lecture Hall in the afternoon, where music was rendered by the orchestra and choir, aided by the little children of the Raja Yoga School. Addresses followed from some of the original Cabinet officers who were present. These addresses touched upon the victories attained in seven years; on the influence of the Universal Brotherhood and Theosophical Society throughout the world, and other subjects were brought in pertaining to the general interest of the work.

One of the most interesting features was the reading of the Constitution of the Organization. Several of the older Raja Yoga children paid tribute as well, their words doing signal honor to the Raja Yoga system of training.

Telegrams were received from different members in different parts of the world, among them being the following from one of the Cabinet officers, who is also one of the oldest members in the Organization:

"To Katherine Tingley. Congratulations on mystic birthday of Society. Congratulations to all loyal members, and renewed confidence and affection. (Signed) W. C. TEMPLE

Dated January 13th, Pittsburgh, Pa."

The Leader of the Organization, Katherine Tingley, in her address, pointed out the importance of the occasion, dwelling upon the unity of purpose among the members the world over, which had made possible so vast a work in so short a time as seven years. She also touched upon the rich promise of the near future.

In the evening, the members assembled in the grand Rotunda of the Homestead, to continue the celebrations. Orchestral music was followed by speeches from a number of students from England, Sweden, Germany, France, Ireland, Holland and other countries—showing the great results of the presence and activity of the Organization among the peoples of these respective countries. The session closed with an address from the Leader on most interesting subjects connected with the future of the work, indicating certain important points of advancement which would be reached during the months of the coming two years, and the signs of the important period in its history through which humanity is now passing.

It is evident that if the second seven years of The Universal Brotherhood Organization and Theosophical Society show a growth in numbers and influence equal to that of the first seven, this great body will have

proved its right to be regarded as the chiefest of the forces now working for the upliftment of Humanity. Indeed, it is acknowledged by competent observers and lovers of the race that it is today the chiefest of these forces.

OBSERVER

FRIENDS IN COUNSEL

DEAR COMRADES: There is always a fascination about the origin of enterprises destined to be great. You hold an acorn in your hand and picture to yourself the giant oak that lies in embryo within, or watch a marching column of the pupils of the new Academy and try to fancy their effect upon the world when they go forth and liberate those mighty forces now concealed within the youthful forms. Nor need we place the dawning of another Golden Age in any distant future time, for men are very weary and ready for a drastic change.

The sympathizers with the Universal Brotherhood's ideals are plentifully scattered up and down the world, and oftentimes reveal themselves as comrades by the kindling of the eye, or hearty hand-grip at some chance word we let fall. But habit and environment still hold them back and the old order still survives, though its supporters voice an ever-growing protest. A universal restlessness is everywhere diffused and no institution, however venerable, is safe from critical enquiry. The leaders of this movement never claimed they had a new philosophy to preach. They simply offered a modern presentation of ancient truths that lay in scattered, unrelated fragments among the religious and philosophical systems of mankind. The only claim we have to novelty is that here we are engaged in forming the nucleus of a universal brotherhood, by putting into practice certain principles to which mankind at large accord but a lifeless assent.

The children, when they issue forth, will stand before the world superb exponents of a life in harmony with natural law, and by the sweet persuasiveness of right example, and their unaffected gladness in the life they lead will draw the willing masses in their train.

Great is the power of a living example. A man may overload his mind with theories of the One Life immanent in all things, and yet pursue a course of utter selfishness; but let the theorist meet a man who lives in conscious union with the Source of Life, whose every action is conceived and carried out with reference to the welfare of his fellow men, and such a theorist will receive a shock that shakes him to the center. Before our students can begin to build the Temple of Humanity to be, much yet remains that must be cleared from off the ground. In this fact lies the reason for the bitter hate and persecution that have followed Katherine Tingley ever since she began her work. Time-honored tyrannies and venerable frauds must certainly totter and fall when confronted by the truthful and unflinching gaze of Raja Yoga manhood, and with a keen instinct of self-preservation the lovers of the present darkness, like bats of the night-time, flutter with threatening wings about the torch of illumination that flames on this sacred hill. STUDENT

DEFIANCE TO TIME

SHAKESPEARE

NO Time, thou shalt not boast that I do change;
Thy pyramids built up with newer sight
To me are nothing novel, nothing strange;
They are but dressings of a former sight.

Our dates are brief, and therefore we admire
What thou dost foist upon us that is old,
And rather make them born to our desire
Than think that we before have heard them told.

Thy registers and thee I both defy,
Not wondering at the present nor the past,
For thy records and what we see do lie,
Made more or less by thy continual haste.

This I do vow, and this shall ever be:
I will be true, despite thy scythe and thee.—*Selected*

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question How would you answer the objection so often made against Reincarnation, that it shatters all family affections and ties? For instance, how do I know what or who my child may have been in his past incarnation, or whether we shall meet again in the next! Will you please explain this?

Answer I think that most of the objections that arise in the mind against this and other teachings of Theosophy are largely due to unfamiliarity with them and because so many minds of today have for so long been turned in other directions. To very many, Reincarnation has come as something new, and so objections have arisen in the mind even before an opportunity has been taken for its study.

But it is not generally known that this teaching of Reincarnation was accepted as true in the time of Jesus, who gave his own confirmation to it. It was also held by the early Christian Church, and discoursed upon by some of the most renowned of the Church Fathers. Further evidence that it was a well-known teaching in the early Church was the attempt, which at the time succeeded only too well, to suppress it at the Council of Constantinople about the year 535 A. D., when it was declared that whoever should teach the doctrine of pre-existence, "let him be anathema"—the old, old story, let them be accursed who shall teach the truth. For so long, this doctrine of hope has been suppressed and false teachings been put in its place, fostering a false sentimentalism, that the restatement of it has come as a shock to some. But should this be so? Should we allow our preconceived ideas to have such sway over us that we permit objections to a subject to arise in the mind before we have given it due thought and examination. Consider for a moment, if Reincarnation be a fact in the orderly progression of Humanity's life, have we so little trust in the beneficence of the law, the Higher Law which governs man's highest nature, and works all things for his true welfare, that we allow sentimentalism to turn us aside, and warp our judgment?

For, is not the objection, raised in the question, based upon the sentimental and erroneous notion that our children are our *possessions*, instead of fellow travellers on life's journey. As Katherine Tingley has said, as quoted in *The Mysteries of the Heart Doctrine*:

"Parents and teachers, study the way more thoughtfully, more hopefully, more soulfully; bind yourselves to the treasures of your hearts with a new bond, to those who are now your children, those precious souls entrusted by the great Law to your protection and guidance, and who may have been or may be your comrades or even your teachers."

Before definitely considering the question as asked, let us ask what do we mean by family affections and ties, and upon what are they based. Does real affection exist between members of the same family because they are members of that family, or because of a deeper relationship than the physical? What did Jesus say:

"But he answered and said unto him that told him, 'Who is my mother, and who are my brethren?'"

"And he stretched forth his hand toward his disciples, and said, 'Behold my mother and my brethren!'"

"For whosoever shall do the will of my Father which is in heaven, the same is my brother and sister and mother.'"

And is it not true for us all, that they are truly our brothers and sis-

ters, or let us say our Comrades, who are linked to us by the relationship, perhaps the highest of all, of true *friendship*? On the other hand, how little does blood relationship count, if this friendship is lacking?

What, or who was "my child" in his past incarnation? What he was is engraved upon his character now, had we but eyes to decipher it, for nature makes no leaps or bounds, but moves by orderly progression. Who was he?—the same as he is now. But do we know him, or do we see but the outer appearance merely? And the teaching of Theosophy in regard to this is that those who are truly related come back life after life together, for the ties of friendship, of true love, are stronger than death.

STUDENT

Question Is not true life a constant overcoming?

Answer The form of the question evidently shows that the answer, Yes, is expected. In one of the ancient books the question is asked by the disciple, "And does the road wind up hill all the way?" To which the answer given is, "Yea, to the very end." Would we be satisfied with anything less? What did the Christ say? "Ye shall be perfect." And if Divinity is the origin and root of our being, how can the final goal be less than Divinity?

"But," I have heard some people say, "must it always be fighting, fighting, striving, striving, with no rest, no final achievement." Rest comes, surely, as we need it; Nature provides that. But it is not a stopping by the wayside. No, Nature gives to each the rest that each most needs, and when the tired body is worn out, then comes the sweet rest of death, preparing one to take up again the battle of life when the time shall come to return to earth in a new body, with all the vigor and enthusiasm of youth.

And is there not a real joy in the striving, not for oneself, but for others, for humanity? Is there not true joy in helping to bring a little more light to others, in seeking to overcome, not that we shall rise as conquerors, but that the pathway may be a little more easy for those whose burdens are well-nigh crushing them down to earth?

But is there no final achievement? In one sense, Yes. Each mountain peak gained, is gained; each fault conquered, is conquered. But there are always mountain peaks beyond; there are always new heights of self-conquest to be reached, new powers of serving humanity to be gained. Have you ever thought of the progress of a great musician, or a great artist? Has it never occurred to you that they always and ever find new harmonies, new beauties of form and color, which they have not yet been able to express, but which fill them with new inspiration and fire them with new ardor. And do they sit down and grieve about it? Is it not their joy to strive and strive yet again?

To rest satisfied would mean to begin to stagnate, and be the first step towards death, not the death that Nature gives when the tired body needs rest, but the death of the soul.

Life is an eternal progression and if we would live, we must act, we must strive, we must constantly overcome. We are all like the artist and the musician; we are all painting pictures of life, carving and sculpturing, helping Nature to grow ever more beautiful, or—hindering her, tearing down and marring her forms of symmetry and loveliness; we are all musicians playing sweet harmonies, playing, even though imperfectly, our part in the great orchestra of the universe, or—making discord. And so the question that confronts each of us is this,—Have we the true artist spirit, the true musician spirit? Do we love this art of right living, have we chosen to be co-workers with Nature and to help on her glorious work? If so, then the fact that true life is a constant overcoming, that it is a constant climbing to ever and ever greater heights, will be our joy.

STUDENT

MAN is not born to solve the problem of the universe, but to find out what he has to do, and to restrain himself within the limits of his comprehension.—*Goethe*

THE practical Theosophist will do well if he follows the advice of the great Teachers to spread, explain, and illustrate the laws of Karma and Reincarnation so that they may enter into the lives of the people. Men's thoughts must be affected, and this can only be done now by giving them these two great laws. They not only explain many things, but they also have an inherent power due to their truth and their intimate connection with man, to compel attention.—*William Q. Judge*

California and the Orient

“WESTWARD the march of empire takes its way.” Have we fully considered how true that is, and the consequences of its truth? What are the facts that we know?

The curtain of history rises on the great empires of Western Asia, the Assyrian, Babylonian, Phœnician, Medo-Persian, and Egyptian. Then a move westward: Greece arose, and under Alexander of Macedon the Persian glory was extinguished. Still further westward: Rome takes the sceptre from the hand of Greece. The mighty Roman Empire, called later by some humorist the “Holy,” came gradually into being. As gradually it broke to pieces; scattered portions of its power dwelt separately here and there; the great Republics of Italy, Florence and Venice, arose; there was the Germanic Empire.

The steady westering reached the very west of Europe, Spain, France and England. The Empire of Spain is only just ended; that of England still lasts.

The current, still westering, pushed across the Atlantic. Spain established herself in South America and extended an arm thousands of miles further west yet, to the Philippines. England and France occupied North America including Canada. England went as far west as this very State, and, like Spain, extended an arm far into the Pacific to some few islands.

Then America arose on her own account. New England became established, of course on the east, for the westering had not yet begun with us as Americans.

The current continued to push west, now very fast. Fifty years ago its first thrills touched this State: California awoke. Nor is it stopping; witness Alaska and the Philippines, now in American hands.

* * * * *

Let us go back for a moment to the beginning again, to the place where we started in Western Asia, from whence we began to trace the wave.

If it has moved forward from there, across Europe, across the Atlantic, across this continent, and across the Pacific to the Philippines, nearly belting the globe, why has it not quite belted the globe?

We said that the curtain of history rises in West Asia. What was the current doing *before* our curtain rises? Was it doing something else, something different to what we have seen it doing for so many thousand years? We have never *seen* it doing anything else. How was Europe peopled? From the East. Waves of tribes came westward, the Euskarians or *pre-Celts*; then the Celts; then the Teutons. Whence came the Turks and Magyars? From the East, moving westward. The great Mohammedan Empire in Spain was a current that had moved west from Arabia. The conquerors Attila and Ghenkis Khan broke westward into Europe from Mongolia.

Let us go back to our question. We began our historic view in West Asia. Is it not reasonable to suppose that the fires of civilization there were lit from yet earlier ones, moving westward from a more easterly place, from China, from Mongolia? And that in that immensely far away time they were lit in China from a still earlier fire, still more eastward? In the history of humanity which Theosophy gives us, this is the picture, the same as we have reached by reasoning from analogy. Among the great races which Theosophy pictures as having succeeded each other through vast time on this earth, ours—all that we have seen—is the fifth. We are told that the Chinese represent the surviving remnants of the once mighty fourth. The Japanese also represent descendants of the fourth. Each great race held the stage of the habitable earth in the main, at its height. As it gave place to the next, its territory dwindled. The flame of the third great civilization died down, shrank, and at last remained as a few points of light. The flame of the fourth, died down, shrank, and at last remained burning with greatly diminished light in the “Orient.”

And the flame of the fifth now floods Europe, America and portions of Asia.

So if we accept analogy, and the history of humanity which Theosophy gives, we have a long line of civilization-centers, seats of the flame; in order of time: Japan and China, Western Asia, Eastern Africa, Eastern Europe, Western Europe to its fringe, America—first Eastern and then Western—the Western edge of the Pacific, almost the very shores of Japan. Now we have two comments to make.

We began with the quotation, “Westward the Star of Empire wends its way.” Empire? Not necessarily. When we say “Empire,” we think

of arms and conquests. But the westering Star has not always moved in blood. The poet went too far. If he could have got it into a line of poetry, he should have said: Westward moves the intensest point of civilization, the intensest point of human consciousness, the focal point at that particular time of humanity’s keenest life, its most active thinking center. It is that, and only incidentally Empire, that moves ever westward. We Californians do not propose to establish an Empire over New England; but we do know that it is here on the West that the spirit of time, of evolution, is most keenly active in American consciousness. And we are sorry if the East does not see it.

And the next comment is this:

If we are right in our view, the current has now nearly circled the entire globe. On one side of the Pacific is the beacon-light of California; on the other, that of Japan; the beginning and the end of the great journey, the earliest and the latest lights.

Has it now *no* significance for us that the light of Japan has suddenly blazed up in such heroic splendor? If so, we must be incapable of learning anything from history.

But as we are not incapable, we can see that a great cycle in human history is now completing itself, full of unimaginable possibilities; a cycle of such enormous duration that we need not try to compute it. It is completing itself because it is just reaching the point where it began. The seventh note of the scale is sounding.

What kind of civilization are we going to make here? Something wholly new, surely. But at present we have not begun upon our real work, or do not know that we have. Thus far, we are hardly more than repeating that civilization of Europe which we have begun to leave behind. But the civilization of Babylon was not like that of Egypt. In her turn Greece developed an art, a drama, a poetry and a life that was also unlike that of Egypt. Roman life was not like that of Greece. And again, the civilization of modern Europe, her thought, art, science, are in many ways dissimilar to Roman. So far then as our ways are merely a copy of those of Europe, so far as San Francisco is merely another London or New York—so far are we from the real and peculiar civilization which we have to develop. But we can rest assured that it will be outdone by nothing that has gone before. Rather may we think that it will sum them all up, and yet be something new? What humanity has done, humanity can do, and more. Is not all the past, present in us? If we trace the blood in our veins back through the generations, shall we not come to Rome, to Greece, to Asia? And it has still all its ancient powers.

What is the meaning of this stately procession of civilizations, one after another through the millenniums? We cannot suppose it to mean nothing. They are successive bursts of energy of the human spirit, ever striving up and out towards the divine, striving to put forth the perfect flower. And as we look back, even with the dim vision of history, we can see one event monotonously repeated. Babylon, Rome, Greece, Spain, England, and probably all the rest, tell the same story. Their civilizations reached a certain point; the consciousness of the people became deeper and richer, seemed about to burst into the perfect flower of life; the premonitory signs were there; when, little by little, the energy began to be diverted, to expend itself in conquest, armies and navies, and to burn itself up in luxury and sensuality. The attempt had failed; the spirit of life could not express itself there as it had tried; so it departed westward and took a new birth in the next civilization. Unless we can see and feel that attempt, we are not studying history aright. Does it not seem as if there were two countries, the beginning and the end of the great march, California and Japan, preparing to be the field of a new trial? Two lands that are the termini of a now sunken continent that once bridged the Pacific! [TO BE CONCLUDED IN FOLLOWING ISSUE]

By this time, like one who had set out on his way by night, and travelled through a region of smooth and idle dreams, our history now arrives on the confines, where daylight and truth meet us with a clear dawn, representing to our view, though at far distance, true colors and shapes.—MILTON: *History of England*

THE MYSTERIES OF THE HEART DOCTRINE

Prepared by
KATHERINE TINGLEY
AND HER PUPILS

*The Theosophical
book of the
Twentieth century*

Tells the story and the history of the Theosophical Movement Throughout the World; tells what it is and why it is — reveals the mystery of the Doctrine of the Heart.

The prices are \$2 in cloth and \$1.50 in paper, which barely cover the cost, for it is printed and bound, not gaudily, but with such carefulness and thoroughness of art and craft as to make it unique among modern edition books.

True Religion Is a Constant Attitude of Mind

IN the keen discussions everywhere going on as to the right attitude for Christians to maintain in face of the contrariety between old religious traditions and the light shed by modern scientific research, one finds such questions asked as these:—"Shall we have to discard religion? Can it hold its own? Is it any longer necessary?"

In short, religion is treated as a department of thought, in a category with science, philosophy, etc.

This view evidently confuses true religion with that spurious religion which consists largely of dogmas and man-made obligations. There is failure to distinguish between religion natural, eternal, and universal, and religion traditional, local and temporary.

True religion might be defined as the sacred obligations which arise

from a sense of the Soul-life within. The presence of this Soul-life inspires us with veneration for the supreme power; with love of order, harmony, justice, purity, etc.; with sympathy, compassion, generosity. It gives us thirst for a fuller knowledge, and glimpses thereof.

But human ambition, taking advantage of human indolence, creates a system of dogmatists. Able individuals undertake to do for us what we do for ourselves; to act as intermediaries between man and the divine;

Beliefs & Du- ties Defined in Dogmas

to be the recipients and dispensers of divine grace. As a necessary part of such a system, formulation is introduced. Beliefs and duties have to be strictly defined in dogmas and rules, for liberty would take people out of the grasp of the system.

Now we have come to a crisis when the formulas are too old-fashioned. Theologians and divines recognize that they must be enlarged, and perhaps entirely remodeled, to keep pace with the times. But they speak of religion as if it were a separate department which has to compete with science and the others.

Religion, however, according to the definition given above, is part of the whole life, and belongs equally to all departments of thought and feeling, which it permeates throughout. Can we not be religious in our science, in our politics, in our social science, our education, our commerce—all? Or are we to be religious only in connection with certain special ideas, and irreligious in everything else; religious only on Sundays (also on Holy Days and Thursdays at half-past seven), and "secular" on all other occasions?

True, there are attempts to replace traditional creeds by moral instruction based on ideas of duty, patriotism, honesty, truthfulness, and so on.

Substituting New Formulas For the Old

But are not these lessons also grafted on, added to, the ordinary life and its ideals, rather than infused into the whole life? What is the use of bringing up a boy in a system of "self before all," and then giving him additional instruction in principles which, from the standpoint of his actual life, are visionary and unpractical? This is only substituting another set of formulas for the old set. Religion remains still apart from conduct.

The fact is religion does not go deep enough into life; and the reason is because religion is not grounded on the facts of life, but on vague notions of Deity, the Soul, and so on.

True religion is based on the principle that the Soul-life is the only life, anything else being merely disease or a living death. And this principle must govern every smallest act. A person whose acts are so directed is religious always and everywhere.

The only schools where this is done in our modern world are the Raja Yoga Schools—for grown people as well, since Lomaland is a Raja Yoga School for adults as well as children. In this method, the principles of true, universal, and eternal religion are applied right at the very center of real life—the "small" acts of daily living which make up the great whole. Those little drops of opportunity and little grains of time are generally left over for the devil, who knows well how to use his advantage.

Raja Yoga Is the Royal Science

Hence the devil of selfishness and impatience and all forms of disquietude has the empire of all the real part of life, while religion worries and amuses itself with the gauzy future and the fading past.

Let us then cease trying to bolster up old traditions, and get our religion right down into our life by Raja Yoga, the Royal Science. H. T. E.

A Pernicious Formula

"THE last bulwark of peace is an absolute preparedness for war." Under the cloak of this formula, western nations are trying a vast experiment. They are increasing their armaments to the limit of endurance. Where exactly this limit is no one knows. That is to say, no one knows what number or proportion of the population must be pushed over the poverty line into starvation before the breaking point comes. It is said that twelve millions of the population of England are now on or over that line. Her national debt is about \$90 per head. Germany is in somewhat similar case, and is likewise steadily enlarging army and navy. Both peoples are, however, extremely open to a criticism made by the German Chancellor in reply to a question on the point. He said that a nation which spent an annual \$750,000,000

on drink should not grumble at having to spend \$300,000,000 in preparation for war. The cure, permanent or temporary, for the difficulty, must be that "breaking point," whatever its nature. And its nature must remain an interesting problem till it comes. One can only hope it may take the peaceful form of an agreement to disarm in part or wholly, and the establishment of an international court of arbitration for all disputes.

STUDENT

The Treasures of Herculaneum

AS soon as the essential money comes in, research is to begin on the site of the buried city of Herculaneum. For some reason, practically nothing has ever been done here, but the city promises far greater additions to our knowledge than Pompeii.

In the first place the eruption did not ruin it as it did the latter city. It lay lower and was buried rather than burned, buried in mud and ashes. But in Pompeii whatever was burnable was destroyed by the hot ash and pumice.

Secondly; whilst Pompeii was rather a middle-class commercial town, Herculaneum was the residence of many of the great Roman families, possessing all the culture of their time. The finds in literature and art are therefore sure to be of priceless value, filling gaps which we have had no means of supplying. Poets and historians that are but names will come out into the clear light of their own productions. We may have the poems of Sappho, the tragedies of Æschylus, the missing books of Livy. One single villa was excavated 150 years ago, the villa of Lucius Piso, father-in-law of Cæsar; and it yielded a finer collection of marbles and bronzes than the whole of Greece, excepting only Olympia, Delphi and Athens. There were also no less than 1750 manuscripts. But Piso was unfortunately a devotee of late Epicurean philosophy, and his library was of little interest.

The work is in the hands of Professor Waldstein, who has secured the interest and help of the King of Italy, King Edward, and several European governments.

STUDENT

China and Christianity

REPORT says the dowager empress of China has been "converted to Christianity through the influence of Minister E. H. Conger and his wife," that she is about to make public announcement of the fact, and that the announcement is to be followed by steps which will inaugurate a great era of reform throughout the Chinese empire. The country will be regenerated like Japan.

The Japanese took over "civilization" in a lump and sorted it out into things which could be used and things which could be discarded. They have probably a pretty good idea of what "Christianity" is—that is something showy and inartistic, which you are expected to wear in public, like frock-coats and silk hats. Possibly the empress dowager intends to create a staff of Christianized Chinamen for the purpose of treating with occidentals. Or perhaps she was only indulging in a sly joke.

The Orient seems to have made up its mind that it is advisable to learn a few of the tricks of the western civilization, so as to hold its own. But it will be "converted" just about as much as a Chinaman is turned into an American by wearing a tall hat.

E.

Religion and Dividends in Papua

THE formation of a company is proposed whose double object will be to teach the natives of Papua Christianity and industry. As their immediate ancestors were, without exception, cannibals, and their own moral level is very low, they undoubtedly offer a field of work to the philanthropist. But a company undertaking this work, and proposing to declare a dividend, does not exactly take one's approval by storm. In the projected plan for getting them to cultivate cocoanut, rubber, coffee, cotton, etc., "the natives will be employed under Christian overseers, who will pay primary attention to their religious welfare."

It is a remarkable combination of business and religion. Suppose the Papuans object to both, would the "Christian overseers" feel justified in suspending their religious ministrations whilst they applied some form of coercion?

C.

Finding Fish-Shoals by Electricity

REPORTS from Germany state that a patent has been taken out for an apparatus which will locate shoals of fish by electricity. The contrivance

consists of a microphone enclosed in a water-tight case, which can be lowered into the water, and is connected with a telephone, battery, etc. The constant tapping of the fish against the immersed vessel is heard in the telephone receiver. The proverbial dumbness of fish can no longer protect them from the scientific ear.

STUDENT

War Mortalities

IT is curious that the more deadly become the weapons of war, the lower is the mortality. The slaughter at the battle of Liao Yang, which appalled the civilised world, amounted only to ten per cent of the total forces engaged. In the oldest wars we know of, the fighting was hand to hand; and each man fighting had to kill or be killed by his opponent. Any kind of missile, from the bow and arrow downward, lessened the mortality; and with our long range modern weapons it has reached a minimum. In the great battles of history, before the invention of gunpowder, a loss of two or three hundred thousand men was no very uncommon story. In the assault upon Alesia, for example, the forces of Cæsar are said to have killed about 300,000 of the enemy. After these battles followed the deaths of the wounded from bad surgery and non-existence of field and hospital relief.

It is not the mortality of modern war that will kill it; nor even the costliness of battles; the crushing burden comes from preparedness for war, the keeping up to date in vessels, guns and ammunition.

C.

Syria Past and Present

TRAVELLING in Syria may not mean much to the casual European or American wealthy enough to try it for a holiday. But to the student of history and archeology it will wake printed facts into a life they never had before. A recent book of travels gives us this picture of the country:

The whole of the route to Ma'aret en-Noman is dotted with wells and tombs, all interesting and worthy of archeological observation: it is on such a road as this that the contrast between the South African veldt and Syrian open country is so remarkable—the former empty, unmeaning, where man is an uninteresting cipher, and the only thoughts of the traveller can be of the future; but in Syria every stone has an interest, every hill has been trodden into paths, man has left his marks on every rock; the very caverns are inhabited by troglodytes, and every stage of early society is to be seen—the cave-dweller, the nomad, the semi-nomad, the villager, the townsman. No one who has the least imagination can long remain unaffected by such associations. The road from Damascus to Aleppo has seen nations rise and fall, vanish, revive, and die out; many have trodden its dusty paths, and there are more to come.

H.

Vulgarizing Natural Beauties

THE project to build a light railway through places in the immediate neighborhood of Snowdon is meeting with natural remonstrance from lovers of beautiful mountain scenes and peaceful surroundings. There are already several railways in the district, and one of them runs to the very summit of the mountain; so that the spot may be said to be already sufficiently vulgarized, and perhaps this newest enterprise is due to the spirit of company-promoting. The building of light railways is a scheme that was devised in the interests of the agricultural transport trade; and it will have outlived its usefulness if it is to be used as a means of vulgarizing natural resorts.

STUDENT

Compulsory Greek

THE battle in the English Universities against the compulsory inclusion of Greek in the curriculum is by no means lapsing. The more conservative Oxford witnessed it in a mild form. The proposal there was only that honor candidates in science or mathematics should be exempt. For the time this has been negatived. But at Cambridge it is proposed to exempt all candidates from compulsory study of this language. No decision has as yet been taken; but there are plenty of men in the latter university who, while opposed to the extremer suggestion, would have welcomed that which was made at Oxford.

C.

Frontispiece---William Quan Judge

THIS week's cover page of the NEW CENTURY PATH contains the face of Wm. Q. Judge, the second in the line of succession of the world's Theosophical Leaders. Mr. Judge succeeded to the Foundress of the Theosophical Society, Helena Petrovna Blavatsky. A successful lawyer, a brilliant writer, and a man of extraordinary insight into human nature, he was well fitted to carry on the great humanitarian and philosophic work of H.P. Blavatsky.

Some Views on XXth Century Problems

Whitewashing the Blood Stains

AT a recent meeting of the Welsh Astronomical Society, a paper was read on the possibility of the inhabitedness of other worlds. But we do not now concern ourselves with its theme; it was by certain historical statements of the writer's that our interest was aroused. Readers can exercise their intuition in trying to fathom the deep secret of his religious connections.

"Cardinal Cusa, in the Fifteenth century, taught and wrote that the sun was the centre of the solar system; and he was followed by the illustrious Copernicus, both of whom received high honors at the hands of their brother theologians." Does it not read charmingly; as if their "brother theologians" eagerly honored them for their presentation of much loved astronomical truth? The fact is that Cusa, after having recanted some very pointed charges of forgeries of documents which he levelled against the Papacy, was rewarded for his recantation by various honors; his academic speculations about the earth attracted no attention, except in so far as they touched on a mystical philosophy which he evolved and for which his "brother theologians" charged him with the heresy of Pantheism. As for Copernicus, the great work by which his name has lived was published synchronously with his death; there was no chance to persecute him, and the "high honors" were for quite other reasons.

"Giordano Bruno is generally believed to have been martyred for maintaining the plurality of worlds; but the late Marquess of Bute, one of the greatest scholars of our time, spared neither pains nor expense in investigating the matter at first hand, and came to a very different conclusion." Quite so. He was martyred for saying that the monks and priests of the time were avaricious, dissolute, and the breeders of every kind of dissension and quarrel. *But the silent burden of the quotation is that he was not martyred at all.*

Now we come to Galileo. "It was commonly thought that the great philosopher was put to the torture; but research had proved that this was absolutely groundless. . . ." No; the threat of torture was over his head for two months, while the Inquisition held him; and the threat was sufficient; he recanted.

"His great contemporary, Kepler, on somewhat similar grounds, was persecuted by the Lutherans, and had to flee, taking refuge with the Jesuits, who, notwithstanding his stout Protestantism, were only too proud to befriend so illustrious a man." What are the facts? He was first banished, as a Protestant, by the Catholic Archduke Ferdinand, and had to leave the country. The "persecution" he received from the Lutheran theologians of Tübingen consisted merely in exclusion from professorship in that University. The Jesuits befriended him on his banishment—by a Catholic—for obvious reasons; they had no objection to his science; and as a Calvinist, he was a useful thorn in the sides of the Tübingen people. It was too late to try and kill the heliocentric theory.

Now these casual remarks came in the course of a scientific paper, hardly noticeable in their setting; but nevertheless effective in leaving their mental impression. There is a general attempt going on to efface our memory of historic persecutions; sometimes its very subtlety consists in its extraordinary boldness. It is therefore worth while to point out the straws whenever one sees them blowing through the air. STUDENT

Misused Imagination

THE Japanese Baron Suyematsu, writing in a contemporary on the religion of Japan, quotes a prayer which he says represents the essence of Shintoism. It is this: "Our eyes may see some uncleanness, but let not our mind see things that are not clean. Our ears may hear some uncleanness, but let not our mind hear things that are not clean." One is reminded of Boehme's statement: "No fire nor sword can hurt the soul; only the imagination; that is its poison." So the Shinto prayer could probably be better translated: "Our eyes may see some uncleanness, but let not our imagination reproduce them." It is through imagination that we fall, and through it that we may rise. "Give up the personal life," says an Eastern book of introduction to the soul life. And it means give up dwelling in imagination

on the passing nothings of the moment till they become of the solidity of iron and of the size of mountains. *What he said, what she said, what they did, what I have now or shall buy tomorrow*—it is these things that tie us to the earth. To begin to give them up is to enter the path on to the light, to peace. And it is also the beginning of compassionate appreciation of the darkness in which dwell those whose entire consciousness is given over to them. We do not need to imagine the diviner life; it is always present; we have only to give up imagining—and therefore creating—the trivial life.

Yet social conditions are now such that the outer life, in which food and warmth and clothing are needed, must urgently and anxiously dominate the whole consciousness of the very poor. While our compassion drives us to lift some of this burden, to give necessities and then to give what are called luxuries—music, pictures, literature—we need not forget that beyond all this, reached in part by means of this, we are giving opportunity to the divine life to enter their minds as it has begun to enter ours. STUDENT

The Lessons of Difficulty

DIFFICULTIES are of no consequence except as a sort of mental gymnastic. That is practically the burden of Helen Keller's recently published essay on optimism. And she is surely entitled to preach that sermon, for she has "been there"—into the land of difficulties—farther than almost any other of her generation, and conquered it and made it fruitful. She does not so much bring, as constitute in herself, a message. Her difficulties would almost seem to be an experiment of the soul—to determine how far they could be accumulated and yet be brought to nothing. May it not be that difficulties of environment and personality are never wholly insurmountable, are never out of relation to the strength of the man or woman against whom they stand? That in fact they are set by the Law and not by chance; that they should be therefore welcomed and respected as opportunity, and treated as whetstones for our unsharpened powers? And one sometimes wonders whether strong souls, in their will to serve, as part of their teaching to us, may not voluntarily assume environments of birth and heredity in order to show us the meaning of difficulty, to unveil for us the purpose and benignity of the Law underneath its hard exterior. STUDENT

The Submerged Ninth

SOME startling statistics on American social life come from Mr. Robert Hunter, a reliable authority on the subject on which he writes. At least ten million of our people, he says, are now in a state of acute poverty. "Acute poverty" covers all those who, while not immediately starving to death, are not able to get enough necessities to keep themselves physically efficient, or in what is called "health," and of course all those who are actually starving. Ten millions—about one person in nine. In certain States—New York, Connecticut, Ohio, and others, the proportion is one in five!

We read all this along with the rest of the contents of Sunday newspapers—we, the heirs of all the ages—and then think no more about it; it is merely "very curious." But those ten millions must be doing a good deal of thinking! Surely the nobler—and safer—course would be for us who are not among that ten million to do more thinking about it than they. C.

Who Are the Roumanians?

A CORRESPONDENT of a literary journal calls in question the accuracy of the usual statement that Latin is a dead language. It is alive, he says (and shows by some sentences), in Roumanian. Judging from his quotations, this tongue is so much more nearly Latin than are either Italian or Spanish that it may almost be said to be Latin.

There are various views as to the origin of the Roumanian people. Romanized provincials of Trajan's Dacia, say some; immigrants in the XIIth century from the west, others think. But it seems also true that during the days of the Byzantine Empire a constant stream of small colonies kept crossing the Danube into this little country. This would account for the Latin, but it is curious that the changes effected by time have been so slight as compared with Italian. STUDENT

✻ The Trend of Twentieth Century Science ✻

Man and the Anthropoid Apes

STRAWS will show the direction of the wind, and many minor discoveries in science are being made which testify to the accuracy of the theory of evolution brought to the modern world by H. P. Blavatsky. Man's evolution has not been the crude, haphazard process, the mere accidental result of blind forces, that Hæckel and the materialists would have us believe. The traditions preserved in the first chapters of Genesis and in other Archaic Scriptures, now that Theosophy has thrown its brilliant illumination over them, show a far more profound grasp of the evolutionary process, for they include many factors entirely forgotten or ignored today. As the complex nature of man becomes daily more realized, and as unexpected facts in geology and natural history come to light, the clues given in the Theosophical teachings will be increasingly demanded by awakened minds.

It has needed the experience of immense periods of time, of whole races of men, whose relics lie under the chalky ooze of the Atlantic or the manganese beds of the Pacific, to bring us even as far as we stand today. And the evolutionary wave has not always moved forward; it has halted, eddied, and even receded for awhile.

Partially supporting the view of some leading biologists, such as de Quatrefages, that the anthropoid apes represent a descent from an early human race, Theosophy adds that this race had intercourse with a pure animal, the original apes resulting. They are an eddy in the stream of life. The anthropoids repeat, in the small cycle of their individual lives, their degenerating racial history which has now led them far from their primal state. As they grow to maturity the skull recedes and the brain is thrown back as the brutal jaw apparatus develops, while the good temper and intelligence of their youth is impaired. A highly interesting discovery in this connection has just been announced from Northeast India where the jaws of a fossil chimpanzee have been found in the Tertiary deposits, the teeth showing unmistakable resemblances to the human form absent in the living descendants.

A few years ago some scattered bones were found in Java and loudly claimed to be the "missing link." It was said that the structure of the hip joint showed that the creature could not easily stand upright. Writing many years before this find, H. P. Blavatsky said, quoting an ancient Eastern commentary on the *Book of Dzyan*, that in the far past there were "red-haired swarthy men, going on all-fours, who bend and unbend, (stand erect and fall on their hands again) who speak as their forefathers, and run on their hands as their foremothers." Students of Theosophy do well in trusting their teachers, and should never forget that the theories of modern scientists are constantly being remodeled and even entirely changed, as they approach nearer Theosophy, the unchanging truth. R.

Artificial Foods

M. BERTHELOT, the famous chemist, thinks that the time is soon coming when the essentials of food will be made artificially. Heat-formers—starches, sugars and oils—consisting of carbon, hydrogen and oxygen, will be built up from water and carbonic acid by means of force obtained direct from the sun or from shafts two or three miles deep, sunk into the earth's crust. The nitrogen of flesh-formers will be added from the air.

There is no chemical impossibility nor even—if one looks a little ahead—difficulty in the matter. And it is quite possible that the artificial foods would be cheaper after a little while than the natural. But it is also possible that they might lack a subtle and as yet unanalysable something which natural foods possess in their natural state. That, however, we probably get rid of as it is by our elaborate cookings and predigestings.

The present facts point to M. Berthelot's conclusion. Fats and oils are already made synthetically; sugars and carbohydrates are partially so. Such industries as were connected with the growing of indigo and madder have ceased or are ceasing because those two dyes are now made artificially. Quinine has been made. There never was any truth in the contention of Malthus that population continually tended to outrun the possible mean of subsistence; even if there had been, modern chemistry would destroy it by its synthetic products. STUDENT

The Conditions for Life

A UNIVERSITY science class is not expected to argue with its teacher; and so, when Professor Matthews, of Chicago University, informed his pupils (according to a newspaper report) that "the present creation of life has been proved the result of purely physico-chemical forces," they doubtless sat silent.

But they might have asked for a *single fragment* of evidence that life has ever yet been experimentally produced, a single case in which something already living was not the base of the experiment. They would have asked in vain. No cell or part of a cell has ever been made. Cells and parts of cells have been stimulated by electricity and saline solutions to begin upon elaborate processes of development; have been made to give origin to other cells. And in the reports, the role of the electricity has been so dwelt on as to obscure the radical fact that *without the living fragment* nothing could have been possible.

These people will never get their mechanical universe. By the time that they have succeeded in getting life to manifest in the laboratory, the public will have outgrown their theories. It will merely say: Yes, very interesting; it corroborates what we knew from other sources—that given the conditions, the omnipresent conscious Life will make use of them to break through into manifestation. And the conditions you have intentionally brought about are but a sample of those which, on the vaster scale of nature, Life itself is also intentionally bringing about for its own purposes.

Professor Ladd voices the scientific conclusion of the near future when he speaks of the mind as "*a real being, which can be acted upon by the brain, and which can act on the body through the brain.*" And human evolution lies in the deepening of its self-consciousness and self-knowledge.

The belief that nature is an unconscious mechanism, that consciousness can arise from various combinations of unconscious stuff, that the whole procession of changes have no purpose and move towards nothing in particular—will soon seem simply barbaric.

Possibly the personal element will one day perplexingly present itself in science. There may be some men to whom the higher lines of even chemical experimentation may be impossible. Nature may not unveil her subtler secrets to those who will not know her soul. The intuition which can divine natural laws in advance of their discovery will have its counterpart in the power to get experimental results impossible to the materialist. STUDENT

A Forgotten Race

CAPTAIN JENSEN, of the barque *Silicon*, which has just returned from the Arctic seas, reports that while he was on the southwest coast of Greenland, there arrived from the interior a party of giants, varying from seven to nine feet in height, copper-colored and with the features of North American Indians. They made known by signs that they had been driven by great storms from the inland.

That a giant race lived in the far interior has long been a traditional belief among the Eskimos. Greenland was once connected with America and with Europe, and, according to H. P. Blavatsky, was part of Atlantis as well as of yet earlier continents. And its climate was once tropical. There are records which give the wanderings of a part of our own "Aryan" race downward from thence, a million years ago, to Central Asia, the point at which science first catches a glimpse of it. Are these giants the belated and severed tail of that procession, remnants of the witnesses of so radical a climatic change? STUDENT

A Hyena Den in England

AN interesting cavern has recently been discovered in Derbyshire, England. Among other purposes to which it was put in the far-off days when that country rejoiced in a tropical climate, was that of a hyena den. It contained also remains of the lion, rhinoceros, elephant and fallow-deer. Great Britain has seen many climatic conditions in her day. In fact she has experienced all there are, ranging from the icy touch of glacial epochs to the hottest tropical. We understand that Englishmen regard their weather as reminiscences of these various periods. STUDENT

A Garden of Winged Flowers

WHY do flower-lovers and animal-lovers never keep butterflies? Not, we mean, dead and under a glass case, but alive in flower-houses and wire enclosures. There is one such butterfly farm in England; but it is kept for the supply of "specimens," and not for the beauty of its occupants. Excepting this, we know of none.

The farm is in Scarborough and occupies a considerable extent of ground. For tropical butterflies there are glass houses containing plants and trees that the insects need for food. Some fly free and some are confined to the neighborhood of the appropriate flowers by light netting stretched on bamboo frames. The tropical butterflies make a very brilliant spectacle, some being as large as half a sheet of note paper.

In the open air the limbs of the trees and whole plants are also sheathed in large netting bags. These are mostly for the caterpillars, which when they reach the chrysalis stage are either removed and taken care of till their season for maturity, or left, if they can stand the winter, attached to the twigs. The flowers needed by the butterflies for food sometimes prove insufficient. What there are, are then smeared with honey, or in some other way artificial feeding is resorted to. In this work the proprietor has found that butterflies and moths can be easily tamed, and in a short time learn to come and feed from his hand. Their market value of course varies very much—from one or two cents up to twenty-five dollars.

One can imagine no more beautiful addition to a hothouse than a number of butterflies flying among the foliage. The drawback is of course the magnificent appetite of their caterpillars.

Wonderful Intelligence of the Crow

THE crow, while generally made war upon by farmers, is a great friend to them, doing them much more good than harm by destroying insects and worms that do far greater injury to the crops. The crow knows the danger of a gun in the hands of a man and gets out of the way as soon as possible. That is, when the guard gives the signal, the whole flock gets out of the way. The schemes that man has devised to entrap them have made them very wary, and they examine well any tempting thing which he may place in their way.

A lawyer thought he would get the better of a flock of crows that he saw sitting on a fence, so he took some corn and fastened long strings to quite a number of the grains, keeping one end of the strings himself. Then he scattered the corn all about under some trees not far from where the crows sat. They watched the performance from their perch on the fence, and after the man had disappeared from sight, one crow flew down to the place where the corn was scattered. He walked carefully all around examining everything with closest scrutiny, turning his head first on one side to look at it with one eye, and then on the other side to look at it with the other eye until he was fully satisfied concerning the character of the affair. Then he flew back to the fence and apparently reported to the rest, and all flew away without touching a grain. Crows live in com-

munities and are said to have a form of government with certain rules of conduct, and any one found guilty of violating these rules, after a trial of the case by the whole community is at once punished according to their ideas of justice.

Finally, cares among crows are quite equally divided, as both birds share the responsibility of sitting upon the nest.

How much that we are wont to consider as characteristic of a high order of human development may be found in the lower kingdoms of nature!

STUDENT

Terrible Cruelties Incidental to Our Civilization

JUDGING from a graphic account, stock ranching on the prairies is productive of terrible suffering to many thousands of animals in winter. They wander over the snows, tortured by hunger, cold, and thirst, eating the snow, sleeping on it, from December to April—those that survive the ordeal. Nature has to bear the crushing weight of so much selfishness and indifference in which we are all involved as in a net. What bounty do we deserve from her in return? E.

A Glimpse of Nature Life

THE dry season is at an end and now we are witnessing the annual wonder of recreation of plant life. From the earth will issue forth the feathery beauty of purple heliotrope and the flame-draped lattice-work of the poppies. Delicate ferns and dwarf iris will appear upon ground which has been as dry as dust for several months; the juicy rock-cress, or miner's lettuce, and the equally palatable wild portulaca will cover the slopes; and expanses of beautiful grasses, dotted with cream-cups, sun-cups, daisy-blooms, and blue-eyes, will offer the sylvan retreats so refreshing to weary mind or body. Of course the chillicothes, or wild cucumbers, are out long ago and are well in bloom, for they have their own schedule quite independent of such a trifle as weather; besides which they make it a point of honor to be out of the way of the delicate annuals by the time they need the space. The squirrels are on the lookout for their seeds, too, and the chillicothe seems to like to furnish them by the quart, keeping them sheathed in spiked armor until they are quite ripe, so that no foolish young squirrel may get the colic by eating them green; maybe there are other reasons also, but that is a good one. There will be nut-grass, too, which is really a relative of the Egyptian papyrus and not a grass at all. It will have little sweetened-cocoa-nut-flavored potatoes about as big as peas, for which the mice and squirrels dig most industriously. At present all the rabbits, cotton-tails, squirrels, mice, rats and the rest of the family are living chiefly on a steady diet of cactus leaves. It is very interesting to examine the places where they have been eating and see how cleverly they nibble through the network of needles at one place, whence they work in each direction, eating around each cluster of spines and allowing it to fall away. A nibbled place, once begun, seems to be a family possession, so we can easily imagine a whole civilization centering about them; the sturdy father clearing a way for dinner and keeping off lazy youths, or watching for hawks while his family dines. A LOMALAND MULBERRY ORCHARD—SOME OF THE BUNGALOW RESIDENCES IN THE DISTANCE

THE GREATER LOVE

HENRY HOYT MOORE

THE bee that sips her sweets from flowers fair,
Flying on careless wing now here, now there,
With azure skies above, green sward below,
Might seem the soul of self-devoted care,
Her life a draught of nectar without lees.
Not so! Her prime is full of strenuous deed
That shames our own in generous mood
Of work for others' good. Long summer days
She builds her golden house, with guerdons stays
Her Queen spreads her young, and stores her food—
Then sudden shuns her wealth, her home, her brood,
And seeks new haven on an unknown sea,
Leaving her life-work to posterity.—Selected

THE written history as yet available to the readers of this age, has so besmirched the characters

and misinterpreted the motives of many of the great ones of earth, that to our vision there comes but a confused picture of their lives; so confused that we wonder how, being so small, they could yet be great enough to stand out boldly from the mass, and do the great deeds that are recorded of them.

So true is this, that only to a few of the world teachers are attributed lives of stainless purity and unselfish purpose combined with results that were far-reaching, and of lasting influence in the world of men.

The records of these few lives have furnished the ideals for millions of the human race. It has seemed, indeed, a universal need of the human heart to have an ideal that shows the union of purity with power, of the selflessness that asks nothing but the opportunity to serve, united with the knowledge and power to heal, to save, to hearten all the others. These teachers lived long ago. The world looks back with weary eyes, so long ago is it, so distant from view are those lives that shine with a purity which the cavilling of ages has failed to cloud.

But rising like a radiant spirit above the smouldering mass of brutishness, and ignorance, and cunningly devised superstition, of the age in which she lived stands the divine Maid of France.

That she lived a life of spotless purity, of selfless effort to lift her country out of its slough of bondage and despair; that she asked only to serve, with no desire for fame or favor, none can gainsay.

The rehabilitation of Joan of Arc has been the means of giving to the world a *sworn* statement of her virtues. Hers was the armour which no dart of venom could pierce; her life has borne the test of probing search, and the more fully it has been revealed, the brighter it shines.

And so, though her frail body was burned by her torturers, Joan of Arc's life remains. Her dauntless warfare with her crafty accusers has been a hidden fire burning away for France the bonds still lying heavy on many nations of earth. Her pure patriotism has left a flame in the hearts of France that will yet be a beacon light to the world, proclaiming the Brotherhood of Nations.

Joan of Arc's short life shows a pure selflessness of effort, and a degree of practical achievement along many lines, her success in any one of which marks her a genius. And as stated recently from one fresh from the investigation of her life records, she stands alone, as having sprung into this career of fulfilment with none of the aid from environment or early training that every other genius known to history has had.

Joan of Arc, Teacher

Let the Soul guide
and teach.—Katherine Tingley

At seventeen she was Commander-in-chief of the forces of the nation—a mark of distinction that has been

given to no other human being, man or woman. In her first military campaign she showed absolute mastery of the tactics of war, though she had never before seen an army. Though totally ignorant of legal processes, and unable even to read or to write, at seventeen she conducted in court her own defense against a false charge and perjured witnesses, and won her case.

The lion-hearted courage, the steadfast endurance, the gifts of oratory and statesmanship, and the astuteness of intellect that confounded her wily enemies, deserted her not under circumstances that might well have crushed the stoutest hero.

That she was a prophet, inspired like those in days of old, is proved by the exact fulfilment of her spoken words.

These are matters of public record. And so, because human lives have so universally fallen short of the standard set by this "noble child," Joan of Arc has been called the Wonder of the Ages, and, to quote a recent magazine article, "while our race continues she will be also the riddle of the ages."

In the teachings of Theosophy, however, is found the solution of the riddle. In Joan of Arc the student of these teachings sees one of that company of perfected human beings who watch over the destiny of man, and from time to time as the Law permits, visit earth to preside over crises in the human conflict, giving the divine touch to the work of man and restoring it to harmony with the divine order.

Though they may leave no body of formal teachings, these great ones are, none the less, Teachers. Joan of Arc, in relation to her time, was ever the Teacher. In the compassion of her heart she possessed a higher solvent of human passions and weaknesses, which enabled her appeal to the divinity in others, to win a response of devotion and of service.

And of recognition! For the first time into the literature of the West has crept a true picture of the sacred relation of Teacher and pupil. For her soul-wisdom so illuminated the daily life that doubt disappeared, and unfaltering trust and devotion grew in the hearts of the few who knew and loved Joan of Arc.

Happy indeed will be the day when there is once more a general conscious recognition on the part of the human race of Helpers, Teachers, such as Joan of Arc. This power to see the Gods on earth belongs to a golden age, when the race is strong, and of pure heart. The Golden Age has been, and shall be yet again. STUDENT

"Riddles of the Ages"

HELENA PETROVNA BLAVATSKY says in one of her great books:

When mortals have become sufficiently spiritualized, there will be no more need of forcing them into a correct comprehension of ancient Wisdom. Men will know then, that there never yet was a great World-reformer whose name has passed into our generation, who was not a direct emanation of the Logos (under whatever name known to us), i. e., an essential incarnation of one of the "Seven," of the "Divine Spirit, who is seven-fold;" and who had not appeared before, in past Cycles. They will recognize then, the cause which produces certain riddles of the ages, in both history and chronology; the reason, for instance, why it is impossible for them to assign any reliable date to Zoroaster, who is found multiplied by twelve and fourteen in the *Dabistan*; why the numbers and individualities of the Rishis and Manus are so mixed up; why Krishna and Buddha speak of themselves as reincarnations, Krishna identifying himself with the Rishi Narayana and Gautama giving a series of his previous births; and why the former, especially being "the very supreme Brahma," is yet called Anshanshavata — "a part of a part" only of the Supreme on Earth; finally, why Osiris is a Great God, and at the same time a "Prince on Earth," who reappears in Thoth Hermes: and why Jesus (in Hebrew, Joshua) of Nazareth is recognized, kabalistically, in Joshua, the son of Nun, as well as in other personages. The Esoteric Doctrine explains all this by saying that each of these, as also many others, had first appeared on Earth as one of the Seven Powers of the Logos, individualized as a God or Angel (Messenger); then, mixed with Matter, they had reappeared in turn as great Sages and Instructors who "taught" the Fifth Race, after having instructed the two preceding Races, had ruled during the Divine Dynasties, and had finally sacrificed themselves, to be reborn under various circumstances for the good of Mankind, and for its salvation at certain critical periods: until in their last incarnations they had become truly only the "parts of a part" on Earth, though *de facto* the One Supreme in Nature.

MISS VAN DORP, a practicing lawyer in her native country, Holland, says, *apropos* woman and the law:

I am proud of my fatherland, which was the first to admit women to this calling. I myself, last October, was admitted an advocate. The notion that advocacy is a masculine calling rests very much on the fact that it offers good opportunities for money-making, which women, they say, have no business to have in equal proportion. On the other hand, advocacy demands much love, justice, industry, to take the cares of others on oneself—all special qualities of the woman. So also she is needed in questions of the criminality of the child, where the notion of punishment must give way to that of education. The Dutch unions for the young will be henceforth brought into relation with the courts. So also in the civil processes connected with divorce, the suffering woman will have more confidence in a woman advocate; and finally, in the case of woman's criminality, I hope that in the future women will have only women as advocates in these cases and also in cases of infanticide. Only a woman can understand such tragedies.

"IF your mouth is like a closed door, your words will become as proverbs; but if it is like a running tap, no heed will be paid by any to what you say."

This is quoted from a book of instructions to women, written by the Empress Consort of the Emperor Yung Lo of China, in 1405. The Empress lays great stress on gentleness, good-temper, economy and brotherliness of conduct, but in her opinion, unrestrained talking is the real rock upon which the domestic barque is most likely to split.

OTIS T. MASON, curator of the division of ethnology in the National Museum, says:

A careful study of all women's work in basketry, as well as weaving and embroidery, reveals the fact that both in the woven and in the sewed, or coil, ware each stitch takes up the very same area of surface. Along with this fact, that each stitch on the same basket made of uniform material occupies the same number of square millimetres, goes one other fact—the most savage women can count.

ANOTHER gifted young woman has surprised learned men of science by her successful research in astronomy. Miss Henrietta S. Leavitt, a young Radcliffe graduate, has discovered more than 400 variable stars.

"That Ther Is Unitie"

BEAUTIFUL Wadham College at Oxford is a monument to the energy and executive ability of a vigorous English woman of the Elizabethan age.

Sir Nicholas Wadham had determined, having no heir, to hand down his name to posterity by the endowment of a Society at Oxford. But his death occurred before he could carry out his plan, and to his wife, Dorothy, then seventy-five years of age, fell the task of superintending the erection of what is conceded to be the most perfect college building in Oxford. She also appointed the college officials and admitted the first students.

All this she accomplished in three years. For five more she continued to personally direct the affairs of Wadham, and her forty letters to "my good Company the Warden and Fellows of Wadham College in Oxon," which have been recently published, show how thoroughly her work was done, from the nominations to scholarships and injunctions to regular prayers and fasting, to choosing the domestics, and advice concerning the tradesmen.

Few women of eighty years would enjoy, as did Dorothy Wadham, the responsibility of such active patronage of education. Few at her age would have the enthusiasm and the hearty interest in others that led her to write to her beneficiaries of it "being myne only joie to understand of all your welfares, and that ther is unitie amongst you." M.

"MISS AUS DER OHE need not feel offended if one says that her Sonate in no way sounds like the work of a woman," is a recent comment made in praise of this well-known pianist and composer.

Adele Aus der Ohe, who is credited with being "not a mere player of the piano, but a veritable interpreter," is winning laurels as a composer. Her new Sonate for piano and violin evinces a delightful originality, charm and freshness, together with the power and maturity of conception which stamps her as one of the most significant women who have ever written music. J.

"JEANNE D'ARC"—FROM STATUE BY CHAPU (Modern French)

A FRAGMENT

by SWINBURNE

YET for a space they abide with us,
Yet for a little they stand,
Bearing the heat of the day.
When their presence is taken away,
We shall wonder and worship, and say,
"Was not a star on our side with us?
Was not a God at our head?"

UNDER the very shadow of the church we find sorrow, poverty and despair.

Our civilization abounds in selfishness, ambition, disease. Why? Because the pure truths of Christ's teaching have been lost and obscured by a certain type of missionaries who volunteer their services, endeavoring to "bring to Jesus" the unsophisticated children of heathen lands. Listen to the following account. A missionary carried his Eighteenth century theology to the Eskimos. An Eskimo woman became indignant with the new religion because a woman was represented as being the cause of all the subsequent spiritual miseries of mankind, to-wit, Mother Eve. Another woman doubted the superiority of Christianity and pointed out to the mortified evangelist that the only Christians she knew were the drunken sailors and debauched traders of her little settlement. She very naturally clung to her own pure and simple belief, saying that she doubted whether she would gain morally by an exchange! STUDENT

QUEEN MARGHERITA of Italy will ascend the summit of Pic d'Ollen in the Monte Rosa range of the Alps, as soon as the snows melt, for the purpose of opening her great Alpine library. This library, which will be of course the highest in the world, will be the most unique and complete of its kind. It has been erected on the top of the mountain, at the Queen's initiative and expense, to the memory of King Humbert, and will contain a complete collection of volumes of Alpine literature, together with hundreds of mountain photographs contributed by eminent scientists and Alpinists. The Queen herself loves the Alps and is said to be an enthusiastic climber.

THERE have been seated on the imperial throne of Japan eight empresses, of whom Zingou is most famous for her military deeds. Much indeed will be revealed when Japan's now secret history shall be given to the world. H.

OUR YOUNG FOLK

The Raja Yoga School

HOW much has been said about the Raja Yoga school—and yet the half has never been told! Everything in the Raja Yoga system tends to develop only the highest and best in the child's nature. That is why the children of Point Loma have the strongest possible bodies, the healthiest and cleanest minds and the highest possible sense of morality.

And the daily life of these children! How describe it? In the early morning all of them meet for callisthenic drill, not only benefiting their bodies, but making necessary that concentration which is so helpful to the mind, and that rhythm which leads to such spontaneous and beautiful development. Then, too, the home and school life in one; how much does this do for the children! "Helping and sharing" is the motto of every day; and how easily, under this regime, do the Raja Yoga children get a practical knowledge of the various handicrafts, of science, of art, of the ordinary school studies and of music.

Music is everywhere; at any hour of the day and frequently in the evening one may hear strains of music from some one of the Raja Yoga buildings. It is always somebody's "practice hour," and yet the "practicing," somehow, is never discordant. Perhaps that is because the children themselves are "in tune" as well as their cellos and violins!

And how strong are the ties that naturally grow from such comradeship—the ties of brotherliness and of real comradeship! The home life is the basis of the Raja Yoga system. It is that which assures the world that something better than it has ever known is coming to be. A RAJA YOGA TEACHER

Lofty Fuji-Yama.

FAR away is a beautiful valley. And right in the heart of it is a quaint old town. The green hills rising high all around are the glory of the place. From this valley many youths have gone out into the world and become great workers. A wise old man once said to a little girl born in the valley: "It is because of the beautiful mountain. The children look upward to it. Nature touches their hearts and strengthens them for their work."

Think then of the beautiful Fuji-Yama, the sacred mountain of Japan. It rises from the valleys 12,400 feet, and is crowned with pearly snow. To this crest the children of Japan turn their eyes many times during the day. The people pause now and then to look up to the lofty crest glistening in the sunlight. They love this sacred mountain. It is part of their life. Their love for Fuji-Yama has kept their hearts near to Nature and Nature has helped them to gain the strength that ever belongs to the pure.

WE think of cliff-dwellers as belonging to pre-historic times, but there is in England today a community of people whose homes are little more than caves cut out of a great rock of sandstone near the river Stour. The sandstone is easily worked, and windows, shelves, etc., can be easily hewn out without the use of nails or wood. The inhabitants declare that their homes are sanitary and comfortable, and more they do not desire. Have they heart light, too, to make them joyous, kind and pure? H.

RAJA YOGA BOYS AT BASEBALL—LOMALAND

The Story of the Mistletoe

HISTORY tells us many facts, but it also does something else, more wonderful. It brings to our hearts, as to an altar, materials with which we may create living heart-pictures, so that we may know the past, not merely as something silent and dead, but living and real; just as real as present day events.

One very beautiful picture is about the mistletoe.

In olden times there lived people called Druids—men and women who loved nature and who were very learned and very wise. They had no churches, such as we have, but they held sacred worship and ceremonies under the forest trees; and especially did they reverence the grand old oak tree. Mistletoe does not grow in the ground, but on another shrub or tree; and sometimes it is planted there by a bird called the mistle-thrush. After eating a mistle-toe berry sometimes seeds adhere to the bird's beak. And should it alight on a tree and wipe its beak on the bark, the seed is sown and the mistletoe grows.

But it was very rarely found on the oak tree. And in olden times, when it was found, those people

who loved nature and knew so many of her secrets, held a great festival. In their hearts they felt the sufferings of humanity, and they used their knowledge to cure and soothe whenever they had an opportunity. They knew of wonderful curative properties contained in the little white berry and wing-like green leaves of the mistletoe. So, clad in white robes, with compassionate hearts, filled with gratitude to Mother Nature, they assembled under the trees, and one of their number ascended to where the mistletoe was growing and cut it with a golden hook. Falling, it was caught below in a pure white mantle. So many diseases did the mistletoe cure, that often it was called All-Heal. ANNIE P. DICK

Facts Worth Knowing

IN America there are nearly eight million families living in homes of their own, more than a million of which acquired these homes in the last decade.

THE river boats on the great watercourses of Burma are very beautiful. The exquisite carving on their prows is equal to the work seen in the great temples throughout the East. The Burmese, who are a happy, light-hearted people, spend a large part of their lives on these boats.

THE largest bell in the world is in the Kremlin, Moscow. It weighs 432,000 pounds. It is said to have been suspended for four years; then a fire caused it to fall, which probably accounts for its being cracked. A hundred years later a chapel was excavated below it, of which it forms the dome.

THE Japanese are practically vegetarians. Beef is sold in Japan by the ounce, and chickens are carefully cut up and sold in parts, as the wing, the leg, or a slice from the breast. It has often been a matter of amusement to the residents of Tokyo to see foreigners living there buy a whole chicken or two whole pounds of beef, all at one time! Rice is the staple article of food, and this, with beans, sea-weed, fish, eggs, nuts and delicious fruits, certainly furnishes the people with an ideal diet.

SILKWEED

LIGHTER than dandelion down,
Or feathers from the white moth's wing,
Out of the gates of bramble-town
The silkweed goes a-gypsying.

Too fair to fly in autumn's rust,
All winter in the sheath it lay;
But now, when spring is pushing out,
The zephyr calls, "Away! away!"

Through mullein, bramble, brake and fern,
Up from their cradle-spring they fly,
Beyond the boundary wall to turn
And voyage through the friendly sky.

Softly, as if instinct with thought,
They float and drift, delay and tarry;
And one avoids and one is caught
Between an oak-leaf and a fern.

And one holds by an airy line
The spider drew from tree to tree;
And if the web is light and fine,
'T is not so light and fine as he!

And one goes questing up the wall
As if to find a door; and then,
As if he did not care at all,
Goes over, and adown the glen.

And all in sliest fashion fare
Adventuring, as if, indeed,
'Twere not so grave a thing to bear
The burden of a seed!—Selected.

THE CHILDREN'S HOUR

The Raja Yoga Question Box

FRANCE in the Old World, America in the New World, bravely struggled in the cause of liberty. Many links unite these nations.

1 Who was Lafayette?

ANSWER—Marquis de Lafayette has been called "the hero of two worlds." He was born in France in 1757. When only nineteen he heard of the American War of Independence. His heart was fired with a desire to help. He bought a ship and manned it and sailed for America. He begged leave to serve in the Revolutionary army as a volunteer, and without pay. He fought bravely and was recommended by Washington. He returned to France and served there as the devoted champion of America. During the French Revolution Lafayette was Commander of the National Guard. In 1789 he presented to the Assembly of France a declaration of rights similar to the Declaration of Independence. Through the bloody years that followed, Lafayette was ever on the side of order and humanity. He

often risked his own life to save others. He suffered imprisonment and defeat, but worked on in the service of liberty and humanity. No foreigner has ever been so beloved by the people of America as the Marquis de Lafayette.

2 Who was Madame Roland?

ANSWER—Madame Roland was a lady of noble character and lofty spirit who lived in France during the Revolution. She gathered about her many who believed that the rights of the people should be respected, and that France should be a Republic. Madame Roland and her husband worked together to try to guide the people in establishing a better order of things. They fearlessly condemned the cruelty and bloodshed practised by the extreme Revolutionists. These became their enemies. Madame Roland was thrown into prison. There she calmly wrote a book about her life. As she was led forth to be executed she exclaimed, "O Liberty! how many crimes are committed in thy name!"

A Hero of Old Greece

HOW much the old Greek legends teach us! How often they reveal the secret of courage and perseverance and trust! To read of heroes inspires us to be heroic, and one of the Greek boys who became a hero was Jason. Jason was the son of a dethroned king. When a little boy he was placed under a very wise teacher, named Chiron. Among his schoolmates were Hercules, Achilles, Orpheus, and Esculapius, all of whom became famous.

Chiron taught his pupils to play the harp, and how to cure diseases, and how to use sword and shield.

When Jason grew to be a man, he learned that he was a royal prince, but that his father had been deprived of his kingdom. He determined to regain his father's throne. So he set out, with a spear in both hands, wearing a leopard's skin for a cloak, and a pair of beautiful sandals, which had been his father's. He had not traveled far, when he came to a turbulent river. He stood, considering if it were safe to cross, when an old woman, followed by a peacock, asked him to carry her over. Remembering that his teacher had taught him to be gentle to all women, he picked her up, and started across, in spite of the danger. In crossing, he lost a sandal, to his sorrow; but the woman told him that it was the most fortunate sign for him, and thanked him for helping her.

Suddenly she became very majestic and beautiful, and the peacock beside her spread its plumage until it looked like a lovely flower. Jason knew she must be some great person. Traveling on, Jason reached the city where the false king, Pelias, lived. When the king saw Jason with but one sandal, he trembled, for there was a saying that a one-sandaled man was to take from him the kingdom.

However, Pelias treated Jason courteously, and agreed to give up the kingdom if Jason would find the Golden Fleece and deliver it to him.

This was the hardest task in the world, and Pelias felt sure that Jason would fail. But Jason took counsel of a wonderful, whispering oak, which advised him to build a ship, and get forty-nine strong men to help him. This he did. Some of the men were his old schoolmates, among them Orpheus with his harp. After many adventures, they came to the place where was kept the Golden Fleece. It was guarded by a terrible dragon, but Orpheus played such sweet music that the dragon was lulled to sleep. This enabled Jason to escape with the prize. As their ship flew over the water, homeward bound, Orpheus, striking his harp, sang a song of triumph. Jason had won back his father's kingdom.

ONCE upon a time there was a little boy who was a prisoner,—and in his own house, too! His jailer was a horrid little somebody, who kept saying "cry words" and who kept the little windows all covered with tears, so they grew dull and the real boy couldn't look out, and then when the beautiful thought fairies came around and wanted to talk to him he wouldn't let the little boy listen. But by and by one fairy, who was sorry for the little boy, came. And she said:

"I will just go down into his heart and see if I can't help him get rid of that naughty little jailer."

So down she went, right down into his heart, folding up her beautiful gauzy wings and creeping in softly,—softly. And then the naughty little jailer began saying "cry words" again, until —until, what do you think?—the little fairy began to sing. Pretty soon the jailer became quiet and then the fairy whispered, "Now little boy, do you want me to help you?"

"O, please do," said the little boy. "Well," said the fairy, "all you have to do is to look at me instead of looking at the jailer, and in a minute your prison doors will all fly open and the windows will all be clean." The windows were his eyes, you know. "Quick, quick, see! see! The doors are open already and the windows are clean."

"O, happy, happy," said the little boy. "Now I understand. And you will stay, won't you?" So the fairy stayed and lived in his heart, and although the jailer tried to come back again once or twice, he couldn't get in, because when things would go wrong and the "cry words" wanted to come, the little boy just wouldn't let them, but instead he kept just as still as a mouse to hear the fairy sing. So, of course, things went right after that. E. E. O.

THE other day a little child of three fell into a manhole in front of his mother's home. At just this time an old milkman passed and with him was his big St. Bernard dog. The dog heard the child's cries, stopped, listened, then ran to the manhole and plunged in.

He seized the little child just in time to save it from drowning and held it above the water until both were lifted out. Then he trotted along after the old milkman, his master, as if he had done nothing at all of any consequence. How many boys would have been as brave and as alert to help? Do we fully realize the wise compassion and unselfishness and *real help* of which animals are capable? I sometimes fear that we do not, or else that we are not grateful when we do. STUDENT

THREE PROMISING LOTUS BUDS

THE ELF AND THE DORMOUSE

UNDER a toadstool
Crept a wee Elf,
Out of the rain,
To shelter himself.

Under the toadstool,
Sounded asleep,
Sat a big Dormouse
All in a heap.

Trembled the wee Elf,
Frighteased and yet
Fearing to fly away
Lest he get wet.

To the next shelter ---
Maybe a mile!
Sudden the wee Elf
Smiled a wee smile.

Tugged till the toadstool
Toppedled in two,
Holding it over him,
Gayly he flew.

Soon he was safe home,
Dry as could be.
Soon woke the Dormouse ---
"Good gracious me!"
"Where is my toadstool?"
Loud he lamented.
And that's how umbrellas
First were invented.

Art Music Literature and the Drama

Hokusai—Exemplar of Artistic Training Along New Lines

EVEN a slight study of Japanese art convinces one that the artists of that land do not feel the limitations so apparent in the work of European and American artists—limitations felt by all but the few who are really great. As the world goes, one artist is known as a painter of portraits, another as painter of landscapes, another of historical subjects; another comes down in history known only for his Madonnas, and still another, having opened what is to most artists a closed book—the secret of mural decoration—is known as a “mural decorator.”

There is a general tendency to limit one's art work to one particular field and nothing in the general training of our artists today encourages them to step aside from tradition. But what is the training of the Japanese artists, such as, for instance, Hokusai, Japan's great apostle of the color print? What did he draw and paint? It were as difficult to answer what did he not. In each of his myriad drawings there is the same simplicity, the same exquisiteness of line, the same courageous adherence to the central idea, the same equally courageous elimination of detail. Hokusai had knowledge greater than the knowledge of what to put into his pictures—he knew what to leave out.

And what were his subjects? First of all, peasant and artisan life, for of that life he knew every detail, the men and women and babies, the customs, the tools and the toys, even the kitchen utensils they used. One series of his color prints, called “One Hundred Views of Fuji-Yama,” shows his marvelous mastery of landscape. For that matter, Hokusai seems to have mastered every subject, nor does he stand, in Japan, as an exception. His marvellous drawings and color prints—the subjects are almost innumerable—the tortured ancient pine, the sea-swept crag; mountains in the distance, in summer, in winter, at dawn, at full noon, in the twilight; sea and land under moon and sun and clouded sky; blades of wind-tossed grass or bamboo—for Hokusai knows when to charm with detail—birds, plants, etc.

Nor does he fail to understand animals, nor the dwellers of land or sea. In his drawings we pass from panther or leopard to the giant cuttlefish, to a dozen kinds of fish, to waving fronds of seaweed. Hokusai loved the rivers as he loved the mountains. What are more wonderful than some of his drawings of a waterfall?—the pure form, the long lines, the mystery of the chasm below? The half-world, too, how well he depicted ghosts and demons, monsters and dragons! Where is he at a loss, whether picturing the sweeping folds of a dress, the expression of scornful lips, the curved and stolid lilt of some fungus, the foaming wave-cap, or the vast sweep of sea and sky? Is there not a lesson here for half the artist world?

On his death-bed, Hokusai said: “Had Heaven granted me but five years more, I might have become a painter.” These—the words of one of the foremost artists of Japan! Hokusai's humble and neglected grave may still be seen by those who care to hunt it out from among

the tangle of pines and cherry-trees in the garden of an Asakusa monastery. Upon the simple headstone is the equally simple inscription, “Tomb of Gwakio Rojin Manji,”—which, translated, reads: “The old man in love with drawing.” Beside it is inscribed a simple ode composed, as is the custom, by the artist himself upon his death-bed. Even the crudities and inadequacies of a literal translation cannot wholly hide the simple loveliness of the sentiment:

Hither and thither over summer fields, goeth and cometh my soul, become even as a will-o'-the-wisp.

STUDENT

“TCHO-YUNG, a successor of Kai-tien-chi, ninth emperor of the spirit dynasty, is said once to have listened to the songs of the birds, while the

empire was in a state of profound peace, and their singing caused him to invent a music which penetrated everywhere, speaking to the intelligence, calming the passions of the heart, causing perfect equilibrium of the emotions, facilitating and improving the use of all the senses, and prolonging the life of man.”—*Elson's Curiosities in Music*

YOU will often see a little child sitting in a garden in Japan gazing attentively for perhaps a whole hour at a bowl of goldfish, watching the tiny bright creatures as they circle round and round in the bowl. Remarking on some particular pose, the child will retain it in its busy brain, and, running away, will put down this impression as nearly as it can remember. Perhaps on this first occasion he is only able to put in a few leading lines; very soon he is at a loss—he has forgotten the curve of the tail or the placing of the eye. He toddles back and studies the fish again and again, until perhaps after one week's practice, that child is able to draw the fish in two or three different poses from memory, without the slightest hesitation or uncertainty.

It is this certainty of touch and their power to execute these bold, sweeping lines which form the chief attraction of Japanese artists. Their wrists are supple; the picture in their minds is sure; they have learned it line for line; it is merely the matter of a few minutes for an artist to sketch in his picture.—*Mortimer Menpes in "Japan: A Record in Color."*

JOHAN LA FARGE, in an article written some years ago, alluding to a certain book entitled *Essais sur l'Histoire de l'Art*, says:

I am confounded at thinking that thousands and thousands of pages were read by me *apropos* this book without finding anything that a person seriously devoted to his profession of art could find of the slightest use. I cannot think of a more absolute condemnation. That a theologian should find nothing in works on theology and a chemist nothing in works of chemistry would be enough, to their minds, to regret having wasted their time.

Comment is surely not needed for the fact, to artists, is plain.

IMMENSELY rich in stories of adventure, of folk-lore, and in tales of fairy-land is Japanese literature. At first glance it might appear that the Japanese were intensely superstitious, but there is a deeper note which one who realizes the symbolic and allegorical character of their literature, cannot fail to perceive. They are, in the truer sense, mystics. H.

NIKE LOOSENING HER SANDAL

(One of the many priceless legacies left by the artists of old Greece)

THERE are in music such strains as far surpass any faith which man ever had in the loftiness of his destiny. Music hath caught a higher pace than any virtue I know. It is the arch reformer. It hastens the sun to its setting. It invites him to his rising.
—*Thoreau*

Universal Brotherhood Organization

Central Office Point Loma California

The European Crusade--- Under the Direction of the Universal Brotherhood Organization and Theosophical Society

IT is interesting to chronicle the latest report of the Crusade work in Europe, conducted by Herbert Crooke, President of the Universal Brotherhood Organization and Theosophical Society in England, and by Fred J. Dick, who has been for many years Editor of *The International Theosophist*, published in Dublin, Ireland.

This work has proven to be a great means of true propoganda for the teachings of Theosophy, and the report is, that at all public meetings held up to the present in England and in Holland, an unusual interest was manifest.

In Manchester, Bristol, Liverpool and other important points, many questions were proposed by members of the audience, which marked, to a very remarkable degree, the progress that Theosophy has made in the last few years.

Reincarnation and the Law of Karma, received much attention. Only a few years ago, when these subjects were presented at our Theosophical meetings, they were treated by the public as being quite beyond human interpretation, and as impossible of application to every-day life. Such is by no means the case today. The new interest in Theosophy is largely the result of the unrest and dissatisfaction found in connection with some of the most serious problems of the human race. The more man suffers, the more he seeks for the solvent that will make a brighter future for man.

A cable just received states that the Crusaders have reached Stockholm, Sweden, having already held public meetings at many of the centers in Holland, with unusual success. From the Work to be done in Sweden and Germany by this crusade, it is expected that further victories will be achieved accentuating the blessings of Theosophy to human life. This crusade is precedent to the establishment of Raja Yoga Schools in Europe. OBSERVER

Desiderio Fajardo y Ortiz---A Cuban Patriot

DESIDERIO FAJARDO y ORTIZ, a patriot, a scholar, a friend to Humanity! This noble friend of the Universal Brotherhood and Theosophical Society, passed away in Santiago de Cuba, on January 23d. It is the Cuban people who must feel this loss most keenly, for our Cuban friend was known from one end of the Island of Cuba to the other as an unselfish and unflinching worker for his country. As Co-Editor of *El Cubano Libre*, his influence was extensive. As an educationalist of very great attainments, he held a high position in the Public Schools.

In the hearts of the members of The Universal Brotherhood Organization throughout the world, his memory will ever be cherished, because of his generous service in connection with the Raja Yoga Schools in Cuba, and with the advancement of the Cuban children's interests at the Raja Yoga School at Point Loma, California.

From the inception of this work in Cuba, our beloved friend acknowledged the value of the Raja Yoga system; and he was always ready to serve that work at all times, and under all conditions.

It was during the time that the Gerry Society for the Prevention of Cruelty to Children interfered with a number of Cuban children, who arrived in New York on their way to the Raja Yoga Schools at Point Loma, that Señor Fajardo y Ortiz rendered invaluable service. It was his action, combined with that of Señor Emilio Bacardi, Mayor of Santiago, with the Provincial Governor of Santiago de Cuba, that brought about the public protest against the unheard of conduct of Gerry and his followers.

He, with a number of distinguished Cubans, was the first to accord our Leader, Katherine Tingley, public recognition on her arrival in Santiago de Cuba in the spring of 1903, shortly after the successful conclusion of her lawsuit against Harrison Gray Otis of the *Los Angeles Times*.

Señor Fajardo y Ortiz was counted by Katherine Tingley as one of her dearest friends and best helpers. The following messages sent to his family on receipt of the news of his death, mark the sympathy all members of the Organization must feel:

H. S. TURNER, Director Raja Yoga Schools, Santiago de Cuba:

A tribute of sympathy from all members Universal Brotherhood Theosophical Society throughout world to Fajardo's family and Cuba. Fajardo a noble patriot, my friend. Raja Yoga children hold memorial service here tomorrow. Cuban flag at half-mast three days.

KATHERINE TINGLEY

January 24th 1905

DON DANIEL FAJARDO y ORTIZ, Editor *Cubano Libre*, Santiago de Cuba, Isla de Cuba:

DEAR SIR AND COMRADE: By cable yesterday, we were advised that our great friend, your noble brother, Desiderio Fajardo y Ortiz, had passed from our presence. In him Cuba has lost a wonderful patriot and her people a far-reaching, beneficent influence.

He worked for Cuba with our Leader, Katherine Tingley, as one who clearly understood the purpose of her life's devotion, and his passing has profoundly affected her, for she called him a co-worker, as one sent to aid her beneficent work for the children and people of Cuba.

Graven in our hearts is the memory of his many noble deeds in this service, and these memories we shall pass on to the children of our Raja Yoga Schools and through them the influence of his life shall go on to the coming generations of

men. It shall never be silenced by death.

We salute you, his beloved brother, with our love and esteem.

Fraternally yours,

F. M. PIERCE,
C. THURSTON,

For the Cabinet of The Universal Brotherhood

Those who will most miss him; those whose sorrow cannot be touched in words, are the brothers and sisters of his family, and the mother he so revered, and those who knew him best; to them we give our tenderest sympathy.

He has arisen in the glory of the new life.

A FRIEND

SEÑOR DESIDERIO FAJARDO y ORTIZ

The Theosophical Crusade in Europe

ON the 7th January, in the Common Hall, Hacket Hey, Liverpool, was held the first of a series of public meetings in England on new lines, at which Mr. Herbert Crooke and Mr. F. J. Dick were the principal speakers. The subject advertised was "Theosophy and the Practical Problems of Life." There was a large attendance. After some introductory music two children of the Lotus Group, in Greek dress, read some short extracts from the writings of H. P. Blavatsky and W. Q. Judge. Then followed more music succeeded by an announcement as to the general purpose of these public meetings, read by the director of one of the Liverpool centres.

Mr. Crooke then addressed the meeting and outlined the work of the three Leaders. He spoke of the manner in which "labels" prevented many people from looking into the merits of what seemed new teachings, and demonstrated that these teachings, really the oldest in the world, were thoroughly practical in character because they affected the very centre of our being and were related to our every act and thought. He showed how these teachings threw a new light upon the change called death and destroyed the fear thereof, and explained the law of cause and effect which runs through all manifested life. After some more music Mr. F. J. Dick followed with a discourse outlining the immense antiquity of man on the earth, and the corroborative evidence afforded by recent discoveries. He referred to the grandeur of the ideas expressed in ancient temples and carvings in stone as showing that these ancient races had a profound knowledge of the soul. He spoke of epochs and leaders, and pointed out the significance of the work now concentrated as a radiating centre at Point Loma. He described the life of the children and students there, and followed it up with a series of about sixty lantern slides which aroused great interest among the audience. He referred to the influence already exerted on the life of the adjacent city of San Diego. The unique character of the organization was outlined, and it was shown that Theosophy touches every department of life. After a short interval of music there were questions handed in on the subject of Theosophy, which were replied to by the members of the Liverpool centres and by Mr. Crooke.

On Sunday evening, the 8th, a public meeting was held at the rooms of the Southport centre, Poulton Road, where the hall was filled by an attentive audience. The same ground was covered generally and the lantern slides again excited much interest. On Monday evening, the 9th, a public meeting was held in the Memorial Hall, Albert Square, Manchester. The following accounts of the meeting appeared in the Manchester press:

Brotherhood and Theosophy

The Manchester members of The Universal Brotherhood and Theosophical Society, which acknowledges the leadership of Mrs. Katherine Tingley and claims to be the only Theosophical organization which is carrying out the aims of Madame Blavatsky, had a meeting at the Memorial Hall last night to explain their doctrines to the public. There was a fairly good attendance. In the course of the evening pianoforte and violin selections were played by Mr. Sydney Smith and Mr. Speelman. Before the speaking there were readings from the works of Madame Blavatsky and Mr. W. Q. Judge. Mr. F. J. Dick and Mr. H. Crooke spoke on "Theosophy and the Practical Problems of Life," and gave some interesting information about the educational work which is being done by Mrs. Tingley at Point Loma, California. They showed that this work is an important factor in the promotion of international good-will and brotherhood. Afterwards a number of questions were asked and answered with regard to the Theosophical theory of Reincarnation.—*The Guardian*

The Beautiful City of Point Loma

An audience which assembled at the Memorial Hall, Manchester, last night, at the invitation of The Universal Brotherhood Organization and Theosophical Society was told the truth about Theosophy.

"The idea," said Mr. Crooke, who presided, "seems to be that Theosophy is something away up in the clouds, and something that does not concern practical life."

As a matter of fact, Theosophy was the most practical thing imaginable, because it concerned every part of a man's life.

The answers to the question which had recently been propounded, "What is belief?" were perplexing, whereas Theosophy came with the statement "There is no religion higher than truth," and the main idea that came to one from the study of Theosophy was the dignity of labour and the necessity of becoming helpful to one's fellows.

The fact of death had also for ages past held men in a thralldom, but now it was beginning to be broken.

Mr. F. J. Dick followed with an illustrated address, in the course of which he drew a beautiful picture of Point Loma, California, the headquarters of the Society.—*Daily Dispatch*

On the 10th Mr. F. J. Dick met the members of the centre at Halifax and a pleasant evening was spent, when he outlined his impressions of the educational work at Point Loma. Those present were mostly teachers. Mr. Dick's description of the beauty of the mutual helpfulness displayed among the Raja Yoga children proved of great interest.

On the 13th, in Hamilton's Rooms, Park street, Bristol, a large audience assembled to hear the discourses on "Theosophy and the Practical Problems of Life."

The platform was beautifully laid out with white screens and palms, smilax and flower decorations. In the hall were quotations on slips decorated with violets in the manner adopted at the Isis Theatre.

Five children in Greek dress opened the proceedings by reading short extracts from the writings of W. Q. Judge.

Mr. Crooke spoke in his usual happy vein, and when the lantern slides were being shown and the children of Lomaland were seen standing in their little classes under a child teacher, there was great applause when the audience realized that the children were more eager to help each other than to excel personally, and that unselfishness was the natural law of life there.

During all the meetings the rapid increase in the membership at large, and the manner in which these teachings are gradually permeating the life of the world were referred to by one or other of the two principal speakers, as well as the dangers of sectarian Theosophy. Also the effect of true Theosophy on life in the home; on the sacredness of the marriage relation; and the influence of the teachings as factors for peace in international relations. The development of the Raja Yoga system was described, and the future of children educated at Point Loma in School, Academy and University referred to, on going out into the world; where they still retain the protection of and unity with the mother institutions.

The following notices of the Bristol meeting appeared in the press:

The Practical Aspects of Theosophy

The practical side of Theosophy formed the subject of addresses given last evening at Hamilton's Rooms, Park Street, the meeting being under the auspices of The Universal Brotherhood Organization and Theosophical Society. The proceedings were opened in a pleasing manner, namely, by children attired in Greek costumes, reading extracts from the writings of Leaders of the Movement. "Theosophy and the Practical Problems of Life" was the subject introduced by Mr. Herbert Crooke, from the European Headquarters, London. He pointed out that Theosophy was not the impracticable thing that some people thought. It was not something away in the clouds; on the contrary, it dealt with the practical things of every-day life. A Theosophist might be a good business man, but he must be a good educationalist, and, according to his ability, labor to the utmost of his powers in whatever department of life he was engaged in. The speaker referred to the introduction of Theosophy by Madame Blavatsky, thirty years ago, and to William Q. Judge, who took up the work after her death. The present Leader, Katherine Tingley, followed up the latter's noble work by launching out in such directions as the founding of schools for children, with the object of making them noble and reliable men and women. Mr. F. J. Dick gave an address, illustrated by limelight views, on Lomaland, California, the Headquarters of The Universal

Brotherhood Organization, which was founded in 1897, after the Crusade round the world by Katherine Tingley. About sixty slides gave the interested audience an idea of the schools, academies, and universities established by the Organization, and, among other matters, of the relief work it was engaged in after the Cuban war. The lecture was also of some antiquarian interest, as ancient buildings were alluded to as bearing out the statements of Madame Blavatsky that ages ago there were races which displayed even greater intelligence, in some respects, than was to be found in the present generation.—*Western Daily Press, Bristol, Jan. 14th, '05*

Theosophical Meeting

Under the auspices of The Universal Brotherhood Organization and Theosophical Society, a public meeting was held at Hamilton's Rooms, Park Street, last night, when the principal speakers were Mr. F. J. Dick (editor of the *International Theosophist*) and Mr. H. Crooke, of London. The subject for discussion was "Theosophy and the Problems of Practical Life." Mr. Crooke, who first spoke, took up the idea that Theosophy was not an impracticable thing as some people thought. It dealt, he said, with very practical affairs of everyday life. A Theosophist could be a good business man, and must be a good educationalist. The speaker traced Theosophy from its introduction thirty years ago, and said that now it had achieved a success that few thought possible some years ago. Mr. Dick explained the work being carried on at Point Loma, U. S. A., the international centre, and some interesting limelight views of that locality were shown. The meeting was largely attended.—*Bristol Daily Mercury, January 14, 1905.*

CRUSADER

THE Theosophical Crusade in Europe of 1905, began its first work by a public meeting in Dublin, Ireland, under the direction of Fred J. Dick, Esq., who has been for years at the head of a Theosophical Center in that city. The meeting was largely attended, and was one of unusual interest. The Crusade was then continued to England, where Mr. Dick was joined by Herbert Crooke, Esq., Director of the Universal Brotherhood and Theosophical Society in England. From thence they proceeded to other countries.

In 1896, at the time of the visit to Ireland of the first Theosophical Crusade, which made a complete circuit of the globe, the Crusaders remained in Ireland for some time, and held public meetings with great success. It is said that the seed that was planted at that time, on lines of Brotherhood, has brought about marked results in liberating thought in that country. The Crusaders spent a week at Killarney, camping out near the beautiful lakes of that name.

The following is an extract from an article published in the *NEW CENTURY* Theosophical magazine, of December, 1897:

The American Crusaders at Killarney—1896

BY G. W. R.

It is a place where if you lie down on the earth for rest it must be whispering to you, and its whispering is more beautiful and full of peace than the silence you craved. Such a speech! For here the memories of earth are not clouded by the sadness which elsewhere hangs heavy around the ruins of its overwhelmed empires. If you lie down with closed eyes, some sunny-hearted figure with long tresses of gold will move with gentle stateliness through your dream over green sunlit grasses, or through enchanted glades in a world of its own, and you know you are gazing on the life of a thousand thousand years ago. It was to no tourist's paradise we went, but to Loch Len, the lake of many hammers, where Len, the divine goldsmith, once worked under a palace roof of rainbow, while the fiery dews sprayed like a shower of stars from his anvil. The earth is always greater than her children; and of our summer holiday, I still remember distinctly the great woods of pine dripping with wet, the mountains with their purple shadows crouched below them in the waters, and hoard in my heart the sunsets and starry nights.

The first night, I think it was, I fully realized that there was nothing common or unclean about the place, for a stray donkey, which I had hardly noticed in my first ramble around, appeared to me in dream and showed itself in no every day animal, for it was rayed about with a pearly lustre. I felt the rebuke, and heard it many times after chanting its orisons at twilight without the repugnance I otherwise would have felt for such ostentatious piety. After that I suspected everything and everybody in the place, even a small child who lingered about the camp; his elfish face seemed to betray affinities with the faery world; and his mysterious reserve when our leader questioned him thereon, intimated, I think, that there were degrees of initiation she was not entitled to inquire into.

We were encamped on the crest of a little hill below Mount Torc; and to tell the truth I would have liked to have attacked it with spade and pickaxe, and dug my way into the imagined caverns brilliant with light

which beset my fancy as existing beneath. The most memorable of our deeds was the selection of a stone for the temple at Point Loma. We drove for this purpose miles on miles, past the Purple Mountain, the Eagle's Nest, and all familiar places, to a wider but not less wondrous spot about twelve miles from Killarney. Here the gift of our gods to America was discovered a little way from the road—a stone, rude and unshapely, but a thing to ponder over. We heaped a cairn on that spot. Above the road was an elevation from which far leagues of shadowy mountains and valleys streaked with the white shining of waters could be seen. Here we sat in silence.

"These mountains were islands once, between which the ocean came up; and there was a great temple here in the past," said our leader, who looked long and long down the vistas, and perhaps down many a path of mystic memories to happier days than ours. Often the hunting call of the Fianna was heard upon these hills; and before their time, as some traditions relate, it was to these lakes Fand by her beauty and magic art drew Cuculain to war in dim battles with the Sidhe and to forget home and kindred. Yet it must have been before all recorded tradition that the temple was filled with worshippers, when the gods had cast round the isle the Faed Fia, the mantle of invisibility, and a magic people wrought their secret wonders in a land loud with music and burning with the light of the Fire-God. But for us who went there today there was surely some magic also. Those rich fountains still send forth in secret their streams of healing over the earth; and we may have opened our hearts to receive there as in a cup some of the immortal waters to refresh us in this grey age when life is so weary. I think it was so, and that the spot is not forgotten of the gods. As I lay there in the sunlight, by the beating of my heart I knew it was aware of more things than my mind could perceive. A little quickening of my senses and I might have fathomed it:

A laughter in the diamond air, a music in the trembling grass,
And one by one the words of light as joy-drops through my being pass:
"I am the sunlight in the heart, the silver moon-glow in the mind:
My laughter runs and ripples through the wavy tresses of the wind.
I am the fire upon the hills, the dancing flame which leads afar
Each burning-hearted wanderer, and I the dear and homeward star.
A myriad lovers died for me, and in their latest yielding breath
I woke in glory giving them immortal life though kissed by death.
They knew me from the dawn of time. If Hermes beats his rainbow wings,
If Angus shakes his locks of light, or golden-haired Apollo sings,
It matters not the name, the land; my joy in all the gods abides:
Even in the cricket in the grass some dimness of me smiles and hides.
For joy of me the daylight glows, and with delight and wild desire
The peacock twilight rays aloft its plumes and blooms of shadowy fire,
Where in the vastness too I burn through summer nights and ages long,
And with the fiery-footed planets shake in myriad dance and song."

Yes, here, surely, though not by any outward eyes, would Angus be seen. Perhaps, for he is the Master of Harmonies, he may have been present and shed the peace which filled us on that grey, cheerful Sabbath when we sat in a circle and talked of our mighty hopes.

Indeed our presence there may well have been of greater import than we knew ourselves, and may have seemed in other spheres no less memorable for what it antedated than the gathering of Amergin and his druids on Mount Usna, when the fires were lit which after filled all Fohla with their glory. Truly, it was strange to find Ireland invaded anew by warriors of the same mystic faith as the sons of Meled, though bent on the more subtle conquests of love and prepared for intellectual battle. They proclaimed here almost for the first time for centuries those great universal ideals, for lack of which the abundant intuition and fire of the Celt has in time past been lost, or gone astray on futile quests.

In the rich nights, as we sat together round the camp-fire, the Kindly Children of Twilight, seen by some, passed us by with shadowy draperies. Perhaps it was by the spell of song and music we raised them from their subterranean palaces; or it may be there was in our hearts some of the golden lustre which shone in the divine races whom here the earth keeps in such living remembrance, for they did not fly from us; and mayhap too there may have glimmered about us some forms they knew of old. It was but a few days we were here, but I do not think they will soon be forgotten. Some tie held a friend and myself in the deserted camp for a day or two; and even long after I had departed I would wake from sleep to find the enchantment recreated in dream. There were the fire emitting mountains, the mystic woods, lakes, stars, around me in the magic night; so wondrous, so ethereal, they did not seem a vestige of the isle I knew, but of that other hidden Eire they called the Land of the Living Heart.

Students'

Path

LIFE

Mrs. BROWNING

EACH creature holds an insular point in space;
 Yet what man stirs a finger, breathes a sound,
 But all the multitudinous beings round
 In all the countless worlds with time and place
 For their conditions, down to the central base,
 Thrill, haply, in vibration and rebound,
 Life answering life across the vast profound,
 In full antiphony, by a common grace?
 I think this sudden joyance which illumines
 A child's mouth sleeping, unaware may run
 From some soul newly loosened from earth's tombs;
 I think this passionate sigh, which half-begun
 I stifle back, may reach and stir the plumes
 Of God's calm angel standing in the sun.

A True Mission

WHAT can be a truer mission than the one that brings Truth and Joy into our lives, giving us the capacity to help others?

These words, so simple, so easy to understand, and yet so profound and world-compelling! What higher mission than to know the Truth:—to know the vast beyond; the within of this outer seeming; the immortality which lies back even of our present life—this little life with its routine of events, its joys and sorrows, and all its varied happenings, from which spring such mighty issues! To know what all this is for, the real meanings of things; to follow, steadily, consciously, and enthusiastically, because feelingly and knowingly, the bright path of eternal enlightenment, the pure path of perfection! What a mission; what a divine and glorious mission! And what a superb strength and thrilling joy to awaken to the consciousness of the Heart Life of all things; to brighten all our tasks with its sun-rays; so to tune our wonderful bodily instrument, that it will join in and be a part of the joyous chorus of life! This surely is Life, real life, soul life, the life of unity, harmony, and beauty.

And this can be done, is being done, and is continually being added to, and not one true duty of every day life is left unfulfilled. Indeed, the pathway of duty is a necessary part of it, and all duties are glorified in it. The interest, the enjoyment, the happiness of life is intensified. Yet we cannot give up the old grey, dead life without a struggle; for we feel bitterly the misery, the pain, the despair of it all as we try to be free. But it can be done. It is being done, and will be done, more widely, more fully, and more numerous as the days go on. We are in the Spring-time of a new glorious life on Earth, that is as sure in its coming as the rising of tomorrow's Sun; for it is linked with that very Sun, and is part of its life. It is real Life, the Truth; and the higher life of all things and the Truth are one.

The public conscience that is awakening in national life shows the stir of this new power, and it is becoming and will become more discriminating, more forceful, as this glorious light expands, being more than a match for all reactionary forces in strength and intelligence. For it is that power that descends "from age to age for the salvation of the Just, the destruction of the wicked, and the establishment of righteousness," as an ancient Scripture says. No temporal power and no moss-grown shams can withstand the spiritual forces that spring from the Heart of things, and when the time has come, and the Divine Voice speaks, they are dissolved into oblivion. Rejoice, then, all true hearts, for yourselves and for your children, enfolded as you are in the protecting arm of the Mighty and Beneficent Law, for you are destined to bear witness to the Truth, and enter into the Joy of this greatest of all Spring-times of our glorious Mother-Earth. A new Day of Peace and Righteousness is dawning for men. Yet shall it not come without sorrow and struggle. But above and over all is this mighty Arm of the Higher Law. T. W. W.

Animal Life

THE One Life is in all, and its natural manifestation in the animal kingdom is animal life. It here forms a link between human life and vegetable life, and is here in its present state when least under the influence of man. But animal life laps over into both the human and vegetable kingdoms. There are no hard and fast lines between the kingdoms of nature, no more than there are between the colors of the rainbow. Each color has its distinct characteristics, yet each blends into the next. So we find plants with animal characteristics and *vice versa*. We see animals with some of the nobler qualities of man, as courage, gratitude and unselfish love, and man with the lower qualities of animals. In fact each kingdom has in itself, either manifested or potential, the qualities of the others.

Animal life when, not affected by man, is simple, natural and happy. It moves on in obedience to the propelling impulse of the One Life, that started all things, into manifestation. But human life has a powerful influence on all manifestations of life below itself, either to ennoble or degrade, according to its own character. Man has largely stepped outside the guidance of the primary upward impulse which lower forms obey and has taken matters to a great extent into his own hands. At the same time he has within himself all the lower forms of life; but he has acquired self-consciousness, a thinking mind and knowledge of right and wrong, with the voice of conscience, which always says, "Do the right." But another voice is apt to say, "I want to do something else;" and this comes from the animal part of the complex being, which, instead of having its own way, should be guided by the higher self.

So man stands where he must choose between two ways.

Where the animal in man rules, we see animal life in its most impure and degraded form, for the intellect and all the higher powers of man that can be made subservient to the gratification of the animal are desecrated to such use to the injury of the whole.

The effect of this wrong is not confined to the one in whom it originates, but other lives are affected also, even animal and vegetable life below man. The common air is contaminated—the inner and outer atmosphere in which all lives are.

We see how man can mould both animal and vegetable life to his liking when he sets his will and his mind to work in this direction. Standing, as he does, at the head of the kingdoms of nature, it is through his help that they may rise to something higher, and it is his duty to so live as to uplift the life about him. Animal life, coming nearest to his own, makes the first plea for that pure and unselfish life that will send its radiant light down the open ways up which the lower lives must climb. B. W.

The Parable of the Hose Pipe

Some men are great because of the Power which stands behind them, the divine energies which flow through them, they are great through having learned how to receive.—W. Q. Judge

TO those whose minds are set on higher things the meanest object may be suggestive of spiritual truth. What more commonplace and ordinary than a hose pipe lying on the earth and pouring water at the roots of a thirsty plant? But how instructive!

The pipe does no work exactly, and yet how useful by its mere presence! Its utility lies in its being the channel for a current to flow through. Its virtue is to be smooth and unobstructive, and to allow free passage.

Sometimes I fancy our best work is done, not by a fussy activity, but in simply standing by and affording a channel through which an influence may be diffused. Labored schemes and petty contrivings often mar our work and only obstruct the flowing of the force.

The great drawback to this form of usefulness, however, in the eyes of some, is that like the hose pipe such a worker is not held in very high esteem among men. The results indeed are valued; the fruit is enjoyed, people expatiate upon the beneficent effect of the irrigation, but the poor hose pipe through whose instrumentality the water was applied, lies unnoticed in his coil. As a matter of fact, however, the hose pipe is supremely indifferent to public recognition, and so is the true impersonal worker.

Readiness to serve is an infallible provocative of opportunity. And if it were not, it is in itself a beneficent force of far-reaching action. A hose pipe that proposes to remain comfortably coiled may look the same as one that lies benignantly ready for use. *But the latter is at work.* STUDENT

California and the Orient

(CONCLUDED)

THE Orient has slept for ages. But, half a century ago she awoke, and now at a bound she has come into the front of modern life and acquainted herself with all its ways and thought, adopting as much as seemed to her, good.

Half a century ago, also, California began her modern life, and stands in the front of the line. According to the history of humanity given by Theosophy, in an altogether forgotten chapter of the great story, Japan and California, and the continent that then stretched its mighty arm between them, also shared the light of an ancient civilization. And now they have awaked again together. In them is the spirit that flowered into the art of Greece and Crete, the architecture of Egypt and Babylon, the splendor of Persia, and whatever was great in every nation from the measurelessly distant *then to yesterday*. Why should not it all come again? Why, as the years pass, should not every flower of art and literature and thought and music, every bloom of genius and inspiration of all the long past, ripen here and in that far-near Orient? And then, when nothing is wanting to us and to that that was worthy from the past, what shall hinder that this spirit of life dwelling amongst us shall at last do what it has waited for through all the ages, rise upon the shoulders of all past effort, and produce that perfect thing that is not art nor science nor anything that the past has fully known, yet to which all those contribute and into which all those blend?

California is not a little Italy, to be overrun by war. The crown of America, she is, set in America, as would have been Italy if all Europe had conspired to safeguard her. The only thing that can hold us back from the light, will come from within ourselves, disunion, corruption, all the influences that absorb human thought and prevent it from reaching its highest.

Now it is possible for us to see in part why the Universal Brotherhood made its Headquarters at Point Loma in California, and what it is doing. It is trying to show the way to the thing that California is destined to reach. Into the life there, disunion, corruption, ambition, do not enter. The attempt of us all, guided by our Leader, Katherine Tingley, is to keep out all those influences that stay human thought from doing its noblest. And the essence of the Raja Yoga training of the children is that the little ones *grow up* in this purified atmosphere which we elders try to keep around them. So they will do far better than we; and whatever there is of possibility in human consciousness, whatever possibilities lie latent in the human soul, whether of thought or art or work or spiritual perception of the mystery of life, can there come forth. It is an experiment in soul life, tried for California, and for the world.

And California will first see its results, first learn from the experiment what she also can do, and make the State show the great Light that first began to glow in the world's darkness at Point Loma. Japan too, watches. There in the far East, as here in the far West, the new Light will shine. She did not enter on her war to *gain*, but to *keep*, to maintain her nationhood. She felt the birth of the new Order, as we in California feel it. And she determined that the Light beginning to glow should not be extinguished or imperilled.

Let us therefore daily try to feel in our hearts the swift rising of the

tide of new life, bearing promise of so grand a future. Swift surely, for in fifty years we have summed up 2000, and the pace increases. We ourselves shall live to see the new thing. And let us whilst we watch each in ourselves this advent of new consciousness, and the signs of it all around us and even in the whole world, try daily and vigilantly to keep from our minds all the clouds, all the littlenesses and quarrels and failings which alone can dim our view, our hopes, and our certainties. H.C.

In Europe

(By our special correspondent, December 31st, 1904)

THIS memorable year is at an end. How does Europe stand today? Have the nations been making progress, or the reverse? On some lines there is little to be hopeful about. Trade has been bad all round. The army of the unemployed has found fresh recruits in Spain, in Italy, in France and in Germany. Of strikes there have been many. The great Northern Empire, with its untold multitudes of gentle toiling peasants, is now passing through an ordeal of terrible import. Every village, every hut—robbed of its men-folk for a war which few can understand, is full of hunger and sorrow. Widows and orphans weeping, while they starve, for dead men in Manchuria. Oh! it is horrible—this suicidal war!

And Macedonia is still at the mercy of the "unspeakable Turk!"

But flowers are to be found even on the edge of the volcano. I think that the flower of Universal Brotherhood has grown this year in Europe amid the most threatening surroundings. For it is needless to say that nearly all the nations realize that the state of things in Russia may spell catastrophe for them. The fierce lava torrent of war may spread Europewards at any moment. So the thought is being forced into the minds of the peoples as they contemplate the possibilities of this climax to European armaments—"Why war at all? Why war at all?"

I do not think it is fear, however, but something higher, that has been bringing about the exchange of courtesies between rulers and representatives of which mention has been made in some of my recent letters. The Europeans have, without knowing exactly why, been drawing nearer to each other in various ways. I believe that the best of them are dead sick of conventional things, and want to do *something* for each other. Something less artificial, more humane, more brotherlike.

As an illustration of this, I note a remarkable movement that has sprung up within the last month or two in France. It is called La Mutualité. A Frenchman described it to my son as a sort of National "State Club."

All sorts and conditions of people can become members, and among its advantages are payments during sickness and old-age pensions. It has the support of the President of the Republic and many other well-known public men. The Government helps it, while it is popularly organized.

But among other things contemplated by La Mutualité is the enrolling of destitute or abandoned children in its ranks. M. Mesueur is, I believe, responsible for the idea, the effect of which will be to break down class distinctions among the children of France during the educational stage. I have not had time to go into the subject fully. But its note of mutual helpfulness seems to be quite peculiarly sweet.

A Churchman on Theosophy

DR. W. H. W. BOYLE, House of Hope Presbyterian Church, declared last evening, in a lecture upon "The Folly and Fruits of Theosophy:"

"This new American Buddhism destroys the idea of a personal God, which is the basis of every true religion. It has no idea of virtue, but advocates only the doing of 'what one desires,' thus giving sweep to unlimited license. It is in direct defiance of the declaration of modern science, as stated by Lord Kelvin, that no life is possible without preceding life, and that the whole universe testifies to the existence of an all-powerful designer."

—St. Paul Dispatch, Jan. 23, '05

Now before commenting on this marvellous medley, it is interesting to append the editorial note affixed to it:

IT MAY BE, AS DR. BOYLE SAID LAST NIGHT, THAT BUDDHISM IS ONLY "THE OLD BUSINESS UNDER A NEW SIGN," BUT THIS, AT LEAST, IS TO ITS CREDIT, THAT IT HAS

NOT HAD TO FIGHT AND BE OVERTHROWN BY MODERN SCIENCE; TO DERIDE AND DENOUNCE EVOLUTION AND FINALLY SURRENDER TO IT; TO FIGHT WITH FIRE AND STAKE THE COPERNICAN THEORY AND YIELD TO IT; TO HAVE TO GIVE UP GENESIS TO GEOLOGY.—St. Paul Dispatch, Jan. 23, '05

Obe! jam satis.

It were a cruelty to imagine that the reverend gentleman above named has been reported correctly, for the colossal ignorance of the subject of

Must Be in a Sad State of Incoherency

Theosophy shown in this report is only equalled by its dogmatism. But taking for granted that Dr. Boyle did use these phrases, then it only remains to say that the ideas of the reverend incumbent of the "House of Hope" Presbyterian church, must be in

a sad state of incoherency. Evidently the speaker imagines that Theosophy and Buddhism are identical, save that the former bears a Western name more agreeable to the Western consciousness than the latter. While it would be grossly inaccurate to admit this for one moment, it is very pertinent to ask the clerical gentleman whether he is fully prepared to as dogmatically assert that there is no kinship between Christianity and Buddhism and kindred faiths? To just how far an extent did the ethical system of Siddhartha the Buddha affect the life and labors of Jesus the Christ? Some 550 years before the birth of the great Galilean reformer, was born Siddhartha. He preached a superb ethical system of religious philosophy which spread with rapidity. Being preached in the vulgar tongue (as also were the teachings which gave birth to early Christianity), and owing to its popular literature and splendidly organized monastic and missionary system, the tenets of Buddhism spread everywhere. Buddhistic symbolical remains have been found in Ireland; Buddhistic ideas

Buddhism on the Dead Sea

are thought to have intimately affected the systems of Greek philosophy; and Pliny speaks of Buddhist monks as being established on the shores of the Dead Sea "for thousands of ages." (Sic!)

Now Jesus, called the Christ, was an Essene, which sect, as every scholar knows, lived in monastic seclusion in settlements in the desert near the Dead Sea, and whose habits of life and thought were modelled on very similar rules to those obtaining in early Buddhism.

The beautiful story of Jesus the Christ finds a parallel in the story of Siddhartha. One instance relates how Ananda, the cousin and future disciple of Gautama, was born about the same time as the latter; and how Maïa the mother of Siddhartha visited the mother of Ananda, both soon to become mothers, the unborn Ananda greeting the unborn Siddhartha, as happened according to Luke, when the unborn child leaped in the womb of Elizabeth when Mary came in.

The story of the Massacre of the Innocents is on its face a most improbable tale. So bloody an event would assuredly have been chronicled by every writer of the day, but no where in contemporary history can there be found a trace of it. But curiously enough, the story is found in the Brahmanical traditions concerning Krishna, where Kansa, the tyrant of Madura, being told by astrologers that a child

Embarrassing Facts for Our Clerical Critic

would be born of his niece Devaki, gives orders to kill the child when born; but the innocent babe is saved by divine protection, being carried away to another place out of the tyrant's reach. Then Kansa, in order to be sure to kill the right boy, has all the male infants in his kingdom massacred. Furthermore, Krishna was adored by the herdsmen of the land!

Then regarding the Immaculate Conception, we find very embarrassing facts for our clerical critic. "Behold, a virgin shall conceive and bear a son," (Matthew i: 23, quoted from Isaiah vii). "In the early part of the Kali Yug shall be born the son of a virgin," (Vedanta.—1905, A. D.—year of Kali Yug 5007 or thereabouts; total duration of Kali Yug, according to Hindu records, 432,000 years). Again: "And I give unto them eternal life, and they shall never perish," (John x: 28). "He shall come, and life will defy death . . . and he shall revivify the blood of all beings, shall regenerate all bodies, and purify all souls," (Atharva Veda). Again: "Behold the lamb of God," (John i: 36); "He was brought as a lamb to the slaughter," (Isaiah 53). "He shall come, more sweet than honey and ambrosia, more pure than the lamb without spot," (Atharva Veda). Again: "God manifested forth his glory," (First Ep. John), and "God was in Christ, reconciling the world unto himself," (2d Corinthians v). "And God shall manifest his glory, and make his power resound, and shall reconcile himself with His creatures," (Atharva Veda). And

Other Scriptures Preceding Christianity

once again do we compare: "Being an unparalleled instance, without any pollution or defilement, and a virgin shall bring forth a son, and a maid shall bring forth the Lord," (*Gospel of Mary iii*). "It is in the bosom of a woman that the ray of divine splendor

will receive human form, and she shall bring forth, being a virgin, for no impure contact shall have defiled her," (*Vedanga*). It has come to pass that these writings are proved to have preceded Christianity, and Krishna, of whom the above is prophesied, preceded Jesus the Christ. *Why is it that the Christian Scriptures parallel so closely a preceding system of religious belief?*

Dr. Lundy's *Monumental Christianity*, interpreted with the Theosophical key to the myriad facts the author presents, is worth re-reading. Just taking one instance, that of the crucified Krishna, called Wittoba. Here we have a figure whose attitude, drawing, nail-marks in hands and feet seem to point to a Christian origin, "while the Parthian crown of seven points, the absence of the wood and of the usual inscription, and the rays of glory above, would seem to point to some other than a Christian origin."

It is evident, of course, that Jesus the Christ and the Hindu Savior and Hero Krishna, are not identical persons. The former's birth date is still uncertain though placed at some twenty centuries ago; while the latter's is estimated at fifty or sixty centuries ago. Yet surrounding the histories of both are gathered various marvels, stories and legends. And these legends are frequently identical.

Legends Are Frequently Identical

We have Krishna the Good Shepherd, born from the virgin Maia (or Mary), who crushes the head of the serpent Kalinaga and who is crucified; in the Hari-Purana we find Krishna raising the young Kalavatti, daughter of Angashuna, to life from the dead, and he uses the words: "Why weep ye? See ye not that she sleepeth? Rise and walk." Whence these identities? Nor do they end here. We find on comparing the lives of Krishna, Gautama-Buddha and Jesus of Nazareth, that the identities grow in proportion to the depth of our research. All three are descendants of kings; Krishna and Jesus are intimately connected with tales of worship by shepherds and both are called "The Good Shepherd."

All these characters, again, are affirmed to be incarnations of one of the persons of the respective Trinities. In the first and third instances both are divinely saved from death at the hands of a tyrant whose throne was imperilled by their births; and in both instances, following the tradition, are thousands of innocent male children ruthlessly slain. In all three cases, again, are the mothers of the Saviors immaculate virgins. All three cast out demons, perform wonders, and are endowed with strange powers. Both Krishna and Jesus the Christ

Both Washed Feet of Their Followers

wash the feet of their followers, descend into "Hell"—or the lowest regions—and return to "Heaven" after liberating the dead. Gautama and Jesus pass their lives with mendicants and sinners. All three strive to abolish idolatry, they preach against the established priesthood, and all three die connected with cruciform symbols, and finally ascend to Paradise. How does our cleric logically explain all this? *Why these identities between Christianity, Buddhism and kindred faiths?*

Many were the "Christs" of pre-Christian ages, indeed!

Some of the most sacred rites of Christianity are pre-Christian in origin. *Witness the Sacrament and Mystery of the Eucharist, which is known to be a relic of the ancient pagan Mysteries, and which Cicero speaks of and wonders at.* (Does our reverend brother know this?) And the Divine Sacrifice of Deity has its parallel in many ancient scriptures the world over.

Now if the strictures of Dr. Boyle against Theosophy are reasonable and true, *how can he help including his own faith in the same category?*

These exquisitely beautiful mystical symbols are really universal, and belong to no one race especially, nor to any particular region of the globe. The Savior and Helper of men, born from a virgin called Mary (or one of the variants of this name, meaning the *ocean of universal Love, Life, SPACE—Mary, Mare, Maia, Maya, Miriam, etc.*); the death of these great Helpers of Humanity when their work was accomplished; the universality of the cruciform symbol; the same religious observances and symbols everywhere—all this points to a very ancient and perfectly universal system of religious belief, whose children, and children's children are the present forms of human faith. In prehistoric America, in prehistoric Egypt,

Theosophy the Primal Wisdom-Religion

India, Ireland, Central Asia; in Babylonia and in the Islands of the mid-Pacific; East and West, North and South, wherever man has wandered carrying with him his faiths, are these identical symbols and beliefs found. Theosophy claims to be the primal Wisdom-Religion of mankind: this universal prehistoric truth, mother of all, and still alive in all faiths.

Thus, when the reverend Doctor criticises so illogically something of which he evidently is in the darkest ignorance, it is unwise, to say the least. Such flagrant offenses to *logic, matters of fact, and to the spirit of the holy moral teachings of Jesus the Christ*, can but set his listeners to *thinking for themselves, and to investigating what Theosophy is after all.*

The statement of Dr. Boyle as to Theosophy "having no idea of virtue, but (that it) advocates only the doing of 'what one desires,' thus giving sweep to unlimited license"—is pitifully inaccurate and untrue. And Dr. Boyle knows it. No system of thought on earth exacts so rigid and uncompromising an adherence to the highest morality. It exacts more than mere adherence to a mental conception; it exacts *works.*

The appeal made to Lord Kelvin's scientific theories, by this speaker, as weapons to brandish against the Theosophical philosophy, (about which the speaker evidently knows nothing), is amusing. The vision of orthodoxy using unorthodox missiles to "settle" something, induces the belief that the theological arsenal needs replenishing. Will the pulpit become the rostrum of scientific

Theological Arsenal Needs Replenishing

theories which have proven themselves as mutable and variable as the winds? But the statement that Theosophy "is in direct defiance of modern science, . . . that no life is possible without preceding life," etc., is ludicrously inapt, as *that doctrine is one of the fundamental tenets of Theosophy.* Theosophy, likewise, postulates and affirms as a matter of course, "that the whole universe testifies to the existence of an all-powerful designer"—as the *Demiurge*; nor does it stop there, as does evidently the reverend Doctor, but it is axiomatic in saying that "no life is possible without preceding life," and back of, beyond, behind, *within the essence of this Demiurge, or Designer, lies the INFINITE MYSTERY OF INFINITELY SELF-CONSCIOUS BEING, CONCERNING WHICH ALL HUMAN SPECULATION IS FUTILE, AND ALL INTELLECTUAL PENETRATION IS VAIN. Hence the Theosophical refusal to recognize the Personal God of the Monotheists, as being a blasphemy on the Infinite.*

Theosophy's Attitude of Forbearance

Theosophy is *not* Buddhism; nor is it Brahmanism or any other ism, for it is the great central Light from which *all other lights have sprung.* Hence its constant attitude of forbearance as a belief, towards all forms of human spiritual faith. It is as silly and as weak to attempt to heap obloquy on Theosophy on account of child marriages taking place in India, for instance, as it would be for a Theosophist to defame Jesus' ethics for the same cause, merely because Christianity and certain Hindu religions are so strikingly similar. As long as crime and vice are so terribly the scourge of our Western nations, after nearly twenty centuries of Christian Doctrine, while our cities are what they are, one may logically *question the efficacy of our own system of professional Christianity!*

This clergyman's statement that Theosophy teaches that "the soul of a criminal inhabits in its second stage the body of a savage, in a third stage the body of a leopard, and in the fourth the body of a hog," is flagrantly false, though it *does* recall to mind a certain story of devils whose name was legion being cast miraculously (?) out of a large number of swine. One wonders where his information was got. Bogus Theosophists, who profess a bogus and grotesque Theosophy, are many; and if his ideas were sought at such a fount, the reverend gentleman is more to be pitied than censured for his amazing ignorance.

Truly, a little knowledge *is* a dangerous thing. It is like a boomerang and rebounds, as does sarcasm, on him who uses it.

Nevertheless it should be clearly stated that the above is in no sense whatever an attack on Christianity. Nor is it written to wound the feelings of any soul sincerely believing in the teachings of Christ. But when an attack is made on a system of thought which has given hope, help and courage to thousands of distressed human minds, such an attack deserves a forcible and well merited rebuke. G. DE PURUCKER

Some Views on XXth Century Problems

Heredity or Re-incarnation? MUSICAL papers are commenting in astonishment on the feats of the little boy violinist Franz von Vecsey. They speak of his ease and accuracy in playing thirds, octaves, and tenths; of his "fabulous harmonics in the *Faust* waltz—a passage which only one virtuoso out of 10,000 might do without the semblance of a 'scratch,' 'squeak,' or slip"; of spiccatos and staccatos "of such marvelous lightness and accuracy as perhaps only one or two grown up violinists in all the world could duplicate"; (we quote from the *Musical Courier*); and of the way in which, at the rehearsal of the Beethoven concerto in Berlin, he "showed an amazing knowledge of the instrumentation, although he had never before played the concerto with any other accompaniment than that of the piano. Nor is it mere technique; his musical interpretation is described as of the highest order."

The idea of Reincarnation does not seem to suggest itself to the critics, though one would have thought it an easy and obvious solution of the difficulty. Heredity may suffice to explain mere aptitude, but it will not do for such technical resources as this. Is it not evident that they lay waiting, folded up as it were, in brain and muscle, for a comparative trifle of practise-work to reveal them? The strong thought of the soul had fashioned its vehicle in advance, for the work it intended to do. Might it not be so with all men if in some other life they had found their right work and refused to be drawn from it by the myriad calls of transient impulse?

STUDENT

A Striking Contrast THE incumbent of the Protestant Episcopal Church of St. Albans, Washington, has made a series of maps illustrating the progress of Christianity towards the occupancy of the whole world. Christianized areas are white; non-Christianized areas are black. The pictures are very striking; but little black now remains.

We do not have to look for light amid the darkness, but rather seek out what remains of darkness in the flooding light. . . . No wonder that missionary optimism looks forward to the Christianizing of the world "in this generation."

One hardly knows what to think. For while on the one hand we are invited to such a feast of optimism, from other *equally Christian quarters* the cry is raised that religion is losing its hold on the human heart. Church attendances are falling away, and it is only by superhuman efforts that people can be got to listen to the message at all. Not long ago the chief Roman Catholic organ in Paris declared that the spirit of peace had fled the earth, explaining that the flight was due to the spread of Darwinism. But if Darwinism be the enemy of Christianity, how can the two enemies be both supreme over the same region? This we must leave the reverend optimists and pessimists to settle.

Other observers sound the same depressing note. Goldwin Smith foresees "fatal results to the next generation unless science can construct something to take the place of the failing religious conscience." Herbert Spencer wrote:

. . . now that the European nations are vying with one another in political burglaries; now that we have entered upon an era of social cannibalism, in which the strong nations are devouring the weaker; now that . . . equity has utterly dropped out of thought . . . ; it is useless to resist the wave of barbarism. There is a bad time coming, and civilized humanity will (morally) be uncivilized before civilization can again advance.

Add to continuous war, and ever more burdensome preparation for war, the one in nine or ten of every country who are *over* the edge of poverty; the increasing unscrupulousness of commercial methods; the general fall in the birth-rate; the increase of insanity, suicide, degeneracy, certain diseases, and divorce; and we have a set of pictures that make a curious commentary upon the other set which is causing so much rejoicing in the heart of the Washington clergyman.

But all this is assuredly no indictment of the teachings of Christ; it is an indictment of the *misunderstanding* of them, of the *falsification* of them, and of the *suppression* of them.

Of the misunderstanding of them; because though that gospel in

which they are most freely reported begins by reference to the "Light that lighteth *every man that cometh into the world*," nevertheless Christ's assertion of himself—"I am the Light of the world"—is made to mean "I am the *whole* of the Light of the world; *no one has any except he obtain it of me as a personality*." As Christ, the Light spoke in comprehensible human terms, so that each man might understand the message *always* coming to him—mostly unheard and not understood—from the depths of his own heart. The difference is between showing men how to walk, and doing their walking for them; between evoking or paralyzing their divinity.

Of the falsification of them; because they have been twisted to the support of as monstrous dogmas as were ever born in the darkness of the soul of a savage.

Of their suppression; because from the very first the formal decisions of Church Councils between books "canonical" and "apocryphal" were but the final and *open* terms of a process which began secretly almost from the very first, and which withdrew from the very knowledge of the people much more than the meagre fragments it was compelled to leave in their hands. Time will show. Nemesis moves slowly, but forgets nothing.

Theosophy has come to reintroduce the Christianity of *Christ* to a world that has never been permitted to know it.

Need of a New Education

EVERY phase of modern life and thought aims at the possession of a journal in which it may set itself in print before the public eye. The most recent and astonishing development of this tendency is a journal published in Vienna, which is the official organ of the Society of Catholic Divorced Men and Women. Its object is the abrogation of a law prohibiting the marriage of divorced Austrian subjects, if either, at the time of marriage, was a Catholic.

The editor of this journal says that in Austria there are 200,000 divorced people, of whom 38,000 are in Vienna. The population of Vienna is about 1,364,000. Of this number those who are or have been married would be something over half a million. It follows then that about one married person in fourteen of the Viennese is divorced. Suppose we add to these cases the others who would be among them if they did not shrink the publicity of the law; and the still larger number who would be among them if the unfaithfulness were known to the injured partner. It is not a pleasant picture, nor do we suppose it peculiar, among great cities, to Vienna. Does it not urgently bespeak the need of new methods in the upbringing of children?

C.

Health and Villages

A MEDICAL contemporary calls attention to the health conditions of Grand Isle county, Vermont. Here the villages have all a population under 100; the houses are all separated by a considerable space; nearly all the people are farmers or fruit-growers; and as the county is nearly an island, it is steadily brushed with winds from the surrounding waters.

Accordingly the deaths from tuberculosis are probably lower than anywhere else in the civilized world. In a population of between four and five thousand there were in 1893 only two.

The whole state of Vermont, for similar reasons, is singularly healthy and its death rate from tuberculosis steadily going down. Its chief cause of mortality appears to be old age.

One can imagine the city-dweller in his steam-heated rooms shivering as he reads of that wind of Grand Isle, steadily blowing from somewhere, never altogether ceasing.

But to complete the picture one wants to hear what the Grand Islander has to say about the city-dweller's apartment and its atmosphere. The tuberculosis germ is thoroughly at one with the latter in his dislike of winds and his love of steam heat and double windows. Surely modern methods of communication and transit will put an end to that fear of becoming "provincially minded" that keeps so many who most need it away from village life. Did Stevenson get "provincial" even in Samoa? STUDENT

Japan to Lead the Orient

A WAR correspondent in the East thinks that Japan's real intention is to orientalize China—perhaps it would be more correct to say head a progressive movement on oriental lines. Schoolboys are going from Peking to Tokyo to receive education and military training, and returning to their own country to take command of troops. A foreign exclusion law has recently gone into effect in Japan which prohibits foreigners from holding land in their own names, entering into business in their own names, practising any profession or teaching in any school or university. China, has, it is said, notwithstanding Government professions of neutrality, facilitated the transport of supplies to the Japanese troops.

This idea will be familiar to readers of the *NEW CENTURY PATH*. In Vol. VII, No. 26, we read:

"Japan has never lost sight of the fact that Japan must be for the Japanese, and as fast as they learn from the white man the secrets and the mysteries of this or that manufacture, out he goes. . . ."

"To predict that Japan is destined to sway the balance of power in this Far East is not saying too much; nor indeed is it going too far to think that a day is brightening in the East for the yellow races, which may bring out from the womb of the future very curious surprises for the West. The enormous inertia of China needs but a touch to transform it into a military power such as the world has never seen nor even dreamed of, and Japan is fully alive to this fact. . . ."

Really it is creditable that there is someone whose perception is sufficiently free from Western complacency to realize that Japan has not become suddenly convinced of the superior excellence of our mushroom civilization and the futility of her own time-honored one. Even in her sleep, this ancient nation was far ahead of us in many respects; and now she is awake and is awakening China too, we shall see a modern revival of ancient prowess. It was child's play to acquire our few tricks in mechanical invention and political machinery, so as to be able to deal with us in our own coin. Even our Bible has been sampled, weighed, and assigned its place among the necessary equipments of Western civilization. Our religion has been tested along with our silk hats and parliaments.

The "Yellow Peril" is indeed a peril to the cold, ruthless, sordid tentacles of commercial despotism.

Genius Transcends the Limits of Personality

TOLSTOY makes somewhere a remark to the effect that the writing about past history is subject to an inevitable artistic flaw, because no man can write with proper sincerity and realism about that which he has not experienced.

Of course such a theory as this would strictly limit one's judgment of a historical romance and render the verdict a foregone conclusion. But viewing the question without preconception, do we not find that people *can* write about historical events as graphically as if they had actually experienced them?

And why should they not be able to do this? Is the mind's eye necessarily limited to things which the present personality of the writer has experienced? Is his range of material confined to the experiences of one life of one man?

No; the man of genius can raise his vision above the plane of personality and avail himself of materials stored up in the race-memory, living for the time so intensely in those experiences that they are to him as real as his own life. The view that all the experience available to me is that which my own petty personality has gone through in one life-time, is a materialistic view, smacking of the "heresy of separateness."

Every thought that ever penetrated human brain is stored up imperishably where it can be reached, in more or less degree, by geniuses, in proportion to the perfection of their powers.

The duty of Science is to find a logical explanation for what actually happens, after experience has shown that it can happen; not to try to reduce infinite and eternal powers to the level of pessimistic theories. E.

Past and Future Glory of America

ARCHEOLOGISTS are at their wits' end to find an adequate explanation of why certain myths, such as the flood, creation, and after-world myths; certain symbols, as the bird, snake, cross; and certain numbers, as three, four, and seven; are found in the mythologies and religious sciences of all races all over the globe.

Some explain it by theories of migration, seeking to show that one race derives its ideas from another, and that races carry their systems from continent to continent in times when geological and climatic conditions permitted it.

Others, finding the migration theory insufficient, say that there is a unity in the soul of man, which compels him to reason along the same lines. This is the view expressed in Brinton's *Myths of the New World*, but he regards "natural religions as the unaided attempts of man to find out God, modified by peculiarities of race and nation." But the great mass of evidence which he collects showing the identity of various American symbols and myths with each other and with those of the Old World, is too heavy a superstructure for such a theory.

The whole speculation is, as usual, vitiated by the deep-seated preconceptions as to the origin of man, which represent him as always ascending from a supposed primitive type, of which the degenerated relics now extant under the name of savages are taken as specimens.

But these degenerates are on the downward path; they are rudimentary in the same sense as certain organs are in the human body.

W. Q. Judge says: "In Egypt the Denderah Zodiac tells the same tale as that one left by the old civilization of the American continent, and all of these are from the same source; they are the work of the sages who came at the beginning of the great human cycle, and give to man, when he begins his toilsome ascent up the road of development those great symbols and ideas of an astronomical character which will last through all the cycles."

In fact archeological research must inevitably lead back toward the time when the last great human race, the Aryan (not coextensive with the Aryan race spoken of in ordinary scholarship), first came on earth, full of knowledge and power, "heroic" or divine in its characteristics. From that epoch a gradual loss of knowledge and degradation of belief and practise, as the race in its various offshoots, descended into materialism, will be marked.

All these different peoples then, the Americans, Polynesians, Asiatics, and Europeans, have *preserved*—not invented—the ancient teachings.

The traditions of their pristine glory—not primitive barbarism—are numerous and persistent among the Americans. Brinton speaks of them, comparing them with the rose garden of Feridun, and the various Edens of the world. "Paradise" in Sanscrit, means "high land"; where, "in the unanimous opinion of the Orient, dwelt once in unalloyed delight the first race of men." Driven thence, their longing has ever since been to find that golden land again—among the Hyperboreans, in the "mountains of the moon," beyond the pillars of Hercules.

"When Christopher Columbus, fired by the hope of discovering this terrestrial paradise, broke the enchantment of the cloudy sea and found a new world, it was but to light on the same race of men, deluding themselves with the same hope of earthly joys, the same fiction of a long lost garden of their youth."

"The Aztec priests never chanted more regretful dirges than when they sang of Tulan, the cradle of their race."

And so on, with many parallels.

Thus, not only the zodiacs, calendars, etc., "so arbitrary," but also the aspirations of these peoples point to their glorious origin and are prophetic of their future destiny; for races die but to be born again in others.

And this regaining of Paradise shall come through the restoration of the true Light of Brotherhood, which brings all other bounties in its train.

Not to the dead Past can we return, but we must aspire onward to its resurrection in the golden Future, when Man's wandering in the valley is o'er, and the Sun shines on him once again.

STUDENT

The Trend of Twentieth Century Science

"It Cannot Be"

ABOUT twelve years ago Lord Kelvin said that there "cannot be" any connection between our magnetic storms and solar radiations. He had some "because's" to back up his assertion which for that time were very convincing.

A magnetic storm is a sudden disturbance in the earth's magnetic currents, those currents whose flow from pole to pole keeps the mariner's needle pointing nearly north. When a storm sets in—these storms have nothing to do with the weather—the needles begin to twitch and swing, telegraphic communication may become impossible, the trolley cars may be unable to run, and there may be a brilliant display of the aurora borealis. These pranks may last from hours to days; serious results to commerce may occur; and there may be many wrecks of ships that do not know what course they are pursuing.

Lord Kelvin's "because" rested on the sudden beginnings of these storms. He said that any magnetic radiation from the sun as a whole or from a spot must follow the laws of any other radiation such as light or heat—that is to say it must be in all directions. And it must therefore reach our earth like daylight, gradually, and as gradually disappearing.

But Mr. Maunder finds that though possibly there "cannot be" any connection, there *is*. For the storms occur at intervals of $27\frac{1}{3}$ days, or some multiple of that interval—the solar rotation-period. His very reasonable suggestion is that from a given point on the solar surface a geyser-like stream of electric particles is discharged in a definite direction. When the earth is in the way she is hit. Presumably the other planets are also periodically hit.

After learning to discount the ceaseless and confident "cannot be's" of science, one wonders whether after all there may not have been something in the claims of the old astrologers—that the planets, when in particular situations on the Zodiacal Belt, threw upon the earth special influences?

There was of course a time when the "cannot be's" came from the Church—usually accentuated with stakes and burning fagots. Science "sang humble" and had not as yet evolved a dogmatic spirit of her own. One is reminded of this by the recent discovery of a sixth moon of Jupiter's. When Galileo proclaimed the existence of the first four, he was deemed guilty of sacrilege. They confirmed the impious heliocentric theory.

STUDENT

The New Physiology

THE keynote of what might be called the new physiology, founded on the discoveries of the last very few years, is compactly given by a California physiologist, whom one might well imagine to have been reading H. P. Blavatsky's writings: "The human system is an electrochemic battery, acting according to known electric laws. It contains many electrical circuits, major and minor, many nerve wires, many poles, many relays, in fact the life principle itself is everywhere electrical in action. The blood is the exciting fluid of the human battery and the nerves are connecting wires."

That in an elaborated form, is what will be taught to the medical student of the future. But there is something to be added to it, to make it carry the whole of the truth. The human system is an electric battery which is conscious of its own states and changes, which can reason about them and which can affect them by a direct act of will. With that addition we have a statement which was made and taught to her pupils as a fragment of Theosophy many years ago by H. P. Blavatsky. She went a good deal further, and there, too, will doubtless be followed in due course by science.

The subjective side of force is mostly ignored by science. It cannot be so permanently, and when it is recognized, some strange conclusions will have to be drawn.

For if, as science is now saying, matter, life and mind, can all be expressed by one word—electricity; that is, if the "four" are identical; then since two of the four are conscious, the other two must be. Which is the same as to say that the universe is conscious! And it is but a step further to say that the universe is dominated by will. STUDENT

The Hidden Cause of Cancer

THE Harvard cancer commission, which has been sitting for two years, appears to have reached mainly negative conclusions. Its report will be that the disease is hereditary, is not infectious, and that its cause is as mysterious as human life.

The last clause recalls Virchow's theory. The body develops by a process of energetic cell-division. At last a little "mulberry-like" mass of cells results, all alike, and all prepared for a long cycle of further work. Then, still multiplying, they begin to differ out into the various tissues of the body, muscle, nerve, blood cells, and so on. Virchow's view was, that in the midst of the fully-developed tissues, occasionally still lie a few of the original "mulberry" cells, undifferentiated, with all their energy still unexpended and latent. In later life, for various reasons, these are apt suddenly to begin the energetic and superfluous growth which, having no relation to the needs of the body, and outside of its harmony and balance, is cancer. He further thought that these cells lay at points where there were, so to speak, unfinished edges, rough joinings, unplaned surfaces, in the complicated make-up of the body.

If the great pathologist was right, how came those points of bad carpentry? What interfered with nature's delicate work during those early months? Is there nothing that can be done in safe-guarding prenatal conditions? Is there no lesson in the self-protected maternity of animals?

It is evident that if this is the right way to look for cause and remedy, we need not be surprised that scientific commissions separate as empty of positive knowledge as on the day they met.

PATHOLOGIST

The Virtues of Garlic

THE use of garlic in tuberculosis is making marked headway. An Irish Physician, writing to a contemporary, quotes from a herbal published two centuries ago. This volume gives a lurid list of the virtues of the plant: "It is hot and dry to the fourth degree; Aperitive, Abstersive, Attractive, Carminative, Digestive, Discussive, Anodyne and Suppurative. It is Stomachick, Pectoral, Nephritick and Arthritick; Ptarmick, Sudorifick and Alexipharmick." We do not know what Alexipharmick means, but it sounds like an admirable quality in a drug; when conjoined with Ptarmick and the rest there should be few maladies which can resist it.

The virtues of this plant do not lack modern methods of trial. An Italian physician has kept a number of guinea-pigs in an atmosphere of tubercle bacilli. To the diet of some he added fifteen grains daily of garlic; these remained healthy. The others, who had no garlic, were all badly infected. From this he infers that it is not only curative, but prophylactic.

The virtues appear to be due to an oil containing sulphur in a volatile and very active form.

PHYSICIAN

The Philosophers' Stone

WE note that the Philosophers' Stone of the old alchemists is about to become orthodox and official. Sir William Ramsay, the eminent English chemist, speaking of the now known transformation of one element into another, remarks that these transformations "are brought about by the application of radium. . . . An illustration of the effect that radium produces may be seen when it is applied to glass. It thereupon appears to decompose or transform the glass into a matter like lead, a matter like actinium, and still into something else."

Now since radium, polonium, X-rays, and so on, will do this transformation, is it impossible that some of the alchemists knew one (or more) members of a group possessing this power, knew it even more accurately than we, and got gold as the final term of their transformations? Why they should have kept their knowledge a profound secret is obvious.

But if, at any time in the future, their claims should be completely justified by the scientific and orthodox transmutation not only of one metal into another, but into gold, their shades need expect no *post mortem* credit. It is a charge against Pythagoras that he maintained the heliocentric theory, "because on the data accessible to him no such conclusion should have been drawn." So those old students need expect only blame for venturing to be ahead of their day. STUDENT

THE LAKES OF KILLARNEY

The Meadow Lark—(Sturnella Magna)

HERE at Point Loma, at the very beginning of the year nineteen hundred and five, are heard the joy notes of the Meadow Lark's song, and occasional glimpses are seen of the bright yellow breasts with their black crescents. Is this happy herald of the new year a herald also of a glad new time?

Not an inch of his body is free from delight.
Can he keep himself still if he would? Oh, not he!
The music stirs in him like wind in a tree.

The Meadow Lark is in close sympathy with his surroundings and sings his song accordingly.

The Western Meadow Lark of the prairie states bordering on the Mississippi and Missouri rivers sings a most inspiring song. The notes are loud and clear, liquid and sweet, and at the same time so wild and free, like the broad, free, undulating prairie, which is the singer's home; and the bird sings as if he felt the vastness and would fill it with his song.

The Meadow Lark of the eastern states, while the same in appearance, sings a different song, one that is more in keeping with its surroundings.

The song of the Californian Meadow Lark also differs from that of the Western Meadow Lark (*Sturnella Magna Neglecta*). Its notes are more softened, and differ from the loud, clear, ringing notes of the Western Meadow Lark, as the greens of the native plants of Point Loma, softened into grays, differ from the brighter and stronger greens of the middle west. Atmospheric conditions may have something to do with the loudness and clearness; but this is not the whole difference. Their songs express a different feeling.

The Meadow Larks of the different regions wear the same coat, and in appearance are not to be distinguished one from another; but they express their souls in a different song, a song that is in keeping with the character of their homes. It is as if their souls were so attuned to the soul of the region they inhabit that they become its voice and sing its song as well as their own. They are children of locality. STUDENT

Trees as Affected by Lightning

TREES attract lightning, but some much more than others. The leaves furnish points of attraction, but the reason why some kinds of trees are struck oftener than others is not considered to be due so much to a difference in foliage as to difference in form and height. Other elements, however, seem to have an influence. Decaying trees, whether from age or disease are more liable to be struck than healthy ones. Trees profaned by some crime were considered by the ancients to be very susceptible to the lightning's shaft, but were also thought to be purified by the same. "The Ruminal fig tree, on the roots of which stranded the cradle of Romulus and Remus when the Tiber bore it to the foot of Palatine, was held doubly sacred after it had been struck by lightning."

The oak, yew and Lombardy poplar are said to furnish the greatest attraction for the electric fluid. One Lombardy poplar is superior in this respect to many lightning rods.

Beech, cedar and fig trees are said to be seldom struck, and the laurel and bay have been considered immune. Byron refers to the immunity of the laurel and also to the sacredness conferred by lightning, in speaking of the iron bust of Ariosto:

The lightning rent from Ariosto's brow
The iron crown of laurel's mimicked leaves;
Nor was the ominous element unjust,
For the true laurel-wreath which glory weaves
Is of the tree no bolt of thunder cleaves,
And the false semblance but disgraced his brow;
Yet still, if fondly superstition grieves,
Know that the lightning sanctifies below
Whate'er it strikes; — yon head is doubly sacred now.

While the laurel may be lightning-proof, we may well believe that the "true laurel wreath" and "the tree no bolt of thunder cleaves" belong to a higher plane of being than does the ordinary laurel tree. STUDENT

Abide in thy purposes as in laws that it were impious to transgress.—*Epictetus*

The "American Woman"

IN general, our foreign composers take the "American woman" quite for granted, yet there are not a few who continue to be surprised at this or that condition which seems anomalous. To quote from a recent article:

I was shocked to find that an American woman will spend the forenoon in cooking or dusting or cleaning, then dress herself like a duchess and sally forth to the meeting of a fashionable club where she is to read a learned paper, as likely as not, or else call a carriage and make a round of social calls. And her standing does not seem to be impaired in the least by the fact that during part of the day she has done the work of a menial; nor has it affected her own personal attractiveness.

Why is it so impossible to realize that the American woman, in living at this high pressure, oscillating, perforce, between washtub and soirée, is merely making the best of certain unpleasant pioneer conditions? Our social life is not yet a settled quantity; we have nothing settled in this country, no settled servant class, no settled peasantry, and while, to be sure, we do have a class of men who do not work, we protest against considering them a settled class; we call them "tramps."

But certain of our foreign friends make a grievous mistake in assuming that American college-bred women cook, dust, scrub, because they enjoy it. They grievously err in assuming that the American woman prefers to play charwoman to having an hour's study with her children or an hour's consideration, in the company of other college-bred and gifted women, of some civic, domestic or social problem. The average American woman does live at high pressure, and she is not infrequently forced to go from the most laborious work in her kitchen to occupations quite the reverse. But the reason of this is simply that transitional and evolving social conditions have forced these things upon her, not at all that she has chosen them deliberately. She has the choice of doing her duty or of neglecting it and, fortunately, most American women choose to do it.

This is a transition stage, no doubt, and it is well, for no woman of the class at present under inspection and discussion, can do her full duty by her children when the main reserve of her strength goes into cooking, scrubbing and keeping furnace fires. No woman so situated can keep the homelife restful and complete, can take her rightful place as comrade and companion to her husband, nor keep the respect of her children. "The life is more than meat, and the body, than raiment." Conditions such as these may be the means of evolving a very remarkable type of

human being—pioneer conditions usually are—but that is not saying that such conditions are ideal. The present stage is a transitional one, and the average American woman is glad to believe this to be true. Because she does believe this there is certain to come, some time, a home-life based quite differently from the average home-life of today, and a conception of wifehood and motherhood that is not absolutely bounded by the vision of the family stomach.

STUDENT

The Scold's Bridle

IN mediæval times, the scold's bridle was used in parts of England and Scotland as an instrument of punishment for women whose harsh chiding was a source of annoyance to family or neighborhood. The bridle was fastened upon the head and, having an iron part that fitted into the mouth, rendered speech impossible.

It is quite conceivable that women of a little more spirit than the majority of their sex, who found no opportunity in their environment for the exercise of talent or ability, might become bitter, and resort to harsh speech in their helpless resentment toward things in general. Having no weapon but the tongue, and little to encourage them to use that weapon wisely, not a few, perchance, spoke unrestrainedly, and became indictable as "scolds."

When we recollect that the gifted and enthusiastic Anne Hutchinson of early New England days, was designated "a common scold" by those of her townsmen who did not agree with her religious opinions; and when, moreover, we read that a "scold" was regarded in much the same light as a witch, the suggestion is inevitable that the scold's bridle may have silenced more than one woman whose speech, however unwelcome, was salutary, and that many an injustice may have been perpetrated in the punishment of so-called "common scolds."

STUDENT

WITHIN the last month the newspapers have recorded no less than three instances in which the word "obey" has been eliminated from the marriage ceremony at the request of the bride. In one case, in which the pastor of the church of which the bride was a member demurred, the determined young woman stepped outside of her creed and was married by the minister of a rival church. In another, after the marriage ceremony both husband and wife signed a document in which was clearly defined the wife's inalienable rights and privileges, the document being certified to by witnesses. Quite outside of the question as to whether or not these instances are steps toward the solution of a century-old problem, they are certainly straws showing plainly, indeed, the turning of the tide. E. W.

MEDIÆVAL "SCOLD'S BRIDLE"

Our Neglected Yards

THE effort of the Chicago Club Women to reform the city's neglected yards, comes like the echo of an address given two years ago to the citizens of San Diego by Katherine Tingley on the possibility of making the city "a great nature garden, a unity, verily, of all that is best in art, and all that is purest in nature."

"But," she said, "you object that this will cost. Yes, it will, and doubtless you have not yet sufficient money. More than that, it would be necessary for all citizens to work together and you will admit you have not yet sufficient unity. What then can you do? What can each do? Each can begin at home. If you have a bit of God's green earth about your home, get acquainted with it. Study it. Improve it. Make it not a *pot-pourri* collection of flowers and shrubs, but a quiet, restful work of art. If you have a back yard, transform it from an eye-sore into a beauty spot forthwith.

"There is no telling how far an apparently insignificant bit of good work may spread. It is like a stone thrown into the water in the endless succession of its ripples. There is no telling how far even one regenerated back yard or one beautifully landscaped garden might influence your whole city, and this influence the simplest and poorest can wield.

"Make a beginning! Make it now, if it is nothing more than laying out a walk in a curved line instead of straight, if it is nothing more than planting a shrub in your yard for the birds to nest in. If you do this, keeping the greater ideal before you, depend upon it, all the rest shall be added. Success will come, a greater spirit of unity shall be born among you and every dream shall be realized."

THE announcement that a monument is to be erected in Galesburg, by the veterans of Illinois, in honor of Mrs. Mary A. Bickerdyke, will bring a glow to many hearts which hold in grateful remembrance this heroine of the Civil War.

The story of her life shows what was accomplished by a woman whose patriotic feeling and ability to serve led to her selection by the women of Galesburg, as a nurse to go to the front.

After the battle of Shiloh, when most of the wounded were carried down to Savannah on the Tennessee river, Mrs. Bickerdyke worked night and day to relieve the sufferings of the soldiers. So efficient were her services, that General Sherman summoned her to be in readiness after the approaching battle of Missionary Ridge. For four weeks she did noble work, being the only woman in attendance. Mrs. Bickerdyke continued in field and hospital work during the Atlantic campaign.

She was successful in correcting abuses in the distribution of sanitary supplies, and in superintending the cookery for field hospitals. Her executive ability was recognized by Generals Sherman and Grant, and she had the encouragement of their hearty support.

All women must feel grateful to Mrs. Bickerdyke for her pioneer work along lines that are now recognized as belonging peculiarly to woman's province. We cannot but think that many of the horrors, not only of battle, but of life in camp, might have been averted, had the way been open then for women sanitary inspectors to follow her initiative. S.

AN English woman investigator, Miss A. V. Baxter, M. A., said recently on the subject of finger prints as a means of identifying criminals:

There are many recorded cases of identifying burglars, who had left finger marks on drinking glasses and blood-stained finger marks on window panes, for the probability of any two finger-prints being identical was but one in 64,000,000,000. Racial distinction has been shown to form no basis of recognition, and statesmen, students and idiots all are likely to give similar markings. Heredity, however, gives more positive results, and the persistence of the pattern is clearly shown to remain throughout life. This bids fair to revolutionize one science at least.

The Duty of the Hour

NO more pathetic instance of doing the duty that lies nearest could be found than the course adopted by Mrs. Florence Maybrick, when she realized that life imprisonment was her fate. Firmly subordinating the bitter sense of wrong and injustice that might easily have driven her into emotional insanity, Mrs. Maybrick roused herself to a persistent effort to make even prison life conform to a higher ideal. She so ordered her surroundings that her cell came to be exhibited to visitors as a model of neatness and convenient arrangement, and her courteous habits gave a touch to prison life that is seldom felt among fellow prisoners. Mrs. Maybrick's experience has thoroughly awakened her to the needs of prisoners. She is now actively engaged in working for the cause of prison reform.

Her prison life appears to have taught her, as well, a secret of self-government. In her recent book she says, significantly:

My safety—from madness—lay, as I found, in compressing my thoughts to the smallest compass of mental existence; and no sooner did worldly visions or memories intrude themselves, as they necessarily would, than I immediately and resolutely shut them out as one draws the blind to exclude the light. But this exclusion of the world created a dark background which served only to intensify the light that shone upon me from realms unseen of mortal eyes. Lonely I was, yet I was never alone.

It is the old secret of spiritual growth. Refusing to let the mind be the playground of memories, desires, and anticipations, it becomes clear and peaceful. Then gradually it begins to reflect the things of the soul. Content with the inevitable frees all the energies locked up in our myriad discontents. And the inevitable, thus met, because it comes from the higher Law, never fails to yield the benediction which is its true self.

THE WAY

by CHARLOTTE A. MASON

WOULD the lark sing the sweeter if he knew
A thousand hearts hung breathless on his lay?
And if "How Fair!" the rose could hear us say,
Would she, her primal fairness to outdo,
Take on a richer scent, a lovelier hue?
Who knows or cares to answer yea or nay?
O tuseful lark! sail, singing, on your way,
Brimmed with excess of ecstasy; and you,
Sweet rose! renew with every perfect June
Your perfect blossoming! Still Nature-wise,
Sing, bloom, because ye must, and not for praise.
If only we, who covet the fair boon
Of well-earned fame, and wonder where it lies,
Would read the secret in your simple ways!

appeal in a very special way to the defenders of Japan. Such a graceful mission was the visit of two delegates from the Ladies' Patriotic Association to the soldiers and sailors, to inquire about their health, and to bear kindly greetings from those at home. They arrived at Sazeho just before the fleet left, and the departing heroes were cheered by the sight of these two women, who watched the ships until they disappeared from sight.

In Tokyo all the women's clubs of the city have united in a relief society, the object of which is to supply the needs of families whose wage earners are at the front.

THE royal ladies of Japan share enthusiastically in the work of the Ladies' Patriotic Association. The Princess Mori is the chairman of the Relief Society in Tokyo. She has long been actively interested in educational and charitable work. It is no unusual sight to see her drive by as early as six in the morning on some charitable errand. The influence of one so kindly and patriotic were, indeed, a blessing to any land. E.

THE CHILDREN'S HOUR

The Raja Yoga Question Box

WHAT magic the artist works with his brush! By his skill, grace and dignity and beauty are given lasting power to delight the eye and cheer the heart.

1 Who was Sir Edwin Landseer?

ANSWER—Sir Edwin Landseer lived in England from 1802 to 1873. His father was an engraver and a writer on art. Landseer could draw well when he was five years old. When he was thirteen he drew a great St. Bernard dog so well that the picture was engraved and published. At that age he exhibited at the London Academy. Many of the beautiful pictures of animals, loved by children, were painted by Landseer. He was so clever with his brush that he painted a fine picture of a dog in a few hours.

2 Who was Sir Joshua Reynolds?

ANSWER—Sir Joshua Reynolds was born in Devonshire, England, in 1723. Early in life he went to Rome. There he studied the works of the great Raphael and Michael Angelo. He also studied in other cities in Italy. He returned to London and became a portrait painter. Philosophers, statesmen, actors and soldiers came to him to be painted. His works are like a history of the time in which he lived. Sir Joshua Reynolds was a lover of knowledge. The men of learning and talent in England and Ireland were his friends. When the Royal Academy was founded in London in 1768, Sir Joshua was elected President. Every year he made an address to the students. These addresses were printed. They contain advice of great value to students. Sir Joshua Reynolds painted also many beautiful pictures of women and children. No artist has ever put into pictures of children more of the grace and charm of childhood.

A Letter From Trinidad

MY DEAR CHILDREN: Today I send you pictures of two little East Indian children, born in the island of Trinidad, but whose parents came from far-away India. They are not yet able to speak a word of English. They do not wear the jewelry which

"SAMUDAYA"

you see in the picture all the time. They just put it on for the sake of looking pretty when the photograph was taken.

The baby's name is Samudaya, and she is very good and friendly, not at all timid about having her photograph taken; in fact she laughed about it and seemed quite at home. Her sister's name is Gandaya. She is seven years old, can manage her brothers and sisters already and behaves beautifully, just as if she were quite grown up! She does not go to school yet, but, children, in my mind I see a beautiful picture of a Raja Yoga school right here in Trinidad, in which Gandaya and her brothers and sisters will be pupils, as well as a great many other little East Indian boys and girls who live all around here and who need Raja Yoga badly.

These little children live in a big pasture, in quaint homes, and play about among the lambs and calves. The kindly old sheep and the cows are friendly with them and never chase or frighten them, as they might do with strangers. I send you my love.
COUSIN BEATRICE

DEAR CHILDREN: As I was playing on a cornet one day, in an open field, an old man passed by. He was driving a horse that looked old, lean and tired. When the horse heard the sounds of the cornet, he stopped and pricked up his ears.

That made me think that he must have been a war-horse. So I sounded the cornet again, and the horse began to dance.

I then played an old war call and he galloped up the road as fast as he could go. On sounding the call to come back, he did so. This is a common thing in old war-horses, as those who have seen army life will tell you.

They never seem to forget the training of war times. H. H.

A Million Little Diamonds

A MILLION little diamonds
Twinkled on the trees;
And all the little maidens said:
"A jewel, if you please."

But while they held their hands outstretched,
To catch the diamonds gay,
A million little sunbeams came,
And stole them all away.—*Selected*

The Story of Two Seeds

IT was dark under the ground, where two little seeds lay side by side. "O, dear!" sighed one seed, "How dark it is down here! No light anywhere! Why was I put here?"

Thus the little seed grumbled on. Presently it heard a sweet voice close beside it saying, "Yes, it is dark here, to be sure, but there must be light somewhere, and I am going to reach up until I find it; so come, little comrade, we will travel together."

But the discontented seed would not go, and the little seed had to start alone; yet it did not feel lonely, for its little heart was full of hope and joy, and they were good companions. So the seed traveled on and on, ever pushing upward, never losing courage, until, at last it saw the light, radiant and beautiful.

How lovely the flower grew! It seemed to reflect this wonderful light in every petal, and as each sunbeam kissed it, the flower said, "Thank you, little sunbeams, I am going back to the dark earth and tell all the other seeds about the great light."

M. H. K.

THERE is something in our hearts which we do not appreciate as much as we should, and that is the power of being kind.

Raja Yoga tells us to be kind to everybody, to plants and animals as well as to each other. If we are not kind to plants they cannot grow as they ought to. To make flowers grow into beauty you must take care of them with kindness and water them when they need it, and help them when they need help, like vines and little plants that might grow crooked. We are taught to be especially kind to domestic animals who help us so much. You will never accomplish anything with plants or animals if you try to handle them roughly or brutally.

We Raja Yoga children are taught to do everything kindly and lovingly. Even our little tots, some of whom are only two or three years old, learn about these things. When you have

a little child in your care always treat it kindly, because some day it will be an example to others. By being kind to people or to animals, you are teaching them to be kind to others. A RAJA YOGA GIRL.

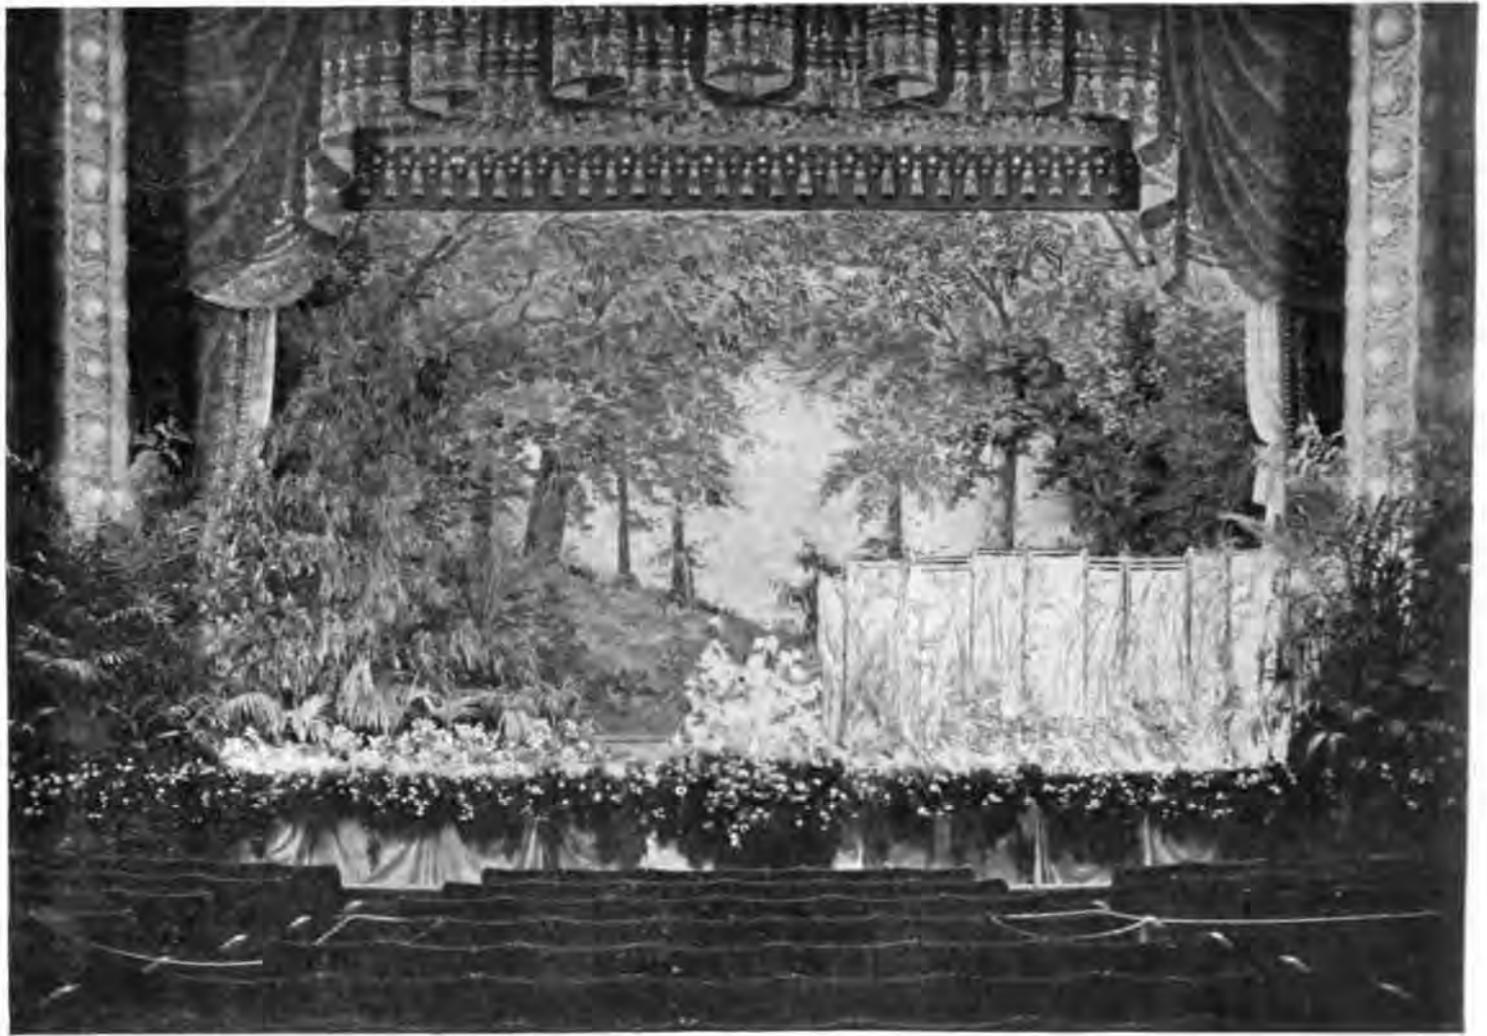

"GANDAYA," A LITTLE EAST INDIAN GIRL OF TRINIDAD, B. W. I.

I SHOULD love to direct the education of the little children of today. I would lead them out and carry them over the world; I would take them where they could see their fellow-men in different aspects and environments; where the old mysteries were taught in Egypt and where Jesus walked and talked,—and we must not forget that Jesus was in that part of Egypt where the Mysteries were taught. There would come to these children a deep comprehension of things that today even their elders cannot understand.—*Extract from report of a recent speech by Katherine Tingley.*

THE THEOSOPHICAL FORUM, IN ISIS THEATRE

THREE addresses, each of special interest, and a carefully arranged and exquisitely rendered musical program, were attractions at the Universal Brotherhood meeting held under the auspices of The Aryan Theosophical Society, at Isis Theatre last Sunday evening.

The opening address was by Miss R. Bernstein, her subject being, "The School of Life." She spoke of the popular idea that education was mere study for personal profit during earth-life; and pointed out that the greater education was a study of our own divine natures. We learn from our contact with our fellow beings and our experiences.

Miss Julia Hecht read a paper on "Purity," from which a few brief, but forceful, quotations are given: "When we look around to see what are the greatest obstacles to true progress, the greatest barriers to freedom, if we look deeply into the facts, and have the welfare of others at heart, we shall be convinced of the necessity of purity—of clean, straightforward, honorable lives. . . . We must ourselves be examples of the truths we desire, and aspire to; otherwise we are hypocrites and our speech has in it a ring of falseness that will injure others. . . . Let us make ourselves beautiful in mind and heart, sweet and fragrant as the flowers and trees. Let us be clean. 'Let us bathe in the river of soul; be ourselves, be pure, be strong, noble and true.'"

"What San Diego Needs Most," was the title of an interesting paper by Mr. W. R. White. In part he said: "Let us consider some of the opportunities open to this city. It has the finest harbor on the southern coast, and a geographical location which renders it naturally the gateway to the East, the portal of the Orient. Its site is picturesque, a panorama of unparalleled beauty. On its hills should be hundreds of beautiful homes, bowered by trees, linked by countless drives, and dominated by hill-crowning public buildings of noble beauty. Along the margin of the bay there should be many miles of wharves and warehouses. A network of railway arteries and electric nerves should bind them all into a living system, and connect them with the enormous mineral and agricultural wealth of the adjacent country. Great four-track trunk lines should give us an open highway to the immense markets of the Eastern States.

"The roads about the city should be dotted with beautiful buildings

and bordered with parks and gardens, to become the most beautiful pleasure-drives in the world. And last and most important, is Point Loma, standing apart and yet connected, the natural site of the greatest institutions of learning. Here we can speak, not merely of what should be, but of what will be—upon its rugged hills, a great white city of colleges and temples, a focus for the world's mental and spiritual life and light—a great seat of learning where shall be taught 'the true Raja Yoga, the laws of Universal Nature and Equity, governing physical, mental, moral and spiritual life.'

"What does this city of San Diego, the portal to the Orient, need most? Can we not best answer by saying that it needs a new standard of citizenship, a new standard of civic ambition, a new method of effort? . . . In place of mutually destructive individual effort, does it not need mutual helpfulness and unity of purpose? What might we not look for if we were to substitute the latter for the former, if, in place of pride in size and wealth, were to be substituted the ambition to excel in beauty, culture and morality, if, instead of a chaotic assemblage of hobbies, its policy of development were to be the consistent plan of some mind great enough to grasp and contain all the possibilities of this city's future? A mind, broad enough and deep enough to realize that separation of interests brings a poverty of fulfilment, so convincing of the truth of human brotherhood, that none can idly thrust it by. Does not this city need such a mind, awake to all the opportunities, resources, needs and possibilities that are right at hand, and finding such a mind, to follow its guidance?"

Theosophical Meetings for Sunday Nights

Public Theosophical meetings are conducted every Sunday night in San Diego at 8.15, at the Isis Theatre, by the students of Lomaland.

Theosophical subjects pertaining to all departments of thought and bearing on all conditions of life are attractively and interestingly presented.

Other interesting features of these weekly gatherings are the excellent music rendered by some of the Students of the Isis Conservatory of Lomaland, and the efforts of the children of the Raja Yoga Schools at Point Loma. Theosophical literature may always be purchased at this meeting.

Art Music Literature and the Drama

Modern Religious Music—The Need of a New Departure

AN editor of a Chicago musical journal wrote recently: There is no place where musical taste is at a lower ebb than in our so-called evangelical churches in America. Speaking from the standpoint of the artist, the entire power and meaning of the art of music are ignored and profaned in the church, persistently and well-nigh universally. The attitude of music in the church is that of a conventional medium for covering up undesirable noises—as the organ voluntaries and the singing of hymns during a collection. This is profanation, pure and simple. With reference to mitigating the prevalent ignorance of ministers on the subject of music, Professor W. B. Chamberlain, of the Chicago Theological Seminary, has inaugurated a church music department, etc.

The public demands an appreciation of its advancing taste and ideas. It seeks to express them with irrepressible persistency, but the religious teachers have failed to recognize the advancing wave. Hence, the churches are gradually growing empty, while, on the other hand, the low variety halls and cheap concert rooms are being filled.

Nothing could so soon revive the public interest in religious matters as the practical participation by the members of a congregation in progressive musical services. There should be spontaneity, progressive methods, and no mechanical or stereotyped forms. Unfortunately, the clergy cannot furnish these nor even intelligently direct them, and it is almost too late to begin now with the present generation of ministers. A new type, more truly religious and better musically trained from youth on, must come. There must be genuine love and devotion to the work and no simulation. One who conducts stands sponsor for church music and must have his heart in it; no mere pretense or counterfeit will answer, nor can a paid soloist or instructor bring to the work the needed spiritual force.

The musical education of a teacher cannot be forced; it grows through a life-time of devotion and application to the art. It is built up in the classic concert room, from high example and by gradual assimilation.

Hence, a check to further degeneracy of church music can hardly be expected under present circumstances. The ministers themselves must first become students of music on new and higher lines before they can hope to exercise any real influence. The custom of leaving matters in the hands of the "paid quartette" has operated most unfavorably on the character of church music. To have substituted, as they have so often done, a frivolous, and emotional class of music in place of that which is aspiring, dignified and serene, is worse than no music at all.

The degeneracy is mainly due to inexcusable ignorance in high quarters. E. A. NERESHEIMER.

THE Japanese have declared painting to be a form of poetic expression and that the painter should strive to represent the soul of things rather than the bare, outer, linear form. Realism to the Japanese means something far different than to the American or European. It has to do with the inner rather than with the outer. That is perhaps why the great Japanese artists' works are spontaneous and poetic to a remarkable degree. They have the courage to omit extraneous details and to subordinate all the central idea. There is a simplicity of treatment, combined with a remarkable command of the brush and an almost magical directness in its use, that one may look for in vain in any other school of art, American or European. How much have not the color prints of Japan taught our American artists in composition, in exquisiteness and subtlety and pure beauty of line, in composition and in the successful generalization of forms. They voice new and higher ideals. STUDENT

Franz Schubert—The Lesson of a Life

I only sing because I must, and pipe but as the linnets do.—*Shakespeare*

FRANZ SCHUBERT, child of music, was in his time unknown, his genius unappreciated, while from his pen flowed the most beautiful melodies in all the world of tone. "His music," said Holzer, his teacher, "seemed to come direct from Heaven." Indeed, Schubert, the man, appeared to have very little part in it, though in coming in touch with his compositions, one seems to get closer to music itself, with less admixture of the medium than is the case with any other writer. His Soul fairly overflowed as with an inexhaustible fountain of the beautiful

in sound; but aside from his music his life was almost nothing, and he composed as he lived, without judgment, discretion or direction.

The spectacle of so insatiable a desire to produce has rarely been known. Schubert would begin to compose as soon as he awoke and, to quote his own words, "When one piece is done I begin another."

If a work were interrupted, it was often never finished, but put aside and forgotten, as many unfinished MSS. have testified. He not only composed works in almost every known instrumental form, but would set to music anything in the way of words that came to his hand. He was yet not able to discriminate between the poems of Goethe and Schiller and the most mediocre works. His songs—there are some six hundred of them—are in some respects the most perfect, as well as the most beautiful, ever written, but not a few are buried beneath the rubbish of commonplace verse. So was the substance of his genius cruelly wasted for lack of judgment. Schumann said of him, "He could have set a placard to music."

Much might be said of the wondrous beauty, the almost transcendent loveliness of Schubert's instrumental works, of the nobility, strength and passionate tenderness of his songs, while the amount produced in the short period of his life is well-nigh incredible. He died at the early age of thirty-one, and it has been said that the end was hastened by his sheer neglect and abuse of his physical health. Here is a lesson, indeed, for the student of life. STUDENT

AN ANCIENT PIPE-ORGAN

AOGIMIYO (Gaze Upward)

Translated from the Japanese

AS towers above all others,
The lofty crest of Fuji, sacred mount,
So, above all earth's nations
Towers the land of the Rising Sun.

Gaze upward, O, ye people,
Lo! in the cherry blossom,
Breathing its perfume sweet upon the dawn
Is reflected Japan's true spirit.

Ancient Pipe-Organ With Keyboard and Stops

CERTAINLY there is nothing new under the sun, at least in principle. Our cut shows a terracotta model of a Roman pipe organ with several rows of pipes. It is in the museum at Carthage, and is believed to have been used by Nero, who suggested various improvements to these instruments. The air-pumps for filling the wind-chest are shown at either side and the pressure was kept even and steady by an ingenious hydraulic apparatus, the water cistern being under the seat of the player. The upper part of the organist's figure is broken off, but his position at the keyboard is clearly indicated. From this plastic model, and from descriptions by Vitruvius and other writers, a working model has been constructed. We know little about the music of antiquity, but if we may judge by the Greek music extant, and from the instruments lately discovered, such as the Etruscan cornet of the best modern pattern, the Irish and Egyptian harps, etc., it must have reached a high degree of excellence. STUDENT

WRITES M. Jean Bardoux in a recent issue of the *Revue Bleue*:

Nearly every person in Japan, from rickshaw-men and geisha-girls up to the Emperor and members of the Cabinet, is a poet. The present Mikado has written nearly fifty thousand odes. He dedicates a portion of every evening, it is said, to the production of poetry, a relaxation, indeed, and a rest from the cares of state.

WHEN THE WESTERN SUN CASTS A SHEEN OF GLORY ON SEA AND SKY AT LOMALAND

Theosophical Literature

THE international influence of our Theosophical work in literature is due to the fact that not only is this literature published in English and distributed everywhere where English is spoken, but also to the fact that each language has its own particular Theosophical literary thesaurus. The Swedish *Theosophia* and *Nya Seklet* are two progressive and reliable Theosophical publications. Both of these are edited by some of the oldest students of the Swedish branch of the Universal Brotherhood Organization.

It is interesting to note the leap that the Dutch publication, *Lotusknoppen*, has taken within the last year. Its circulation has been enlarged considerably, and it meets a positive demand in Holland, made by earnest seekers after the truth. This demand is further met by the continuous issue of pamphlets, touching on the important subjects of Theosophical teaching.

In Germany there is the same demand for Theosophical literature from many quarters, and it is gratifying to know that it is being met by the publication of *Universale Bruderschaft*, a paper well worth reading by those who know sufficient German to do so. France, too, has the benefit of Theosophical teachings, through translations of some of the English publications. Already the *Mysteries of the Heart Doctrine* has been given to the French public, and this book has also been translated into Swedish.

The *International Theosophist* published for some years past in Dublin, Ireland, has carried its influence throughout Erin, and even into England.

The *Theosophical Chronicle*, published in London, has been a light—a great factor in chronicling the general doings of the Theosophical movement for several years past. This is now merged into a larger publication, the *International Theosophical Chronicle*. The first number of this latter magazine was issued in London, in January of this year.

When one remembers that the editors of these several Theosophical organs are men of rare scholarship and devotion to the great Theosophical movement, and that they give their best thought and much of their time without recompense to this work, it stands to reason that such unselfish efforts must have telling effects upon all who read the pages of these periodicals. Another thing to consider is the fact that the international spirit is broadly cultivated in all these papers, as in all those published at Point Loma, which include the *NEW CENTURY PATH*, a large number of books and pamphlets, books for the Raja Yoga children and the *Lotus Song Book*.

FRIENDS IN COUNSEL

DEAR COMRADES: A number of the children from the Lotus Home have now moved into residence in the Academy. The halls and corridors echo to their light footfalls, and their voices, blending in delightful harmonies, rise together under the central dome. This stately building is indeed a fitting casket to contain the choicest

treasures on the hill. Its graceful architecture, and the decorations with their easy, flowing outlines and restful coloring, combine to form an ideal environment. To describe the impression made upon an observer by the daily life of the inmates is not an easy thing. It is all so different from the ordinary school. The educational establishment we elders know so well was divided into two hostile camps, the teachers and the taught. The staff, perpetually attempting to enforce a discipline which their youthful foes as constantly endeavored to evade. The absence of a master was the immediate signal for riotous diversions; his sudden re-appearance gave the cue for the assumption of a preternatural solemnity. Here, instead of mutual antagonism, a friendly co-operation prevails. A bond of deep affection binds the pupil to the teacher through which, as through a channel, the instruction freely flows. Evenness and balance mark the day's engagements. The students do not rush to play when class is over like skylarks let loose from a dark cage, but turn as rational beings from one agreeable duty to another. With perfect regularity the marching columns come and go, yet with no dull monotony, but rather as an ordered progress like the revolutions of the planets in space, and seemingly as much a part of Nature. A steady flow of satisfaction attends the pupils through the day and goes far to justify the Leader's claim that the entire curriculum is absolutely based on natural law.

Here the young mind will not be overburdened with a vast variety of unrelated facts; but will be trained as a facile instrument for thought; and best of all, the soul will be evoked and called upon to occupy its rightful place. Established at the center as the friend and ruler of the three-fold man, a royal reunion will result, and soul and mind and body, blended into one harmonious whole, will form a focus through which the purposes of Deity may find expression.

The institution being purely unsectarian, no system of theology will here be taught, but a religious purpose, like a thread of gold, will gleam through all the duties of the day and glorify the lowliest services performed. Their studies in Philosophy are not to be confined to any special school of thought. The subject matter for investigation will be daily life itself, while they will welcome light upon its problems from whatever source it comes. Morality will be inculcated by living example and not so much by formal precept, for it is found that in the lives of those who live for others the virtues rise spontaneously as wild flowers do in spring. STUDENT

For the Benefit of Enquirers

REGULAR weekly meetings of the Aryan Theosophical Society, established in New York City by William Q. Judge, the second Leader of the World's Theosophical Movement, are held every Thursday evening at 8 o'clock in Isis Hall, 1120 Fifth Street, San Diego, California. These meetings are intended to meet that large and growing body of earnest enquirers who desire to know more of the different tenets of the Theosophical philosophy. Students from the Universal Brotherhood Headquarters at Point Loma, California, conduct these interesting gatherings to which every truthseeker is cordially invited.

ITER SUPREMUM

by ARTHUR SHERRBURNE HARDY

O H, what a night for a soul to go!
The wind a hawk, and the felds in snow;
No screening covers of leaves in the wood,
Nor a star abroad the way to show.

Do they part in peace---soul with its clay?
Tenant and landlord, what do they say?
Was it sigh of sorrow or of release
I heard just now as the face turned gray?

What if, aghast on the shoreless main
Of Eternity, it sought again
The shelter and rest of the Isle of Time,
And knocked at the door of its house of pain?

On the tavern hearth the embers glow,
The laugh is deep and the fagons low;
But without, the wind and the trackless sky,
And night at the gates where a soul would go.—Selected

The Omnipresence of the Most Essential

THAT which is most essential to the sustenance of life is so common and ever-present that we have scarcely to give it a thought.

The air we breathe and must have to continue our physical existence is about us all the time except as we artificially shut it out, and we take it in each moment, asleep or awake, with seldom a thought. And the sun, from which life flows to the earth, is always shining somewhere with its life-giving power into the ever-moving atmosphere, and its blessings come without the asking. Water, without an added supply of which life may be sustained for a time, is abundant, but not always at hand. Food, without which life may be sustained still longer, requires yet more effort to obtain. And luxuries, without which we might live longer than with them, cost more effort and trouble than all our needs. How beneficent is the provision for our welfare and happiness, and how hard many of us work for the non-essentials but to shorten our lives and make ourselves miserable.

All this refers to material things and physical life; but how is it with the soul and its needs? Here, too, the most essential is everywhere present, sustaining all from the least unto the greatest, seated within the heart of every being, giving that enlightenment, love and power needed for further growth and experience. It is always at hand and would illumine our lives did we not shut it out by our selfish seeking of things less essential, and even of things that harm us. But most of us have built up so many barriers between ourselves and the light in the way of personal pride, attachment to the fruit of our own actions, and gratification of our personal desires, that we have a herculean task before us to knock them all down and clear them away. But the Light is there just the same, and as fast as we make a clearing by forgetfulness of the personal self and sincere altruism, shall we find it pouring in upon us.

STUDENT

Human Possibilities

THE possibilities of man are infinite. He may rise to the highest heights or sink to the lowest depths. We read in *Mark x: 27*, that Jesus said, "With God all things are possible," and God is in the heart of all things, the source of their life and strength and the evolver of their possibilities. Hence all things are possible to all things, for God working in all and through all makes it so.

These teachings are found in the Bible. In *Matthew iii: 9*, we read that "God is able of these stones to raise up children unto Abraham," and in *Galatians iii: 16*, that the seed of Abraham is Christ, so the possibility of a Christ being raised from a stone is taught. In *Romans viii: 21*, it is said "the creature itself also shall be delivered from the bondage of corruption into the glorious liberty of the children of God." In

Isaiah xlv: 7, God is represented as saying, "I form the light, and create darkness: I make peace, and create evil: I the Lord do all these things."

The duality found in the manifested universe arises from one source, and is essential both to manifestation and evolution. We gain strength through resistance and conquest, so there must be something to resist and to conquer. There must be freedom of choice to develop a masterful and discriminating character, so there must be the opposites between which to choose. The possibility of climbing the heights involves the possibility of descending into the depths. The Spirit is involved in the lowest that it may be evolved to the highest. There being one Spirit in all that binds all together, each has an influence on the whole, a power, either in a potential or active form, to help or hinder the whole. The higher the development, the greater the power and present possibilities.

So we, students of the Universal Brotherhood, by reason of the advanced position in human evolution which this implies, are able, as vehicles of Divine Power, to lift the whole world out of darkness into light, out of turmoil into peace, out of discord into harmony. And not only is this a possibility on our part, but it is an obligation; and should we fail to make and keep ourselves fit vehicles for the Light, the world would sink into deeper darkness. We need to fully realize how great are our possibilities, and, in consequence, how great is our responsibility that every thought, word and act of ours should help the upward progress of the race.

B. W.

All-Round Culture and Specialization

SOMETIMES one hears these things discussed as if they were necessarily antagonistic and irreconcilable, one party taking one side, and one the other. But this is a fallacy that is often committed; things that on a superficial view appear antagonistic, are seen on a wider view to be complementary to each other. There is no need to go to one extreme, and say that everybody must be a jack of all trades; nor to go to the other, and say that every man must devote himself exclusively to his own calling. A man should be fairly good all round and specially good in one direction. In all created beings there are some qualities that are common and general, and some that are characteristic and special. A literary man ought to be able to dig a little, and a field worker should not altogether despise the pen. We cannot all be Admirable Crichtons, but we need not all be one-tune steam organs.

We should be men first and then craftsmen on top of that. The great masters have been specialists in one way, but all-round men in another way. They had a fair knowledge of collateral subjects—and perhaps for the true artist all subjects are collateral.

H.

Practical Theosophy

THE ethics of life propounded by Jesus are not different from those found in Theosophy, but the latter holds in its doctrines a compelling power which is absent from Christianity and those systems which require a man to be good for virtue's sake alone. It is not so easy to practice virtue for the simple reason that we ought to do so, since the desire for reward is inherent in humanity, and is a reflection of the evolutionary law which draws the Universe to higher points of development.

Theosophic doctrine, however, on either the selfish or spiritual line of life, convinces that the moral law must be obeyed. If we regard only the selfish side, we find when people are convinced that evil done in this life will be met with sure punishment in another incarnation, they hesitate to continue the old careless life when they lived for themselves alone.

Hence practical Theosophy must enter into every detail of life in our dealings with others and our discipline of ourselves. It reminds us that we should be more critical of ourselves than of others, that we must help all men if we are to be helped ourselves. And herein the Theosophist may escape the accusation of selfishness, for if in desiring to lay up for a future incarnation a store of help from others by giving assistance now himself he does so in order that he may then be in a still better position to help humanity, there is no selfishness. It is the same as if a man were to desire to acquire the world's goods in order to help those dependent on him, and surely this is not selfish.

W. Q. JUDGE

THE restriction of thought to purely mechanical grooves blocks progress in the same way as the restrictions of mediæval superstition. Let the mind think, dream, imagine, let it have perfect freedom. To shut out the soul is to put us back more than twelve thousand years.—*Richard Jefferies in The Story of My Heart*

THERE is no man that imparteth his joys to his friend but he joyeth the more; and no man that imparteth his griefs to his friend but he grieveth the less.—*Bacon*

The Metropolis of the British Empire

TO historians who have studied of the struggles of nations to express themselves upon the polity of the world at large, perhaps no national center appeals more strongly than the metropolis of the British Empire. The city and its neighborhood are full of monuments of stone which bear the impress of the national life. Two of them are found in accompanying illustrations.

Situated on the tideway of a magnificent river, fifty miles from its mouth, London is both a seaport and an inland city. And so the Romans, with their keen eye for natural advantages, selected it for the site of a fortress, upon the ruins of which was afterwards built the Norman Tower of William the Conqueror. The building was completed by William Rufus and other Norman and Plantagenet kings, but substantially the fortress is now the same as it has been for centuries.

The Tower of London was once a stronghold and a security for the maintenance of the royal authority. Its walls were a protection for the refugee and a prison for the rebellious. Within it have been confined a long list of the most celebrated characters in English history, most of whom left it only to walk in the sad procession to Tower Hill. Kings, queens, soldiers, poets, statesmen, even children, have pined within it and scratched their screeds upon the stone walls of its dungeons, where they can still be seen. In these latter days the tower is used as a treasure house, as a museum of ancient armour, as a barracks for a regiment of soldiers, whilst its state is maintained by a body of pensioners clothed in the raiment of the middle ages, and pleasantly described as *beef-eaters*.

Six miles nearer the mouth of the river is situated the ancient town of Greenwich, once the seat of a royal palace of the Tudor kings, in which were born Henry VIII and his two daughters, Queen Mary and Queen Elizabeth. This palace was afterward pulled down, and in its place was erected the present building, formerly called Greenwich Hospital, for the accommodation of retired seamen and naval pensioners. Here the remains of Lord Nelson were landed after the battle of Trafalgar, and they lay in state in the painted hall before their interment in St. Paul's Cathedral.

In recent years, however, other arrangements have been made for naval pensioners, and since 1873 the extensive and stately buildings have been used for the *Royal Naval College*.

On the summit of the hill to the right of the college, may be seen the buildings of the Royal Greenwich Observatory. This institution is the centre of the world's time calculations so important in the science of navigation. From this point geographers reckon the longitude all over the world. At one o'clock every day a signal is made by electric wire from the Royal Observatory to hundreds of places in the United Kingdom. E. V.

THAMES AND ROYAL NAVAL COLLEGE

English Notes

(By our London Correspondent)

13TH JANUARY, 1905

THE *Hibbert Journal* contains an article called "The Warp of the World" by Newman Howard, which is apparently an unconscious reflection of the *Secret Doctrine*. Here is an example:

The last years have seen the dawn of a revolution in science as great as that which in the sphere of religion overthrew the many gods and crowned the One. Matter, as we have understood it, there is none, nor probably anywhere the indivisible atom. The so-called elements are systems of electronic corpuscles, bound together by their mutual forces too firmly for any human contrivance completely to sunder them—alike, nevertheless, in their electric composition, differing only in the rhythms of their motion. Electricity is all things, and all things are electric.

Between gray matter and bright electricity we prefer the last, it is vivacious; it loves and hates, flashes, burns, leaps, and sleeps—in the tick of your watch it will fly round the earth. Like Ariel, it is quick as thought; nay, perhaps it is thought itself.

Still more interesting is an article by Sir Oliver Lodge on "Mind and Matter." It is a criticism of Professor Haeckel. The latter is treated with great respect by the essayist, but

it is politely suggested that he is somewhat old-fashioned in his ideas.

The following is a good illustration:

A traveler who has lost his way in a mountain district, coming across a path, may rejoice, saying, "This will guide me home." Him Professor Haeckel, if he were consistent, should laugh to scorn, saying, "What guidance or purpose can there be in a material object? there is no guidance or purpose in the universe; things are because they cannot be otherwise, not because of any intention underlying them.

How can a path, which is little better than the absence of grass or the wearing down of stone, know where you live or guide you to any desired destination? Moreover, whatever knowledge or purpose the path exhibits must be *in the path*, must be a property of the atoms of which it is composed. To them some fraction of will, of power, of knowledge, and of feeling may perhaps be attributed, and from their aggregation something of the same kind may perhaps be deduced. If the traveler can decipher that, he may utilize the material object to his advantage; but if he conceives the path to have been made with any teleological object or intelligent purpose, he is abandoning himself to superstition, and is as likely to be led by it to the edge of a precipice as to anywhere else. Let him follow it at his peril!" This is not a quotation, of course, but it is a parable. W. J.

In London 36 leaves of *The Mirror of the World*, printed by Caxton in 1481, have been sold for £100, to a collector who had already acquired 36 other leaves of the same work for £103. There should be 99 leaves altogether. The initial letters in this book are left blank and filled in with red ink. The pages are 8¼ by 6. Sixteen perfect copies of this work have been traced, and some of these fetched £200 or £300. This particular fragment was bought by the last seller from a London grocer for an "old song."

Reincarnation in Pulpit and Newspaper

AMONG the pulpit occupants today, two opposing tendencies of action are very visible. One of them is to go out from the hedged retreat into the world of modern thought and discovery, and fully and sympathetically comprehend what is going on there. Men of this tendency fear nothing, have no prejudices that blind them to the possible value of what is new; and not unfrequently incur religious out-lawry for their honest avowal of an advance on old belief.

But there are others whose system of beliefs has come to possess the primal instinct of self-preservation. It is very fearful of danger to its own stability. These men, whilst they cannot in our day but bear of what is new in thought and discovery, are careful not to comprehend. Yet they never let their ignorance keep them silent.

Especially is this true of Theosophy. Once met with ridicule, the light which it throws upon all the difficulties and problems of today is more and more fully recognized and sought. It is in the newspapers, in essays; it tinctures the sermons of many who do not know the source of their new ideas, of a few who know and give credit, and of others who know without giving credit. And others again, who know but little of it beyond the names of a few of its teachings, advertise it by foolish attacks which an hour's reading and honest thought would have rendered impossible. It is now not seldom that a newspaper report of such a sermon will be accompanied by an editorial correction of the ministerial mistakes and mis-inferences.

Editorial Cor- rections Fre- quently Made

A typical example is now in our hands. The pastor of a church in a western city is reported as commenting upon the common wish of those who in later years look back on their sins and mistakes: "If I could live my life over again, what mistakes I would avoid! How differently I would do!" "To know how to live," he replies, "one would need to have lived before. But if we have lived before we have no memory of it, and the experience then gained is therefore of no use to us."

It is a little shot at the Theosophical teaching of Reincarnation, half grasped. Even the newspaper knew better, and adds: "But here Theosophy brings the more hopeful gospel—that each existence builds better for the next, whether we know it or not." The preacher would not name Theosophy, merely casting at one of its teachings an ill-aimed stone—and thereby gives every reader of the paper a chance of learning something about it! Fortunately for our peace of mind, we do not at this stage of our growth remember the details of former lives that we have lived, any more than we remember the falls and aches and bruises by which we learned to walk. But we remember the art of walking. And so from the (temporarily) forgotten experiences of old lives we have remembered the one important thing—the art of living wisely and rightly, or rather another stage in that exhaustless art.

The Art of Living Wisely and Rightly

The Bishop of London recently delivered himself of an attack upon the doctrine of Reincarnation, in no wise more intelligent than the one to which we have referred. This likewise was corrected by a newspaper, a well-known London illustrated, which characterized the criticism as "based rather upon zeal for the faith delivered to the saints than upon a true appreciation of the moral bearings of the theory of rebirth." And then followed a defense of the theory.

Is it not time that such preachers took a higher view of their calling? To the preacher no belief by which men have ever tried to raise their lives to a higher level, should be outside his comprehension and sympathy. Though he rejects it, he should know it as one who holds it knows it; with all its imperfections he should respect it as one of the ladders by which men have humbly tried to climb. He should in some measure be to his congregation what they have mostly have not time to be, do for

Preachers Must Raise Their Ideals

them what they have but little time to do—a man who has well acquainted himself with human spiritual history, a man in touch with all that is now being offered as solution of the deep problems of life. Only if they know him as such will his words weigh well with them. Yet how many are there who study other creeds, dead and living, other philosophies of life than their own, with their hearts as their minds, nay who study them at all?

Because men know how few are such is the pulpit losing its power to guide. It is getting out of touch with the needs, as it is out of touch with the acquisitions and productions of the general mind of the Twentieth century. If the churches are to gather in the generations to come, the preachers must raise their ideal of their calling, and broaden not only their knowledge but their sympathy.

H. C.

Anthropological Theories at Fault

A geography book which tries to trace the differences in degree of culture and energy among peoples to the influence of climate and soil, reverses its usual policy in the case of the Dutch. Their country did not make them; they made it. It was their natural industry and ability. According to theory the Netherlands, as described, ought to be incapable of supporting a large population, and should be sparsely tenanted by a low type of humanity. But this is no difficulty to the author. He calmly inverts his logic and finds his explanation of the facts in the high character of the Dutch. E.

Armenia and Gothic Architecture

A TRAVELER in Armenia has recently expressed the opinion that Armenia was the birthplace of Gothic architecture. It was the first country to have a national Christian Church, and Christianity was its religion long before Rome adopted Christianity.

The deserted city of Arni, discovered among the mountains, was probably one of the most beautiful in the world. The cathedral was a magnificent piece of architecture, erected at a time when the architecture of Europe was Romanesque; and it is because the remains contain the salient features of the Gothic style, that the traveler came to his conclusion as to the birthplace.

The country occupied by the Armenian race is a most beautiful one, watered by the Euphrates, Tigris and Arasces, and with grand mountain scenery. Explorers speak very favorably of the character and qualities of the people; but they are one of the most oppressed races on earth, being under the terribly lax and ruthless Ottoman rule. They have remained true to their religion for 1400 years, in spite of all that persecution and example could do to induce them to embrace the Moslem creed. Their fate is involved in that seemingly "Eastern Question," whose meaning is that the selfishness and rivalry of European powers enable the Ottoman Empire to maintain its hold by playing on these vices. The Armenian patriarch appeals in vain against the self-interest of his fellow-Christians.

The Armenians trace their descent from Japhet. Their history is a long and eventful one of successive periods of independence and subjection to various great powers. The Armenian Church is separate from both the Greek and Roman Churches.

Arni (Ani, Anni) was the capital of a line of Armenian kings who ruled from the Eighth to the Eleventh century A. D. Its ruins show the former greatness of the city.

The origin of "Gothic" architecture, so-called from its association with Gothic invasions, and of which the characteristic form is the pointed arch, is a most disputed question; but evidence points to an Asiatic origin. It appeared with the Crusades; and though it is almost unknown in Europe before those migrations, it is common in Asia. The Moslem nations, who have never copied anything from Europe, practise it; as, for instance, is seen in the Mohammedan architecture of India. This discovery at Arni therefore supports the Asiatic theory.

A New "Great Power"

"TO the Hague! To the Hague!" may not be as blood-stirring a cry as "To arms! To arms!" but there is more civilization and common-sense in a minute of it than in a millennium of the other. The slogan was proposed for general adoption by Oscar Strauss, member of the Hague Tribunal, at the recent great Arbitration meeting in New York. It must come to that in any case, for the financial pressure of modern armaments is getting so enormous that only the very wealthiest nations can afford any pretense of keeping up to date. We do not say that the one person in ten on—or beyond—the extreme poverty line in America and England is due to this alone; but it is assuredly one of two or three main causes in the older country and may become so in the younger.

As to disarmament, one wonders whether some great Power—and one almost involuntarily thinks of France—will ever have the sublime courage to trust the Higher Law more fully, and see what happens? That Law, assuredly one of the Great Powers, has never yet been fully invoked and trusted by a nation. May that be the reason why it has never been able to show what it can do?

STUDENT

New York's Unemployed

A LITTLE earlier in the winter, Mr. Sargent, Commissioner of Immigration, received a letter from a prominent New York philanthropist pointing out that that city then had a larger proportion of the unemployed than any other in the country. At least 100,000 men were then idle—40 per cent more than last year. By now, the number is doubtless greater. Fifty thousand children go to school unfed, and so overwhelmed is the Department of Charities with applications for relief that it cannot cope with the situation. In short, the writer added, the city this winter is facing a problem with regard to the unemployed that no recent years can parallel.

STUDENT

The Awakening East—The Ameer of Afghanistan

IF "the East" is awakening, Afghanistan as part of it, will not be behind the procession. It was in December last that the Ameer suddenly announced a project that had been maturing in his mind, of founding a College in which the basis of instruction should be the English language, taught by native graduates of India. He has for some time lighted his palace with electricity, and is now considering the possibilities of wireless telegraphy and railways. At present the only carriage of news in his kingdom is by runners.

This remarkable development is due to Habibullah's enlightened understanding of the times, aided by two or three very tactful acts of Lord Curzon's. For many years the Ameer has been anxious about the intentions of Russia. They think she might find their country not only useful on general principles, but also as a path Indiawards. And the present monarch, who watches the war very closely, suspects that if she should receive a final check in Manchuria, it might accentuate her pressure in his direction. And then it was suddenly found that the northwest boundary pillars had somehow all disappeared!

The Government of India took this opportunity to do something for him. Lord Curzon sent two officers, with his consent, to superintend the replacing of the vanished pillars. On the way back, says Mr. Demetrius Boulger (in *The Fortnightly*), they "enjoyed a week's hospitality in the palace at Cabul, and received the Ameer's repeated thanks for the good work that they had done."

Almost immediately after, he wounded his fingers with a gun, and was like to die of native surgery. Lord Curzon, hearing of it, sent his own surgeon, under whose care the wound quickly healed.

Beside the College, another result of these amenities is that Habibullah is sending his heir-apparent to India in order to welcome Lord Curzon on his arrival.

A really safe and friendly Afghanistan would be an immense boon to the antiquarian. The country is full of the almost unexplored remains of ancient cities, temples and shrines. Such exploration as has been done has mainly resulted in quantities of old coin.

STUDENT

Submerging Great Britain

IT is said that some years ago an American girl was being initiated into the mysteries of fox-chasing by an English peer. She was from one of the largest of the States, and was greatly impressed by the smallness of the country in which she was a guest. At last she said:

"And do I understand, your grace, that they chase the poor animal round and round the island?"

Every year her question is nearer to a possibility, for in many places the sea is steadily encroaching. A few weeks ago 200,000 tons of cliff fell at Dover. Whole fields have disappeared, and another huge fall is expected. The cliff is gradually falling away from the mainland, and this last gap is a quarter of a mile wide. Nature should remember that though she may have done very well in making the "silver streak," it is now quite wide enough.

C.

The Simplon Tunnel—Geological Difficulties

THE geologists do not seem to have scored shining successes in their predictions about the nature of the difficulties which would be encountered by the diggers of the great Simplon Tunnel through the Alps—now nearly complete. They said the rock strata would be tilted almost perpendicularly; but they were horizontal. They predicted very little water; but there was an enormous quantity. But with regard to a certain spot they thought there would be a good deal; at this spot the rock was perfectly dry. They thought that the maximum temperature at the depth of the excavation would be 107; but suddenly, for no assignable reason, it rose to 131.

Geology has difficulties peculiar to itself. It is somewhat as anatomy would be if dissection had to consist in scratching the skin.

STUDENT

Frontispiece—William Quan Judge

THIS week's cover page of the NEW CENTURY PATH contains the face of Wm. Q. Judge, the second in the line of succession of the world's Theosophical Leaders. Mr. Judge succeeded to the Foundress of the Theosophical Society, Helena Petrovna Blavatsky. A successful lawyer, a brilliant writer, and a man of extraordinary insight into human nature, he was well fitted to carry on the great humanitarian and philosophic work of H. P. Blavatsky.

Ancient American Myths

THE origin and meaning of what anthropologists call "animal-worship" is to be found in the teachings of the ancient Wisdom-Religion, which, in the far past golden age of the last great Race of humanity, was generally known in all parts of the world. After the golden age passed away and the downward march towards materialism had set in, this Race became scattered; and the sinking and rising of continents isolated portions of it in various parts of the globe. These isolated branch-races thus preserved the knowledge which was once common; but they gradually lost it, and, though a portion of the written records may have survived, even to these the keys to their true interpretation have been lost.

In the light of these facts (which, be it remembered, are attested by a resistless mass of evidence on all sides) the explanation of the mysterious culture and identical symbolism and mythology of various widely-separated human races is clear. But to scholars who seek an explanation consistent with the usual narrow scientific views, these circumstances remain a sad puzzle.

The most natural way for scientists to explain why Americans have a zodiac and a calendar-division the same as those of Old-World races, and why the bird and serpent are symbols having the same comprehensive and apparently arbitrary meaning in both hemispheres, is to suppose that their ancestors immigrated from the Old World at an epoch when there was a dry-land connection.

But one writer at least (D. G. Brinton, *The Myths of the New World*) rejects this hypothesis in favor of a view that the similarity is due solely to "the uniform development of human culture under similar circumstances." He does not think the Americans derived their religions and other ideas from the Old World; and probably he is right in concluding that what few immigrations there have been in recent times were inadequate to produce such an effect. But history, as we know, goes much further back than is ordinarily imagined. To account for the facts, therefore, this author says that man will, by virtue of his ever-identical innate faculties, arrive at the same results in his attempts to explain the universe in which he finds himself; and that these results will be modified in minor details by particular climatic and temperamental idiosyncrasies.

As we shall see, the wealth of facts brought together by the author strain his theory beyond all possible bounds of coherence; while to the teachings outlined by H. P. Blavatsky, as being those of the Wisdom-Religion, these collected facts merely add confirmation.

The sacred animals, which are supposed to be worshipped, and which may possibly among very degenerate tribes be actually worshipped, are symbols used in the Ancient Knowledge to denote the cosmic powers and principles with which that Knowledge deals. Symbols convey more than mere words. Sometimes they are geometrical, as the circle and cross. But animals constitute symbols more comprehensive in their meaning. That mysterious duodenary, the zodiacal circle, consists mostly of animals.

Many of those universal fairy-tales in which animals, like the Fox, Bear, Wolf, and Ass play parts, are the last relics of ancient symbolical teaching. Says Brinton:

In many legends these animal gods created and directed in their course the heavenly bodies, and established the institutions of human society.

He then asks how it comes that Man should degrade himself by worshipping animals; and concludes that the savage hunter was inspired, by awe of their strange instinct and faculties, into surmising that animals were inspired. We get a gleam of light in the remark:

Therefore it was not the beast that he worshipped, but that share of the omnipresent deity which he thought he perceived under its form.

The Bird and Serpent are two of the most important and persistent symbols. Our author tries to divine the reason for this:

The bird has the incomprehensible power of flight; it floats on the atmosphere,

it rides on the winds, it soars toward heaven where dwell the gods. . . . What wonder, then? . . . So natural.

And so forth. There was a College of Augurs in Peru and Mexico, as in Rome. The Algonkins say that birds make the winds; the Navajos place a bird at each cardinal point; the thunder is caused by a bird.

How important a symbol did they thus become! For the winds, the clouds, producing the thunder and the changes that take place in the ever-shifting panorama of the sky, the rain-bringers, lords of the seasons, and not this only, but the primary type of the soul, the life, the breath of man and the world, these in their role in mythology are second to nothing. Therefore as the symbol of these august powers, as messenger of the gods, and as the embodiment of departed spirits, no one will be surprised if they find the bird figure most prominently in the myths of the red race.

Another author, quoted by H. P. Blavatsky, marvels that "uncultured savages should possess powers of imagination and poetical invention far beyond those enjoyed by the most instructed nations of the present day." And well he may marvel!

The Natchez and Akansas paid the great American eagle religious honors and installed it in their most sacred shrines. The Nahuas revered the *quetzal*, with its bright green plumage, as a symbol of *Quetzalcoatl*.

The dove has always been a symbol of the all-conquering divine gentleness.

With regard to the Serpent, we find the same kind of remarks as to its wonderful powers, which would so inevitably and naturally cause the admiring Red Man and his brothers on the other continents to make it the symbol of Life, of Time, of healing, of a wise man, and so forth. But here, more than ever, the superstructure erected on the back of this unfortunate reptile does as much credit to the imaginative powers of primitive Man as to those of the evolved men who are responsible for the theory.

The Algonquins and Iroquois had a myth that in the great lakes dwelt a monster serpent, of irascible temper, who unless appeased by meet offerings raised a tempest or broke the ice beneath the feet of those venturing on his domain, and swallowed them down.

This myth will be recognized at once as universal by all who know anything of symbology or even of fairy tales and Dragon stories. Its meaning is, roughly, that the aspirant who seeks to win the waters of life or the fountain of Soul-wisdom, is liable to destruction by the dragon of selfishness, unless he is strong enough to subdue it. That calm lake of eternal peace and knowledge that is in the mountain tops must be fought for.

New Fossil Animal Found in California

RECENT discoveries made by the Palæontological Department of the University of California announce that a specimen of the very early ichthyosaurus was found in the middle limestones of Nevada. It showed the skull, vertebræ and front limb. A California contribution was a specimen of a hitherto unknown fossil animal, belonging to the ovine or sheep type. It consisted of the greater part of the skeleton of an enormous animal as large as an elk, but with sheep and goat affinities. The horns were very large and magnificently formed. The discovery was made in the Samuel cave, Shasta county, and it will be set up for exhibition in the Berkeley museum.

STUDENT

Prehistoric Cave Found in Nevada

ANOTHER mysterious cave has been discovered, say reports, in the southern part of Nevada. It is located on the line of a new road near Caliente. This cave has been explored to a depth of 300 feet, and shows evidence of having been inhabited by a prehistoric people. Myriads of stalactites hang from the roof, and hieroglyphics have been found, and old stone seats. Mineral wealth in gold, silver, and other metals is also reported. There are inner caverns to be explored, and the results are awaited with quite eager anticipation. E.

The Trend of Twentieth Century Science

Modern Science and H. P. Blavatsky

THE modern theories of matter to which, in the last year or two, radium has given rise, are so conspicuously forestalled in the theosophical writings of H. P. Blavatsky, that it is important from time to time to point this out.

According to the science of today, the atom is a little mass of substance made up of vast numbers of immaterial electric units, force-points. Up till quite recently, these points were regarded as material, each carrying a charge of electricity. The still more modern view is to regard them as consisting of the charge. The nature of the atom, whether it shall be carbon, sulphur or what not, is determined by the number, mode of motion, and grouping of these bodiless corpuscles. "Matter" has no other existence than this. It is but the effect produced by the behavior of these aggregations of electric points.

Fourteen years, and more, ago, H. P. Blavatsky anticipated all this. She used a slightly different terminology. She reserved the term *atom* for the electric points; and employed the word *molecule* for what we call atom, and also for the molecule of science.

Her words are: "Our philosophy teaches us that atoms are not matter; but that the smallest molecule—composed of milliards of indivisible and imponderable atoms—is substance," therefore, she goes on, like all substance, being an illusion. As for the atom it is "an immutable Entity, a reality within an appearance"—the molecule—"informing it as life, spirit, soul, mind, inform Man. The Atom is all these, and Force itself. The Atom represents, according to the geometrical combinations of its groupings in the molecule, life, force (or energy), mind, and will. Atoms are the (spiritual) sparks on the manifested plane thrown out by the Universal Soul or Mind from the plane of the Unmanifested. In short the Atom may be regarded as a compact or crystallized point of divine Energy and Ideation."

Elsewhere she identifies electricity with the Atoms, and speaking of primordial electricity, compares its action as resembling—on an immense scale—"that of a living Force created by Will."

In short the physical universe is a manifestation of Will, whose immediate vehicle is the Atom—which, she says, is Sound, though to us inaudible. And Man, as sharer in that Will, must also be an Atom-guided.

STUDENT

A Story Told by the Hudson

IF nature should continue her present programme, New Yorkers will sometime have to seek other residence. They need not hurry; there are three or four hundred years yet to look about. For the eastern coast is only sinking at the rate of about two feet in a century. Soundings show that it has been sinking at that or some other speed long enough to lower the eastern border between 3000 and 4000 feet.

The tale is told by the channel of the Hudson river, which can be followed for more than seventy miles out to sea. The geologist Dr. J. W. Spencer gives a most interesting account of the soundings in a scientific contemporary.

From the point where the river now enters the sea onward to the old sea line seventy miles out, it had cut for itself a mighty cañon. "At its head the cañon begins in an amphitheatre, having a descent from 330 feet to 1100 feet in the distance of about a mile. Two more steps of 400 and 500 feet respectively, follow. Again, between 27 and 31 miles below its head, there is another great step of 2000 feet" to a depth of 4800 feet. This is the floor of the cañon, which is here 3800 feet deep. A thousand feet of water lie over this. "At 42 miles the cañon begins to widen into a valley, which at 48 miles has a precipitous wall of 2000 feet in height. . . . The valley is continuous to a point 71 miles from the head of the gorge, and where it is recognizable at a depth of about 9000 feet."

The sinking of this part of the country has not been continuous. Recently (in geologic time) it was 250 feet lower than now and rose again. But the raising was only a little episode, and, as we said, the sinking is now steady, and for geologic changes, rapid. STUDENT

The Whims of a Primrose

IN the current number of a contemporary, Professor de Vries describes the steps of experiment by which he has tested the current theories of Natural Selection.

The motive of the current theory is to make the process seem as mechanical as possible. On any given piece of ground, for example, more plants spring up from the scattered seed than the soil will properly feed. There are minute differences between them. Those whose shade of difference adapts them better than others to that particular soil and climate prevail over the others; hand on that shade to their offspring; who again exhibit slight shades of their own; which again are sifted according to their adaptedness to that soil; and so at last the original species has entirely changed to another.

"We know this is the way new species arise," says the ardent Darwinian, "because—because—well it *has* to be the way anyhow because it's simple and satisfactory." And then he adds that, under experiment, pigeons and flowers have been made to produce new species by this very method—that is by continuously selecting slight variations on some desired line, breeding from them only, and so at last producing individuals so different from the original stock as to constitute new species.

The answer is obvious: this is artificial—man-done—work; no one has seen it occur in nature; and the species prove they are not real ones (in nature's sense) by relapsing to the original as soon as man's selecting hand has been withdrawn.

Professor de Vries took the evening primrose for his experiments, and raised many thousands from seed. Among these, seven new species suddenly arose, differing in marked characteristics from the others and with no shades of gradation between, appearing as it were because they chose to, not better adapted to that place and climate than the others, permanent, showing no tendency to relapse, and not increasing in numbers at the expense of the others.

The Professor concludes that that is the way that new species arise in nature; and he has no suggestion as to the how or why. If one suggests that they arise because nature chooses then and there, according to a conscious need or impulse, to express herself in that particular way, there would be no ground for denying the idea, even if we cannot as yet say what she gains by that expression.

STUDENT

Plants' Myriad Eyes

A GERMAN biologist makes the interesting suggestion that the tiny epithelial cells that constitute the "skin" of the leaves of plants, are eyes. They have no very acute vision, but they see all that the plant needs to see, namely light. These cells are "plano-convex," that is shaped like half an orange. The flat surface is outward, and as it is practically transparent, light enters and illumines the interior of the little hemisphere. If it enters at right angles to the surface it strikes the bottom of the cup. If it enters obliquely it strikes the sides.

In the human eye, the spot most sensitive to light, and of acutest vision, is exactly at the back of the eye-cup. To see anything, we move the eyes so that light from the object falls on this spot. If we do not do that, the light falls on some other part of the retinal cup, and our view is indistinct.

So, according to this theory, with the plant. The bottom of the epithelial cup is the most sensitive, and is the place where the plant wishes the light to fall. It cannot move the cell to effect this, so it moves the whole leaf. Then it sees or feels the light most distinctly and gets the most vital benefit from it.

That is why plants move their leaves so as to spread them in the eye of the sun. It is quite a rational manoeuvre, and in its way the plant is doubtless as conscious and purposeful as we when we direct our eyes to anything we want to see.

It seems also reasonable to suppose that the minute vesicles of oil in the leaves of such trees as the eucalyptus, and in the rind of oranges and lemons, are not mere excretions, but serve as minute lenses. STUDENT

To Become a Child of Nature Again

WE grown folks only look at the outside of Nature through our dull eyes, and thus see merely her raiment—and most of us very little even of that. We do not now *feel* Nature, through the blending of our life with hers. But there was a time when we did, and that was when we were very small.

Perhaps we are not even now entirely without reminiscence of that state; but the memory, when it comes, is not an ordinary thought-memory, but a brief return of the feeling itself. It only comes in the borderland of sleeping and waking, or when the gross life of the body is in abeyance through illness or long watching, or in some other rare moment of exaltation. Then we remember for an instant how we used to feel as a child—but it is gone!

And Nature still keeps this balm for those whom she deems worthy, for those upon whom alone she *can* bestow it. But they must have ceased to desire it and look for it; and, when it comes, they must not try to detain it nor plan how to get more.

It is useless to go out and try to find peace and quiet meditation. If somebody else does not interrupt you, your own desires will. But the busy fearless worker gets moments of joy at all times and places, and they are as years to him. For Nature is everywhere.

Riches, real riches, are to the non-covetous. Give up seeking happiness and Nature will cheer you when you need it. Give up trying to discover things, and you shall *see* them.

Man himself *is* Nature, ensouled with Divinity. But he has maltreated the Nature that is in him, and so shut himself off from communion with Nature in the whole. He must regain the lost child-state, non-covetous, unanxious, unanalyzing. He must become a child again, and yet be a man also.

CHARRED REDWOOD STUMP—BEN LOMOND
(Santa Cruz Mountains)

THE WORD

by RICHARD REALY

O EARTH! thou hast not any wind that blows
Which is not music; every weed of thine
Pressed rightly, flows in atomatic wine;
And every humble hedgerow flower that grows,
And every little brown bird that doth sing,
Hath something greater than itself, and bears
A living Word to every living thing,
Albeit it holds the Message anawates.

All shapes and sounds have something which is not
Of them: A Spirit broods amid the grass;
Vague outlines of the Everlasting Thought
Lie in the melting shadows as they pass;
The touch of an Eternal Presence thrills
The fringes of the sunsets and the hills.—Selected

Luminescence of Plants

FLOWER LORE says that "Many plants have at times a luminous appearance, others a phosphorescent, and some are surrounded by an inflammable atmosphere which readily takes fire on a light being brought near it. The tuberose has been observed, in a sultry evening after thunder, when the air was highly charged with electric fluid, to dart small sparks or scintillations of lurid flame from such of its flowers as are fading. The younger Linnæus states that the flowers of *Nasturtium*, the orange lily, African marigold, and other orange flowers, give out similar flashes. Dowden mentions that on the 4th of August, 1842, at 8 P. M., after a week of dry, warm weather, he observed a luminous appearance in the common marigold; a lambent light seemed to play from floret to floret, and to make a course round the disk of the flower. These luminous phenomena have been remarked by sev-

eral observers, but only in orange and gaudy flowers, and during twilight."

As an exception to this the *Oenothera Macrocarpa*, during an evening thunder storm accompanied by heavy rain, has been observed to be brilliantly illuminated by phosphoric light. During the intervals of the flashes of lightning in the very dark night, nothing could be seen except the light upon the leaves of these flowers.

The luminosity of several species of fungi is well known. The *Rhizomorpha subterranea*, which grows in dark mines and caverns, gives out a phosphorescent light. So do some lichens growing on trees. *Fraxinella* excretes a volatile oil which is highly inflammable, and if a lighted candle be brought near it, the plant will be enveloped in flame for an instant without injury. The dust from spore cases of some club mosses will flash with light and go out so quickly that it has been used to produce the effect of lightning.

STUDENT

Potatification of Radishes

RADISHES transformed into potatoes! This sounds like a revolutionary achievement in the artificial molding of species. But, judging from the accounts, the word "potato," as here used is an abstraction

of minor inclusiveness, involving only a few of the concepts usually comprehended under the category "potato." M. Moillard has not turned a radish plant into a potato plant; he has merely turned a culinary radish into a culinary potato.

The more ardent root is "cultivated" in a glass retort, after a process invented by Pasteur, in a concentrated solution of glucose. Small wonder that the fiery radish should, under such sweet treatment, lose its pepperiness and become starchy, bulky, and nutritious, like its less enthusiastic fellow vegetable.

The achievement is not regarded as having a commercial significance likely to threaten the culture of the homely tuber; but it may be the first step in a new branch of food manufacture. If starch can be developed in the cells of a radish, and the pungent principle eliminated, it may be possible, in a potato famine, to invent a cheap process for rendering all sorts of undesirable roots palatable and nutritious.

One can even see visions of wood being converted, by this higher form of cooking, into digestible dishes. The laboratory may be, under wise management, an extension of Nature's laboratory; for, with God-like Man as the chemist, the artificer would be the same in each case.

A Collection of Lichens

One seldom sees anything written from a nature-lover's point of view about lichens. Yet a student of Lomaland remembers as a child studying some illustrated articles in an old magazine, on lichens, and making a live collection of these most beautiful and variegated fabrics—a fascinating study. H.

THE subject of higher education for women refuses, like Banquo's ghost, to be laid. Again and again it comes up, and its effect upon some minds is invariably similar to that of a red rag upon certain members of the species *Bovidae*.

In today's paper appears an extract from a lecture just delivered by a physician at a certain State Medical Conference. This physician heroically declares that higher education for women is not only unwise, but unjustifiable, because it interferes with, or makes impossible, the duties of motherhood. He says, in brief, that women who have higher education deteriorate physically from that cause, becoming unfit to bear children. He also declares, unequivocally, that when educated women do bear children, the latter are almost invariably mentally and physically weak.

He would eliminate from every woman's education such studies as algebra, geometry and astronomy, and substitute instead, cooking, sewing, taking care of babies and other knowledge that pertains to the marriage relation.

(If a digression may be excused, what greater crucifixion can there be than that of a woman who has some glimpse of true knowledge in regard to marriage, yet who is forced to play the rôle of wife to a man who not only doesn't have this knowledge, *but doesn't want it?* If women should be instructed in their duties as wives and mothers, how about another subject upon which this physician is silent—men, and their duties as husbands and fathers?)

Now, in the light of existing facts, statements such as are made by this physician appear less damaging than absurd, for the truth is plain to all who honestly look about, compare and observe, free from personal prejudice. America alone boasts of thousands and tens of thousands of women who have had higher education, who have survived it, and who today are mothers. These women, almost without exception, are in excellent physical health and, what is more to the point, their children mentally and physically are several degrees finer, as human specimens go, than the children of their washerwomen, the women who work in factories, their society sisters who

Women and the Higher Education

spend thirty-five hours a week over "bridge," or, in fact, any of the classes not inflicted with the penalties of

"higher education." Extremes, while rarely themselves containing truths, do often point that way and lead to the discovery of actualities which otherwise would not be recognized. In this case an extreme example is not out of place and it might be a good plan for this physician to make personal observation as to the kind of children produced by women who are the furthest removed from all possibility of contamination by the higher education. A day in Castle Garden, New York, or in the Polk Street station of Chicago, spent among the immigrants from southern Europe, observing their progeny of from ten to twenty-four per mother, and comparing these stunted, undertaught, neglected, misunderstood children with the well-cared for children of the average college-educated woman, might open a door in the consciousness of this professor—and then, too, it might not!

"MATCHLESS FUJIYAMA"—JAPAN'S SACRED MOUNTAIN

Another point is worth observing. This particular physician has before now called attention to the lowering birth rate in France and in America, has learnedly talked of race suicide and has lavished upon women in general and American women in particular, warnings as well as contempt. He is one of a number who, like himself, have been expressing themselves upon the "race suicide" question very much as gunpowder expresses itself at the touch of a match, while at the same time, not one of these gentlemen has had anything to say about problems far more pressing

and terrible—such as child labor, the social evil in our cities, the overworking of wives and mothers in our factories, coal mines, etc. It is strange, indeed, how compassionate and how eager to achieve the welfare of their race some men become at the suggestion that every single American woman is not bent on producing from eight to fifteen children as did her grandmother.

Far be it from the writer of this article to suggest that any motive other than the purest compassion and the most disinterested philanthropy may lie behind the intense and spasmodic interest taken by a few so-called

scientists in this question of woman's higher education, or what means practically the same thing in their eyes, "race suicide." *Absente reo*, to presume otherwise were unjust. Yet is it not in itself a sort of "higher education for women"—this spectacle of the incapacity of a certain pitiful few to distinguish between the soul's own summons and the hypnotic whisperings of that mediæval-reared entity *yclept* "masculine prerogative?"

The Book of Flowers

THAT art is the A, B, C, of training to the Japanese girl is shown from the importance given to the *Book of Flowers*, a book that is said to be originally Chinese, many centuries old, and to have been received by Japan from the older nations who have since forgotten the art that is now used in the every-day life of Japan.

This book of fifty-two pages is made mainly up of illustrations with but a few pages of text. What a contrast to the library of books that western college girls wade through! One recalls a bright young American whose particular fad was an herbarium, and also what a dead flat thing it was in comparison with the Japanese girl's artistic book, where each flower is a poem, a practical, living part of the home-life. The arrangement of flowers ranks, in Japan, as one of the arts and the understanding of it is part of every young woman's education in that rare land where cherry and plum-trees are cultivated not for their fruit but for their flowers. Few people love Nature as do the Japanese. What other nation in the world will take a holiday just to look at the flowers—for it is scarcely exaggerating to state that on flower-viewing days the whole nation turns out as on a big picnic.

February is the month of the pine; March, of the plum; April, of the cherry; May, the wisteria; June, of the iris; July, of the peony; October, of the chrysanthemum, etc. Whole communities will go into the country to see the marvelous plum-trees in blossom, or the cherry blossoms; again, to the parks to see the lotus, or to the hills to see the maples. Surely there must be something deeply idealistic in the hearts of a nation such as this! STUDENT

THE MUSÉE CLUNY—PARIS

IN the United States women are admitted to practice in the bar in thirty-four States, and up to the present time about six hundred women have availed themselves of the privilege. This presents quite a contrast to the state of affairs in Great Britain, as disclosed in the case of Miss Cave. It will be remembered that she asked the privilege of studying to qualify for a barrister. Upon her application to be admitted to Gray's Inn there was created a special tribunal to consider her application. The Lord Chancellor presided over this tribunal and among his associates was the Lord Chief Justice. Miss Cave's application was refused upon the statement submitted by the Benchers: that, as under the regulations of the Inns of Court only men are eligible, the tribunal could not assume responsibility for making exception to these regulations, believing that it were unwise to establish, by any exception, a precedent.

MISTRESSES of homes, don't let there be a dog or a cat or a donkey or any other creature, in or about your homes, which shrinks when a man or a woman approaches it. And here I may add that, without specially victimizing the animals through dislike, a household frequently makes the life of some poor brute one long martyrdom through neglect. The responsibility of this neglect lies primarily with the mistress of the house. She must not only direct her servants, but see that her directions are carried out, in the way of affording water, food, and needful exercise. A pretty "kingdom of heaven" some houses would be if the poor brutes could speak.—*Frances Power Cobbe*

"The Giving of Light"

IT was a July evening in West Central London. All day the heat had been oppressive, and now in a poor quarter near Gray's Inn road, dirty men and scantily clad women were seated upon the rows of doorsteps of mean dwellings, in the vain hope that a breeze might spring up and refresh them before they went back into their stifling rooms for the night. A crowd of sadly neglected children, unkempt, unwashed, and obviously ill-fed, hung around, scarcely more joyous than their parents.

It was a sad and depressing view of humanity,—one might almost say a hopeless one. Suddenly, upon the heavy air there fell the sound of a woman's voice—a woman's voice singing. Attended by two men she had come unperceived and taken a position in their midst. She was one of a little body of musicians organized to bring music to the "slum dwellers," and this was the first concert of the summer season.

The parents, at first, made scoffing remarks, but the children drew near her in evident appreciation, and she sang bravely on to her strange audience. Soon all the talking ceased and the dejected heads were raised to listen, the tired bodies lifted themselves to catch the sound, and on the current of the song there traveled from the woman's heart to theirs a touch of healing, a note of human sympathy, that where it fell awakened and revived.

E. H. B.

THE air-ship, "The California Messenger," which recently made a successful flight, was invented by a woman, Mrs. George E. Heaton.

"It was Mrs. Heaton's own idea," said Mr. Heaton recently, referring to his wife's statement that she owed the perfecting of the engine to her husband's genius.

"I thought it ridiculous when she first suggested it to me, and told her so. But she insisted that the construction of such an engine was feasible, and the more I pondered over it the more I became convinced that she was right. We planned it together, and you see the result.

Here is an engine that weighs but forty-five pounds, that generates eighteen horse-power and that requires no cooling apparatus. In these essentials it is perfect."

The engine in question is described as a double-cylinder, two cycle, eighteen-horse-power machine.

The entire mechanism is within the cylinders and the propellers are directly fastened to the cylinders.

IT has been stated that Fraülein Bertha Krupp, heiress of the big Krupp iron works at Essen, Germany, is the richest woman in the world.

That, however, is less interesting than the undisputed fact that she is one of the most sensible. She is a judicious business woman who not only knows how to take care of her riches, but uses them to better advantage than mere selfish display. She is accomplished and benevolent and is much beloved by the Empress. In the welfare of her thousands of working men and their families she interests herself personally.

ACCORDING to the newspapers, Queen Wilhelmina of Holland has just appointed Jonkheer Van Green as her private secretary. He is a Roman Catholic. This is the first time since the days when the Dutch fought and suffered for the sake of religious liberty that a Roman Catholic has been appointed to any office of trust in the royal household of the Netherlands.

It was not until 1894 that a monument was erected in honor of Mary Washington by the Mary Washington Association. The monument stands in Fredericksburg, Virginia, a plain shaft bearing the following inscription: "Mary, the mother of Washington, erected by her country women."

"And the uttering of song is like to the giving of Light."—*Sidney Lanier*

OUR YOUNG FOLK

George Washington

THERE is something about the lives of great men that is like the springtime. The thought of them brings to the soul what flowers, the rippling of mountain streams and the wafting of fragrant breezes, bring to mother earth. Why is it that time does not obscure the beauty of these great lives, but only serves to make it more clear? Because this beauty, this genius, was of the heart.

Washington did not work for his own good. He did not know personal ambition. He was a leader of men because he knew how to serve. To the comrades who labored at his side he ever gave his whole confidence and love. He was ever the first to point out to the nation their services. Thomas Paine was one of these comrades and of him it has been said, "America owes no less to the pen of Paine than to the sword of Washington."

Hamilton, Jefferson, Benjamin Franklin, Adams and many other leaders were among his friends. All worked together, yet in all his intercourse with them Washington showed no trace of jealousy or a tendency to rule them. What an example to us is his refusal to take any salary when appointed Commander-in-chief of the army and later, when elected President of the United States.

Does not this take us back to the days of Greece, to the days when Marathon was fought and Thermopylæ was defended—those noble days when young Sophocles marched, lyre in hand, before the troops at Salamis? What was the quality of patriotism then? Was it the kind that can be bought for a salary? What was the quality of Washington's? Surely something as high and pure as that of Greece, or he could not have guided these little States through those first trying years when they took their places as parts of a whole, as members, merely, of a new nation.

Washington, in his farewell address to the people of the United States, himself gave us the key-note of a nation's real life. His own words are more eloquent in his praise than the words of any other:

The unity of government which constitutes you one people, is dear to you. It is justly so; for it is a main pillar in the edifice of your real independence, the support of your tranquility at home, your peace abroad; of your safety; of your prosperity; of that very liberty which you so highly prize. But as it is easy to foresee that from different causes and from different quarters much pains will be taken, many artifices employed, to weaken in your minds the conviction of this truth; as this is the point in your political fortress against which the batteries of internal and external enemies will be most constantly and actively (though often covertly and insidiously) directed, it is of infinite moment that you should properly estimate the immense value of your national union to your collective and individual happiness; that you should cherish a cordial, habitual and immovable attachment to it; accustoming yourselves to think and speak of it as of the palladium of your political safety and prosperity; watching for its preservation with jealous anxiety; discountenancing whatever may suggest even a suspicion that it can in any event be abandoned; and in-

dignantly frowning upon the first dawning of every attempt to alienate any portion of our country from the rest, or to enfeeble the sacred ties which now link together the various parts.

Observe good faith and justice towards all nations; cultivate peace and harmony with all. Religion and morality enjoin this conduct; and can it be that good policy does not equally enjoin it? . . . The experiment, at least, is recommended by every sentiment which ennobles human nature. Alas! is it rendered impossible by its vices? STUDENT

"Oh, for a Washington! Oh, that the power of his patriotism might sweep in upon us today and bring about a higher type of liberty and of justice!"—*Katherine Tingley*

RAJA YOGA CHILDREN IN PATRIOTIC PROCESSION, MARCHING PAST EAST ENTRANCE OF RAJA YOGA ACADEMY

FROM

"THE BUILDING OF THE SHIP"

by HENRY WADSWORTH LONGFELLOW

THOU, too, sail on, O Ship of State!
Sail on, O UNION, strong and great!
Humanity with all its fears,

With all the hopes of future years,
Is hanging, breathless, on thy fate.
We know what Master laid thy keel,
What workman wrought thy ribs of steel,
Who made each mast, and sail and rope,
What anvils rang, what hammers beat,
In what a forge and what a heat
Were shaped the anchors of thy hope!
Fear not each sudden sound and shock,
'Tis of the wave and not the rock;
'Tis but the flapping of the sail,
And not a rent made by the gale!
In spite of rock and tempest's roar,
In spite of false lights on the shore,
Sail on, nor fear to breast the sea!
Our hearts, our hopes, are all with thee,
Our hearts, our hopes, our prayers, our tears,
Our faith triumphant o'er our fears,
Are all with thee,---are all with thee!

Washington, the Commander-in-chief of its Armies, the Assertor of Freedom." On the reverse, the device shows troops advancing towards a town; others marching towards the water; ships in view; General Washington in front, and mounted, with his staff, whose attention he is directing to the embarking enemy. The legend is, *Hostibus Primo Fugatis*—"The enemy for the first time put to flight." The *exergue* under the device, *Bostonium Recuperatum, xvii. Martii. mdclxxvi*—"Boston recovered, March 17th, 1776."

Facts Worth Knowing

WASHINGTON said, in a letter written to the Presbyterian Church in the United States, May, 1789, "No man who is profligate in his morals or a bad member of the civil community, can possibly be a true Christian or a credit to his own religious society."

DURING his whole military career Washington never received an injury. In the terrible battle on the Monongahela, where Braddock and others were mortally wounded, Washington was unhurt, the only officer who escaped. To his mother he wrote: "I luckily escaped without a wound, though I had four bullets through my coat and two horses shot under me."

THE earliest celebration of Washington's birthday found

on record occurred in Richmond, Virginia, February 11th (O. S.), 1782. The *Virginia Gazette* made the following record four days after the event: "Tuesday last, being the birthday of his Excellency, General Washington, our illustrious commander-in-chief, the same was commemorated here with the utmost demonstration of joy." The day was celebrated there, in New York and other places, on February 11th, until 1793, when it was changed to February 22nd.

ON March 25th, 1776, when news of the British evacuation of Boston reached Congress, that body resolved that its thanks be presented to the commander-in-chief and the officers and soldiers under his command, "for their wise and spirited conduct in the siege and acquisition of Boston; and that a medal of gold be struck in commemoration of this great event and presented to his Excellency." This medal was nearly two and three-quarter inches in diameter. On one side was a profile head of Washington, with the Latin legend, "*Georgio Washington, Supremo Duci Exercituum Assertori Libertatis Comitum Americana*"—"The American Congress to George

THE CHILDREN'S HOUR

The Raja Yoga Question Box

“WHERE liberty is, there is my country,” said Benjamin Franklin, at one time, to his friend, Thomas Paine; and this was Paine’s reply: “Where liberty is not, there is mine!”

1 Who was George Washington?

ANSWER—George Washington was the first President of the United States. He was born in Westmoreland County, Virginia, on February 22, 1732. When a mere child, his father died and his training was left in the hands of his mother. To his mother George Washington declared that he owed all that was best in his nature. She was his first teacher. He became a surveyor and, when only twenty, was sent on a delicate mission in connection with the French and Indian War. After overcoming many dangers he finished the task so successfully that he was appointed Commander-in-chief of the armies of Virginia. Many years later, when the Revolutionary War broke out, Washington was appointed Commander-in-chief of the whole army. For this he refused to accept any salary. Later, when elected President, he again refused to accept a salary. He had many persecutors, but time has revealed them in the true light. Washington was clean, honorable and unselfish.

2 Who was Mary Washington?

ANSWER—Mary Washington was the mother of George Washington. She was born in Virginia in 1706. She was a woman of wise judgment, of great stability of character and of noble ideals. She was one of the most highly educated women of her own day, for in those days it was not thought necessary to educate women as highly as men. The whole nation owes her a debt of gratitude for the wisdom she showed in training her son.

3 Who was Thomas Paine?

ANSWER—Thomas Paine was born in England in 1736. When but a young man he came to America. This was just before the war for American Independence. He began to help the struggling Colonies by writing. He once said, “It was the cause of America that made me an author.” It was Paine who first suggested to Washington the idea that the American colonies ought to be free and independent. When the war broke out he enlisted and was for many years Washington’s comrade and close friend. Later, he went to France to help the cause of human brotherhood and liberty. There he was beloved, honored and appreciated. Paine’s memory has been defamed by some religionists who did not share Paine’s belief in human brotherhood and a compassionate God.

A Snowflake Story

SOFTLY from the thick grey clouds fell the white snowflakes, each containing a tiny fairy. As they fell to earth, they sang happy songs about the trees and flowers and the river which would bear them to the great sea, where, all united, they might help the great ships to sail along until the sun should gather them into the mist and take them back to the clouds again.

When they reached the earth, they changed from being soft white flakes into round silvery drops of water. Then some ran swiftly down the little streams to the river, while others sank deep down into the ground, and it was so long before they found the river that they became very thin and pale.

There were many who went to live among the trees, grass and flowers. These were the happiest of all the snow fairies.

There were two little fairies who became great friends as they floated downward side by side when, all of a sudden, a puff of wind separated them from each other. Although one little fairy hunted and hunted for his little friend, he could not find her in the hurry and scurry of the many falling snowflakes, so he was very sad as he floated nearer the ground.

Just before he reached the ground, a kind little breeze said to him, “I know where she has fallen. Come, I will take you to her,” and he lifted him gently over an ivy-covered wall into a beautiful old garden, and there by the old sun-dial, he saw her smiling in the grass.

So he dropped down beside her and they were very happy to be together again.

Then the sun came out and they melted and sank into the earth, but on the spot where they disappeared, there grew up a lovely snowdrop, and deep down in the heart of its pure white blossom, lived the two little snow fairies, full of joy because they knew they had come from the clouds to help the beautiful snowdrop to grow.

This is the “Snowflake Story” as Grandmother used to tell it. H. H.

Die Wahrheit

DEAR CHILDREN: One of your friends, a lady who is too ill to leave her room, lies thinking of you day after day. What do you suppose her thoughts are?

Once, when she was traveling in Germany, she saw a beautiful little drama called “Wahrheit” (Truth), and she wishes she might recall it for you.

Her recollection is that an aged couple are disputing over their evening meal, when the door is opened softly by a worn and weary woman, clothed in pilgrim’s sombre attire. It is Truth. She does not tell her name at once, but talks to them of the long and tiresome journey she has made, of the places where she has asked for admittance and been refused, of the hearts she has tried to reach and failed. At last she reveals herself to the humble, astonished people; her dark garment falls away and she stands before them, a radiant, white-robed being.

Now here is a question for you. What do you think was in the minds

of the poor old people, quarreling over their supper, that they should be visited by Truth herself?

Your friend cannot recall whether it were the contemplation of a good deed by one of them, or a temptation to do some wrong thing, that made Truth’s appearance to them in that moment necessary. What do think, dear children? W. D.

HOW many people there are who are continually thinking of going to Heaven! All their good acts are done with the idea of reward. Our good or bad acts will not make us go to a place where there will be eternal bliss or suffering.

Our kind, unselfish acts make heaven in our hearts. We will have only suffering as long as we are selfish. It is impossible to have happiness and selfishness at the same time.

Even criminals need not fear, because their hearts can be educated, no matter how hardened they are, if we know how. A RAJA YOGA BOY

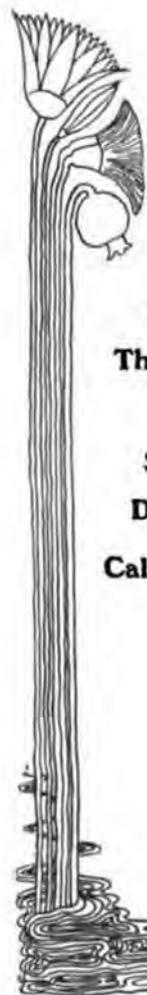

ONE OF THE STILL LIFE CLASSES—AMERICAN AND CUBAN STUDENTS OF THE RAJA YOGA ACADEMY

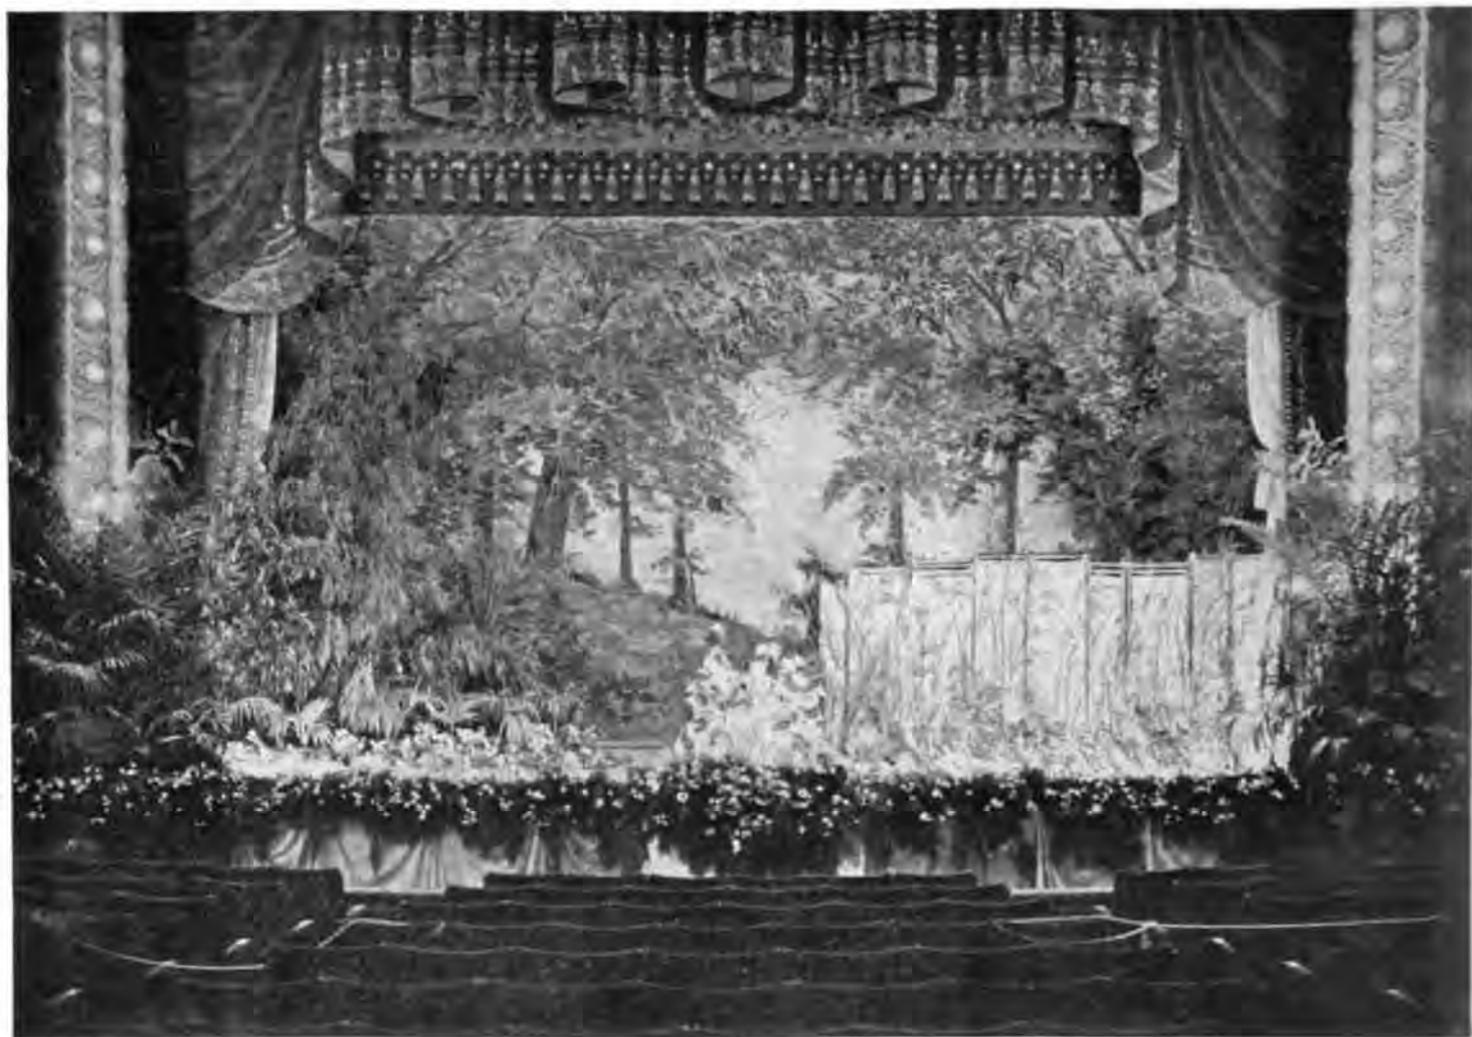

MORNING

by EMILY DICKINSON

WILL there really be a morning?
Is there such a thing as day?
Could I see it from the mountains
If I were as tall as they?
Has it feet like water lilies?
Has it feathers like a bird?
Is it brought from famous countries
Of which I’ve never heard?
Oh, some scholar, oh, some sailor,
Oh, some wise man from the skies,
Please to tell a little pilgrim
Where the place called morning lies.

THE THEOSOPHICAL FORUM, IN ISIS THEATRE

THE announcement that Katherine Tingley would deliver an address on "Marriage and the Home," served to fill every seat and all available standing room in Isis Theatre last Sunday night. From the foot-lights to the roof was crowded, and hundreds were turned away, unable to gain admission.

In opening her address, Mrs. Tingley said the subject was one that she had been requested to speak on. She approached the subject with a full realization of its importance. "Think of it!" she exclaimed, "three hundred and twenty thousand divorces in America in the last twenty years. Think of all the misery, and suffering and agony of it. We read in the sacred writings that 'Those whom God hath joined together let not man put asunder.' But do you not think the Nazarene was incorrectly quoted by the scribes? Do you not think he said that those whom God hath joined together no man can put asunder? No power on earth can separate two people who are really and truly united. Pain, suffering, aye, even death, cannot separate two human souls who are thus truly united."

The speaker was pronounced in her belief that our marriage laws should be maintained and enforced. They were a protection to parents and children. But we should have a higher ideal of the married life. We should regard it as sacred and divine. We must place marriage on a higher plane—or we must bend to this travesty of married life, with its inharmony and divorces, that surround us.

The Theosophical idea of marriage is a very sweet and beautiful one, based upon a knowledge of man's divine nature. Theosophy teaches that man is dual in his nature. There is the lower, the sordid, selfish, animal side; and there is the higher, the diviner side that leads to righteousness. By living in the higher part of his nature man gains the power to use his will—to shape his life. Such a man can will for the good of humanity. Such men and women look upon marriage as a divine institution, to be approached thoughtfully and reverently. Such a man will not select a wife because her father has a million dollars, or for social position. It will be because they are united in their ideals for a higher standard of home and married life. But the law makes not the marriage—so says Theosophy. Marriages are made, as the sacred book

says, in heaven—in the higher life. "Can you believe that in such a marriage as this there would ever be divorce? Do you not believe that two such people, thus united, would bring into the world children who would be pure and good and free from disease?"

The speaker urged her hearers to study the teachings of Theosophy, the Wisdom-Religion, which would give a knowledge of the higher law and one's own divine nature. These truths should be taught to little children, for they are so simple that little children can understand them. But she warned those who would study, against following those who posed as teachers of Theosophy.

Parents should most carefully and watchfully guard their children against the contaminating influence of pernicious literature and bad companions. Sensational newspapers, with their sickening details of divorce and immorality and crime, were brought into homes and poisoned the innocent mind of the child. Fond mothers are in an agony of suspense and dread when the body of a loved child is sick, but carelessly allow the morals of their children to be exposed to the dangerous influences of sensational novels and evil companions, trusting the inexperienced youths to select their own reading and their own associates. The safety of the child lies in its understanding of its higher and lower nature, and a realization of its inherent divinity.

Mrs. Tingley's address was listened to throughout with the closest attention, and again and again her words were loudly applauded by the immense audience.

Delightful music was rendered by Students of the Isis Conservatory and by the Raja Yoga children from Point Loma.—*San Diego News*

Theosophical Meetings for Sunday Night

Public Theosophical meetings are conducted every Sunday night in San Diego at 8.15, at the Isis Theatre, by the students of Lomaland.

Theosophical subjects pertaining to all departments of thought and bearing on all conditions of life are attractively and interestingly presented.

Other interesting features of these weekly gatherings are the excellent music rendered by some of the Students of the Isis Conservatory of Lomaland, and the efforts of the children of the Raja Yoga Schools at Point Loma. Theosophical literature may always be purchased at this meeting.

Art Music Literature and the Drama

The Songs of Finland. Their National Influence

IN the palatial supper room of the great hotel in Helsingfors, the capital of Finland—the best hotel in Russia, for the Finns represent all that is most progressive in the Czar's empire—a company of ladies and gentlemen seated at one of the tables suddenly began singing," writes the correspondent of a London paper. "With trained voices they sang a four-part folk-lore song of the Northland. Never heard I a song so deeply melancholy. It was the music of the unhappiest of the enlightened peoples of the earth. That was on my first evening in Finland. From that time forth throughout a stay of four weeks among those sad-hearted people I listened to their singing morning, noon and night, almost continuously.

"The Germans sing a great deal, the Swedes sing part of the time, the Russians sing most of the time, but the Finns, as a nation, actually sing all the time. From noble to peasant, the men of Finland may be said to form one mighty male chorus. From the great lady of the capital city to the lowly woman who builds houses with her own hands on the borders of Lapland, the women of Finland may be said to comprise one vast choral society. The acknowledged finest singing society in Europe is, indeed, the Helsingfors Male Chorus. It is composed of 100 members, and from their ranks are recruited the singing teachers of the country.

"Singing festivals as held by the Finns are on a scale unequalled in any other country. Five thousand singers gathered one night last year in the public square in Helsingfors to serenade a Finnish artist named Rosenfeld, whose picture had been awarded first prize at the local Salon. In a city that is a surprise to all travelers, near the Arctic Circle, many miles from a railroad, the city of Uleaborg, 2,000 school children gathered in the park in front of the hotel, and for half an hour, for the travelers' benefit, filled the air with the music of the snow wilderness, with songs that told of the vast loneliness of the country beyond the city. Once in Helsingfors 10,000 voices joined in chorus to sing the national anthem. It was an improvised chorus, but the singing was by no means the harum-scarum, go-as-you-please sort, but thoroughly organized into four parts and executed with precision. This happened only a few months ago, and the incident was later described to me by the man in whose honor the great chorus gathered. Said he:

I was one of the first persons ever exiled from that part of the Czar's domain. My departure from Helsingfors was the occasion of a public demonstration of surpassing solemnity. Ten thousand persons gathered at the railway station to say good-by. The crowd watched the leave-taking in absolute silence, but as the train began to move 10,000 heads were uncovered and 10,000 voices began singing the national anthem. And this scene was repeated, with fewer singers, of course, at every railroad station all the way to the port where I took steamer for America.

"These singing Finns do not always sing their folk-lore songs or their patriotic anthems. They are a deeply religious people, mostly Lutherans, and each town has its special choir for singing nothing but hymns. I went to the largest church in the country to hear the singing of a choir of nearly a hundred male voices. The grandest cathedral organ never produced music of such majesty and power as did that choir, which in-

cluded the most wonderful bass voices in Russia. Even the companies of Finnish guards, though officered by Russians, sang the Finnish anthem as they marched past the hotel every morning on the way to relieve the old guard. The Russian officers once tried to put a stop to the singing of the Finnish national song by the soldiers, but the discontent among the men became so apparent that singing was again permitted. Thus, wherever the Finns get together they burst into song. When they cannot get together they sing individually. The housewife preparing the cabbage soup sings. The farmer ploughing his field in summer or journeying long distances on snow-shoes in the winter sings at the top of his voice. Whenever I passed one of the men in the lonely districts in charge of a herd of reindeer, he was singing. In the post-houses, where the traveler is sheltered over night, the servants gather, when their day's work is done, and join their voices in the chorus.

"This constant singing is regarded by all students of Finnish life as an important national influence. The effect of so much music in the nation's soul is seen in the emotional side of the people's nature, and has its concrete form in a ready sympathy that binds the Finns together as one family, each for all and all for each. Such is this nation of singers that sings all the time."

"This constant singing is regarded by all students of Finnish life as an important national influence. The effect of so much music in the nation's soul is seen in the emotional side of the people's nature, and has its concrete form in a ready sympathy that binds the Finns together as one family, each for all and all for each. Such is this nation of singers that sings all the time."

POETIC King James, nearly three hundred years ago, wrote out the following "Reulis" (rules) for verse making: "First, ze sall keep just cullouris quhair of the cautelis are thir: that ze ryme nocht twyse in ane syllabe." (First, ye shall keep just colors whereof the cautions are these: that ye rhyme not twice in one syllable).

And he later summed up the whole matter in these homely Scotch words: "Zour care maun be the onely iudge, as of all the other parts of FLOWING" (that is, of rhythmic movement), "the verie twichestane quhair of is musique." Truly he was right,—the very touchstone and basis of all true verse is and must be, *music*.

I saw all with mine own eyes; the fish, the maw, the piece of sail-cloth, the book; and observed all that I have written. . . . There was no impostor here without witness. The fish came from Lynn.

A letter now in the British Museum, from which the above extract is quoted, tells of a fish sold in 1626 at Cambridge market, which was discovered to have swallowed a book. Curiously enough, the book itself, which when rescued was found to be in good condition, was reprinted under the title of *Vox Piscis*.

SHAKESPEARE'S works abound in a great variety of allusions to music, and some of his verses have been set to music. His relation to music has been the theme of many interesting lectures. It was, at one time the composer, Schumann's, intention to write an essay on this attractive subject, but unfortunately he did not carry out his plan.

It is the artist who guides the public. In every age in which art has declined it has fallen through its professors.—*Schiller*

THE Japanese are a reading people. Tourists say that even the jink-rikishaw man, while waiting on the street-corner for a customer, may be seen reading a magazine or book. Well-informed Japanese are certain to be familiar with the best in European and American literature.

It is our authors more than our diplomats who make nations love one another.

PAN

WHAT are heroes, prophets, men,
But pipes through which the breath of
Pan doth blow

A momentary music. Being's tide
Swells hitherward, and myriads of forms
Live, robed with beauty, painted by the sun;
Their dust, pervaded by the nerves of God,
Throbs with an overmastering energy
Knowing and doing. Ebbs the tide, they lie
White hollow shells upon the desert shore.
But not the less the eternal wave rolls on
To animate new millions, and exhale
Races and planets, its enchanted foam.—*Emerson*

Universal Brotherhood Organization

Central Office Point Loma California

WHEN THE WESTERN SUN CASTS A SHEEN OF GLORY ON SEA AND SKY AT LOMALAND

What Point Loma Is to the World

PPOINT LOMA, that famous tongue of land running for some miles southerly from the mainland into the Pacific, has now already become one of the central points of interest to the world. This has come about, in a very large measure, through the strenuous efforts of a number of earnest lovers of humanity, the kind of people, in short, that the world so sadly needs in this our age,—indeed, the kind the world must have, if humanity is to realize any part of its spiritual destiny.

The question may be asked: "What led these people to this place? And to their choice of a life of unselfish endeavor? What light had they to lead them, more than others have, or claim to have? And what possible achievements can result from this effort, greater than those which might have been attained elsewhere?"

These questions are easily answered, for it was the choice of the teachings of Theosophy which directed these workers to a path of knowledge and discrimination. Theosophy, in teaching man his divinity, places very clearly before his mind his duty to his fellows, in unselfish service. Therefore, when the Theosophical Society, which was organized by H. P. Blavatsky, William Q. Judge and others, was merged into the larger body called the Universal Brotherhood and Theosophical Society, the faithful Students of the former organization found that by forming the nucleus of a Universal Brotherhood, they could more unitedly work to make practical the philosophy of Theosophy.

Point Loma was chosen for the International Center of Theosophical work. The location of this Theosophical Mecca was wisely chosen, for as the tide of human progress rolls on in its mighty waves westward, Point Loma will one day be where the heart of American civilization shall beat in splendid power. Many are the achievements already accomplished, through presenting and applying this Wisdom-Religion in connection with certain of the most difficult problems the nations of the world have before them.

One of the greatest achievements as yet accomplished has been the sowing of seed for a newer and better race, men and women of the future who shall show the great world of sin and suffering, something of the diviner power now almost asleep in the human heart. This will be brought about, aye, is even now in process of fulfilment in our children, through the holy knowledge and sacred practice of Raja Yoga—the kingly science of Altruism and self-control.

That the world is discouraged becomes evident by studying the faces of those we meet. That hope for better things still lives in man's heart is apparent to any close observer. At Point Loma that hope has become a reality; and the coming years will demonstrate that it is no vain hope. The motives of those who see fit to attack or decry this work for Humanity's upliftment are sufficiently patent to all and need no comment.

FRIENDS IN COUNSEL

DEAR COMRADES: Standing by the foundation stone of the Temple and looking over the group of buildings which forms the nucleus of the city set on a hill, the salient feature is certainly the Academy building; and as we take a mental survey of the present position of the work, it is the training of the children which stands out in highest relief. The other achievements though showing great possibilities of development, dwindle into comparative insignificance contrasted with the illimitable possibilities lying latent in the children. We stand as on a mountain top and as we scan the distant horizon which hides the future from our view, we now and then catch such a glimpse of coming splendor for the human race that what has been accomplished up to now, appears as nothing by comparison.

What mighty movements owe their origin to the efforts of a few intensely earnest persons, the stories of whose lives may be said to cover all that is important in past history!

The mind is powerless to conceive of the effects to follow when those now being reared from infancy under Raja Yoga influences shall step into the arena of public affairs.

The modern educationalist is fond of comparing a child to a tree which being bent in early youth retains the tendency in its maturity, and indeed the comparison is a fair description of much that passes nowadays for education. Prejudices and habits of thought may be impressed upon the plastic mind and the young traveler retarded on life's way with his chariot wheels so deeply sunk into a rut that no spontaneity or new departure can ever be expected in his subsequent career. The aim of the staff of the new Academy has no resemblance to the twisting of a sapling until the distortion becomes a fixed habit of growth. The pupil is regarded more as a rare plant of wonderful possibilities to be watched and tended with a view to anticipate and meet its needs as they arise and afford exactly those conditions required for the perfect unfolding of its natural qualities. Discipline and due restraint of course must be, but it is a discipline for the lower nature of the child, that the animal elements being subdued, the soul, with the mind as its instrument may enter into full possession of its home. The teacher cooperates with the overshadowing divinity and helps it purify its vehicle that thus it may descend and occupy the chariot, taking its place among the warriors on life's battle-field.

COURAGE

by HANNAH MORE

TRUE courage is not moved by breath of words,
 While the rash bravery of boiling blood
 Impetuous, knows no settled principle.
 A few risk tide, it has its ebbs and flows,
 As spirits rise or fall, as wine inflames,
 Or circumstances change; but inborn courage,
 The generous child of Fortitude and Faith,
 Holds its firm Empire in the constant soul,
 And like the steadfast pole-star, never once
 From the same fix'd and faithful point declines.—Selected

Karma, the Law of the Adjustment of Cause and Effect

EVERY thinking man knows and acknowledges the fact that there can be no effect without its cause, and it is only to be wondered at that humanity at large, particularly that portion which we generally denominate as "civilized" is so slow and unwilling to apply this fact to all conditions of life, and especially to the individual life.

Modern science, though recognizing the action of the law of cause and effect is so distinctly materialistic, that in general it grants this recognition only in the domain of material physics, and most of our Western philosophers and religionists also refuse to recognize the action of the law upon mental, to say nothing of spiritual planes. For as soon as they should admit that the law of Cause and Effect, which is so plainly existent upon the physical plane, governs also the intellectual and metaphysical and spiritual planes, the whole system of modern materialistic philosophy would fall to pieces, and they would have made one more step towards the wisdom of the ancients. But the main trouble with the terrible materialism of our present Western civilization is that that which cannot be demonstrated by crucible and balance and microscope, that is, which cannot be tested by the physical senses, has been denied existence, with the result which we all know.

But what is Karma? Karma is much more than the simple law of Cause and Effect as we generally are inclined to view it; it is the law of compensation, of retribution, of absolute divine Justice; it is an undeviating and unerring law or tendency, existent throughout all realms of the Universe, to restore equilibrium, harmony, balance, wherever these may have been disturbed, operating incessantly on all planes of being, physical, mental, moral and spiritual; and no spot or circumstance or being is exempt from its sway.

No finite limitations bind this great law, and time, for it, does not exist. Ages, judged by our illusion-conditioned conception of time, may elapse between the enactment of the cause and the emerging of its appropriate effect; yet the two have never been really separated, for when the environing conditions permit, the effect takes place as surely as though no interval had elapsed.

Not only have individuals Karma, but every collection of beings, families, cities, nations, races, and worlds, all have their Karma, and come under the sway of this law. The Karma of this earth is the combination and result of the acts and thoughts of all beings of every grade which in the past have been and today are concerned in the earth's progress. The Karma of the race influences the life of each unit in the race, and in a more direct way national Karma influences each individual in the nation; so too is each member of a family affected by the Karma of that family. The history of the world as we know history is the history of the Karma of the races and nations of the world—too often but a record of war, oppression and gradual degradation.

And while the individual reaps his own Karma, still it must conform to and be included in the larger Karma of the nation and race. Indeed, the individual Karma of anyone, although always sufficient to insure to him his just recompense of happiness and opportunity or of sorrow and

hardship, is but as a drop in the ocean compared with those causes which he sets up in common with his family, his community and nation and may be entirely overruled by these, such as in times of national calamity. Yet even in such case, each man reaps his just reward. Humanity is one great hierarchal whole, and he who fancies that he can separate his destiny from that of the rest of his nation or race makes a most grievous mistake. No one can rise more than a comparatively very small degree above his fellows, and then he must work to elevate his brothers if he himself would advance further.

The law of altruism thus becomes the law of true progress, when the human kingdom is reached in the evolutionary progress of the soul. And Karma is the most perfect exponent of the necessity for and the fact of Universal Brotherhood. For while it is the living, ever present demonstration of the sublimity and grandeur of the impersonal and unalterable Will of the Divine-Eternal, it also forces us to recognize that every thing finite and conditioned must fall far short of that immutable perfectness, although ever approximating thereto. Not the highest and holiest, no more than the weakest or most wicked, dare defy its inflexible decrees. Karma is just; or, rather, that of which Karma is the expression, is itself absolute Justice. But justice is not the sole attribute which we find in Nature. Compassion, love, devotion even up to the point of self-sacrifice, are all to be found in man, and therefore must have their source in that Divinity from whence man in common with all nature springs.

The law of Karma is inextricably interwoven with that of reincarnation and these doctrines alone can explain to us the mysterious problem of good and evil, and reconcile man to the apparent terrible injustice of life. Nothing but such certain knowledge as these two laws give, could quiet our revolted sense of justice. For when one, unacquainted with these noble doctrines, looks around him and observes the inequalities of birth and fortune and intellect and capability; when one sees honor paid to fools and profligates, on whom fortune has heaped her favors by the mere privilege of birth, and their neighbor with all his intellect and noble virtues—far more deserving in every way—perishing from want and from lack of sympathy; when one sees all this and has to turn away, helpless to relieve the undeserved suffering, one's ears ringing and heart aching with the cries of pain around him—the blessed knowledge of Karma alone prevents him from cursing life and men as well as their Creator.

If the teaching of the Nazarene had been understood and its truth inculcated and insisted upon, that "with whatsoever measure ye mete, it shall be measured to you again," and the same teaching as expressed by Paul, "Be not deceived, God is not mocked, for whatsoever a man soweth, that shall he also reap," how different might not have been the whole course of civilization, and the destinies of the entire human race set in fairer lines than they are today.

In connection with this subject of Karma, the question is often asked in regard to prayer, shall we then pray? In answer, it may be said that the only prayer taught in Theosophy is the same as that which Christ prayed when he said, "Thy will, not mine, be done." But prayer in the sense ordinarily understood, of asking for personal benefit—No! for such a prayer means that we ask that the immutable law of the Universe, the sublime justice and will of God shall be set aside. To a mind, once awakened to a realization of this great and beneficent teaching of Theosophy, how foolish and sacrilegious must those appear who demand that this divine law should be nullified for their individual gain and profit, or for the sake of their escape from the just penalty of their former acts!

One of the great Helpers of Humanity has said that the two teachings which the world most needs today are those of Karma and Reincarnation. And these are the teachings which more than any others, Theosophy continually brings before the minds of the public. They contain hope and encouragement, they make clear the pathway of life where before all was dark, they point the way to a new order of ages, which by virtue of the unerring law of Cause and Effect man may enter upon, reaping with fortitude all the harvest of his past deeds, and sowing the seeds of true progress and happiness in the future. H. T. L.

THE appreciation of justice is common to all, and the exact justice of Karma appeals even to the person who is unfortunate enough to be undergoing heavy punishment; even if, ignoring justice, he does good in order to make good Karma, it is well, for he will be reborn under conditions that may favor the coming out of unselfish motive.—W. Name

Address

Trafalgar Square and St. James' Palace

TRAFALGAR SQUARE is the finest public square in London, and may be regarded as the center of that vast city. It lies just north of the Thames, or, more particularly, west of a north and south bend of that river, and so separates the north from the south of London, while it lies between the city and East End on the east, and the West End on the west.

The atmosphere, however, is seldom clear in the midst of such an expanse of smoky chimneys, and on damp or foggy days the scene is one of dripping gloom. The large space in the center is paved and contains fountains which are a welcome relief to the weary wayfarer tired of the streets; large public buildings and hotels surround the square, including the National (Art) Gallery, and important thoroughfares radiate off in all directions.

But the most important monument is that which commands the whole prospect and with which the name of the square is associated,—the Nelson Monument. This was erected in 1848, on a classical model at generous

outlay, to perpetuate the memory of England's greatest naval hero, whose name is synonymous in every mind with DUTY. It was this watchword that enabled him to die happy on the deck of his battle-ship, conscious that, by devotion to the duty entrusted to him by his country, he had defeated the schemes of personal ambition, then threatening Western civilization, and, at the Nile and Trafalgar had swept England's enemies from the seas. Every English child knows his famous signal before the battle of Trafalgar:—"England expects every man to do his duty!"

At the foot of the column are four colossal bronze lions, sitting, by Landseer.

The same locality is known as Charing Cross, and used as a familiar landmark; the name dating from the erection of one of those large crosses that used to be erected at important cross-roads. This one was erected at the village of Charing in the Thirteenth century. Till about the Eighteenth century it formed the western boundary of London.

St. James' Palace was, after the destruction of Whitehall in 1697, the principal royal residence until 1809, when it was nearly destroyed by fire, excepting the old gateway, the chapel adjoining, and the presence chamber. It was built by Henry VIII for a country residence, but it is now in the thick of the West End, being not far from Trafalgar square in a south-west direction. At present there are, beyond the gateway (illustrated), two or three courts surrounded by low old buildings used as official residences, and occasionally minor levees are held here. The other royal palaces are the Palace of Westminster, which existed at least as early as the reign of Canute; Whitehall, which passed, after Wolsey's fall, into the hands of Henry VIII; Buckingham Palace, the present royal residence; Kensington Palace, Marlborough House; and the Tower, which was used as a residence by Henry III. STUDENT

In Europe

(By Our Special Correspondent)

JANUARY 14th, 1905

LE PETIT PARISIEN lately notes a marked increase of cremations in France. Paris takes the lead in this reform, but the provinces are slowly following her example. In other countries, especially in England and the United States, there is a similar progress to report.

Apart from the undoubted benefit to the living of this method of disposing of the dead; especially in view of the modern tendency of people to crowd together in cities, there is the ethical value of cremation to be considered. It suggests to the mind a higher conception of both life and death.

The identification of man with his body is close enough during life, and our ordinary funeral customs tend to associate him with that body after death. Cremation destroys this illusion, whatever other advantages it may bring to modern civilization.

The *Heraldo de Madrid*, in its review of the year 1904, after referring to the "terrible year"

1898, makes the following significant comparison:

If then our misfortune was to lose forever our ancient colonial power, this year we have been made a convention with Rome, which is our Santiago de Cuba and Cavite in the realm instituted, moral and political. We lost our colonies, our men and our ancient fame in the world in 1898, and as compensation for our disasters, liberty is eclipsed in 1904, and Spain is involved in the black night of clericalism!

But the darkest hour is that before the dawn. Spain will awaken and arise to be a helper of Universal Brotherhood. The fact that the *Heraldo de Madrid*, a paper that one always reads with interest, thus frankly faces the present situation is in itself a most hopeful sign. For this paper voices some of the most thoughtful and devoted citizens of Spain. The state of that land would be far more than it is, if there were general contentment with evil conditions instead of their bold, if sorrowful acknowledgment by an influential minority.

Indeed in another column of this very paper is an interesting contradiction of its pessimism. This is a record, with portraits, of men and women who were notable in the year just passed away. There are some strong faces, full of character among these. Spain ought not to despair.

In Europe generally the one theme of interest at the present moment is the fall of Port Arthur, and so far as I am able to sift public opinion it would seem to be this: that at last the opportunity has arisen for considering the subject of Peace. The striking humanity of

the Japanese towards the Russian wounded will make Peace easier. If all Europe and America united in desiring this Peace it may come of its own accord; without any official interference of the Governments of the world. For Governments have to follow the united will of the people, and the united will of the Anglo-Saxon race would be irresistible.

Our "Intellectual" Age

WE call this an intellectual age, an age of great and general mental culture, and so on; but what is there really, on an honest view, to be proud of in this respect? Culture in general is extremely shallow and superficial, and when it runs to greater depths it does so only within narrow limits. We have a vast multitude whose knowledge is practically nothing on all subjects; a smaller number who have a superficial smattering of various things; and some specialists who have gone pretty deeply into their specialty but suffer from want of the light shed by collateral knowledge.

It is scarcely to be expected that a civilization suffering so much from the paralyzing effects of selfishness, with its infinite friction and mutual

frustration; a civilization of people with constitutions impaired by unhealthy habits, neglect of the laws of marriage and birth, bad upbringing, etc.; would have the energy and stamina to develop itself thoroughly in any direction. Nor is it the fact.

And this feebleness, this indolence, has been ministered to by the cheap press, which provides flimsy information in sweetened and predigested doses, and by all the machinery and external appliances of writing, registering, and recording, that replace the memory.

The Imagination Is Undisciplined

The result is that we are mentally flaccid and inept; unable to remember the slightest thing, whether an appointment with some one or an item of knowledge. The attention is weak and vacillating, the mind has no grip, the imagination is undisciplined and misbehaved.

Our school-books are mere schedules, in which every conceivable trick is resorted to in order to present the facts in a form that shall cause the student the least possible exertion of his feeble mind. The old-time solid well-written treatise would be as useless to such minds as the fruitfulness of our ancestors would to a predigested dyspeptic.

Nowadays, too, people—even the smallest boys—want to know exactly "what use a thing is going to be to them," before they will condescend to notice it. If their education is to be confined to those things of which they see the use, it will be small indeed! Probably a trained dog does not see the use of what is taught him at first, nor a baby either.

What we call the "use" a thing is going to be "to us" is all a question of \$ and of capital i's. But there are higher uses. Meanwhile the urgent necessity of training the faculties to obedience, and the will to faith, is purpose enough for any one's studies, until he has gained the faculty to perceive some of those higher uses.

Boasting of Their Mental Incapacity

Why, in heaven's name, cannot we have the same kind of pride and confidence in our intellectual faculties as we have in our muscles? While it is considered possible and desirable for a man to be athletically proficient in a variety of directions at the same time, mental culture is supposed to be very limited.

And sometimes people even boast of their mental incapacity! The kind in the lunatic asylums do not do this.

To have a bad memory is not at all disgraceful; it may with propriety be advertised. It is supposed that if I learn this it will unfit me for that, that I cannot learn one thing because I am learning another, that I cannot study two languages at once, that if I learn shorthand it will spoil my spelling, and so on *ad nauseam*. Is this a thing to be proud of? Surely not; we should have more confidence in that marvelous instrument, the mind, and rather expect to find that the more we use it, the larger it will grow. Studies help each other, not hinder.

Discipline is another thing needed. This also we permit ourselves to admire in bodily concerns. But mentally we are sloppy and down-at-heel. Do we want to go humming and hawing through life, and stuttering and tumbling over ourselves? We need a disciplined mind, punctilious, ready, exact, girded up.

The Greeks' ideal surely included mental training. It was not that of the mere gladiators. It was that of a man like Plato, master in Soul, in Mind and in Body.

Pacific and Atlantic

THE biggest trading ship afloat—the *Minnesota*—has just been constructed for commerce across the Pacific between our West Coast and Asia. She is one of twins, with a carrying capacity of 28000 tons. Our Pacific trade with Asia is one seventh that of our Atlantic trade with Europe. But the Pacific trade is, say, a quarter of a century old, and our Atlantic as old as the days of Columbus are remote. In 1881 our exports to Japan amounted to one-and-one-half millions; in 1903 they were twenty-three millions. About the same with China.

Moreover, the Atlantic trade is served by forty or fifty million people in connection with the great Eastern seaboard towns and cities; our Pacific trade is served by the three or four millions about the Western border.

A hundred years ago von Humboldt prophesied the coming supremacy of the Pacific; and a well-known political economist asserts that during this century the Pacific will become what the Atlantic has been for the last two centuries and what the Mediterranean was for thousands of years before that. "Westward the star of Empire . . ." is no mere

poet's phrase; it did and does correspond to a fact. But Empire may not always move to the accompaniment of bloodshed. The days of universal peace may have set in ere it returns to the place whence it began its vast journey—how long ago?

STUDENT

Celtic and Roman Christianity in Britain

AN interesting landmark in history is the Council of Whitby, A. D. 664, at which it was decided whether Britain was to accept the Roman Christian Church or the Celtic Christian Church. The Celts had been Christianized during the Roman occupation of Britain; and being driven by the Saxon invaders into the mountains of Wales, had carried their religion with them. This religion they maintained among themselves, without caring to propagate it among their Saxon enemies. From Wales they sent out missionaries into Ireland, where an Irish Church was founded by St. Patrick. This Irish Church missionized Scotland, Germany, and even parts of southern Europe, with such zeal that "for a time it seemed that the course of the world's history was to be changed; as if the older Celtic Church that Roman and German had driven before them had turned to the moral conquest of their conquerors; as if Celtic, and not Latin, Christianity was to mold the destinies of the churches of the West." (Green.)

Hence, when Augustine came to Britain to found his church, he met with a rival faith, which had deviated in some points, considered vital, from the Roman doctrine. One of the points of difference was as to the precedence of the disciples John and Peter, the Celtic Church preferring the more genial-natured John and the Roman the more doctrinal and formal Peter.

Oswy, King of Northumbria, who thought that "as they all expected the same kingdom, so they ought not to differ in the celebration of the divine mysteries," summoned the council to arrange the rivalry. With an evident desire to arrive at peace by the shortest road, he seized a favorable opportunity to turn the decision in favor of St. Peter.

Thus England adopted the later form of Christianity, and historians trace to this renewed connection with Roman civilization, the molding of the future character of the people.

STUDENT

A Modern Colosseum

A"COLOSSEUM" is shortly to be opened in London, really a gigantic theatre, modelled as nearly as may be after its ancient prototype. But that covered no less than five acres and seated 87,000 people; the London imitation seats but 3,000. However, the other had to accommodate no small part of Rome whenever there was a burning of Christians or some other equally interesting spectacle. Perhaps the modern prize-fight is our equivalent in English-speaking countries, and the bull-fight in Spain. We do seem to have made some progress.

The Roman building was of course really an amphitheatre—that is, the spectators were all around. Its last use was in the Sixth century, and it was not for two more centuries yet that the builders of the great palaces of mediæval Rome began to take stones for their purposes from the mighty edifice. It was in four tiers and the highest supported a gigantic awning that covered the whole space. The arena was separated from the spectators by a smooth wall—smooth, so that the wild beasts should not climb it and make trouble for others than Christians! Emperors who wanted to curry favor with the people sometimes substituted powdered fragrant woods and even gold dust (!) for the customary sand. And the space was capable of being filled with water, so that mimic sea-fights could be exhibited.

On the whole, a populace that could fill this building to see the spectacles for whose display it was habitually used, one honestly thinks deserved the invasions, sackings, burnings and other miseries that made up their history for so many centuries. For, so far as we know, these spectacles always involved bloodshed and death for men or beasts.

C.

France and the Guillotine

IT appears that France is so little in love with capital punishment that the other day she was about to abolish it because of the expense. The force of this statement lies in the minuteness of the outlay. The salaries of the executing staff are less than \$4,000, with an additional trifle for each execution, and another for housing and repairing the guillotine. If only the staff would strike for higher salary, the matter might determine itself in the discharge and the disappearance

of their function. Cannot some agitator be induced to inflame their minds to this point?

A.

The Darker Depths of Commercial Soullessness

TO whatever extent the following story may be true, the fact alone that it has been said is sufficient comment on the state of a community in which such things can ever be suspected.

A navy officer is reported to have stated that, in his opinion, the ordinary vicissitudes of sea traffic do not by any means account for the ever-recurring reports of ships having disappeared without any trace of them or any survivors. He was morally sure that in many instances explosive material was shipped in cases registered as miscellaneous goods, and exploded at sea by clockwork mechanism, to secure the over-insurance.

Opportunity is all that is required to make the criminal among people who are policed rather than morally educated. The respectable classes are kept in awe by public opinion; but, given an opportunity to sin without detection, and some characters cannot stand the strain.

And the system in which these enormities take place is the self-same one in which we are struggling for profits.

Proposed Shakespeare Memorial

THE London County Council having decided to provide a site in London for a suitable memorial to Shakespeare, a committee has been meeting to arrange for the collection of funds and for the settling of plans. It was proposed to appoint a date this spring as a universal Shakespeare Commemoration Day, and to have subscriptions in connection with it. It is one of the most difficult problems of the age to erect a memorial in the midst of a modern city which shall be in keeping at once with its surroundings and with the object it commemorates; nor will it be easy to find a genius adequate to the difficulty of the undertaking. A fine statue perched amid the scenery of a street makes a painful and perhaps ludicrous contrast, though the surroundings by themselves may have a beauty of their own for the artistic eye. But it might be possible to place the statue within a temple or shrine, which would provide interior surroundings suitable for Shakespeare's memory, and an external appearance in keeping with the city. Thus the world's great poet could repose in a sanctuary for devout worshippers, instead of looking sadly and grimly down upon the heedless traffickers as do Nelson or Cobden.

E.

Jewish Aspirations

THE "Zionist Movement"—"to obtain for the Jewish people a publicly, legally assured home in Palestine"—appears to be making steady progress. Half the Jews in the world, says Israel Zangwill, are in Russia—curiously enough; for there their condition is the worst. And so in that country there are 1572 organizations working for the Zionist project. Through the rest of the world there are about 1000 more, the United States coming first with 300. The alternative to Palestine as the locus of the projected "Jewish State" is East Africa, where a tract of land has been offered by the British government. But every Jewish memory naturally clings about Jerusalem and the hundred years between the dominations of Syria and Rome, the times of the Asmonæan Maccabees; a memory whose hold twenty centuries has not weakened. It is 1835 years since Titus wrecked Jerusalem, destroyed the Temple, and scattered the people. One wonders whether it is really on the books of Destiny that their long and stormy history should enter on a new chapter of peace and national unity.

A New Rubber Plant in Mexico

The arid northern plateau of Mexico produces a shrub known as the guayule, which yields an extract having the characteristics of rubber. It is found chiefly in the eastern part of Durango State. A company has been formed to develop the industry of obtaining the juice of this plant and manufacturing it into a substitute for rubber.

T.

THE cover-page of the NEW CENTURY PATH this week shows the well-known face of Helena Petrovna Blavatsky, Foundress of the World's Theosophical Movement.

Her work and teachings have startled the world by their depth and scope in a humanitarian and philosophic sense, while its characteristic feature is that it binds all men together in an absolute Brotherhood of Humanity.

Some Views on XXth Century Problems

Jekyll & Hyde

"MULTIPLE PERSONALITY" is today a favorite subject of scientific study. Of more value to humanity, of more immediate application in conduct and thought, would be a study of human duality. And it is one which all can undertake at once for

themselves and in themselves.

Stevenson did an intensely vivid piece of work of this kind in his *Dr. Jekyll and Mr. Hyde*, but as it was in the form of a story it has not often been taken seriously. And now comes an English critic to damn it with the charge of vulgarity.

He compares it with some other stories and legends of human duality which, many years ago, he himself gathered from many sources, ancient and modern. There was Edgar Allen Poe's story, *William Wilson*. There was Houssaye's story of the young man who, "starting along life's road, sees on a lawn a beautiful girl and loves her, and afterwards—when sin has soiled him—finds that she was his own soul, stained now by his own sin."

He had gone back to oriental sources, and quoted Manu who advises each man to collect virtue in order that after death he may be met by the pure part of himself, a beautiful companion and guide through that region where the deep gloom makes a guide sorely needed.

There was the Arabian story of the wicked King who after death found himself with a frightful hag for his eternal companion. She too was a part of his dual nature, this time the essence of the evil, the smoke of all his evil deeds.

On the other side again was the allegory in *Arda Viraf*, in which a virtuous soul walking amid the beauties of Paradise, meets a lovely maiden who says, "O youth, I am thine own actions."

Stevenson's story was not on the same plane of beauty as these, nor as many others from Eastern sources which come to one's mind. But just because of their very beauty do they stay in that part of our minds where we keep beautiful things, whose connection with conduct we do not see, or which have no connection. Stevenson told his story so as fit the consciousness of the man who wants a cheap "shocker," to whom the others would not appeal, and who would not read one line of an essay on human duality. And many of these it must certainly have made to think, even though Stevenson probably had no such conscious purpose.

Man is every moment effecting alliances with principles of his nature which only do not seem absolutely wicked—that is, selfish—or absolutely good because they are held partly in check by their opposite. And in a case here and there they reveal their entirety of good or evil by reason of the entire and final rout and departure of their opposite. Until that point is reached, man's mind, his life, is—whether he knows it or not—a never quiet battle-field. To learn to know it is the first step to wisdom. After that, good actions can be intentionally done that strength may arise out of them and pass into the hands of the "Divine Warrior" who can only give the supreme and final blows when he has been recognized and appealed to. Stevenson's story was incomplete. There is a Presence in man which is the counterpart of the "Hyde," as much beyond the "Jekyll" on one side as the "Hyde" is on the other. And he who has once noted the operation of purely evil or selfish impulses in himself, impulses which, if steadily yielded to, will make him a fiend, will easily suspect that there must also be a center of purely divine impulses which if steadily yielded to, will make him divine. That is his *Self*, of the far or near future. C.

Work & Sport

THAT ideal of life which finds its most brutal expression in the phrase, *Let us Eat, Drink, and Be Merry, for tomorrow we die*, often takes much subtler forms. One of the latest of these, from the pen of a celebrated English man of Letters, takes the form of an attack on Carlyle's *Gospel of Work*. He appeals to Nature: "In order to realize the folly of the modern Carlylean heresy of work, it is necessary to realize how infinitely rich is Nature, and how generous, and consequently what a sacred duty, as well as a wise resolve, it is that be-

fore he 'returns into the ground,' man should drink deeply while he may at the fountain of Life." By all means. But let him be sure that it is the fountain of Life and not that of death and obscurity. "Drinking deeply at the fountain of Life" usually translates itself as giving free rein to every sensual impulse.

"Yet," he goes on, "it is not a little singular that this heresy of the sacredness of work should be most flourishing at the very time when the sophism on which it was originally built is exploded; the sophism, we mean, that Nature herself is the result of work, whereas she is the result of growth. . . . Nature's permanent temper is the temper of Sport, that her pet abhorrence is really Work. We see this clearly enough in what are called the lower animals—the final cause of the existence of every conscious thing is that it should sport."

By "Work" Carlyle meant doing of duty. That is what the tree is doing in lifting itself against gravity and in unfolding a million leaves. It is what the lizard is doing in its intent watching for flies, and the kitten in rushing after a ball. All these doings are pleasurable, are duty, and subserve growth. The critic has lost sight of, or never had sight of, a number of facts.

First, that the doing of duty, and the growth of the spiritual nature, are two sides of one and the same thing; and the third element—pleasure in the place where there is growth—is also present. Carlyle never urged anyone to undertake work that was not duty. But he included among duties, work for others. Half the work of the animal kingdom is work for others, their young. Half the work of the vegetable kingdom is the maturing of the succeeding generation. Man's duties to others extend beyond his own progeny; that is all. Those who do not find them so are not yet fully conscious of their humanity.

And secondly; that the majority of the duties of men are painful and even detrimental to or destructive of life is due to the lawless desires of other men. A nation desiring the territory of another imposes upon a million men the duty of fighting. When such desires are at an end, man will rise into line with Nature. His duties, well done, will be such as conduce not only to his spiritual but his physical well-being, and they will produce pleasure and content. Work, growth, and pleasure, will once more go together. STUDENT

Miscon- ducted Education

ONE would think from some recent French statistics that education and bad eyesight are inseparable. For the badness of the sight and the goodness of the education proceed together. While the children are in the primary schools, 5 per cent of them have short sight; by the time they are in the secondary, 25 per cent of them have it; and at the university stage the figures are no less than 50 per cent!

From the same set of figures it appears that education has other evil comrades. Thus 65 per cent of adolescent French school children are round-shouldered. In Germany it is worse; the round-shouldered there, among the boys, amount to 81 per cent, and among the (less educated) girls to 68 per cent.

Of course there is no need for any of this. It simply means too long school hours, insufficient open air games and athletics, faulty position at the desk, and the sloping handwriting. Hours of evening work also contribute.

Children are educated that they may have "a good start" in life; nothing is thought about a good *finish* nor about the goodness of the many decades that ought to intervene. Yet it is these periods—surely as important—that are injured by the habitually congested and misdeveloped forebrain to which the eye-failures are witness. In the case of all children the blood circulation in the brain should be frequently relieved by intervals of recreation, following the Raja Yoga system which holds to short hours of study. A well-known American oculist has recently asserted that every case of chronic alcoholism has eye-strain as a factor in its production. He regards the same cause as at the root of a multitude of other conditions of ill-health. His view may be extreme but it is worth remembering here. PHYSICIAN

Human Evolution Implies Divine Potentiality

SCIENTISTS say that Nature forces Man to develop his powers, in order that he may satisfy his wants. They repeatedly show us the picture of a primitive savage, goaded by hunger and other cravings, developing intelligence, inventing contrivances, and creating a religion and cosmogony.

But man could not develop any powers unless he had them already in the germ state. Not even Nature could force a wooden Noah's Ark animal to develop into a yellow painted Mr. Noah. It is of no use to sow nails and sawdust and expect Nature to make a house grow. An acorn will produce an oak-tree and nothing else. Nothing can develop unless the entire thing is already existent in another state, which may be called the germ state. And Nature is merely secondary to this first and main cause; she assists the Spirit to develop the organism, but the Spirit is the prime mover.

So, in the human race, if it is to evolve and invent and make religions, there must already be present in the race, in germ form, the entire divine ideal. No man could possibly yearn after a knowledge of God unless he had the divine ideal within him, or grow towards perfection unless the perfect model were in him as the perfect oak-tree is in the acorn.

Facts and logic compel scientists to admit all this by implication. But they stop just short of stating it in plain words, because such a statement would confute materialistic theories. To admit Spirit would never do.

It is ludicrous to see the straits they are put to in order to explain the obvious facts without sacrificing the materialistic position—such as it is. For instance, one authority says that Nature forces Man to "develop his own inherent faculties;" which amounts to nothing less than an admission of the whole Theosophical position that Man is potentially divine and perfect. Yet this admission accords ill with other ideas expressed by the same writer. H. T. E.

The Ancients Knew How to Work With Nature

RELIGIOUS rites are unconscious commentaries on religious beliefs. At first they are rude representations of the supposed doings of the gods. The Indian rain-maker mounts to the roof of his hut, and rattling vigorously a dry gourd containing pebbles, to represent the thunder, scatters water through a reed on the ground beneath, as he imagines up above in the clouds do the spirits of the storm.

Every spring in ancient Delphi was repeated in scenic ceremony the combat of Apollo and the Dragon, the victory of the lord of bright summer over the demon of chilling winter. Thus do forms and ceremonies reveal the meaning of mythology, and the origin of its fables.—*Brinton, Myths of the New World*

AS to rain-making, the Zuis adopt no such foolish mummery. They assemble on a peak after sundown, build a circle of fires, and practise incantation and rhythmic motion, actually producing rain. Western science can imitate this in a very partial degree by sending up smoke, but it does not as yet understand the part played by the sound and rhythm. These Indians, at all events, if they imitate the gods, do so to some purpose. They know that the forces of Nature must be the

manifestations of intelligent beings, just as the forces of men are. This is what is understood by "gods." They also believe that Man can call in the aid of such intelligences by methods which are neither scientific nor religious, because both. Ceremonies may survive for long as mere customs, but all have originally had a well-understood purpose. There are ways of invoking and setting in motion the potencies of the human Soul, which are strictly analogous to the ways used by Nature. And it would not do any harm if we nowadays could inaugurate the beginnings of our epochs by a sunrise ceremony celebrating the victory of light over darkness, instead of by a pandemonium representing the victory of uproar over peace.

STUDENT

Historical Accuracy of Bible

THE names of various potencies mentioned in the fourteenth chapter of *Genesis* have been discovered on Assyrian monuments recently brought to light. This points to a greater antiquity for the Biblical record, as well as a greater reliability in historical details. S.

Is All History Allegorical?

WHEN we find that old legends and myths, which are obviously allegories of the pilgrimage of the soul or the career of the human race, are also founded on actual facts, what conclusion can we draw? If we find that a king was a symbol, and yet dig up his palace, how can these things be reconciled? Why, that the whole

of history is symbolic and allegoric. Every event is ruled by Law; and, once we get far enough away in time to get a bird's-eye view, and see the pattern, we detect the allegoric character of the events and personages. It may be that Henry VIII or Washington will one day be utilized as "heroes" or "gods," as Hercules is quite and as King Arthur is almost. But this

will not mean that superstition has displaced accurate information, nor imply any disparagement to human accuracy or intelligence.

It will simply mean that the parts which these characters played in the great drama of history have become evident, and that their trivial actions have been lost sight of in the clearer perception of their real deeds. E.

Engraved by Lomaland Photo and Eng. Dep't

COLONNADE OF THE TEMPLE OF LUXOR, THEBES

The ruins of the ancient Thebes occupy a space on both sides of the Nile of which the extreme length north and south is two miles and the breadth four. Of these the most imposing are those of the two temples of Karnak and Luxor, named from two modern villages which are around the sites. The colonnade of the temple of Luxor is on the river bank, and consists of fourteen magnificent columns, elaborately sculptured, sixty feet high, and eleven feet in diameter at the base. This forms only the central avenue of one of the courts, and the remaining ruins show how vast the whole temple must have been; and yet this temple was only an adjunct to that of Karnak. The columns were raised by Amenophis III, Eighteenth dynasty.

Studies

Violet Lore

VIOLETS were anciently said to have sprung from the breath of Io.

Wheresoe'er her lip she sets,
Said Jove, be breaths called violets.

The violet was sacred to Venus, and white violets became purple by being washed in blood that flowed from the wounded feet of Venus as she wandered through gloom of woods and tangled brakes and thorns seeking Adonis. The violet was the favorite flower of the Athenians, and they set up tablets engraven with the name; and are said to have preferred for themselves above all other names that of "Athenians crowned with violets."

The violet is a favorite flower in all eastern countries. The Troubadours considered it an emblem of virtue. They awarded a golden violet as prize for the best poem. In the Middle Ages the violet was the symbol of the twelfth hour of the day. It was the family flower of the first Napoleon, and the Empress Eugénie wore violets in her hair on her bridal day. It is an emblem of steadfastness, simple virtue and innocence. Laertes seems to have had this in mind when he said of Ophelia:

Lay her i' the earth
And from her fair and unpolluted flesh
May violets spring.

Shakespeare makes Ophelia endow violets with a human sympathy in saying:

"I would give you some violets, but they withered all when my father died."

Poets, from ancient times to the present have sung the praises of this flower. It has a special welcome as harbinger of spring.

I have found violets, April hath come on.

There's to me a daintiness about these early flowers,
That touches me like poetry; they blow
With such a simple loveliness among
The common herbs of pasture.— Willis

What will the violets be
There in the Spring of springs?
What will the bird-song be
Where the very tree-bough sings?

Beautiful secret wait!
A morrow or two, and we
Shall know in the Spring of springs
How the violets come to be.— W. C. Gannett

Man as a Natural and Geological Agent

THAT wonderful modern invention, steam locomotion, which has spread a network of nerves throughout the human body corporate, has also largely modified the distribution of plant-life. Varieties which, in the old days, were peculiar to certain localities, have now become diffused from their original centers to the most remote parts. Maize, no longer an American specialty, is cultivated on the other continents; while the characteristic grains of the Old World have migrated to the New. Southern Europe has no longer a monopoly of the vine and olive; and the almond, peach and fig, proper to Asia Minor, are cultivated wherever the climatic conditions are suitable. The same is true of tea, coffee, oranges, and many other things.

Man, as an agency of Nature, has great influence. As a geological influence, he is allotted a small province in the records of that science; but to Man, as Theosophists understand his antiquity and past culture, a much larger place must surely be assigned among the modifiers of the earth's surface. H.

The Silent Butterfly

THE butterfly, with its transformations, has always been a symbol of immortality and rebirth; while the briefness of its life as a winged creature typifies the evanescence of earthly dreams. But some one has remarked that it also represents *silence*. No butterfly has been found which makes the slightest vocal sound, and the vast

majority of them are as soundless in their flight as they are in voice.

Breeding Wax-Producing Insects

THE production of white wax from a mysterious insect called the wax-insect, is a curious industry of some parts of China. In the Chien-Chang valley in Szechuen these insects, which are a species of coccus, are bred on evergreen trees; but, as the wax is due to a disease of the insect, the eggs are transported to another place a fortnight's journey off, where the climatic conditions favor this wax-excreting state. There the eggs, done up in leaf-bags, are hung on trees and left to themselves; and in the spring the insects come out and cover the bark of the trees. As they grow they cover the whole bark surface with their white wax excretion.

This is then scraped off and boiled in water; the purified wax rises to the surface. It is used for lighting, furniture polish, and imparting gloss to silk. T.

“ODIN'S OAKS,” WOLFHUISEN, HOLLAND

“THERE is no doubt that the woman's club movement is on the decline, and naturally, since women's clubs avoid all vital topics. Women seem to be intimidated by any real problems, and when the members of these clubs find they really have to do something, they draw back. If you go to their meetings you will find dress to the exclusion of ideas; you will discover they admit men, and seem satisfied with trivial subjects. They all serve tea and wafers, of course, an absurd concession to the merely trivial.”

Is this a new evangel? By no means. The absurdly misleading sentences are worthy of notice merely as serving to point a moral along certain lines that women do not observe as closely as they should. One who is unfamiliar with the noble work done by Women's Clubs might suspect a brief so tersely stated to contain some truth, but a little knowledge reduces the argument to ashes.

Much light is thrown upon all opinions when the personality of the author of them is made known. The author of the present tirade has been for many years herself a club member and not long ago presided over a certain club which had been organized under her direction. At the meetings of this club tea and wafers were served, fine clothes were not debarred (so far as known), politeness was not frowned upon. These are facts within the personal knowledge of the writer. But a day dawned when this club refused to be guided wholly by this woman's personal ideas and, in short, declined to run upon the track laid down by her. Then came trouble, which was only the beginning of other troubles, and at last—well, perhaps the opinion quoted above is one result.

It is interesting, in this connection, to look back to the days of Katherine Tingley's ministerial persecution and reflect upon what happened when the unsavory life of her chief theological persecutor was brought to light. How soon he lost his followers! Part of them changed their ideas and the other part, for obvious reasons, changed their places of residence! It surely needs no argument to those who recall this to prove that personal opinions can only be wisely judged in the light of the personal life of the one who expresses them.

The Woman's Club movement is one of the greatest of modern times. It has its inadequacies—and these, club women themselves have been the first to acknowledge. The movement has been kept away from its higher possibilities to a great extent, and our nobler club workers now realize that this has been due to forcing the work along personal

✻ The Fancy and the Fact ✻

lines. Fine clothes have been worn, doubtless, and men have been known to be present at women's club meetings, but these things have not ruined the movement. For that matter, the traditional “Ladies' Day” of our finer men's clubs served as an example, in its tacit recognition of the fact that neither sex can do the best work or find the broadest outlook, alone. It is doubtless true that some men would best be excluded from women's clubs, just as some men would most benefit certain homes by being excluded from the latter. But no woman has yet risen eloquent, determined to psychologize her sisters with the idea that *all* homes would be better if men were debarred, and until that time there still must be those who refuse to write “ruin” upon the work of clubs which occasionally entertain some husband or brother as lecturer, co-worker or guest.

As to avoidance of vital topics—will not some kind-hearted person send the author of this Philippic a volume of statistics? Are hygiene, sanitation, domestic science, pure food, the education of our children, the protection of young womanhood, the proper care of women who are insane, the various questions of child saving, of industrial competition—are not these questions vital? Yet not one today but is nearer its solution because of the existence of Women's Clubs, and it were almost safe to state—barring accessible statistics—that scarcely a remedial law passed in the last ten years in this country has not felt the touch of woman's hand.

One of two conclusions is unavoidable, either that this very pessimistic individual has tried to use some club for her own purposes and has failed, or else that her knowledge of Women's Clubs as a whole is painfully limited. And as to the indictment that women's clubs serve tea and wafers—they do. This difficulty, however, could be easily remedied. They might substitute porterhouse and sherry. E. W.

MARCHIONESS OYAMA, wife of Field-Marshal Oyama, is active in leading the wives of the army officers in gathering money with which to send presents to the soldiers. Marchioness Oyama was educated in America, as was also her husband, and their first meeting occurred, it is said, while he was a cadet in the Naval Academy at Annapolis.

THE dismissal from the Imperial Theatre, Paris, of a poor charwoman, has revealed the fact that she is a granddaughter of the Empress Marie Louise, widow of the First Napoleon. Since this fact became known, she has been cared for by relatives, reversing Fate's decree.

“Thou givest to every man his place, thou framest his life.”—
From Ancient Egyptian Hymn to Isis

A Type of Extremist

THE death of Louise Michel, in her native France, within the last few weeks, has served to call one's attention again to this eccentric woman. She was a born fire-brand, in wild rebellion perpetually against the existing order of things, whatever that order might be; dangerous, indeed, was she to the peace of states, perpetually tearing down, with neither disposition nor capacity, apparently, to build up again, her cry being ever, "Class against class!" She seemed like an enraged eagle, screaming forth defiance and hatred.

But there was another side to her nature—why did it not serve to leaven the whole? She often busied herself in works of humanity, nursing the sick, cheering the miserable. One cannot help wondering what must have been the errors and opportunities of former lives, and by what strange chance pre-natal conditions so willingly fostered and developed the erratic tendencies developed in the past.

Louise Michel was in some respects logical and clear-headed, in others misguided—most wretchedly so. Her heart was capable of compassion on certain lines, yet she could close it and sit unmoved before the direst cruelty. It has been said of her that she might have sat at the foot of the guillotine with her knitting, like the old women in the Days of Terror in Paris, quietly clicking her needles and counting the heads as they fell. But that would have been too passive an occupation for Louise Michel. One can more easily picture her as another Madame Du Farge. STUDENT

THE report is current that Miss Sullivan, who for eighteen years has been Helen Keller's devoted comrade and teacher, is soon to be married. The assurance that the gifted, but unfortunate, young woman will retain her friend in unbroken comradeship for the future, in spite of the change in this friend's life, brings out but another phase of the rare unselfishness which has made this teacher of a blind deaf-mute one of the most remarkable women of the present day. The spectacle so often seen in the cases of brides, of a willing, even anxious, descent into a purely selfish existence serves to throw this circumstance into greater relief. Were marriage entered upon with a better realization of its possibilities on the part of women and a lessened willingness to be dazzled by the glamor with which unhealthy and selfish sentiment has invested it, there would be fewer divorces, fewer unhappy homes, and in all probability, pure strong life comradeships between man and man and between woman and woman would be by no means so rare. God speed that better day!

EVERY Japanese home has, in place of carpets, thick, soft mats of straw. It is on these mats that the Japanese walk, sit, work, sleep and, sometimes, even place the dishes containing their food. It is necessary to keep them very clean, not difficult to do when one considers the custom which is universal in Japan, of removing the outside sandals or shoes before entering the house. But what a sensible, as well as cleanly, custom. Think of the disease germs and the filth that we daily carry into our homes from the streets! And we call ourselves civilized!

DR. EMIL REICH predicts that the coming great American poet, as well as the coming great American artist, will be a woman. He says, "Much as prophecies are to be dreaded, I do not hesitate to risk this prediction."

JAPAN is unique in one respect, the fact that so many of the most famous works of its literature were written by women. It is not improbable that the future will yield many surprises and that the unsolved "woman question" may yet be illumined by light from an unexpected source. E.

A New Departure

ANOTHER commentary upon present conditions—a certain W. H. Fletcher of New Jersey has just withdrawn a divorce suit instituted by himself against his wife and has made public his reasons. In a statement given out by himself he publicly apologized for the great wrong and injury done her and declared that the charges made in his bill were untrue and absolutely unfounded. To his credit be it said, he placed the blame where it belonged, on certain gossiping women, also declaring that the gossips were prejudiced against his wife because she attended to her own business.

Many men have been as credulous, to their sorrow, but few indeed have had the nobility to acknowledge their mistakes and do everything in their power to make reparation. Full reparation for so grievous a wrong can never be made, for the arrow that has left the bow fieth whither it must. That is the pitiful part of this tangle that we call the world's life. E. W.

SO psychologized are we, as a whole, by a sense of separateness from the animal kingdom that there is something uncanny in the thought of wild animals as pets. Yet not a few well-known women have found a real joy in affiliations apparently most strange. One member of the nobility has several pet snakes, of which her favorite is an enormous boa constrictor. Another has a pet leopard, still another, a number of baby lions. Ants and bees as pets are less frightful and yet no more common.

Even had this general prejudice some basis, were it not a little out of place to criticise the owners of these strange pets and call them "faddists," while thousands of apparently sane women find a delight in hunting, maiming and persecuting animals to their death, from the lion and mountain-cat to the fox and helpless hare? Which occupation is least open to the charges of cruelty and even crime? H.

THE suggestion made recently by President Roosevelt, in his Congressional message, that "some form of corporal punishment is desirable" in dealing with wife-beaters and "other offenders whose criminality takes the shape of brutality and cruelty toward the weak," has resulted in efforts to establish a whipping-post in the District of Columbia, and, incidentally, in more or less discussion in the newspapers. One law journal remarks: "It is bad enough for a man to beat his wife, but it is still worse for the state to beat him for doing it." Why is it worse? Granted that there be no argument in favor of whipping wife-beaters—why is the beating of a woman—the mother, perhaps, of little children—by a drunken or passionate brute, a lesser crime? Will the editor kindly explain? E. H.

IN the old days a law was passed in the legislature of the Cherokee Indians requiring that white men desiring to marry Indian women should present a certificate from the County Clerk of the place in which they last resided, to the effect that they were good citizens and of high moral standing.

In addition it was required that, after this was conformed to, a petition be issued, to be signed by at least ten representative citizens of the Cherokee tribe before a license could be issued to any white man or foreigner to marry a Cherokee, Delaware or Shawnee woman. At one time the legislature made provision by which white men might be entitled to the rights and privileges of Cherokees, but after two or three white men had complied with it to the sorrow of the Indians, the law was repealed.

Considering certain of our governmental problems, would it not be a good thing for us to take some lessons in legislation from the poor Indian? H.

A COZY CORNER IN THE LIBRARY OF THE INTERNATIONAL HEADQUARTERS, LOMALAND

TRUE reform has one beginning—
The right hand of brotherhood.
Would you help men out of sinning?
Would you lead them into good?
Would you teach that Christ has risen?
Prove it by your deeds of worth.
If you want to close the prison,
Beautify the homes of earth.
—Ella Wheeler Wilcox

OUR YOUNG FOLK

The Silence of the Wise

DEAR GIRL-WORKERS FOR BROTHERHOOD: There are so many of you all over the world, just blossoming into womanhood. How often I think of you,

Standing with reluctant feet
Where the brook and river meet,
Maidenhood and childhood fleet.

What kind of women will you make, girls—for there are many kinds, you know. At one extreme we have the loyal, helpful, true, strong, pure woman who stands as an example. At the other, there is the selfish, the slatternly, the unkind, the forgetful and the gossiping woman. I sometimes think that the woman who gossips does more harm than any other. The wise have always enjoined upon men silence. They have told us that silence was one of the open secrets for the attainment of wisdom, but, heedless of this precious advice, we continue to talk, talk, talk, letting the words stream from our lips, willy-nilly, without rhyme or reason, whether for help or for harm. What a mistake it is!

But what do the wise mean by silence? There is a silence that is as bad as gossip itself, but there is another kind—the true silence—when the mind is alert, yet held steady and calm, and when the mere passing thoughts that flit by and knock are not allowed to enter unless the guiding soul sees fit. Much less are careless thoughts allowed to find expression in words. This is true silence.

It is in true silence that we store up enormous energy. Used at the right time, who can measure the good it may do, or the evil it may avert? When women, young or old, have gained the power to live in the true silence, then they will be able to use speech in the right way; their words will be purposeful, reaching the hearts as well as the minds of those who hear them. Think what it means to be able to say just the right word at the right time. You know, as there are two kinds of silence, there are also two kinds of speech. How glorious is the knowledge of Raja Yoga that teaches us to discriminate between the true and the false; the speech that is wise and the speech that is foolish!

AUNT ESTHER

MANY millions of dollars have been spent in explorations in the Arctic seas and in other parts of the earth's surface. But as yet little effort has been made to add to our knowledge of the interior of the earth. The greatest distance to which man has penetrated, either by mining shafts or deep borings, is a little over a mile. What we know of the depths below this, we have learned from the strata upturned by geological disturbances and from the study of volcanoes. An engineer has calculated that to sink a shaft to a depth of twelve miles would take eighty-five years and would cost £5,000,000. At this rate when will man reach to the center of the earth? And what will he find there?

JAPANESE children, on returning from school, invariably report their home-coming. "Honorable mother, we are at home," they say. Children in that land are so well brought up, almost without exception, that they never leave the home nor return to it without reporting in this quaint fashion. What a contrast to the lawlessness of so many American boys and girls! How can one wonder that so many step into vice and misfortune even in early life! Is it not time for Raja Yoga?

The Youth of Indian Tribes

AMONG the Ojibway and some other Indian tribes the young men, during the period of adolescence, pass through a ceremony of initiation. Its object is to prepare them for the office of a Mide or Medicine Man, one of whose first duties it is to preserve the traditions of the tribe. The Indians believe that those thus initiated communicate with spirits, which is but a crude way of stating their belief that those who have passed this degree become acquainted with certain of Nature's laws unknown to the others. It is then that the young Indian boy learns about the septenary system of the Indian philosophy and that the number seven to the Indian teachers is a sacred number.

Truly, all this points to a past when the Indians knew the mysteries and when they knew far more about natural laws than those who presumed to teach them. Pere Marquette, the Catholic priest who came among the Indians of Green Bay, Wisconsin, many years ago to teach them religion, was quite astonished to find a cross set up in their midst, and he wrote home to his friends about it, saying that he was glad to see it, as it was an evidence that they had already adopted Christianity. The wise "teacher" did not know that the cross is a universal world symbol which has been known and used from time immemorial, the crucifix being merely a modern and extremely simple interpretation of it.

One thing the Indians *did* have as a basis for their religion, and that was the purest and loftiest system of morality. It was left to the white men who followed Pere Marquette to bring them a knowledge of vice and disease.

STUDENT

Facts Worth Knowing

THE training of the old Samurai of Japan was something more than just the training of the body and of the mind. Those who fancy it is all comprised in a course of training in "Jiu-jitsu" make a great mistake. The training of the old Samurai was one of high idealism and faith. It was, more than anything

else, a knightly consecration. The Samurai can command today because they learned in past days how to serve.

A WISE Japanese said recently to an American, "You talked of us as great artists while you thought of us as barbarians. But now we have shown you that we can kill scientifically and you call us civilized."

THE United States has long been behind foreign countries in good roads and it is estimated that the loss on this account at present reaches a billion dollars each year. In Europe macadamized roads hundreds of miles in length are common, but that they are not so common in America is no indication of lack of enterprise. Our country is large and the conditions so far have been chiefly pioneer conditions. Wait awhile. America will yet be an example to the world in road-building, just as was ancient Rome.

ONE of the most remarkable scientific instruments that we have is the seismograph. This records the oscillations and vibrations of the crust of the earth which occur during earthquakes. The instrument is of great cost and of extreme delicacy and there are but three or four in our country at present. Japan, however, boasts of a complete seismological library and apparatus. In no other country have the records become so reliable.

WORK DONE IN ONE OF THE ELEMENTARY DESIGNING CLASSES—ART DEPARTMENT OF THE RAJA YOGA ACADEMY

THEY are slaves who fear to speak
For the fallen and the weak;
They are slaves who will not choose
Hated, scolding and abuse.
Rather than in silence shrink
From the truth they needs must think;
They are slaves who dare not be
In the right with two or three.

—James Russell Lowell

THE CHILDREN'S HOUR

The Raja Yoga Question Box

IN many cities of the world may be seen beautiful pictures by the artists of sunny Spain.

1 Who was Velasquez?

ANSWER—Velasquez was born at Seville, Spain, in 1599. He once painted a portrait which was shown to Philip IV. The King made Velasquez his Court painter, and was his warm friend until the artist died in 1660. Velasquez had every opportunity to improve his art. He visited Italy twice and made friends among the great sculptors and painters there. Velasquez painted many portraits of persons of high rank. Velasquez was not only the greatest of the Spanish artists, but he was the noblest man among them. He was free from jealousy and often befriended artists less fortunate than he was. In Velasquez, Spain gave the world a true teacher in art. Modern art students learn from his works.

2 Who was Murillo?

ANSWER—Murillo was an artist, born in Seville in 1617. He studied first with his uncle. He set out on foot and without money over the mountains to Madrid. There he sought Velasquez, who received him kindly and took him into his own house. Murillo made such progress with his painting that Velasquez advised him to go to Italy. He offered to give Murillo letters to the great masters there, but Murillo returned to his native city and did his life work there. He painted many beautiful pictures for the churches and convents of Seville. Murillo's model was the life he saw around him. He painted the Spanish nature into his pictures of saints and visions and miracles. The cherubs of his pictures were the bright-eyed children of Seville. Murillo was always pure and good and charitable. He was beloved by the people of his city.

A Visit to Thoughtland

CURLED up in grandpa's big arm chair, little Emily Merryman was enjoying her favorite story book one wintry afternoon, before the fire. Old Bruno lay contentedly at her feet watching the sparks dancing about the big logs on the fire-place, and merrily chasing each other up the chimney.

Out of doors the snow was falling, slowly and noiselessly, in great starlike flakes, covering all the bare, brown places with soft white down and making the garden look like fairyland.

After a while Emily finished her story and began to watch the snowflakes come fluttering down. It was very still in the house, and sitting there by the warm fire must have put Emily to sleep, for the snowflakes all seemed to be changing and taking on many curious shapes. Then suddenly she was in quite a different world, among the strangest people Emily had ever seen. There seemed to be millions and millions of them of every size and shape and color you could possibly imagine. There were tall white fairies that looked just like angels, they were so beautiful and good. Then there were others who at first seemed to be beautiful, but looking more closely she could see were not—their expression was disagreeable or they were somewhat deformed; there were ugly little gnomes, pinched and miserable looking and always making others unhappy wherever they stopped. She also saw some hideous beings almost as big as giants, who were black and evil-looking and made Emily feel afraid.

She was standing all alone in a corner, feeling rather lonesome, for none took any notice of her. She began to wish one of the beautiful fairies would come and tell her where she was and who all these strange people were. Then, no sooner had she wished it, than one of the very most beautiful ones came running towards her. Emily loved her at once and began to ask so many questions and so fast, that I wonder the fairy could remember to answer them all, but she did, just as fast as they were asked.

She told Emily that this place was called Thoughtland, and that all these people were the earth-folks' thoughts which had come there to dwell;

that the earth people imagined they were wise, but very few even knew there was such a land, or that their thoughts all day were making real live beings who went there to live.

Emily asked this fairy her name and was told it was Joy-Thought. Then she wondered who some of the others were, and Joy-Thought pointed out several and explained how they came there. The big ugly giants had once been tiny dwarfs, just some little unkind thought which perhaps a child had sent there, but every time another of the same kind came both grew bigger and bigger, for that was the way these thought-people did.

The white ones with bright sunny faces were loving, kindly thoughts and where they went it was always spring-time, with flowers and birds around. Emily said to herself that when she got back home she was going to watch very carefully to see that she only sent beautiful fairies to Thoughtland, and

was going to tell all the children—and grown people, too, if they would listen to her—about this wonderful land.

Before she went away Joy-Thought told Emily a secret. She said there was a magic way by which the ugly giants and disagreeable little dwarfs could be changed into beautiful beings; and if Emily really in her heart wanted to help people back at home not to make any more bad thought-people, to transform those they had made, she would tell her how. And Joy-Thought said if, whenever an unkind or naughty thought did slip out of the mind, if right away a big loving one was sent after it, it would overtake the evil thought, and just as soon as it was caught it would be changed into a loving thought too, and could do them good instead of harm.

Just as Joy-Thought finished Emily heard a great barking and stamping of feet, and there she was again in the big chair by the fire, and papa and Uncle Jack had come home to tea and Bruno was barking his welcome. But she remembered her journey to Thoughtland always, and often when she feels cross or unhappy, would think of what the fairy had told her and quickly change her thoughts into loving ones by the magic that Joy-Thought had taught her. You see, Joy-Thought knew about little girls—and Raja Yoga, too! **COUSIN ALICE**

RAJA YOGA CHILDREN—FESTIVAL IN THE GREEK THEATRE

WHERE did you come from, baby dear?
Out of the everywhere into the here.

Where did you get your eyes so blue?
Out of the sky as I came through.

What makes the light in them sparkle and spin?
Some of the starry spikes left in.

Where did you get that little tear?
I found it waiting when I got here.

What makes your forehead so smooth and high?
A soft hand stroked it as I went by.

What makes your cheek like a warm white rose?
Something better than any one knows.

Whence that three-cornered smile of bliss?
Three angels gave me at once a kiss.

Where did you get that pearly ear?
God spoke and it came out to hear.

Where did you get those arms and hands?
Love made itself into hooks and bands.

Feet, whence did you come, you darling things?
From the same box as the cherub's wings.

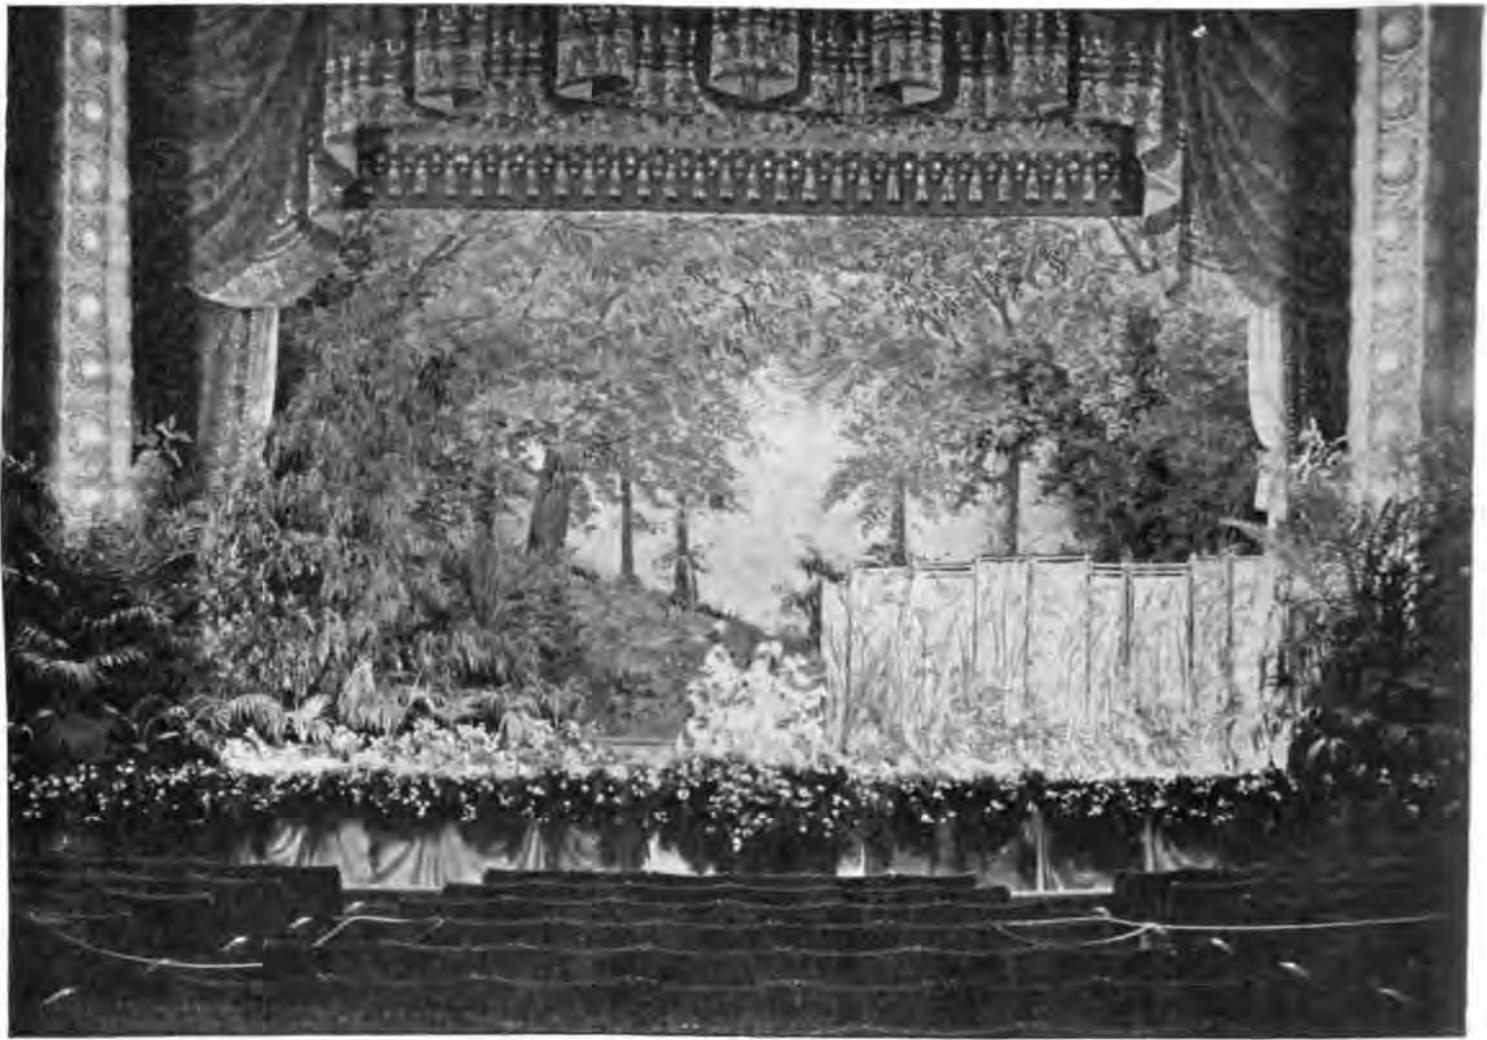

How did they all just come to be you?
God thought about me, and so I grew.

But how did you come to us, you dear?
God thought of you, and so I am here.

THE THEOSOPHICAL FORUM, IN ISIS THEATRE

THE announcement that Katherine Tingley would speak again upon the subject of "Marriage and the Home," served to fill Isis Theatre last Sunday night to the doors. Her address was in the nature of a continuation of the one of a week ago. In opening her address she quoted the familiar words of Christ: "Thy will, not mine, be done," declaring that we should place our faith in the supreme law. If we had a knowledge of this supreme or divine law, as we should have, we would have a basis for right action. The speaker believed that many whose lives and homes were unlovely were to be pitied more than censured. They were not bad people; they meant well but lacked positiveness and self-control. Not having a knowledge of the sacred law, not having an understanding of themselves or their own natures, yet meaning well, they often drift along in a negative way, gradually creating conditions that finally result in inharmony in the home. Thus children are reared under conditions that make the highest and best development impossible. Wrong methods are pursued in the training of children. They are threatened with punishment to make them good. The result is the child learns merely to repress the lower, or evil, in his nature, instead of to control it. But when they step out into life, into what they call freedom, they are quite unprepared for the temptations that beset them upon every side.

The speaker pictured those who were too much absorbed in trivial things to find time to study the higher law and get an understanding of their own divine natures. From this class young men and women are often drawn together by attractions that are not of the highest. If we were to trace the results of such unions they would lead us not infrequently to the inmates of insane asylums and prisons. The condition of these unfortunate ones is often the result of unfavorable home conditions.

She denounced capital punishment and in tracing the causes that led the prisoner to the commission of the crime for which such an unwise punishment was provided, she knew that in a majority of cases we should find the primal cause in unwise marriages, ignorance of the higher laws of being, and the influence of inharmony upon the life of the growing child. Ignorance and selfishness obscured the truth.

In contrast to this she pictured the home where the higher law prevailed, where the husband and wife were united in an unselfish effort for the betterment of the race, where peace and harmony prevailed, and the child life, nurtured in an atmosphere of purity and perfect love, could grow and expand naturally and healthfully into the full fruition of mature and perfect manhood and womanhood. Divorce and crime and misery would not be the fruits of such a home.

The speaker did not wish to censure the churches or the conservative public press, but she believed that the public should demand of those who stand as professed teachers and leaders of thought, a higher standard of ethics and education, a something that would enter into the hearts of people and give a new and better impulse to their daily lives. A passive acquiescence in morality is not sufficient; press and pulpit should accentuate its tone for right action and a higher and purer atmosphere in the home life.

Parents should continually keep before their children the good example of their own lives. If the young life of the child were thus guarded and directed, we would soon see its effect in the lessening of evil in the world. She spoke earnestly and strongly against hasty and ill-advised marriages, especially of the young, declaring that if she stood in the place of the clergy in pronouncing marriage ceremonies, to many of the applicants she would say, nay! She believed it would be better if there were fewer marriages and more perfect ones; fewer children and better ones. The tones of the speaker's voice plead with a sympathetic strength as she concluded her address, and their import reached many who heard her.—*San Diego News*

Theosophical Meetings for Sunday Night

Public Theosophical meetings are conducted every Sunday night in San Diego at 8.15, at the Isis Theatre, by the students of Lomaland.

Theosophical subjects pertaining to all departments of thought and bearing on all conditions of life are attractively and interestingly presented.

Other interesting features of these weekly gatherings are the excellent music rendered by some of the Students of the Isis Conservatory of Lomaland, and the efforts of the children of the Raja Yoga Schools at Point Loma. Theosophical literature may always be purchased at this meeting.

Art Music Literature and the Drama

Our Critics and the Eccentricities of Genius

IT takes a hack writer to laugh at the peculiarities of men of genius and to hold up their weaknesses to ridicule. With what gusto does such an one recount, in today's paper, Beethoven's habit of going out in the pouring rain for a walk, and his other equally curious habit of pouring water upon his hands, first upon one hand and then the other, again and again, to cool them after playing. Was this mere eccentricity? It is not difficult for those who know a little about the processes of the human body to find a certain method in this madness. A dash of cold water may be as effectual in changing the currents from an unhealthy to a healthy direction in one case as well as in another, and no one holds up to ridicule a dash of cold water in cases of sudden faintness.

And what a huge joke is that contention of Haydn's that the melody of birds helped him in his composition; that, in short, while birds were singing, musical ideas came most freely to his mind! And how absurd was his habit of getting up with the larks; and that other habit of always seeing that a favorite ring was upon his finger while he was composing! And that glass chamber of Meyerbeer's, built at the top of the house where he could come close to sunbeam and to shower, where nothing but glass, and often not that, was between him and the sky. Of course it was the merest child's fancy—of course!

Oh, ye critics of modern times! Not even geniuses are infallible on common-sense lines—they are perhaps less so than average humanity. But there is no doubt, to those who observe much and talk little, that many of the so-called eccentricities of men of genius were but an intuitive recognition of natural laws, only today beginning to be re-discovered and known. However, *apropos* Beethoven, there are many instances in his life that are simply humorous. One of these is related in Ullrich's work, *Beethoven, Seine Kritiker und Ausleger*, of which the following is a translation of an extract:

After a number of annoying experiences with cooks and maid-servants, Beethoven decided to dispense with them altogether. Could it be more difficult to keep house himself than to write a Symphony in C minor? Enraptured with so brilliant an idea, he hastened to put it into effect. He invited some friends to dine with him. Then he bought the provisions at the market, carrying them home himself, put on a white apron, used his night-cap to take the place of the cook's official's head-gear, seized the kitchen knife and set to work. The guests came and found him before the hearth, whose flames seemed to act like a fire of inspiration upon him, and their patience was put to the test of a long wait. Finally everything was ready and the result proved that waiting for this wonderfully unique meal had been worth while. The soup vied with the traditional almshouse concoction; the half-cooked entrée presupposed the digestive powers of an ostrich; the vegetables swam in a sea of water and grease, the roast was burnt almost to a crisp, and black as if it had come down the chimney—nothing was eatable. But the host, who did honor to all the dishes and praised them all, wearied not, by word and example, of exciting his guests to valiant trencher feats. Still none could be induced to touch Beethoven's *chef d'œuvre* of the cooking art, and they confined their attention to bread, fruit, sweetmeats, and wine to make up for the lack of substantial courses.

The experience of this dinner convinced Beethoven that to cook and to compose are two different things, and he installed his cook again!

One experience is, to the truly wise, sufficient. STUDENT

The Only Remedy—When Shall It Be Applied?

THOSE who weep over the decadence of modern drama and who long for the simple purity of the old Greek theatre as earnestly as Madame de Staël once longed for "*le bienheureux ruisseau de la rue du Bac*," will do well to reflect upon the old adage that "It takes a gentleman to play a gentleman." If there were today a higher general ideal we would not have to sift the present generation so strenuously to find just a few actors and actresses who are cultured even in the accepted sense. More than that, if true ideals could be presented to the children of today, the men and women of tomorrow would witness a drama that does not stand submissively asking *hoi polloi* what it would like next, but which would step forth as a Teacher of men, its every utterance a new evangel. If the general tone of our thought and act were higher and purer, we would not have occasion to weep over the modern stage. We would have not one Booth, one Irving, one Duse, one Terry, we would have scores, nay, thousands. More than that, we should have actors and actresses consecrated to something higher than even an intellectual ideal, men and women as consecrated to a great Spiritual Message as was ever knight consecrated to his spiritual vows.

The best advice to those who are inclined to be pessimistic while they sit still and weep is, "Stop weeping and go to work. Do something. Do something to elevate the moral tone of your city, your community, your family. Do something, in God's name, that will help straighten out this earthly tangle of ours, *something*—if it is nothing more than emptying your neglected waste basket. That will serve for a beginning, at least, and on right lines." STUDENT

THE GREAT TEMPLE AT EDFU—EGYPT

FRAGMENT TRANSLATED

from one of the early and beautiful examples of Anglo-Saxon verse, possibly of the period of William of Malmesbury

GEMON mortha lisse.
Her sinda milta blisse
Hyhtlice is keofosa rice.
Utoa an halgam gelice
Scyldum byscytede.
Scydam genæde.
Womnum biwæde.

Thær moa cya mot
For meotade rot.
Sothæc God gescea
And as is sibbe gefean.

into modern English, it reads:

REMEMBER death's favor,
In it are merciful blessings,
Full of hope in heaven's kingdom.
Ah, may we be like the saints

Washed from our sins,
Liberated from condemnation,
Protected from error,

Where mankind shall
Before their Creator glorious,
Behold the true God
And joy in peace evermore.

TO those who think the number "13" an unlucky one, it may be interesting to note that this number occurs very frequently in the life of the colossal genius, Richard Wagner, who left such a rich legacy to the world of music and drama. The following is a partial list of the figures given by a writer of statistics: Wagner was born in 1813; there are 13 letters in his name, and the sum of the figures in 1813 equals 13. He composed 13 operas or "music-dramas." His first and determining impression in favor of a dramatic career was formed on the 13th of the month. Wagner's first public appearance as a musical personage dates from the year 1831 (1+8+3+1=13). The stage at Riga, where he became a director, was opened on the 13th day of September, and he there began the composition of *Rienzi*, which he completed in 1840 (1+8+4=13). On the 13th of April, 1844, he completed his *Tannhauser*, and it was performed in Paris on March 13, 1861, and on the 13th of August, 1876, he began the first presentation of his "Baireuth dramas," the *Nibelungen Ring*. Wagner was exiled from Saxony for 13 years. He died on the 13th of February, in the 13th year of the new German Confederation. STUDENT

POWERFUL intellectual as well as spiritual forces have had more to do with Japan's step outward into the arena of the world's life than we realize. There is a closer connection between the Japanese modern Renaissance in literature and in philosophy and the fall of Port Arthur than any but philosophers would be willing to believe. How often may outer events serve as a commentary upon the inner and more real! H.

Universal Brotherhood Organization

Central Office Point Loma California

WHEN THE WESTERN SUN CASTS A SHEEN OF GLORY ON SEA AND SKY AT LOMALAND

The Theosophic Heart of the World

By E. A. Neresheimer, Chairman of the Cabinet of The Universal Brotherhood Organization

THE well intended theories and systems of thought and even religion, which have from time to time come before the world, have all failed for want of being put into continued practical operation.

If Theosophy is successful by being put into practice it will produce an Utopia.

According to Theosophy there is a certain plan in the divine economy which is progressive. Human evolution has advanced through the dark times of material progress to a point where the innate spiritual qualities can no longer be held back. They must become manifest. At present great advancement is possible.

The Theosophical Movement was started by H. P. Blavatsky in the last quarter of the Nineteenth century, a woman who spent her life and energies on the one hand in demolishing the fallacies of modern thought, and on the other in building up an entirely logical system of philosophy comprising the genesis, evolution and destiny of cosmos and man. The doctrines are unassailable, they have stood the gauntlet of criticism, analysis and dissection, but it remained to make them practical and applicable to the needs of mankind.

The Movement has also passed through the intellectual stage. The learned public and even the members of the Organization and friends of the Movement had threatened to monopolize the truths and to surround them with such mysticism and metaphysics as to make them inaccessible to the popular mind. This promising Movement therefore would have shared the fate of many organized efforts on similar lines had it not been for the powerful successors of Madame Blavatsky, of whom Katherine Tingley is the present living representative. It was she who concentrated with wonderful insight and magnificent power the workable forces of the Organization, and who established the multiform institution which exercises now such widespread influence throughout the world.

It is noteworthy that her activity began with first demolishing the antiquated methods of purely intellectual dissemination. She unseated the metaphysical hairsplitters from their thrones of glory, and at once established most practical methods by causing the members to put the philosophy into action. She insisted that it has to be lived and felt to be understood. That no amount of subtleties and preaching alone would make it acceptable to the multitude.

The better and most earnest class of her students and members of the Organization, those who felt the need for spiritual regeneration, and who desired the success rather of the Movement than their own glorification, recognized in Katherine Tingley a Leader of extraordinary power, wisdom and superior ability, and invested her officially with supreme authority over the affairs of the Movement. This by no means implies that such au-

thority is exercised over the personal affairs of members of the Organization.

From that time on a large following of these workers throughout the world upheld her hand and delighted in supporting her in absolute authority, for, soon they saw that unconditional control of the Organization in the hands of a wise and honest ruler was safer and more conducive to success than divided power among many.

The number of men and women of genius, talent and learning, who came to her in increasing numbers from year to year, and now from month to month made it possible for the Leader to press on with the work with great rapidity. Herself the example of great self-sacrifice made it possible for many to follow her confidently and gladly, and to consider no effort too great to carry out her instructions and plans. The result is that now there is a center at the world's heart of the Theosophical Movement at Point Loma, Southern California.

The Universal Brotherhood Center is composed of the most remarkable literary, artistic, musical and scientific ability and genius that could be collected from the four corners of the earth, all bent on the one aim and object of bringing help and succor to the Orphan Humanity by promulgating under their wise Leader the philosophy of hope. They are fired with immense enthusiasm and unflinching zeal; the smallest effort and ability is turned to account; they are unified like no other body of humans; they are certainly setting the keynote to the coming age.

E. A. NERESHEIMER

THERE is a road steep and thorny, beset with perils of every kind, but yet a road, and it leads to the Heart of the Universe. I can tell you how to find those who will show you the secret gateway that leads inward only and closes fast behind the neophyte for evermore. There is no danger that dauntless courage cannot conquer; there is no trial that spotless purity cannot pass through; there is no difficulty that strong intellect cannot surmount. For those who win onward, there is reward past all telling, the power to bless and serve Humanity. For those who fail there are other lives in which success may come.—H. P. Blavatsky

For the Benefit of Enquirers

REGULAR weekly meetings of the Aryan Theosophical Society, established in New York City by William Q. Judge, the second Leader of the World's Theosophical Movement, are held every Thursday evening at 8 o'clock in Isis Hall, 1120 Fifth Street, San Diego, California. These meetings are intended to meet that large and growing body of earnest enquirers who desire to know more of the different tenets of the Theosophical philosophy. Students from the Universal Brotherhood Headquarters at Point Loma, California, conduct these interesting gatherings to which every truthseeker is cordially invited.

Students'Path**DUTY**

TENNYSON

NOT once or twice in our rough island-story
The path of duty was the way to glory:
He that walks it, only thirsting
For the right, and learns to deaden
Love of self, before his journey closes.
He shall find the stubborn thistle bursting
Into glossy purples, which outtreden
All voluptuous garden-roses.

Not once or twice in our fair island-story
The path of duty was the way to glory:
He, that ever following her commands,
On with toil of heart and knees and hands,
Thro' the long gorge to the far light has won
His path upward, and prevail'd,
Shall find the toppling crags of duty scaled
Are close upon the shining table-lands,
To which our God Himself is moon and sun.

Agnosticism

WE do not know! This is an attitude of mind at least, and perhaps of heart and soul, which, from one aspect, may be full of merit. In fact, without such an attitude, a man would soon become an insufferable egotist. Agnosticism, in its best meaning, is a state of proper reverence and humility in the presence of the Truth, and yet, like so many other weapons in the arsenal of Truth, it has been misused, and in the hands of the enemies of the Truth it is employed with withering effect on human efforts at spiritual unfoldment.

The Universe is infinite; even the stars are numberless as the sands of the sea, and those numberless stars revealed by the aid of powerful telescopes may be considered as a single unit in countless other stellar systems located in realms of space unknown, into which the eye of imagination cannot reach. Each of those numberless stars is a sun, about which revolve planets with their attendant satellites; each sun with its attendant worlds constituting a system which more or less corresponds to our solar system. If we try to picture the myriad forms of life on our earth, and to conceive what marvelous change a variation in the inclination of our earth's axis from what it now is, would make; or what a revolution in earth life an increase or decrease in the size of the earth's orbit would produce; or how our seasons would be affected if the orbit of the earth were more or less elliptical than it now is; and then if we realize that no two planets in our solar system have the same axial inclination, the same degree of orbital ellipse, the same speed of rotation or of revolution, we may begin to shadow forth the endless variety of life in our little corner of the Universe.

Then consider that every planet differs more or less in chemical construction, and that each sun differs from each other sun in constituent elements; then reflect that the heat and light of the numberless suns varies, one from another, in quality as well as in quantity, even in color; that in some systems there are more than one sun, or a hierarchy of suns with a supreme luminary at the head, and that some planets out in space have several colors poured upon them, year after year and age after age from their system of unlike suns, and we may begin to form a faint nebulous sense of the inconceivable variety, and abundance of difference which pervades the measureless spatial depths. And this picture refers only to physical unlikeness of type and form.

There is doubtless a corresponding gamut of change which will sound eternally, wherever we turn throughout any plane or realm of manifested or unmanifested life. And who shall know it all?

Because some neophyte on the path of knowledge and wisdom cannot thread such interstellar mazes on his initial essay to explore the mysteries of being; or because the transcendental intricacies seem to be but an-

swerless puzzles, shall the neophyte declare that nothing can be known or that there is no truth? Surely this conclusion does not follow either as the end to logic or as the goal to intuition. In the presence of such vastness the finite organism need not lick the dust in hopeless abasement, nor is it meet for that little self to rear its pigmy head in boastful arrogance. It is better for the pilgrim, the candidate, the truthseeker to look with upturned face and trusting eyes full at the revealed form of God, and say, "I do not know all, but I may know more." "I know enough to take one step forward, and if I take no step save those which that in me which is most like God shall show, then no step shall e'er be false; and in the most supernal depths, or on the loftiest heights, my feet will bear me safely on and upward, nearer to the Truth." STUDENT

Do Not Be Moody

DESPONDENCY should most certainly be classed as a deadly sin, for it is the negation of light, life, love, and every other ray of the great Spirit of Life. It kills, chills, and takes all the glow and beauty out of things. To indulge it amounts to disloyalty to one's divinity, one's manhood.

It is easy, when one is not under its sway, to give advice about overcoming it. People who talk so buoyantly about this are often subject to violent ups and downs. It is not so easy to find the steady counsel that will stand by one in times of depression when ordinary resources seem used up and the will itself paralyzed.

Perhaps the most helpful way is to think of the meanness and selfishness of indulging in a dark mood; to reflect what other people look like when they are doing it, and to vow that we will never look like that; and to remember that our friends still think well of us.

But we cannot get very far by considering despondency by itself. It is only one of several moods which are selfish and unworthy. Vanity, elation, anger, suspicion, are some others. Avoid being moody.

The way to do this is to put your heart ever more and more into impersonal work. This in time creates a new vitality which is not affected by the moods and quickly throws them off. A person with such an endowment always has a laugh somewhere down in his inside, and the dim consciousness of this is never entirely absent. STUDENT

FRIENDS IN COUNSEL

DEAR COMRADES: "Forward march." The words ring loud and clear in the fresh morning air, and looking over the honeysuckle fence we see the boys of the Raja Yoga School at their morning drill. The moving column goes its way as though its steady tread was regulated by a single mind; as though the drum-beat was the body's pulse whose rhythmic throbbing all obey. Some tender-hearted philanthropists are apt to deplore the interest taken by the healthy-minded boy in military affairs; but surely the ideals of the warrior cannot be omitted from the mental equipment of youth without great loss. Life is a combat and the drama of the soul finds ready expression in the language of the camp, and the imagery of the battle-field. Every earnest youth is very soon aware that he stands confronted by an opposing force to be subdued. The Bible, often quoted as a book of peace, is full of exhortations to "fight the good fight," to "endure hardness as a good soldier." The Prince of Peace himself has told us that "the Kingdom of Heaven suffereth violence and the violent take it by force."

We have only pity for the boy whose imagination never has been fired with the lives of heroes. He will be no more humane than other boys, and his mental life will be the poorer for the lack of the imagery of the camp and field. The terms of warfare lend themselves very helpfully for the statement of the basic facts of life. The Soul, the king by right, finds its domain, the body, occupied by the passions of the lower nature. To drive out the invading host and to repossess the throne, is the great enterprise that lies before it. This view of life as a campaign, is a fine corrective to luxurious living, for soldiers of the tented field are barred from many indulgences and need to be "in training" all the time to keep up their efficiency.

Loyalty to the leader is a most evident requisite for military success and the necessity for prompt obedience with neither comment, cavil, nor delay, is easily seen when viewed from the military standpoint. What kind of warfare could be waged if private soldiers formed their judgments on chance scraps of information drifting to their ears and then took independent action? Disintegration and defeat would unavoidably ensue. P. L.

SWEET MERCY

WILT thou draw near the nature of the gods?
 Draw near them then in being merciful:
 Sweet mercy is nobility's true badge.—*Shakespeare*

Of all the paths which lead to human bliss,
 The most secure and grateful to our steps,
 With mercy and humanity is mark'd;
 The sweet-tongued rumor of a gracious deed
 Can charm, from hostile hands, th' uplifted blade,
 The gall of anger into milk transform,
 And dress the brows of enmity in smiles.—*Glover*

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question Some time ago in talking with a friend on Theosophy, on the subject of Karma, he said to my utter surprise that this doctrine of Karma might be taken as giving an excuse for continuing a life of wrongdoing, declaring it was "his Karma." He used the argument that Karma is simply an endless chain of cause and effect and that there was no way of escaping from this chain. Will the Forum please explain?

Answer The question really reduces down to this, Is Karma fatalism? This has been answered again and again, but continually comes up in the minds of those who have taken their ideas of Theosophy from certain people who, without studying, without indeed knowing anything at all about the teachings, decry Theosophy, and for the sake of upholding systems in which their self-interest is bound up, by salary or otherwise, do, and often willfully, misrepresent these teachings.

And in reply to this false idea, caused by such misrepresentation, of the teaching of Karma, it is first suggested to those who have any real interest in obtaining a knowledge of what is actually taught in Theosophy regarding Karma, that they read what has been written upon the subject by those through whom the knowledge of Theosophy has again been given to the world, H. P. Blavatsky, William Q. Judge, and Katherine Tingley. And first the reader is referred to *The Mysteries of the Heart Doctrine*—"prepared by Katherine Tingley and her pupils," from which the following extract is taken:

Another wrong conception of Karma is that which regards it as equivalent to "Fate." Fate is conceived to be a blind force working without regard to human effort, whereas Karma is put into operation by ourselves. We are today the sum of all past yesterdays, "we reap the seeds we sow, the hands that smite us are our own." Karma is no more fate than is the harvest of the seed sown last springtime the result of chance. . . . It is a great mistake to get into that negative, hopeless condition, which some manifest who say, "Oh! it is my Karma; I must submit; I can do nothing." It is true we must reap what we have sown, but the present and the future are not simply a reproduction of the past, else life would be an endless treadmill, and progress impossible.

But while Karma is not "fate," it is *destiny*, self-made destiny, from which escape is impossible until it is completely fulfilled. H. P. Blavatsky, in one of her books, says:

Those who believe in Karma have to believe in destiny, which, from birth to death, every man is weaving, thread by thread, around himself, as a spider does his cobweb, and this destiny is guided either by the heavenly voice of [man's Higher Nature, the Soul, or by the promptings of the lower nature, the evil genius of the embodied entity called man.] Both these lead on the outward man, but one of them must prevail; and from the very beginning of the invisible affray the stern and implacable law of compensation steps in and takes its course, faithfully following its fluctuations. When the last strand is woven, and man is seemingly enwrapped in the network of his own doing, then he finds himself completely under the empire of this self-made destiny. . . . It is not therefore Karma that rewards or punishes, but it is we who reward or punish ourselves according to whether we work with, through and along with Nature, abiding by the laws on which that harmony depends, or—break them. Nor would the ways of Karma be inscrutable were men to work in union and harmony, instead of disunion and strife. For our ignorance of those ways—which one portion of mankind calls the ways of Providence, dark and intricate; while another sees in them the action of blind fatalism; and a third simple chance, with neither gods nor devils to guide them—would surely disappear if we would but attribute all these to their correct cause. . . . We stand bewildered before the mystery of our own making and the riddles of life that we will not solve and then accuse the great Sphinx of devouring us. But verily there is not an accident of our lives, not a mishapen day, or a misfortune, that could not be traced back to our own doings in this or another life.

Thus it will be seen that the doctrine of Karma is that our destiny is self-made, and this implies, and it is a part of the teaching, that as we have each woven his own destiny, so each can unweave it, or rather can work it out and from this very moment commence to weave an entirely new pattern for the future.

Karma is, as said, an endless chain of cause and effect, just so long as we continue to put new causes into operation, but it rests with us what shall be the character of these causes. Our life at any moment is not only the result of the past; there is another factor, which at any moment we may call upon, and by means of which we may rise above even the most restrictive Karma. This factor is the eternal spirit of man, his own divine self, a ray from Divinity itself. By virtue of this, man is verily a creator in the realm of causes. The doctrine of Karma cannot be understood without taking this into consideration, and in the light of this it becomes at once apparent how utterly false is the inference that Karma gives an excuse for wrong doing. According to the teaching of certain bodies of people that no matter what kind of life a man might have led, all that was necessary was for him to repeat a certain formula and say "I believe" and that all his sins would thereupon be wiped away, we might be justified in saying that such a doctrine would encourage a man in wrong-doing, when he could escape the consequences so easily. But not so with Karma. Karma means the certainty of our reaping the exact result or equivalent for all our misdeeds as well as for all our good deeds. Coupled with the doctrine of Reincarnation there is no other doctrine that gives such hope to man or such certainty that not even his smallest effort is wasted, but must bear its fruit in due season. And so far from being an excuse for wrong-doing, it is an incentive to right action and noble living.

STUDENT

Question Suppose a person of small means and little time wishes to do something to better the condition of the water-front children, how much of the Raja Yoga method can be intrusted to one who is not a member, but thoroughly in accord?

Answer It has been several times stated that the Raja Yoga system of training cannot be imparted on paper, however much might be written about it; it can only be learned through experience and actual training—self-training, the foundation of which is a knowledge of Theosophy,—and would demand, not a "little time" which the writer has at her disposal, but one's whole time and life-service.

This does not mean, however, that the writer may not be able to help the children she refers to. Of course, how far she can help depends upon herself, her capabilities and training. But if she comes in contact with them, even an unselfish desire to help them will have its effect, and a kind word, and sympathy are ways in which everyone may help to brighten the world around them.

STUDENT

Question In the light of Theosophy, how do you interpret the following passages of Scripture: "In the way of righteousness is life; and in the pathway thereof there is no death."—*Proverbs xii: 28*

"Verily, verily, I say unto you, If a man keep my sayings, he shall never see death."—*John viii: 51*

Answer It is clear that the death referred to cannot be the mere death of the body, though the Jews evidently placed that interpretation upon the words of Jesus. The death referred to is surely the death of the soul. A further reference is made to this in *Matthew xvi: 26*: "For what is a man profited, if he shall gain the whole world, and lose his own soul?"

The death of the body comes in the orderly processes of Nature to everyone, but man is more than the physical being, and the life of man is more than physical life, more than even mental life. The true life of man is the life of the soul, the inner life, the spiritual life; those who do not live this life have already entered the gateway of death, even though they may be physically alive, and appear in physical health.

True life is the eternal life, which if we were to read the words of Jesus aright, we might know from this saying of his:—"Verily, verily, I say unto you, He that heareth my word and believeth on him that sent me, hath everlasting life, and shall not come into condemnation; but is passed from death into life. Verily, verily, I say unto you, The hour is coming, and now is, when the dead shall hear the voice of the Son of God: and they that hear shall live."—*John v: 24-25* STUDENT

The British House of Parliament

THE Royal Palace of Westminster, commonly called the Houses of Parliament, is a comparatively new structure, having been completed in 1832, to replace the older building destroyed by fire. The clock tower is a conspicuous object from all parts of London, and the notes of the huge bell, "Big Ben," are listened for, as the recognized authority of correct time.

On the rebuilding of the palace, the very ancient and interesting building called Westminster Hall, was included by the architect in the new structure. Its long roof can be seen near the center of the picture. Here, for nearly six centuries, occurred most of the celebrated State trials which marked the critical epochs of English history, and the royal banquets following the coronation of the English kings.

The interior of the House of Commons cannot fail to be of much interest to every visitor. The appearance of the chamber conveys, at once, the pictured representation of the most advanced phase of national Government. This has been evolved by England as a pioneer among nations after a struggle of seven centuries. If the historian allows his imagination to travel back to earlier times, he can form vivid and varied pictures of typical governments of every age and nation. Egypt, Assyria, Persia, Greece, Rome, Byzantium, Germany, Spain and France, in the days of their ascendancy had each their great ideal. But the English House of Commons will go down to future times as the ideal of the Nineteenth century.

Let us note the arrangement of the chamber. There are two sides to the long room, and each side is occupied by one of the two great political parties. The party in power sits to the right of the chair, and the other party is on the left. *There are only two.* They are the elect of the people, and they, in their turn, elect their chairman, who occupies the throne, called the Speaker's chair. The gallery behind the Speaker is for reporters. Ladies are admitted only behind the white grill, seen over the reporters' gallery, whilst other visitors are in the opposite gallery.

What was the origin of this two-party system of government? It was unknown before Tudor times, and evidently began with the Reformation of Henry VIII. It sprang from religious differences and intolerance. The aims of one party have been generally progressive, and the aims of the other have been the maintenance of the *status quo*. And through successive centuries we may tabulate them thus:

CENTURY	PROGRESS	STATUS QUO
XVI	Protestants	Catholics
XVII	Roundheads	Cavaliers
XVIII	{ Hanoverians Whigs }	{ Jacobites Tories }
XIX	Liberals	Conservatives
XX	?	?

Incidentally, it may be noted, that however much public opinion may have been modified in the interval, the two great American parties are children of the same division. For whilst the emigrants of Mayflower days who settled in New England were Roundheads, the families of the South were Cavaliers to a man.

It would appear however that the days of a strictly two-party government are numbered. Many close observers of the trend of events are of this opinion. Witness the article by Mr. Leonard Courtney in the current *Monthly Review*. He is now, or was recently, the chairman of the English House of Commons Committee and a recognized authority. He says:

The force of individuality declines. Large views, and the advocacy of great ideas is discredited. The men who are in request are those who will fall into their places according to pattern.

The necessity of the two-party system is a postulate politicians are fond of assuming. The Tadpoles and Tapers who have not probed things to the same depth, doubtless feel a genuine apprehension of any danger that can touch the two-party system. They may be comforted by the assurance that it is not easily destructible. It has its roots in human nature, and the real question of public policy is whether it might not be to our advantage that the strictness of its discipline should be abated. Who can pretend that the process of dividing politicians into two camps, and of drilling the men in each, to think alike, and speak alike, over against the men of the other, tends to the development of sincerity or assists in the apprehension of Truth? . . . Parliamentary institutions may be said to be past being on their trial. The newer age condemns them. E. V.

THE HOUSES OF THE ENGLISH PARLIAMENT

He is buried on the hillside of Hemimura, above the naval arsenal of Yokosuka.

So he drowns till the screaming of the sirens once again
Calls him back to where beneath him, like mailed barons of the main,
Ride the warships; while the rattle
Of Dai Nippon's seaward battle
Rings and mingles through his dreaming like a distant song's refrain.

The Smells of the Next World

FROM a little parish magazine, published by the rector of an English village church in the interests of ritualism, we have acquired a novel and surprising piece of information about the Next World. It is this:

ENGLISH HOUSE OF COMMONS

There are only two smells in the next world—the smell of incense in heaven and the smell of sulphur in hell. Of course you all want to go to heaven, and therefore it is your bounden duty to get used to the smell of incense while you are here on earth.

If any one should hereafter be in any doubt where he is, he has only to note which smell is prevailing.

Are we out of the Dark Ages yet? Or is their darkness a condition of place rather than of time? H.

Food-Value of Chestnuts and Potatoes

THE value of roasted chestnuts as a food is discussed in a medical paper. The sanction of scientific authority is thus given to what the ordinary public has known ever since roasted chestnuts were sold on the streets. Chestnuts contain a goodly proportion of starch and proteid, and sufficient fat;

this last not being in excess as in most other nuts. It is said that an area of land planted with chestnut trees produces the maximum amount of food possible; and it is a pity the cultivation of them is not more studied, as it is in France. But people who are accustomed to eat large quantities of meat do not appreciate vegetable and fruit farming. The roasted potato also comes in for a share of scientific authorization, it being necessary to find a reason for its popularity among the scantily-fed. It may contain much starch, but that starch is in a form "peculiarly easy of digestion"—a fact which does not show in the analysis but which the public found out by a more practical method of testing. The analysis however shows why the public likes butter with its potatoes,—because fat is deficient. E.

THE MYSTERIES OF THE HEART DOCTRINE

Prepared by
KATHERINE TINGLEY
AND HER PUPILS

*The Theosophical
book of the
Twentieth century*

Tells the story and the history of the Theosophical Movement Throughout the World; tells what it is and why it is—reveals the mystery of the Doctrine of the Heart.

The prices are \$2 in cloth and \$1.50 in paper, which barely cover the cost, for it is printed and bound, not gaudily, but with such carefulness and thoroughness of art and craft as to make it unique among modern edition books.

Is the World Grow- ing Better?

Hence, while some countries may be advancing others may be going backward; and in estimating the progress of the world as a whole the forward States must be compared with the backward ones.

Taking the case of England, if one accepts the statement of the Archbishop of Canterbury made on New Year's night, that country is progressing. He said, "That notwithstanding all their failures, and folly, and cowardice and sin, there were now more people in England than ever who were intelligently caring about and holding to the Christian

faith." This is hopeful, if true:—especially if "Christian faith" be really the faith of Christ, and not Churchianity simply.

But it is very recent history how this same Christian gentleman gave his influence, though with some hesitancy, to the importation of Chinese laborers for the mines in the Transvaal. Also, that England in the opinion of many took a very retrograde step, at the instigation of the ecclesiastical body whom the Archbishop represents, in getting a law passed which practically hands over the schools in England to the control of the Anglican clergy, notwithstanding the strong and unanimous protests of the other religious bodies. And further, that for many months members of other denominations have been fined, and imprisoned for not contributing money to have their own children taught by a church which they did not accept: and all this with the approval, more or less open, of the church which the Archbishop represents!

Once upon a time H. P. Blavatsky wrote an open letter to the then Archbishop of Canterbury. I wonder what she would say now. Perhaps she would point to the paragraph which follows that by the Archbishop which I have just quoted, viz.:

Owing to members of the Orders expelled from France finding asylum in this country, there were now nearly 1000 Roman Catholic religious establishments in England, said Dean Lefroy at Norwich Cathedral last night (1 January). The soil for this seed had been carefully prepared by the Tractarian perfidy of sixty years ago.

That is not pleasant reading for those who wish well to England, and in line with this we read in the *Daily Mail*, 14th January, that the Bishop of Chichester is having a hot time with some of his people and clergy, owing to the clergy refusing confirmation to children because their parents would not allow them to go to confession!

Looking at these and other similar facts one does not feel very sanguine over the religious state of England, and the only hope is that her people may indeed have enough real Christianity to endure, and to unflinchingly resist all unrighteous action in the name of Christianity. England got a rude shaking over the South African war; she should set her house in order lest worse things befall.

The other European countries are not without their special troubles. The brave fight France is making we know. The slow but sure progress Spain is making is not so well known. Italy and Austria are, in different ways, in a state of ferment. Germany has had something of a setback in a struggle with savage tribes (so-called) in West Africa. And the state of tension in Germany must be very great. There is no need to say much of Russia. The country is having to fight for its manhood, the struggle for liberty. Even in Sweden and Norway there is unrest, for according to recent reports Norway is trying to get Home Rule; and to be separate from Sweden. One should have thought that recent events ought to have tended to bind Finland, Sweden, and Norway more strongly together so as to be really one country.

After all, perhaps we are prone to give too exclusive attention to affairs in Europe. The rejuvenation and consolidation of the Orient may, before long, considerably alter the relations of the East and the West.

Then, in spite of the mutual jealousies and preparations for war, we have, within the past few months, had a considerable number of treaties of arbitration signed; and the President of the United States of America is pressing on the Peace Conference of the Hague. And it is somewhat significant that an American has given, or promised the money, to build a splendid Temple of Peace at the Hague. It is one of the remarkable signs of the times how America has within the last year or two become such a power in international affairs; and that her influence is so markedly for peace.

War, and the preparations for war, hardly less ruinous, are the punishment which the world has to bear as the result of selfishness. The time may be nearer than is generally thought when a new direction will be given to human energy; and it will be found to be a much cheaper, as well as more blessed thing to work for others, and in harmony with them, rather than against them. The last hundred years have witnessed unprecedented progress in the direction of mutual understanding and appreciation between diverse races and nations; and that progress is now accelerating to a wonderful degree. REV. S. J. NEILL

Miguel de Cervantes

THIS year is the tercentenary of Miguel de Cervantes, author of the immortal *Don Quixote*. The indestructible popularity and reputation of his work entitles him to be classed among the very few rare geniuses, such as Shakespeare, Bunyan and De Foe, who have produced one great work, unique, undying and the fount of perpetual inspiration to minor talent. Such men are suns amid the host of mere planets and satellites. Their genius is lofty, massive and rounded, and springs from a nature in which the powers are developed in that just proportion which so supremely enhances their effectiveness.

In 1605 was published the first part of *Don Quixote*; and, though the second part did not appear till ten years later, the author's fame was immediate. He began it in prison, where he had been thrown by an enraged mob whose tithes he had been charged to collect for the priory. He finished the work amid the surroundings of poverty, maintaining himself by odd literary and business jobs, assisted by the needle-work of his family. As usual, it was only after considerable difficulty that a publisher could be found willing to give a trifle for the manuscript; and as usual, the publishers reaped a golden harvest, while the author retained until his death that poverty which is, after all, the sure preservative of genius.

Cervantes was of good birth and education; and, during the fifty-seven years before he wrote his masterpiece, led a very eventful life in which he distinguished himself as a soldier and had many political ups and downs.

In 1575 he was captured by Algerine pirates, against whom he was fighting on board a Spanish galley, and thrown into prison at Algiers. He was treated very cruelly, being believed by the Turks to be a wealthy noble able to pay ransom; and testimony shows that he bore his five years' captivity with courage, cheered those who were despondent, shared with the poor, helped the sick, and behaved himself like a true soldier and a noble gentleman.

The Education of the Russian

PROBABLY in no country in the world are the educated and the uneducated classes marked so definitely apart as in Russia. Her educated people are educated to the last point of culture and finish. The literature, art, and science that they produce is of the very front rank. And the universities where this education is given are the equals of any in Europe or America.

But for the common people there are practically no schools and no schooling. Of the eighty millions of people in the United States, eighteen millions are children on the public and private school rolls. Russia has one hundred and forty millions of people, but the school roll is less than five millions. As a consequence the world of the peasant is limited to his commune; beyond that he knows nothing. We can hardly appreciate the narrowness of such a mental horizon; we cannot imagine what it must be to have never heard any book read except the Bible, to have never read a newspaper, and to be in complete darkness about the rest of the world and the whole course of history. It is in fact the peasantry of the feudal period.

Divorce in England

IN connection with Katherine Tingley's speech at the Isis Theatre on Feb. 12th, in which she cited the fact that in the United States there had been 320,000 divorces in twenty years, the following statistics from an English paper, relative to divorces in Britain, are interesting:

For the first 30 years after the Act of 1857 came into operation, only 8,306 marriages were dissolved. In these more progressive days marriages are dissolved at the rate of nearly 10,000 a year. "If divorces continue to increase in the future at the same rate as in the past, in 30 years' time England would be as bad as the United States in the matter of the extent of divorce."

H.

Judge Torrance Not Impeached

THE report of the Assembly Committee on the charges against Superior Judge E. S. Torrance of San Diego, just filed, recites in brief, that "the personal integrity of Judge Torrance is unchallenged and his ability as a jurist unassailable."

It will be remembered that Judge Torrance found for KATHERINE TINGLEY in her suit for libel against H. G. Otis of the *Los Angeles Times*.

The Threatened Fall of St. Paul's Cathedral

LONDON seems to be in serious danger from its own downward growth. Not, of course, the suburban parts, but in the massive center, where the great buildings stand. Tunnelling for underground transit is proceeding so extensively that the foundations of the massive pieces of masonry are giving way. Especially is this true of St. Paul's Cathedral. For some time ominous fissures have become visible in the stonework of the southern transept, and it is now found that the great cross and bell which surmount the dome are as much as three feet out of perpendicular. The building is as it were used to be being destroyed, but fire has hitherto been its enemy. Where it now stands, there was, 1300 years ago, a church, founded by Ethelbert. After 400 years, fire put an end to this first edition.

The second edition was in the Norman style, took about 40 years to build, and was apparently of some magnitude. At any rate William of Malmesbury wrote of it that it "could contain the utmost conceivable number of worshipers." In 1561 lightning and fire made a mere ruin of it. Its restoration by Inigo Jones may be said to constitute the third edition. This in its turn was wiped out by the great fire of 1666.

The fourth and present edition was built during the twenty years 1675-97 by Sir Christopher Wren. In the most crowded part of the city, its fall would cause an extraordinary amount of devastation, and one may well hope that the very obvious warnings may be practically acted upon.

President Eliot of Harvard recently remarked that if some great change should destroy our present civilization, about the only thing by which the archeologist of 2000 years hence could judge us would be our subways. It would seem as if the multiplicity of subways might be the very cause of the "great change" of which he spoke, at any rate as far as regards our cities.

An Excellent Spanish Law

THERE was a very excellent Spanish law, never repealed, to the effect that all patent medicines sold in the island of Cuba should have their composition stated on the label. The Cuban Government proposes to revive the action of this law. But it appears that the island is flooded with these concoctions, mainly of American manufacture. And the effect of the revival of the law in question will be that the Cuban chemists, ascertaining from the labels the formulæ of the medicines, will make them for themselves instead of importing them. Money will thus stay in Cuba that has hitherto come here. A great outcry has accordingly arisen from our unselfish manufacturers, and the pressure they have brought to bear upon the Cuban Government has been able to effect a modification in the action proposed. It will be sufficient that the formula shall be lodged with the Board of Health instead of being placed at large upon the label. There is a good deal of discontent even at this.

One would be glad if that Spanish law were in force here. People would take fewer drugs if they knew what poisons they were inflicting on their long-suffering organs. They will take any quantity of X's "Infallible Vitalizer," but they would hesitate before taking so much avowed strychnine, arsenic, and what not.

Nigeria

NIGERIA, in West Africa, has within the last few years been transferred from the chartered company which was developing it, to the British Crown, which now controls it directly. Later the Northern Hausa States, Kano and Sokoto were added. Northern Nigeria contains vast undulating plains of fertile country, which support large herds of fine oxen, and where the tsetse fly is unknown. Cotton is grown in Southern Nigeria. Much difficulty is experienced from the primitive methods of transport by pack-carrying, and the unconquerable indolence of the Natives, which makes road-building a protracted undertaking.

T.

Frontispiece --- William Quan Judge

THIS week's cover-page of the NEW CENTURY PATH contains the face of Wm. Q. Judge, the second in the line of succession of the world's Theosophical Leaders. Mr. Judge succeeded to the Foundress of the Theosophical Society, Helena Petrovna Blavatsky. A successful lawyer, a brilliant writer, and a man of extraordinary insight into human nature, he was well fitted to carry on the great humanitarian and philosophic work of H.P. Blavatsky.

Some Views on XXth Century Problems

The Real Path

THE road to truth, to the inexhaustible springs of real life, has many bye-paths; and every one of them looks like the true way. But all, except the one, close with a blind wall. All, in our day, are being gradually found out; the wall, the stagnation point, the place of exhaustion, is being discovered. So, gradually, as the situation clears up, the one old way which we might have learned ages ago, which every Teacher has pointed out, is coming to general recognition. That recognition is the generator of the new note of modern literature.

An English art critic recently put the real and only solution in the clearest words:

And it is meet and right that if we wish to live the fullest life we should not only experience our own puny and limited adventures of living, but that we should hold out eager hands and open eager hearts to the emotions of the world; and, if we are not little mean souls, we shall, courage helping us, essay to know the tragedy and the pain and the agony of life as well as its more pleasant splendors and its more alluring mysteries, that we may thereby grope the deeper into life than did the beauty-seeking Greek, setting up pity and nobility and gentleness and the wiping away of tears as a part of our godhood so that beauty alone shall be but the carpet of our heavens.

We have italicized the last sentence; for an art critic is here expressing the truth at last being discovered by those who a few years ago were preaching the cult of beauty and the doctrine of "Art for Art's sake:" the truth that the quest for sensation afforded by objective beauty of any kind, leads at last, like the quest for any lower sensation, to the blank wall. The real path leads to all that is worthy and good among those things to which the bye-paths seem to lead.

The Russian novelist Gorki, has the secret:

The sense of life is not in self-satisfaction, after all; man is better than that. The sense of life is in the beauty and the force of striving towards some aim; every moment of being ought to have its higher aim.

"Not in self-satisfaction:" man must go deeper into himself than that surface "self" which is only a dynamo constantly at work in generating the impulses to self-gratification. The deeper promptings, from the heart, to take up the world's burdens, lead first to peace, and then to joy and self-knowledge. For they are promptings of the soul, the real self, and, followed, are the real path.

Religious Colleges, Once & Now

ONE of the highest officials of the German Protestant Church, Dr. Kaftan, has addressed an open letter to the nation, in which he calls attention to the serious falling off in the number of those studying divinity. He anticipates a famine of preachers, and his anticipations are echoed here and in England. The chief German Protestant organ attributes the situation to the prevalence of critical negative theology, in fact the higher criticism.

The teaching institutions don't attract; the young men feel that they teach things which research has shown to be not true. And the general public feels that the true preacher is not one who has learned something at college, but become something.

These institutions correspond to the initiation colleges among the ancient peoples. We know a little of the work done at these. The primary aim was not to teach, in our sense of the word; it was to awaken in its full strength the soul of the candidate. All else was at first accessory to that, and they recognized the necessity for a degree of preliminary ascetic discipline from which most of us moderns would recoil. To them the soul, the seat of spiritual understanding, was a veiled Presence, a veiled light; and the veil was woven by personal desires. Progress, therefore, lay at first, not in learning things, but in thinning the veil.

Whatever we may now think of their teachings and of their methods, the aim—to unveil the inner Presence—should be that of our modern religious teaching institutions. And they will not again magnetically attract their old numbers till to this extent they imitate their pagan predecessors. They must think out methods that will suit our day.

Diet Simplification

CANON LYTTLETON, in a recent address, denounced the eating of meat as one of the contributory causes of vice. In his indictment he included the modern menu with its complex stimulation to gluttony. We eat, he said, such things as stimulate appetite rather than satisfy hunger.

The question of diet is but little understood. The evils probably flow more from excess, and from mixtures, and from accessories, than from any one article of food in ordinary use. Meat is certainly a stimulant, but some or most of the stimulation attributed to it is due to products (alcohol for instance) generated by its interaction during digestion with other things eaten with it. The various diet reformers' good results are due at least as much to the mere reduction in the number of things eaten at one meal as to the omission of this or that particular thing. The first point is simplification. Cut off the "kite's tail" of the meal, all that procession of diminishing items that follows the main course. And make that main course as simple and uncomplex as possible, including in it hunger satisfiers only, no hunger makers. Many of the benefits promised (rightly) by Canon Lyttleton to the vegetarian would at once follow. For we have educated the palate cravings till they are altogether out of accord with the needs and powers of the digestive system. Each course of a modern meal makes a new appeal to the former without any regard to the latter. The materials for disease are thus steadily accumulated.

We are in no way arguing against the vegetarian propaganda. On humanitarian and many other grounds we wish it every success. But there are large numbers of people who, rightly or wrongly, think vegetarianism impossible for them. Heredity, social reasons, or dislike, make too formidable a barrier. To such of these as are groping about for some sort of reform short of vegetarianism, it is worth while pointing out the great benefits of simplification of mixtures. The more thorough the simplification, the less the chances of interior fermentation and production of alcohols, vinegars and other poisons, to which are due no small proportion of the evils ascribed to meat—even the moral evils.

PHYSICIAN

Prison Reform

IN France, England, and America, the reform of prison régime is receiving much attention. The most urgent element is the separation of the first offender from the habitual criminal, and the marked differentiation of their respective treatment. California seems to be behind the times, judging from the recently issued official report, and to have in use a system which often leaves the young criminal much worse than it found him.

The accommodation for the prisoners is entirely inadequate. . . . The result is that the young and inexperienced criminals are frequently placed in direct contact with experienced convicts, with the inevitable result that the novices learn many tricks and details of crime with which they were not before acquainted, learn to look upon vice and crime as excusable and not disgraceful and to be condemned; and above all, in many cases, are taught the most revolting vices.

The proportion to the rest of the population of those who are, have been, or will be, in prison, is so great that the treatment of criminals is one of the most important problems yet awaiting solution. For it is not anywhere solved; the mean between gushing sentiment and the straightjacket and treadmill has still to be found. The popular attitude must change entirely. The one general idea is to get the criminal under lock and key that we may feel safe—and then to forget him. We are thinking of ourselves, and with nine out of ten of us the approval of punishment rests on gratified desire for vengeance. We never consider any one as affected by the mental atmosphere made about him by the thought of others, or that there is any such thing at all as a mental atmosphere, except as a metaphor. But there is, and most criminals are dehumanized and morally outlawed much more by the trend of our thoughts as they serve their time, than by their own minds and deeds. They are made to feel that the door of human sympathy is shut forever. The alteration of this is the only basis of a reform that shall be real. C.

The Trend of Twentieth Century Science

Harmony and Melody in Vowels

MUCH valuable work has recently been done in the study of voice tones. The further research is carried, the more complex becomes the result.

The subjects of the experiment speak into a phonograph, and the lines traced on the wax of the cylinder, made very exaggerated by unusually long levers, are examined. There are many elements that go to a vowel sound, beside the pitch at which it is uttered. The pitch depends on the rapidity of vibration of the vocal cords, which again depends on their tension. But the sound once made is echoed in various chambers in the larynx, mouth, nose, forehead and head. Some of these have their own fixed note, which they blend into the primary tone. Others, by conscious or unconscious muscular action, can change their note. Then, again, after their first note, they go on and yield certain overtones. Moreover, as their walls are soft, not rigid like those of the resonators of musical instruments, any tones they yield must be very delicately complex. Finally, the main tone as it comes from the vocal cord, is not simple as if sent forth by a mechanically-stretched membrane. It is stretched by a multitude of sets of muscular fibers. A recent lecture reported in *Nature*, expounding the results of recent experiment, says: "Assuming that each muscle-fiber has a separate nerve fiber . . . one can see that the tension of the cords, even when adapted to the production of a tone of a special pitch, might be so modified as to give out a tone-wave of a special form, and that thus an almost infinite variety of qualities of tone (tone colors) might be produced. The special quality of tone would thus, in the first instance, depend on the psychical condition of the individual at the moment."

The voice is thus the exact manifestation of the condition of the owner at any moment. His feeling is indicated by the primary pitch at which he will speak his vowel; by the shading of the tone due to minute differences of tension of different parts of the vocal cords; by the overtones added in those of the resonating chambers which have muscular walls under the control of the will; and by the overtones added in the bony resonating chambers. And finally, subtler overtones in vast numbers, never yet studied, must be added from all over the whole body, answering in the most marvelously complete way to the temporary conditions of health and feeling. Truly if we knew how to interpret voices there would be nothing hidden from us in the character of men; nor could we hide anything of our own character.

Each vowel, it is found, is a musical movement, with melody and harmony. It is a melody, because from the moment that its sounding is begun, on to its end in a consonant, it is subject to a succession of changes of pitch, varying from the slightest shading up to several tones. And the melody is harmonized, because at each fraction of time, the overtones—which make of every tone a complex chord—continually change as the tone is sustained, even though its whole duration is only a minute fraction of a second. It is this melody and harmony, not, of course, the primary pitch of tone, that determine the differences in quality between one voice and another. STUDENT

Crystallizing the Dialects

SOME Austrian men of science are now doing for the European languages and dialects what is being done for the Indian languages here—that is, they are registering them for all time to come on the phonograph. Dialects will be added from time to time, and ultimately it is intended to get every form of speech in the world thus placed on permanent record. Special metal plates have been prepared to take the impressions. The work has already made some progress. The dialects of Austria, Germany, Greece, Servia, and some of the Slav countries have already been photographed, so to speak. There are also records of Arabic and Bedouin songs and dialects. If only the old Romans and Greeks had known of the phonograph! Not only should we have escaped all the difficulty in determining how those languages were pronounced, but we should have the self-recorded history of nearly every speech on earth for the last several thousand years. STUDENT

The History of the Horse

THE whereabouts of origin of the "original horse" is a somewhat doubtful point in science; but modern opinion is inclined to give him this continent for a home. In the days of his origin here he was striped. Then, going southward into South America by way of Panama, into Asia by way of a strip of land that once spanned Bering Strait, and possibly into Europe by way of Atlantis, he split up into the various forms of ass, horse, and zebra. His migrations were very thorough; none of him stayed behind here, so that when the Spaniard came he was most conspicuous by his absence.

Contrary to the general trend of animal life, the horse, as he gradually evolved, has increased in size. His primeval ancestor, curiously enough, was the same with the ancestor of the tapir and the rhinoceros. After he had begun to diverge from these, his cousins, and become distinctly a horse, he was at first no larger than a fox. Then he was as large as a sheep; finally as large as a donkey. Along with this change he was learning to walk more and more on the point of the toe-nail of his middle toe. And finally all the other toes entirely disappeared and this nail became so large as to lose all resemblance to what it had been. It is in fact now his hoof.

That, in brief, is his eventful history, and one wonders whether primeval man, selecting him and breeding him for the qualities he wanted, may have had anything to do with his increments in size? STUDENT

The Earth's Interior

WHEN we reason about the earth, we do not keep sufficiently in mind its vast dimensions and the proportion between these and the objects and distances on its surface. Let the circumference of the earth be represented by the largest circle that could be drawn on this page, 8.8 inches in diameter. Then the highest mountain is 1-164 inch high. The volume of the earth is about 260,000,000,000 cubic miles.

All this mass, we are assured, is continually contracting as it cools. No doubt the contraction is slow, but one cannot imagine the very slightest movement taking place in such a stupendous mass without utterly shattering everything upon the surface, so great is the disproportion in size.

The difficulty is, not to account for earth-movements, but to explain the miraculous *stillness* of the earth's surface. Perhaps it is held motionless by powerful magnetic forces. The tendency in science is towards finding electrical explanations of things. Dynamical formulas are going out of favor everywhere.

Geologists cannot sufficiently well calculate even their ordinary physical data to determine whether the earth's interior is solid or liquid or partly solid and partly liquid. Possibly it may be gaseous, since gases cannot be compressed into liquids above their "critical temperature." Perhaps it may be hollow. E.

The Vitality of Seeds

WHETHER corn, taken from Egyptian tombs, has ever sprouted, seems open to considerable doubt. There is however fair evidence that raspberry seeds have retained the power of growth after half that period. An English horticultural magazine says that some time ago it was found that some seeds of this fruit tree were taken from a tumulus near Dorchester, presumably at least 1500 years old, which, planted, grew into raspberry canes and were publicly exhibited. Strawberry seeds also, have lived as much as a century. There was a beech forest at Selborne which had stood for that length of time. Previously the spot had been covered with strawberry plants. When some of the old trees were cleared away Gilbert White noticed that the ground became once more covered with strawberries. So far as we know, the only cause of the death of seeds is the development in their substance of some minute form of fungus. Any such invader requires at any rate some moisture; and if before the invasion the seed had become perfectly dry, it is difficult to see why it should not remain alive. But even dry seeds may have a secret cycle of changes ending in death. STUDENT

WOODS NEAR ARNHEM—HOLLAND

SYMPATHY WITH NATURE

FROM "THE POET'S BOAT," BY WORDSWORTH

LONG have I loved what I behold,
The night that calms, the day that cheers;
The common growth of mother Earth
Suffices me,—her tears, her mirth,
Her humblest mirth and tears.

The dragon's wing, the magic ring,
I shall not covet for my dower,
If I along that lowly way
With sympathetic heart may stray,
And with a soul of power.

These given, what more need I desire
To stir, to soothe, or elevate?
What nobler marvels than the mind
May in life's daily prospect find,
May find or there create?

Gorgeous Fabrics of the Deep Sea.

THE skeletons of certain Protozoa, known popularly as Glass Sponges and scientifically as Silicispongiae, are most magnificent, being composed of a network of silicious spicules which looks like beautiful spun glass. The shapes, too, resemble elegant vases and intricate baskets, of design and proportion such as no mortal artist could conceive. Nevertheless, we are told, these organisms were many years ago thought to be specimens of Chinese carving(!),

and even sold at fabulous prices as such. Their distribution is almost world-wide, and they occur in deep water, sometimes even in abysmal depths. One of this group, called Protospongia, occurs as far back as the Lower Cambrian System of Wales. The living animal is a humble and unadorned denizen of the mud, and does not reveal his beauties until after death. STUDENT

Wonderful Endurance of Insects

IT does not seem quite clear why insects should ever be spoken of as "cold-blooded" creatures, since they have a circulatory system and an unusually powerful respiratory system by which the blood can be oxidized.

And experiments have been made which show that insects do produce heat, varying in amount according to the intensity of their muscular exertion, as with other creatures.

Inch saw a Fahrenheit thermometer rise five degrees in a glass vase full of *Lytta vesicatoria* and seven degrees in an anthill. Swammerdam and Réaumur observed that the temperature of beehives keeps above that of the exterior air in winter. . . According to Huber, who repeated these observations, this temperature is nearly constant at 25° Réaumur (88° F.) When the bees in the glass hives used by Réaumur in his observations were agitated they caused their wings to vibrate with great rapidity, and the interior heat then increased to such a point that the walls became very hot; often even the wax melted.

Insects have a remarkable power of resisting extremes of cold and heat, which they do by suspending nearly all the vital functions. Lacordaire observed that some caterpillars of the genus *Leucania*, though frozen so hard that they were brittle and made a metallic sound when dropped into a glass, yet went through their metamorphosis normally in the spring and turned into butterflies at the usual time. Another observer saw caterpillars return to life after having been enclosed in a block of ice.

Similarly there are records of insects coming to life again after immersion in boiling water. Hydrocanthars live in hot springs; melasomes can live on the surface of the sand under the ceaseless rays of a vertical sun.

The Oriental Plane-Tree

THE oriental plane-tree is highly prized for its shade, though it gives less shade than the occidental or American plane-tree, also called sycamore and buttonwood.

The oriental plane has been most highly valued from ancient times, and was held to be the finest shade tree in Europe. Cimon planted a public walk with it to please the Athenians. Pliny tells how this tree was brought across the Ionian Sea to shade the tomb of the Trojan hero Diomedes; and expresses his admiration that a tree should be brought so far only for its shade. From this place the tree was taken to Sicily and Italy, where it arrived as early as the taking of Rome by the Gauls. Thence it was carried to Spain and remotest France, where "the natives were made to pay for the privilege of sitting under its shade."

It was held in highest esteem by the Romans, being valued in summer for its deep shade and in winter for letting the sun shine through. They made great use of it in ornamenting their villas, and are said to have nourished it with pure wine to make its shade more broad.

Pliny describes some wonderful planes. He says there were trees in the walks of the Academy at Athens whose trunks were forty-eight feet to their branches. He tells of a tree at Lycia near a fountain by the roadside, having a cavity of eighty-one feet circuit within its trunk and an immense forest-like head. Within this cavity, made to resemble a grotto by moss-covered stones, Licinius Mucianus dined with nineteen companions and slept there also.

The largest plane-trees are found near running water. That is their natural home.

Modern Persians prize the plane-tree highly and make use of it in their gardens and worship in its shade. Great numbers of these trees planted near their dwellings are thought to be a protection from the plague.

Much use is made of the wood of the plane-tree in Persia and other parts of Asia. The Persians are said to employ no other for their furniture, doors and windows. It has a smooth grain and takes a brilliant polish.

Students of the classics will remember that Horace, in one of his Odes, alludes to the curious fact that ivy will not twine around the plane-tree. S.

In one sense, all our interpretations must be imperfect, for language fails in its effort to declare the simple Truth.—*Katherine Tingley*

SEARCHING and searching for the truth,—students of the true philosophy of life,—are we absolutely certain that the truth is what we want, after all? We want the glorious truth, the hopeful truth,—but do we perpetually and honestly want the terrible truth, the whole truth? We wish to know something of human nature,—are we always brave enough to look into our own natures? We desire to fathom the hearts of others,—dare we fathom our own hearts and can we bear the sight of all we find there when we do?

It is an old saying that he who tells the truth is turned out of nine cities. It is historical that all Teachers of Truth have been crucified, and, until humanity is transformed, crucifixion will still be theirs; if not the crucifixion of the body, then the more subtle and torturous crucifixion of heart and soul. Humanity might bear the truth, *but it does not want to*. So the World-Teachers come and pass on, doing what they can and all that humanity will let them. But there are always the few who listen, in every age, to the great Teacher. These, just in the proportion that they earnestly desire truth, step aside from humanity's beaten track and become pioneers. Yet, even they can bear only so much,—or rather only so much do they want to bear, so insistent are personal desires, personal likes and dislikes.

Most of us—as women—lack what might be called “the adjusting sense.” Little things fill up our life's entire horizon; great things, that might better absorb our attention, we fail to see at all. Circumstances assume proportions that are vague and distorted because the brain is clouded by some desire or other. And so it goes. With many, if it were not for an occasional shock, there would be scant hope of their ever seeing things in the proper adjustment or the true light at all.

But the shocks come, usually from a sharp, quick awakening to some blunder. Then it is that, for a moment, the clouds are torn away, and we have the opportunity to see things as they are.

Few, indeed—among women or men—have the courage to look upon the bare truth, even though they know that to do so, honestly and impersonally, would actually place the soul in command of their lives. We shrink, our eyes drop, the pain is greater, not than can be borne, *but greater than we desire to bear*. And so most of us get but a glimpse of the real thing when we drop back and let the personality rule. That is why we make mistake after mistake. That is why events discourage us; that is why we are so often simply crushed under the weight of circumstances. We say that we want the truth, but when the wise Law

“GIVE ME TRUTH FOR I AM WEARY OF THE SURFACES”

offers it to us, *we will not pay its price*.

To the soul all events are appropriate, all opportunities divine, all circumstances fitting, for the soul's place is close to the Law. To the personality no event is ever quite what is desired, and most events are righteously to be lamented. This thing must be changed, that adjusted, and so on until the frying-pan is exchanged for the fire, again and again.

And the personality,—is it satisfied then? Oh, no, it becomes still more obstreperous and one of two things is certain to result. Either we meander on and on, through disappointment after disappointment, to destruction, or the pain becomes so great that we are awakened to our true position and bid the soul come forth and take the helm. How many women have the courage to do this—the courage to take the personality—that part of ourselves which is a bundle of squirmings and objections and wants—steadily in hand, never once loosening our hold on the reins until it is under control? Until we do, however, we will be but half sane, nine-tenths of our mental energy expended in rummaging the past and speculating on the future, one-tenth only at our service in the living present. Shall we wait till this godless thing that looks over our shoulder has burned out our whole being, ruined our hopes, stripped us of all that belongs to the heart life? Most of us do, alas,—*but we need not*.

How many of us dispose of this or that desire (and fancy that we are making tremendous inner conquests) by simply transferring its energy to another field? We kill out the desire for fine clothes, for example, and in its place plant the seeds of a selfish, personal desire for, say, fine morals! There are those who, ceasing to strive for the approbation of their neighbors, forthwith go to lengths that are debasing to gain the approbation of one whom they consider their superior on moral lines—all blissfully unconscious of their own hypocrisy! And so it goes. Result—peace is no nearer than before and one's capacity for making blunders has increased.

Let us, as women, meet the events of life,—at least let us make a superhuman effort to do so,—as one meets that which is within control. Let us not insult the Law by complaining at its gifts nor by trying to make them over. Let us acquiesce, not passively, but consciously, actively, joyfully, gratefully. Until we can do that, day after day, year after year, in sunshine and storm, not with a mighty effort, but as easily as a sea-bird flies—until then we are hypocrites to talk of wanting truth. We don't really want it, and, what is equally to the point, we wouldn't know what to do with it if we should get it.

DO your duty, that is all;
Go right on and close behind thee
There shall follow still and find thee
Help, sure help!—*Selected*

Evangeline

ALIVING descendant of the family into which the heroine of Longfellow's poem was taken as a child, her own parents having died, has recently told her story as, he says, it was told to Longfellow many years ago.

Emmeline Labiche was just sixteen, gentle and sweet-tempered, the handsomest girl in the village of St. Gabriel. From childhood she and Louis Arsenaux had been lovers, and their formal betrothal had just taken place when the hostile ships entered the peaceful harbor.

The men were rudely separated from their families and friends, Louis Arsenaux resisting with all the rage and despair of baffled love. Emmeline witnessed the whole scene; tearless and speechless she stood, fixed to the spot, to see her lover wounded by his captors and forced on board the strange ship.

Henceforward she lived a quiet and retired life, mingling no more with her companions and taking no part in their amusements. The remembrance of her lost love remained enshrined in her heart.

Thus she lived in our midst, always sweet-tempered, with such sadness depicted on her countenance and with smiles so sorrowful, that we had come to look on her as not of this earth, but rather as our guardian angel. Thus it was that we called her no more Emmeline, but Evangeline, or "God's little angel."

Banishment was the fate of the young girl's protectors and she journeyed with them to Maryland and later to Louisiana. When they reached their destination in the Teche country the whole population came out to welcome them. Emmeline walked at her mother's side.

Suddenly, as if fascinated by a vision, she stopped, and then the silvery tones of her voice vibrating with joy, she cried: "Mother! it is he! It is Louis!" And she pointed to the tall figure of a man standing beneath an oak. It was Louis Arsenaux. She flew to his side in an ecstasy of joy and love.

But a cruel blow was in store for the gentle, faithful girl. Her lover's constancy had not survived the separation and the blighting of his youthful hopes; he had pledged himself to another, and could only shrink, shamefaced, away from Evangeline. This rude awakening from the dream she had so long cherished was too great a shock. Her reason fled, never to return.

We cannot but be grateful to Longfellow for giving us, in his version of the story, an Evangeline of more heroic mould, one of the stronger sisterhood who draw from a great love their inspiration to work for others, an inspiration unaffected by desertion or disillusion. Humanity owes a tribute to many such brave souls, who cannot be crushed by the rending of personal ties. The world needs women not to die for love, but, like Longfellow's Evangeline, to live and work, not only for love's sweet sake, but because it is right and true, the open gateway to the Higher Joy. And even the darkest ages have had many such.

STUDENT

AN undertaking of unusual interest is the establishment, in an eastern city, of several food-supply kitchens, all conducted by women. The idea originated with two young college graduates who had made a study of the chemistry of cooking. They started a bakery for the purpose of supplying scientifically-baked bread, rolls, etc.

This enterprise was so successful that they next opened lunch rooms and later formed a food supply company. Hot meals, in patent cans, specially designed for retaining heat, are furnished by these laboratory-kitchens, which have now become famous and are taxed to supply the ever-growing demand. Why may not this be a step toward the solution of the wearisome, perplexing—and still unsolved—domestic problem? H.

Japanese Dress

THE social functions in Japan at the present time offer an opportunity for an object lesson in dress. Japanese ladies in the costume of their country, with its exquisite colors and rich textures robbed of none of their beauty, but hanging in the classic folds that so delight and rest the eye, move about side by side with their sisters whose so-called progressive ideas have led them to adopt Western modes of dress, and the women of the foreign colony in all the elaborately designed elegance of a Parisian costume.

The last-named may well accept the evidence of their own eyes as to the peculiar fitness and charm of the Japanese costume, and begin to do a little adapting of ideas on their own account; for one point in which Oriental peoples are in advance of the West, is in the beauty and comfort of their dress.

Ideal costumes will never be evolved among us until our appreciation of color and texture forbids the disrespectful use of beautiful materials, which most of our dress-patterns necessitate. Perhaps, when the women of the West have some actual experience and training in the industries that produce these materials—not as factory hands, but as intelligent investigators of Nature's offerings, and as artists and experts in crafts belonging particularly to the distaff side—their interest may hasten the revival of some of the ancient ideas on the subject of dress, ideas based on knowledge of the relation of the soul to the outer garments worn by the body.

Is it not time for a new gospel on the subject of dress? STUDENT

APPLE BLOSSOMS IN EVANGELINE'S LAND NEAR GRAND PRÉ, NOVA SCOTIA

FRAGMENT

by LOUISE IMOGEN GUINEY

"**S**PIRITS of old that bore me,
And set me, meek of mind,
Between great dreams before me
And deeds as great behind,

Knowing humanity my star
As first abroad I ride
Shall help me wear, with every scar,
Honor at eventide.

Let claws of lightning clutch me
From summer's gloaming cloud,
Or ever malice touch me
And glory make me proud.

Oh, give my youth, my faith, my sword,
Choice of the heart's desire;
A short life in the saddle, Lord!
Not long life by the fire."

What California Club-Women Are Doing

CALIFORNIA Club-Women have started a campaign against the spread of tuberculosis. The Social Science department of the California Club of San Francisco not long ago distributed through the State a circular stating facts upon this question. To quote from this circular:

WHEREAS, It is the sense of the California Club that State and Municipal laws should be enacted whereby the spread of tuberculosis in all its forms may be prevented, and whereby there shall be inaugurated a systematic education of the public in the care, treatment, and prevention of the disease, and whereby State Sanitoria shall be established for the scientific treatment of pulmonary tuberculosis, etc.

This club is preparing a bill to be introduced in the coming Legislature, asking that an appropriation be allowed to stop the spread of this evil. An urgent appeal is also being made to the people of the State to aid in the passage of this bill.

Clubwomen are also interesting themselves in a petition to the Legislature for the preservation of redwood forests. A. L.

MISS LAURA CORNELIUS, a young Indian girl of the Oneidas, who has been sufficiently well educated to appreciate the position of her people, feels that the threatened extinction of her race will be a serious loss to the world. She wishes to secure better opportunities for her people and along wiser lines. For this purpose she is preparing to study law, and when qualified she will give her advice to her kinspeople free of charge. She says:

I am proud of my Indian birth and blood. But my people must conform to the new order of things . . . they need good and intelligent advice and guidance. And it is to this work that I intend to devote my life.

We may yet turn to the Indian for inspiration in self-forgetting devotion to the larger interests of our own race. Who can prophesy? W.

OUR YOUNG FOLK

The Days of Chivalry

MANY boys and girls enjoy reading the legends of the age of chivalry. When they read these romances full of the brave deeds of knights-errant, they are fired with enthusiasm and long to serve nobly in some sacred cause. People have forgotten, today, all that it meant to be a knight. Schools and colleges such as we have did not exist in the age of chivalry; there was little learning, but, nevertheless, the youths were trained.

He who would win the golden spurs of knighthood must first of all learn to serve. Every court and castle was a school in which the young received moral and physical training. The boys began, when they were eight years old, as pages. The page was in constant attendance on the lord and lady of the castle. From his master and the squires he learned to use the spear, to bear a shield, to march like a soldier, and from the huntsman he learned "the mysteries of the woods and rivers."

When he was fifteen the youth became a squire. He still served his lord and lady at meals, and he assisted in preparing the great hall for the dance or for the performance of minstrelsy. He learned to tilt, to use the sword and battle-axe, and to run and leap and swim. He learned also to bear the weight of the heavy armor of those days. And every squire voluntarily submitted to hunger and thirst, fatigue and sleeplessness, while still on duty, so that he might be practised in endurance.

Next, the youth became "a squire of the body." His duty was to bear his master's shield in battle, to hold aloft and guard his master's banner. If his master fell in the fight, the squire must raise him, if he were overpowered the squire must fight by his side; must rescue him if he were captured, care for him if wounded, bury him when dead.

For seven years he served thus. If he served loyally and worthily, he received the accolade, and was dubbed "Sir Knight."

In the age of chivalry religion and arms were closely allied. The knights were the only class outside of the clergy who had any real power. And they had what all great warriors in every age have had—an ideal. Their ideal was devotion to the service of others. Every knight must be a champion, a defender. As the years passed, different orders of knighthood were founded to protect and guard the things that were held precious. Self-denial, generosity, high courage, nobility of spirit, were the knight's duty. And one other thing, oh dear boys and girls of the Twentieth century—*courtesy*.

The knight must not only have at his command the forms of ceremonious politeness, but he must have always as well the sense of his own dignity, the consideration for others, the modesty of bearing, the power to obey without surrendering his freedom, that makes true courtesy.

Some boys and girls who are students at an academy in Chicago, recently organized a club called "Knights and Ladies of Courtesy." The object of the club is "to promote politeness and a more accurate and dignified use of the mother tongue."

A crusade against careless speech and the use of slang! This is as noble a cause to serve as ever knight or paladin had in days of chivalry—an order of knighthood to guard and protect from ignoble use the lan-

guage that is every day growing to be the language of the world. The "Knights and Ladies of Courtesy" will discover, if they are faithful in their quest, that if they do gracious deeds, and speak gracious words, their hearts will soon yield the true feeling that is the very soul of courtesy.

Early in the age of chivalry the wonderful custom of "brotherhood in arms" was established. Brothers in arms shared every danger and every victory. The honor of a brother was as dear to a man as his own. Vows of fidelity were exchanged, and were kept till death. We may well believe that there were many true comradeships in the days when knighthood was in flower, and that many a noble and gentle knight served the cause of brotherhood as well as might be, in the world as it was then.

COUSIN MARJORIE

What about Air-ships?

IT is stated that the first successful flight of an air-ship was made at the St. Louis Exposition during the month of October last, an almost remarkable fact, considering the fascination that the air-ship

has always had for inventors and the many attempts that have been made to solve this problem. When one watches birds fly, one cannot help dreaming of that time, so long ago that no written history tells us anything about it, when man had the same power over the air as over the earth. What was the secret of this power? Was it some mechanical twist and contrivance, or some secret the birds have and which boys and girls, and scientific men as well, have not yet rediscovered?

Raja Yoga boys know that all things have their opposites

and the other day I heard a Raja Yoga boy reasoning something like this:

"If there is a force called gravitation, has it not its opposite force; and will not the time come when we shall rediscover and understand it, and why have we not rediscovered it already, and why——" and then he stopped, for he had a duty at hand. Raja Yogas spend no time speculating, you know; they just work on, doing the duty of the moment and the first thing you know

there is a miracle. If I cared for prophecies, I'd venture just one and it is this, that something better than any air-ship ever dreamed of, may be discovered one of these days, and that men will regain some of their long lost powers. But that will not be until men become just enough to use their knowledge wisely.

Facts Worth Knowing

THE United States Government plans to cover eight hundred miles in its Philippine railroads.

HISTORIANS say that the year 1904 has given us the greatest battles, one of the most remarkable sieges, and perhaps the most brilliant series of victories ever known.

THE only citron orchard in the United States is located in California, at the foot of the San Gabriel mountains. The citron, as you know, is related to the lemon, and until recently all fruit of that kind used in the United States has been shipped from Corsica. We use something like 300,000 pounds of the dried fruit, annually, chiefly for candies and cakes.

YOUNG STUDENTS OF THE RAJA YOGA SCHOOL, LOMALAND
AMONG THE GUAVA BUSHES

A Boy, with a mass of tangled curls,
And ruddy cheeks, and laughing eyes,
Beginning to search for the meaning of things;
Who has no creed but his Whates and Whys.

Naught but a boy!—yet suddenly
The years slip past and I seem to see
Through the mists of the future a far-off day:
I look; and I know what the boy may be!

THE CHILDREN'S HOUR

The Raja Yoga Question Box

TWO great souls were at work during the same years, one in England, the other in Spain. They died on the same day, leaving their books to teach to men the mysteries of the human heart.

1 Who was Cervantes?

ANSWER—Miguel de Cervantes Saavedra was born in Castile, Spain in 1547. As a boy he recited one of his poems at a public festival. He studied at the University of Salamanca. When twenty-one he went to Italy as page to a man of letters. Spain, Venice and Rome were then at war with the Turks. Cervantes enlisted as a soldier. In the famous battle of Lepanto Cervantes fought in a post of great danger and showed extraordinary courage. He was severely wounded. Later in the war, Cervantes was captured and taken to Algeria. He was imprisoned there for five years. In prison Cervantes was still a hero. He was patient and cheerful, beloved and honored by his fellow prisoners. At last a ransom was paid for him, and he went back to Spain. When he was an old man he wrote *Don Quixote*.

No book since printing was invented had had so many readers. Cervantes suffered much in his life. He was poor, and he was persecuted. But he was always a man of unstained honor, brave, and wise, and kindly.

2. Who was Shakespeare?

ANSWER—William Shakespeare is the national poet of England. He was born in Warwickshire, the very heart of England, in 1564, in a glorious age. Men loved their country and their Queen. Brave soldiers fought for England on land and sea. Daring seamen sailed the world over to add to her wealth. Scholars studied the heroic deeds of the past. There were poets, cavaliers and wise men in England then. The nation was ready for the touch of a master hand. Shakespeare gave this touch, and it was felt over the world. The stage was the voice of the nation at that time. Shakespeare was an actor, a dramatist and a poet. His plays are a great book in which we can learn about life. Shakespeare was also a prompt and prudent man of business. He was honorable and generous, and loved by all because of his gentle honest nature.

Theosophy's Message to Children

WHAT is Theosophy's message to children? It is to Katherine Tingley that the formulation of it is due, for she brought a new watchword and sounded for all a new joy-note, but especially for the children. It is, "Life is Joy."

The child heart knows that life is joy and responds to the truth. It is the message that every child brings with it out of the fair beyond. But because we, the grown-ups, have failed to keep this joy-note in our hearts and have lost our knowledge of what life means, this beautiful truth is soon stifled in the hearts of the children. How they must wonder and how the child soul must grieve that the joy-note it brings with it from the past is so little understood!

What can keep this sense of joy alive, this assurance that *life is joy*? For answer we have the second part of Theosophy's message to children: "Raja Yoga." This, too, Katherine Tingley has defined as being "the perfect balance of all our faculties, physical, mental and spiritual." How shall we gain it? By learning to know what only Theosophy can teach, our own natures. These, too, are her words: "Too often do we ignore that which lies beyond the young form, the soul, seeking and reaching out to gain a place in the common life of humanity and to fulfill its mission in serving all that lives. Make the child acquainted with its divine nature, point out its comrade-in-arms, the little evil-doer, the undeveloped lower nature seeking entrance but to blind and draw the child away from its good, true, happy, joyous place in life."

Still another message has Theosophy, and it is this: that the beautiful legends of the past, of queens and kings and heroes are true; that there was once a Golden Age on this fair earth; that the children, and only the children, can bring back again those golden days, fairer and purer than ever; and, also, that in doing this, children themselves shall become kings and queens, warriors and true knights.

Their own hearts tell children that these things are true. They know what grown-ups sometimes have to be told, that children may be the Light-bringers, the Torch-bearers of the new time.

"The children, the children, surely they are the Torch-bearers, the Light-bringers!" These are the very words spoken but a few years ago by one of our compassionate Teachers; by one who loves little children beyond all else in the world. What a prophesy they hold! **STUDENT**

SOME LOMALAND PETS

THE FAIRIES

WHEN all the world is fast asleep,
And stars bestud the sky,
Some say that fairies revels keep,
Until the dawn is nigh:

They visit the earth from the realms of romance,
To gleefully sing, and to laugh and to dance;
They never bend the branches, in skipping o'er the trees,
Nor crush a blade in dancing to the music of the breeze.

A Rainbow in Winter

DEAR CHILDREN OF LOMALAND: Have you ever seen Niagara Falls? And if you have, can you ever forget the wonderful sight of that pouring, shifting mass of water, falling down, down, down until it is lost in the mist? And can you ever forget the roar and the swirl of the rapids above and the rapids below, and the whirlpool and the rocks and the brave little boat that winds in and out, so close to the danger line? Do you imagine the noise could ever be silenced, even a little, or the flow of the water stopped, even a bit? Well, that is the case sometimes. It happens in the winter—and here I am in Niagara Falls in February! The great Horseshoe Falls are narrowed somewhat and the American Falls look like a little river and all about is snow and floating ice. Snow and ice are everywhere.

I cannot help writing you this when I think of you, Buds and Blossoms of Lomaland, in that Paradise where the sun always smiles and where never a day passes but flowers nod and beckon to you. It does not hurt to have contrasts, does it? Sometimes it helps.

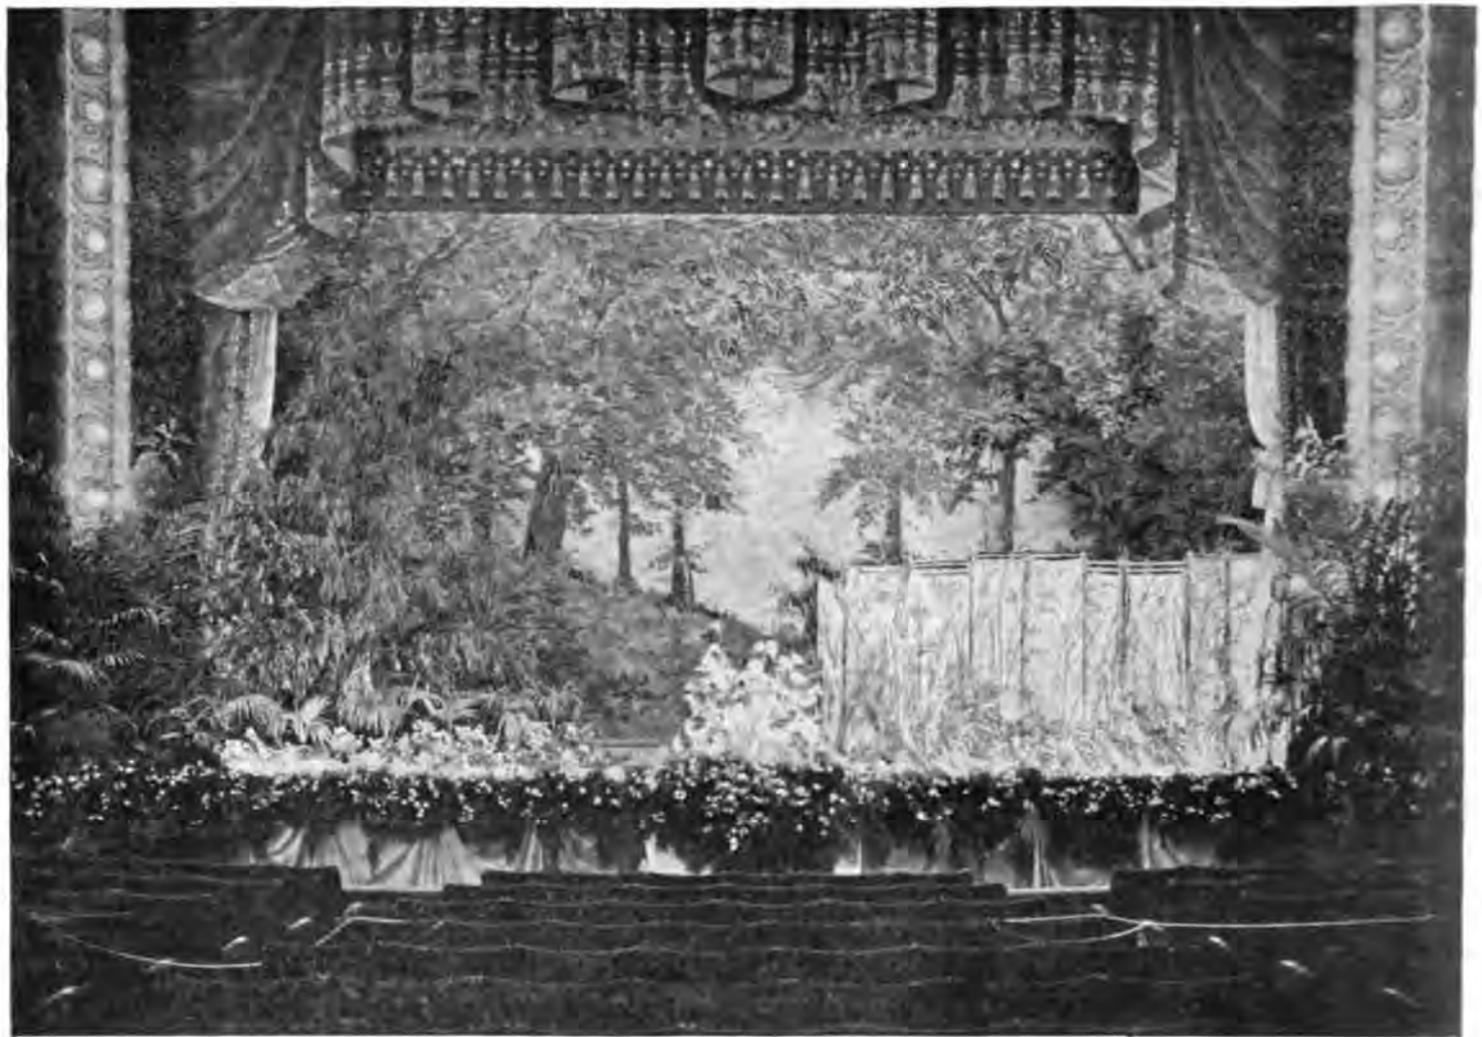

Oh, I must tell you about the rainbow of this morning, for you know what rainbows are like. The rainbows of Point Loma, that arch the whole sky at times, are famous, you know, as far as tourists can journey or letters can go. Well, this morning at the side of the American Falls the wind swept the mist into a great mass of cloud and above it hung the most beautiful rainbow. As the sun came out its beauty was reflected on the shining snow crusts. It was a lovely sight.

Well, goodbye, Buds and Blossoms, I wish I might send you a snowball. Your loving friend,
H. H. S.

DEAR CHILDREN: Here I am going up old Mount Vesuvius; and how? On foot? No, on a trolley car. It does seem curious, doesn't it? The highest section of this Mount Vesuvius railway is a cable-road which was constructed nearly a generation ago. At the top is a great cone of ashes rising above the vast hill of lava, about which fields of petrified lava spread themselves in the most extravagant formations. Over all rises a black column of smoke. Is Vesuvius sleeping merely and when will she waken again? Who knows? Soon Herculaneum, the great summer city, buried under the lava from the crater of Vesuvius will awaken, and give its treasures to the world. For men of science have begun to dig down into the lava bed where it has quietly rested so long. **A LOTUS GROUP TEACHER**

THE THEOSOPHICAL FORUM, IN ISIS THEATRE

THE Universal Brotherhood meeting at Isis Theatre last Sunday evening, beside the very delightful music rendered by the Isis Conservatory students, consisted of three short addresses by Point Loma students.

The first speaker, Miss A. Wheeler, announced as her subject: "Theosophy for Children." "All systems of philosophy must stand or fall by their practical value to the needs of humanity. Today, Theosophy is challenging the attention of the world by the application of its principles to the education of children, under the title of the Raja Yoga system. To quote the words of Katherine Tingley, 'The truest and fairest thing of all as regards education is to attract the mind of the pupil to the fact that the immortal self is ever seeking to bring the whole being into a state of perfection. The real secret of the Raja Yoga system is rather to evolve the child's character than to overtax the child's mind; it is to bring *out* rather than to bring *to*, the faculties of the child. The grander part is from within.'"

In a paper entitled, "Theosophy for Young Folk," Miss A. Lester said: "I hold that a practical application of the truths which Theosophy teaches is what the boys and girls of today need. And what are these truths which every child should be taught? A knowledge of his own divinity—that he is a soul with many lives behind—with the eternities ahead—that he is a result of his own past—that his future depends upon his own effort, and that there is no limit to the possibilities of his own nature."

The closing address of the evening was by Mr. S. G. Bonn, his subject being "Theosophy for the Old." In part he said: "There have ever been in the hearts of men in all ages a yearning for and clinging to youth, and the disappointment and shattered hopes have come only wherever they have striven for one of physical imperishability. When the explorer, Ponce de Leon, came to this country shortly after its discovery, the Indians told him of a Fountain of Eternal Youth, whose waters would keep him who drank of them young forever, and he spent years of hardship and suffering searching for it, only to die broken-hearted and disappointed. Had he but understood the real and deeper meaning of the Indian legend, his quest would not have been in vain.

"For there *is* an eternal youth—a youth that never dies. And it is to this spark of youth that is ever present in the most withered body, that Theosophy brings the hope and power to kindle again the flame in all its beauty. Those who have passed the turning point in life that divides youth from old age, and who look with saddened eyes back o'er the happy plains of early manhood or womanhood, with all their hopes and aspirations, Theosophy bids look up and forward—bids them turn to that divine youth that is ever waiting to be called. It brings to them the assurance of a realization of all the noblest aspirations that they once had and have put aside as hopeless.

"For those who rightly practice the teachings of Theosophy there is no old age, nor can there be where life is true and real. That this body which we now inhabit will in time have served its purpose and pass away is but natural and to be wished for. Let us see that we use it wisely and that it always rings true to the Master's touch. Let us feel, as Theosophy teaches, that it is but the temporary home of that youth that is incorruptible and that will guide us safely if we will but let it.

"Old age? It is but the preparing for another and more glorious youth, where the battle will be fought again, but with greater hope and greater power to succeed. Where brother calls to brother, and the call is universal.

"And it is to be in harmony with this Divine Law that Theosophy urges men. To feel that they are a part of it, not outside of it; to feel that they are builders, not destroyers, under it; to feel that it is ever striving to express itself if we will but call upon it to work through us."

Theosophical Meetings for Sunday Night

Public Theosophical meetings are conducted every Sunday night in San Diego at 8.15, at the Isis Theatre, by the students of Lomaland.

Theosophical subjects pertaining to all departments of thought and bearing on all conditions of life are attractively and interestingly presented.

Other interesting features of these weekly gatherings are the excellent music rendered by some of the Students of the Isis Conservatory of Lomaland, and the efforts of the children of the Raja Yoga Schools at Point Loma. Theosophical literature may always be purchased at this meeting.

Art Music Literature and the Drama

The Music of the Future—What Are the Assurances?

WITHIN the last thousand years music has progressed from primitive two-part harmony to the vast resources of musical art found in the complex and expressive works of Richard Wagner. The question arises, will music continue to progress at this rate?

Some musicians doubt the probability of greater advancement along certain lines than has already been made, and one of Beethoven's biographers speaks of him as the greatest composer the world has ever known or ever will know, adding that, with Beethoven's symphonies, the last word in instrumental music has been spoken.

Beethoven was a colossal genius, one who in the particular forms in which he worked has given the world the greatest tone-poems in its history, yet he was an *avowed student* at the time of his death, declaring that at best he had only made a beginning.

We must consider the means that are used to develop musical faculties, and what is the future of music?

Albert Lavignac, of the Paris Conservatory, has recently published a work entitled *Musical Education*, which deals with this very subject. He speaks of the commercialism connected with music-schools in America, and he suggests that the business interests of these institutions make impossible truly artistic results. The fact is that conservatories in this country are so poorly endowed that, as an American writer suggests, "they must cultivate commercial shrewdness in order to exist at all," but as he further says, "Commercialism and real education cannot long exist together, and so we need a musical Carnegie—to donate millions for the establishment of finely equipped conservatories which will afford the real opportunities."

But, given national institutions with all the so-called "best advantages," are we then assured of the impetus to *real* growth from which will spring the higher musical life—the true art—of the future?

We can see the product of just such well-equipped institutions, among those who have had their training in Europe. Do they satisfy the deepest longings of the human heart, do they promise the celestial music of our dreams—that music of the future which will be greater than that of the past, a more perfect expression of life's song?

What is the outlook, considering the products of the best of present-day training? The musical education of today develops wonderful technique, clear intellectual conception, and with the "gifted few" there is some warmth (!) of expression, but does it give the soul the opportunity and the power to fully express itself?

It is a fact known to earnest musicians who look far below the surface of things, that the deepest truths of the human heart have not yet found expression in musical form. The curious anomaly has arisen in the experience of such earnest musicians, of the lack of a musical composition which reaches the heights of expression that accord with the grandeur of certain inspiring occasions which have arisen.

The education of today is lacking in the recognition and fostering of those higher qualities from which shall spring the new and more glorious music. A deeper insight into human nature is needed, the proper balance and development of all the faculties, for music should be the expression of the inner, the soul-life.

STUDENT

PLATON ne fait rien voir, mais il éclaire, il met de la lumière dans nos yeux, et place en nous une clarté, dont tous les objets deviennent ensuite illuminés. Comme l'air des montagnes sa lecture aiguise les organes, et donne le goût de bons aliments. — *Joubert*

What Are Our Literary Prospects if This Is a Sign of the Times?

AT an examination in literature held in a prominent New England college recently, a curious state of affairs was brought to light.

Out of some thirty young men and women fifteen failed to name even one of Scott's novels; three could not imagine who might be the author of the *Pickwick Papers*; fourteen had never heard of Thackeray and only twenty knew that it was Longfellow who wrote *Hiawatha*. That was the beginning only. Fifteen were total strangers to the works of Matthew Arnold and only three out of the entire number examined could name a single work by Carlyle or Ruskin. What does this indicate?

Comment seems almost out of place, particularly in the light of the following quotation from a recent article by England's Poet Laureate, Alfred Austin:

Men and women of a former generation seized with eager hands on a new poem, read it with fervent tenderness, returned to it again and again, learned much of it by heart, and gave it a permanent place in their thoughts and affections. Thus did our fathers, thus did our mothers. Their descendants look on a long work in verse with coldness, and for the most part refuse to become familiar with it; Chaucer, Spenser, Milton, Dryden, Pope, Byron, even Shakespeare himself, being read and tolerated today but fragmentarily, when at all, what constitutes the real superiority in those great writers, viz., imaginative thought and imaginative action being especially repugnant to them.

MONCURE D. CONWAY's latest book, *Autobiography, Memoirs, and Experiences*, has been called a model in its line, and rightly. Few readers will not be indebted to him for his just views with regard to certain individuals usually misunderstood. His tribute to Carlyle is just, and few have been able to discover behind the ill-humor, the dyspepsia and the pessimism, the real Carlyle. He says:

The thing that especially amazed me about Carlyle was the extent of his intellectual pilgrimage. From the spring of 1863 until shortly before his death in 1881 I saw him often. During that eighteen years after my thirty-first birthday I had studied scientific problems under scientific men and revised my religious and political philosophy; I had entered new phases of thought and belief; but there was never one in which Carlyle had not been there before me. He had studied every philosophy, generalization and theology. He knew every direction where an impenetrable wall would be found and every deep and byway of speculation.

But Moncure D. Conway, it is safe to say, will be more gratefully remembered by the generations to come for his *Life of Thomas Paine*. Few men would have had the patience, the almost inspiration, to unearth and wade through such a mass of historical documents as did Conway in preparation for this book. But this patience has made it possible for many facts in American history, hitherto obscured, to be brought to light. Historians owe him much, philosophers, more, and those who love justice and their fellow men, most of all. The book, outside of its historical and, one might say, religious significance, has the fascination of all writings which are clothed in the vesture of sincerity.

STUDENT

THE swan has ever been the symbol of the Muses and the wild swan a favorite symbol with poets, who have ever loved to find mystic meaning in his solitary habits, the pure whiteness of his plumage and his wonderful death-song. The ancients called the sky covered with cirrus clouds a lake or Lotus pond, upon which swans were floating, and the Swan Maidens of Northern mythology are the Hours of the Vedic heaven.

THE following was written in English by Mozart in the Album of an English Freemason—quoted verbatim:

Patience and tranquillity of mind contribute more to cure our distempers as the whole Art of Medicine. — *Wolfgang Amadeus Mozart, Wien, den 30 März, 1789.*

THE BRONZE HORSES OF ST. MARKS', VENICE

BROWNING writes in "Old pictures in Florence," of the Old Masters' frescoes, which are being allowed to fall into decay:

WHENEVER a fresco peels and drops,
Whenever an outline weakens and wanes
Till the latest life in the painting stops,
Stands one whom each fainter pulse-tick pains;
One, wishful each scrap should touch the brick,
Each tinge not wholly escape the plaster,
A lion who dies of an ass's kick
The wronged great soul of an ancient Master.

FREEDOM

HARTLEY COLERIDGE

SAY, What is Freedom? What the right of souls
Which all who know are bound to keep, or die;
And who knows not, is dead? In vain ye pry
In dusty archives, or retentive scrolls,
Charters and statutes, constitutions, rolls,
And remnants of the old world's history:—
These show what has been, not what ought to be,
Or teach at best how wiser Time controls
Man's futile purposes. As vain the search
Of restless factions, who, in lawless will,
Fix the foundations of a creedless church—
A lawless rule, an anarchy of ill;
But what is Freedom? Rightly understood,
A universal license to be good.—Selected

A Good Word for the "Heathens"

A RECENT book on the religious beliefs and practices of West African natives takes, according to a newspaper review of the same, a much more enlightened view than is customary. The author denies that "the heathen in his blindness bows down to wood and stone," and says that the West Africans believe in a supreme being, in immortality, and in a something corresponding to the Christian idea of the soul.

Being allowed a deeper entrance into the arcana of their soul than would be accorded to a passing explorer, I am able unhesitatingly to say that among all the multitude of degraded ones with whom I have met, I have seen or heard of none whose religious thought was only a superstition.

Their knowledge of God is, however, said to be a mere theory seldom exercising influence on conduct. This does not agree with other facts related; but, even if true, would it make the heathen any worse than us?

The belief as to God seems to be that God the Creator, after making the world and men, has withdrawn and plays no further direct part in man's affairs; but that minor intelligences (called here "spirits") do so direct man's affairs. This, to the author, seems to imply an abandonment of faith in God, in favor of faith in demons. But it may well be a survival of the ancient philosophy, according to which a distinction is made between the Supreme Being as creator and as maintainer of the universe. Krishna, in the *Bhagavad Gita*, says:

My divine manifestations are without end. Whatever creature is permanent, of good fortune, or mighty, also know it to be sprung from a portion of my energy. But what, O Arjuna, hast thou to do with so much knowledge as this? I established this whole universe with a single portion of myself, and remain separate.

Our religion is in many ways elementary. It does not discriminate between the Supreme Being and the many manifestations of his power. But the author admits the Theosophical position; for he goes on to show (1) that the heathen belief is philosophical, (2) that it is a survival of former greater knowledge, and (3) that the knowledge has in some cases degenerated into fetichism and spirit-worship. He compares their theory of the world with Descartes' "Pre-established Harmonies;" quotes Max Müller to the effect that the ridiculous is not necessarily synonymous with the primitive, and that fetichism is much more likely a sign of *faith in process of decay* than a mark of man's first attempt at worship; and says that—

It is not true that they worship the actual material objects in which the spirits are supposed to be confined. Low as is fetichism, it nevertheless has its philosophy, a philosophy that is the same in kind as that of the higher forms of religion.

Thus H. P. Blavatsky's claim that such races are the degenerate descendants of the great races of the past is abundantly fortified. They have eminently philosophical ideas, degraded in many cases into corrupt forms but still sufficiently suggestive of their origin. H. T. E.

The Power to Forget

WE never utter the words "I forgot" without a feeling of shame, for we are thereby confessing to a weakness. But there is a power of forgetting quite distinct from a failure of memory; that power namely by which we expel old memories and force them back into the oblivion from which they have emerged. This power like every power may be obtained by a determined will and constant practice. One very interesting result of practice in the art of forgetting is that the power of recollection increases in proportion as we gain facility in excluding memories that arise unbidden. We are slowly gaining control over both the poles of memory, and doubtless when we can command an absolute mental blank in respect of the years gone by, we shall also be able to recall any past experience in vividness and detail at our will.

Old memories! How they spoil our lives. Those pictures of past failures! how they come to paralyze the will and to daunt the courage that we need for present duty. Many are tied in bondage to their past by these uncalled-for recollections. They cannot rise to higher levels, but continue to grovel in the mire, helpless spectators of the dismal phantoms which their uncontrolled memories cast upon the screen of their minds. The thing to be done is to assert that you are the Soul which stands behind, and that the mental screen on which the pictures are reflected is your apparatus which you prefer to keep clean for other purposes. Never allow these dead corpses to find a place in your mind. Destroy them on the threshold and before they have succeeded in coming to life again at your expense.

W. Q. Judge once said that an ungoverned memory was one of the chief obstacles preventing our illumination by the indwelling Soul. Memory flashes a picture on the screen of the mind and, as it instantly disappears, another, linked to it by the law of association of ideas, takes its place, so that the normal condition of some men's minds is a mad procession of broken pictures flitting like lightning over the helpless, passive screen of the mind. Each picture arouses an emotion either of joy or grief appropriate to its character, and how upon such troubled waters can the sun of spiritual truth cast his clear image?

Before the surface of a lake can give a perfect reflection, the dancing waves must be stilled into absolute calm, and before our minds can mirror Truth, the memory and the emotions that it conjures up, must be held in that masterful grip which is the great reward of firm resolve and patient practice.

STUDENT

A Man's Self

By OWEN FELTHAM, a writer of the Seventeenth century whose history is little known. A genius of the Shakespeare cycle, and of the renaissance of English literature.—(An extract)

"THERE was never a sounder truth than *Nemo læditur nisi a se ipso*. Had we the command of our own passions and affections, outward occasions might exercise our virtues, but could not injure them! There is a way to be wise and good in spite of occasions. We cannot be drawn into evil courses, if we help not ourselves forward. It is our inside that undoes us. When men strive to entrap and ensnare us, they do but second our own inclinations; and if they did not see a kind of encouragement from ourselves they would never dare to attempt it. When men fall upon things which go against the genius of the mind, they then work in vain; but when the flatteries of others shall join with the great flatterer, a man's self, he is then on the way to be wrought upon. It is true there is sometimes a self-constancy which is not to be tempted. But generally we are the authors of our own ruin; if not totally, yet primarily. . . . The wise man should ever therefore maintain a double watch; one to keep his heart from extravagancies, the other to keep the enemy from approaching it. . . . No man has power over my mind unless I myself give it him. . . . All the precepts of wisdom we meet with, are given us to guard against ourselves; and undoubtedly he who can do it is rising towards Deity.

"One eye I will sure have for without, the other I will cast within me, and lest I see not enough with that, it shall ever be my prayer that I may ever be delivered from myself."

Nelson's Original Letter-Book

NELSON'S original letter-book was recently sold in London. It contains the original drafts of sixty letters written from 1796 to 1797, all referring to naval operations. There is a record of the storming of Santa Cruz. On the last page is this entry, "Officer killed and wounded, Rear-Admiral Nelson, Right Arm shot off."

DIVINER THAN A LOVELESS GOD

BROWNING

IN youth I looked to these very skies,
 And probing their immensities,
 I found God there, His visible power;
 Yet felt in my heart, amid all its sense
 Of that power, an equal evidence
 That His love, there, too, was the nobler dower.
 For the loving worm within its clod,
 Were diviner than a loveless God
 Amid his worlds, I will dare to say.

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question If it is true, as I have heard stated, that not the body, but the man himself, is responsible for his criminal tendencies; whom or what part of man should be punished for the criminal deed?

Answer In order to get a general idea of the complex nature of man, and the interrelation of the different parts of his nature, it is suggested to the questioner that he read our literature, and he is specially referred to *The Mysteries of the Heart Doctrine, Key to Theosophy*, and the NEW CENTURY PATH.

It may be said here, however, in answer to the question, that most assuredly it is not the body that commits crime, any more than it is a set of workman's tools that builds a house. The body with all its faculties is a set of tools through and by means of which we come into contact with the outer world and perform actions in it and receive the result of actions from it. The one who builds the house is the workman and if he also has planned it, the analogy is still closer between him and man, the worker in the body, the one who thinks and causes the body to act according to his thoughts.

Let us push the analogy still further. Suppose the workman becomes careless and neglects to keep his tools in order; they become dull, rusty, some of them perhaps broken. Let us imagine the tools endowed with a measure of self-consciousness and that they realize that they can no longer be used to do good work, partly because of their present condition, and partly because the workman, through his carelessness, has ceased to be a good workman. The tools might argue thus: Why should we suffer, why should we be neglected, and permitted to get rusty; why should we be punished for the faults and neglect of the workman who should have taken care of us? But who is the real sufferer after all? Is it not the workman who now reaps the reward of his carelessness and neglect, who can no longer get employment, or if he should, can no longer do good work because he has not good tools.

Now, taking up the question directly, without considering as to how far, if at all, it is man's prerogative to punish, we find that the law of Karma does bring upon man physical suffering—punishment, if you will—in return for infraction of the laws of Nature. If physical laws are disobeyed or disregarded, it is to be expected that physical suffering shall ensue, but the infraction of the higher laws of our being also entail physical suffering in the long run, so closely related are all the planes of life. Even our thoughts, good or bad, mold not only our characters, but imprint themselves on our faces.

But has the questioner considered what is the body without the inner man. When the inner man finally leaves the body, death results. And without now going into the subject of the dual nature of the inner man—the higher and the lower—is it not a fact that aside from the connection between the inner man and the body, the latter could not suffer, and that finally it is the inner man that is the real sufferer, even when the suffering appears to center in the physical body? With a knowledge of Karma, however, we may rest assured that the suffering which comes to us is in the fulfillment of the Law, and that if we will we may make of it in the words of the poet, a stepping-stone to higher things.

Regarding the punishment of criminals, perhaps when we have learned more truly and deeply the truth of human brotherhood, and of the solidarity of the human race, and that we are our brothers' keepers, we may have different ideas on the subject and different methods of meeting the problem. Katherine Tingley has given us a hint of the right way, in these words: "Don't brand a man as a criminal, teach him he is a soul, and give him a chance."

STUDENT

Question How would you answer the objection so often made against Reincarnation, that it shatters all family affections and ties, etc. (See question in NEW CENTURY PATH for January, 1905, Vol. viii, No. 12.)

Answer As a further answer to the question, the following extract from an article written by William Q. Judge will help to clear away the difficulty. He says:

. . . . The fact that we are now working in the Theosophical movement means that we did so in other lives, must do so again, and, still more important, that those who are now with us will be reincarnated in our company on our next rebirth.

Shall those whom we now know or whom we are destined to know before this life ends be our friends or enemies, our aiders or obstructors in that coming life? And what will make them hostile or friendly to us then? Not what we shall say or do to, and for them in the future life. For no man becomes your friend in a present life by reason of present acts alone. He was your friend, or you his, before in a previous life. Your present acts but revive the old friendship, renew the ancient obligation.

Was he your enemy before, he will be now even though you do him service now, for these tendencies last always more than three lives. They will be more and still more our aids if we increase the bond of friendship of today by charity. Their tendency to enmity will be lessened in every life if we persist in kindness, in love, in charity now. And that charity is not a gift of money, but charitable thought for every weakness, to every failure.

Our future friends or enemies, then, are those who are with us and to be with us in the present. If they are those who now seem inimical, we make a grave mistake and only put off the day of reconciliation to a future life if we allow ourselves today to be deficient in charity for them. We are annoyed and hindered by those who actively oppose as others whose mere looks, temperament, and unconscious action fret and disturb us. Our code of justice to ourselves, often but petty personality, incites us to rebuke them, to criticise, to attack. It is a mistake for us to so act. Could we but glance ahead to next life, we would see these for whom we now have but scant charity crossing the plain of that life with ourselves and forever in our way, always hiding the light from us. But change our present attitude, and that new life to come would show these bores and partial enemies and obstructors helping us, aiding our every effort. For Karma may give them greater opportunities than ourselves and better capacity.

Is any Theosophist who reflects on this so foolish as to continue now, if he has the power to alter himself, a course that will breed a crop of thorns for his next life's reaping? We should continue our charity and kindnesses to our friends whom it is easy to wish to help, but for those whom we naturally dislike, who are our bores now, we ought to take especial pains to aid and toward them carefully cultivate a feeling of love and charity. This adds interest to our Karmic investment. The opposite course, as surely as the sun rises and water runs down hill, strikes interest from the account and enters a heavy item on the wrong side of life's ledger.

. . . . Karmic tendency is an unswerving law. It compels us to go on in this movement of thought and doctrine; it will bring back to Reincarnation all in it now. Sentiment cannot move the law one inch; and though that emotion might seek to rid us of the presence of these men and women we at present do not fancy or approve—and there are many such in the acquaintance of every one—the law will place us again in company with friendly tendency increased or hostile feeling diminished, just as we now create the one or prevent the other.

What will you have? In the future life, friends or enemies?

Question Theosophists often speak about the "real" man. Will you please explain just what is meant by that term?

Answer The term, the "real" man, is used in contradistinction to "outer" man, to refer to the permanent Ego, the true self. A little observation and analysis of one's own nature will reveal to any one the existence of two selves, the higher and the lower, between which there is a continual striving for the mastery. In extreme cases we can see the terrible results that follow the giving up the supremacy to the lower man, as in cases of passion, self-indulgence, drunkenness, &c. And it is quite common to say even in apparently lesser matters, when an act has been done which we regret, "Oh! I was not myself when I did that," showing how firmly rooted in men's minds is this idea of a true self and a false self.

The "real" man, the true self, is that which acts in our highest moments, and from which spring all of man's noblest qualities, unselfishness, self-restraint, and all the virtues. The distinction between the two natures of man is one of the most important messages of Theosophy, for when man realizes their existence and right relation he has it in his power to take the first step towards regaining his lost heritage. Av. yearly temperature						66° 54° 12°	Av. yearly temperature						68° 56° 12°
Total yearly rainfall						5.79	Total yearly rainfall						6.87

THE above are the first complete yearly details of the temperature and rainfall at Point Loma. They are extracts from the records of the Weather Observatory which began its work in October, 1902.

It will be noted that the highest temperatures in both years, were in the months of October and November, and that the lowest were in January and February.

The maximum thermometers showed that 80° F. was reached only twice in 1903 and thirteen times in 1904; whilst the minimum thermometers were as low as 40° F. six times in 1903 and only once in 1904.

The difference between the highest and lowest mean temperatures for each month, furnishes a remarkable testimony to the equable character of the Point Loma climate. The difference varies from 16° in winter to 8° in summer. This being the general average difference between the temperature of day and night, it may be doubted whether any other place in the world can show a similar record.

In each year the rainfall has been practically confined to the months December to February. The slight traces of moisture in the rain-gauge during intervening months is largely accounted for by heavy night dews.

In order to appreciate the import of the above summary of apparently dry detail, it is necessary to bring into play our experience of other climates. In how many places in the world, for instance, do we find conditions such as are here indicated; where the hottest day in summer rarely reaches 80° and the coldest day in winter is very seldom as cold as 40°?

Of how many places can it be said, as it can of Point Loma, that it is very rare indeed for a day to pass without some sunshine; and that for months together one may be practically certain that the weather will be fine and bright and clear?

Again, of how many places can it be said, that the heat at midday is only some 10° or 12° greater than that of midnight or of the "hour before the dawn"—and this all the year round and without intermission?

In this way only can we form an idea of what it is like to live in this favored land.

STUDENT

Tolstoi Today

MR. HUGO GANZ, describes a recent visit he made to Tolstoi, now seventy-five years of age. This is the picture he gives:

Thick, bushy grey eyebrows shade the deep-set eyes, and sharply define an angular, self-willed forehead. The nose is strong, slender above, broad and finely modelled in the nostrils. The long grey moustache completely covers the mobile mouth. A waving white beard, parted in the middle, flows from the hoary cheeks to the shoulders. The head is not broad—rather, it might be called narrow—wholly unslavonic, and is well poised. The broad, strongly-built shoulders have a military erectness. A narrow foot is hidden in the high Russian boot, and moves elastically. The step and carriage are youthful. An irony of fate will have it that the bitterest foe of militarism betrays in his whole appearance the former officer. The man in the peasant's dress is in every movement the grand seigneur.

Autograph Letters of Dr. Johnson

SOME interesting literary relics have recently been sold in London. One lot contained sixteen autograph letters of Johnson to Mrs. Thrale; and there were also two by Boswell to the same lady, and letters by Garrick, Goldsmith and Burke. One can imagine that actual autograph letters written by these historical characters would have a sentimental value quite apart from the artificial value of curios as such.

There was also a signature of Sir Francis Bacon on a warrant for payment of money, dated 1620. While this fetched £41, a sign manual of Queen Elizabeth realized only £15. Other relics were five letters by Coleridge to Thomas Poole, and a letter from Dickens to Mrs. Howitt. Dickens says:

My father was originally in the Navy Pay Office, and his stations at the outposts led to my being born at Portsmouth, and to my having passed my earlier youth at Chatham. . . . Do you care to know that I was a great writer at eight years or so, was an actor and speaker from a baby, and worked many childish experiences and many young struggles with Copperfield?

"I Will not Leave the Dog"

EVERY student of Indian literature knows the magnificent story of the hero Yudhisthira, the eldest of the five Pandava brothers, who, arriving after long wanderings at the gate of heaven with his faithful hound, refuses to enter because he finds that the dog cannot be admitted.

A pathetic story with something in common comes from Ireland. Some time ago two women, starving, and worn out with a walk of twenty miles, presented themselves with their dog at the gates of the Belfast workhouse. A workhouse is hardly heaven; but as it offered food and shelter, the condition of the poor creatures probably made it for the moment a very fair substitute. They could be admitted, they were told, but not the dog. They declined to come in on those terms, and left the gate. If the dog was to starve so would they. Later, all three were found in an empty house, and in due time taken care of. C.

A Thinking Machine

ONE of those enterprises which, together with perpetual motion, circle-squaring and theories of gravitation, perennially occupy ingenious and laborious, but unpractical minds, is that of reducing logic to an

exact mathematical science. A California professor is, so report says, perfecting a machine that will answer syllogistic propositions as fast as proposed and yield the answers in convenient form.

Of course, if premises can be universally agreed upon, axioms exactly defined, and processes of inference definitely fixed, machinery will do the rest far more easily and infallibly than human thought; and, as with calculating machines, much labor will be saved. But the "if" is too large. In mathematics axioms, definitions and terms may be exact; but mathematics are an ideal science, made to order. In thought, the data are as vague and indeterminate as are physical measurements. Who will agree as to the precise meaning of *thing, entity, equals, contrary*, and so on? Yet all these will have to be defined, and defined to the last decimal point of exactitude, if the machine is to be a success.

In practice, conclusions are not reached by the method of laying off a starting-point and a direction, and then proceeding blindly in that direction. If you want to get to a place, you do not take so many steps north-east-by-north, then turn 47° and take so many steps more. One might possibly get there by such a method; but, unless the most precise man that ever lived, he would be apt to get somewhere else. Truth is arrived at by fixing the eye of anticipation and intuition on the goal and tacking about until one reaches it by successive approximations. Logic comes afterwards and shows how we got there, or ought to have got there, as a map-maker who measures out the plans after the country is explored. But logic has its right uses nevertheless. H. THE MYSTERIES OF THE HEART DOCTRINE

Prepared by
KATHERINE TINGLEY
AND HER PUPILS

*The Theosophical
book of the
Twentieth century*

Tells the story and the history of the Theosophical Movement Throughout the World; tells what it is and why it is—reveals the mystery of the Doctrine of the Heart.

The prices are \$2 in cloth and \$1.50 in paper, which barely cover the cost, for it is printed and bound, not gaudily, but with such carefulness and thoroughness of art and craft as to make it unique among modern edition books.

■ A Theosophical Fragment ■

A VERY remarkable sign of the times is an article on Reincarnation—though headed "Human Preëxistence"—contributed to a contemporary by Mr. J. Ellis McTaggart, of Trinity College, Cambridge. He points out that what we call innate characteristics, those which each of us manifests, one by one, as he comes towards adulthood, are often the same as those which in other cases we know to have been acquired, have seen in the process of being acquired, as the result of experience or effort—or the abnegation of effort.

Reincarnation, he thinks, implies "immortality without memory." But then it is immediately obvious that he attaches the narrower meaning to the word memory, namely, the actual reproduction in consciousness of bygone events. And he argues that in this sense, memory is

unnecessary for our real growth, and undesirable. The experiences of our past can help us to guide our present conduct *without our memory of concrete facts*. No power acquired in a former life is lost; memory has only dropped out of its ken the steps by which the power was acquired. "And so," says Mr. McTaggart, "a man who dies after acquiring knowledge . . . might enter his new life, deprived, indeed, of his knowledge (?) but not deprived of the increased strength and delicacy of mind which he had gained in acquiring the knowledge."

Reincarnation and Memory

(Italics not his.)

The same with the virtues. The struggles by which they were acquired have passed from memory. But the virtues remain, *now innate*.

The same even with friends. Mr. McTaggart argues that it is not proximity which begets the tie; but the tie, pre-existing, brought from another life, is the cause of the proximity of this life. We are drawn, in each birth, into the company and neighborhood of those with whom we have ties made in the forgotten past.

All this is a loose fragment of Theosophy, taught years ago by H. P. Blavatsky, and since by the successive Leaders of the Theosophical Movement, W. Q. Judge and the present Teacher. Mr. McTaggart has doubtless been reading and thinking over Theosophical literature.

In the *Key to Theosophy* H. P. Blavatsky distinguishes between memory and reminiscence. Memory is dependent upon the existence, health, and activity of the physical brain. On its tablets are written the events of life down to the last detail. We may not be able to recall them at will; but there they stand, and at death they recall themselves, the whole vast procession. As they pass before the vision of the soul at that hour,

Memory and Reminiscence

every one of them in which the human—as distinct from the purely animal—consciousness had any share, is taken into the memory of the soul.

When the time comes again for birth again on the earth, and the light of the soul begins to illuminate the brain of the infant, it does not come bearing the concrete memories of the last birth. Such a load would be an impossible hindrance, instead of an aid to life. It carries, as the writer whom we have quoted points out, the effect of them, the fruitage, the cream, not the details. This effect is partly present character, partly present relationship to others.

But in very many persons, glimpses of events of other lives do occur, glimpses into the vaster memory of the soul, hardly placeable, not understood, but real. It is these that H. P. Blavatsky calls *reminiscences*. The deepest of them all, the most common and persistent, is the sense of having lived before. And the nearer we live to the soul, the closer we approach to that ideal of perfect life, the clearer become these reminiscences; until, we are taught, the veil is at last torn asunder.

Such is another fragment of the teachings of H. P. Blavatsky, added to the fragment presented somewhat imperfectly by Mr. McTaggart.

H. CORYN, M. D.

Invading the Cliff-Dwellings

AN Arizona pastor proposes to collect a flock of people who are tired of the monotony, grind and rush of modern life—and lead them to the mighty and long-silent cliff-dwellings of that territory. There they will lead the simple life, clad in skins, doing only enough work for the supply of food, and discarding money, alcohol, tobacco and almost civilization. The perfect peace will, they hope be unbroken by the rude echoes from the world, and the ghosts of the old inhabitants will be by this time too decrepit even to laugh o' nights.

The scheme may have, at any rate, one good result. It will draw a little more attention to these mysterious and innumerable remains of an absolutely forgotten past. Here are great stone chambers, palaces of many rooms, vaults, watch towers, passages, excavated into and built out from the bare faces of cliffs hundreds of feet up. Many, many thousands of people once lived a life of no inconsiderable civilization and art here, protecting themselves and their industries as best they could against the hordes of savagery that ever threatened them. Their antecedents no one knows, whether they were colonies of old Atlantis or evolutions of the country; nor where they went, whether they were at last wiped out, or migrated somehow to Europe or Asia and became the ancestors of part of our race. Much further research must sometime be done, and if the Arizona pastor's venture leads to that it may perhaps be thought to have been worth the doing, even if that forms no part of his objective. C.

Some Views on XXth Century Problems

Burlesquing a Great Idea

ASSUREDLY a sign of the times is a symposium recently occupying a large space in an English popular magazine, on the Reincarnation theory. A number of well-known men contributed to it, writing *pro* and *con*—Alfred Russell Wallace, Rider Haggard, and others of equal note.

The point, however, is not so much *what* they said, as that in their collectivity they said *anything* in all seriousness about an idea which 20 and even 10 years ago, met with little save ridicule.

But a good deal of light is unconsciously thrown on the causes of the ridicule by a writer signing himself "An Occult Student," who in another magazine comments on the discussion. He is one of those who not only accepts the theory, but knows all about his former lives. "I am in a position," he says, "to identify at least 15 or 20 other persons, with whom at various periods during my own former lives I have been closely associated, and I know of one remarkable case in which a continuous series of lives culminating in one now going on, has been traced back for twenty-two thousand years, seventeen lives having been lived through during that period."

Such people have done more than the novelty of the idea to hold it back from popular acceptance. When not persons of obviously unbalanced mind, who live in dreams and take them for reality, they are mostly egotists so absorbed in their own personalities that they seize on the idea of Reincarnation as a ready means of increasing the size of the canvas on which they paint themselves. They can now loom large along the centuries, appropriating for themselves all the great characters not already bespoken by their immediate friends. And though one should ask why they do not now exhibit the powers of those whose historic rôles they claim to have played, they can easily reply that unkindly fate has wedded them to a quill and a ledger and hampered their eagle wings by the disgusting walls of a counting-house.

We all come upon earth with that "memory" of former lives which consists in the innate character acquired in their slow succession. And many of us may have half pictures, momentary flashes, that look like fragments of memory, unplaceable, unformed, that indeed may be memory of the far past. But shall we presume to say that it *is* so? The true memory, full and complete, is in possession of the over-brooding soul; and we cannot get it till we have "overcome," and are at one with that soul. And the very very few who have done that, who have resurrected themselves in their redeemed and divine humanity, are not among those who call attention to their powers and wisdom.

STUDENT

Athletics and Health

PHYSICIANS are increasingly calling attention to the common confusion between large muscles and perfect health. They are pointing out that the former are indeed a demand, a charge, upon health, rather than contributory to it.

Health is the ability of all the organs—of which the voluntary muscles constitute one only—to respond instantly and fully to all demands made upon them; ability to liberate the energy residing in them. The popular confusion is between the energy and the ability to liberate it. The little Japanese wrestler, with no marked muscular development, liberates his muscular energy quickly—and wins against a man whose total stored muscular energy may be much greater but who cannot liberate some of it at all, or any of it quickly. The Japanese muscle is then the healthier.

The key that unlocks the energy, and probably supplies part of it, is the nervous system, behind which are the will and mind; and to them we get back in our search for the root of health.

The will has no power of direct action upon the majority of the organs. So it cannot directly compel of them any reaction. But it does act directly upon most of the muscles, which, collectively, are much the largest organ of the body.

The voluntary muscles have several functions. *First*, to move the limbs. *Secondly*, to keep the blood going. Most of the blood vessels run in the muscular masses. If these masses are alive, tense, almost

quivering with readiness for work, the blood will be swiftly squeezed along all over the body. *Thirdly*, they are the fireplaces. If they are lax and flabby, not enough heat is made. And *fourthly*, they are electric batteries helping to keep the cells of the other organs alert and alive.

It is clear that the health of all the other organs largely depends upon the muscles' ability to discharge the last three of these four; much less upon the first of them. Yet the ordinary athletic exercises are solely concerned with the first! But the last three functions, the important ones for health, depend upon a tension, an alertness, of every moment, and, that being allowed for, *have nothing to do with the muscles' size*.

It follows therefore that the athletic exercises that really conduce to health are not those that involve strain or much exertion; and that the really useful exercises must be such as train the muscles equally all over the body (no more the biceps than any other), to *speed and promptness* in their ordinary contractions.

But even when that is attained, it does not follow that the condition of tense readiness will be necessarily kept up between the times of exercise. Yet unless it is kept up, the exercises will be but of small and temporary value.

And here is the final secret. That which maintains muscular alertness in the intervals, which keeps them tense and in full discharge of their three important functions, is *an alert mind constantly cheerful, free of all unkindliness and of all the darker moods, ready and eager to learn and to help*. The idea that perfect health is to be got independently of practical ethics, independently of brotherly feeling and action, is a mischievous delusion, one of many fostered by the "physical culture" journals and teachers. H. C.

A Feminine God

A WRITER in an important monthly review has been developing some ideas on "The Feminine Element in Deity." The basis of them is not new and in various forms may be met with in several quarters today. Most of the exponents support their views with a quotation or two from Swedenborg.

A couple of sentences from the article we refer to may be given as sufficiently epitomising the theory and (implicitly) the practise of this school: "Womanhood, divine womanhood, forms a portion of Godhead," and "If God be a biune Being, asceticism and celibacy must be direct contraventions of His nature."

These people have the formula of life exactly upside down. Man is spiritual, touching Deity at his higher pole; animal, touching earth, at his lower. Instead of compelling the below to come into subordination to the above, such theorists see the Divine through earth-darkened eyes and insist that it is even as the lower. Having made a God to suit themselves, in man's image, they naturally find in such a God a complacent sanction of all the further developments of their theory.

Verily their "wisdom" is that which St. James referred to as "from below," from flesh; and it is not from that source that comprehension of the Divine can come.

STUDENT

The Things We Mustn't Eat

A RECENT lecturer on Health Culture gave a formidable list of things which we must not eat. These include salt, pepper, sauces, vinegar, and all spices, as being irritants; jams, jellies, cheese, and all canned foods, as containing borax and aniline; tea, coffee, cocoa, and meat extracts, as harmful stimulants; aerated waters, as containing tartaric acid and flavorings; sugar and all foods which contain it, including honey and dried fruits; fats, and foods containing them; pastry, puddings, and cakes, all plain and fancy bread, etc. One of the audience asked, at the end of the lecture, "What may we eat?" and was told, "Vegetables, rice, and salads."

Of course there are many foods which contain adulterants, and many which are eaten to please a morbid palate. Of course, also, everything is bad when eaten in excess.

But, on the other hand, many of the foods in the above list are perfectly wholesome, and it is the bodies of the eaters that are at fault. If a person cannot digest wholesome food, he should see the doctor. E.

Brief Glimpses of the Prehistoric World

Archeology
Paleontology
Ethnology

Chaldean City 7000 Years Old

ADAB, the oldest Chaldean city yet unearthed, has been found by the Oriental Exploration Company of the University of Chicago, which began work in December 1903 and has pursued its excavations amid great difficulties from Arab marauders and drifting sand.

This city was discovered during work on the supposed site of Bismya. It is located on a desert in the Turkish domain about 30 miles from Nippur and 50 from Babylon. It was the city of King Naram-Sin, son of Sargon. Sargon's date is fixed at 3800 B. C., by an inscription of King Nabonadius (555 to 538) who says that he found at Sippara a cylinder which had been deposited 3200 years before his day by Naram-Sin. Adab itself is supposed to date at least 5000 B. C. It is unique in not having ever been rebuilt, as the Babylonian cities always were, whenever their clay roofs and walls caved in. No later remains are found in it, and it was evidently deserted through war or pestilence.

As usual, the reports go to prove that the ancients were at least our peers in skill and culture, and that knowledge does not wane as we go backwards in history. There are temples, palaces, and houses, now filled with drifting sand. The system of drainage and sewers is described as of stanch mold and *the same system as is used in the civilized world of today*. There is much artistic work, and scarcely a brick in the city that is not rich with handicraft. The statues are of *perfect chiselling and proportion*. Vases of terra-cotta and marble abound.

The signs on the bricks show that at least five kings built the Temple of Adab; it was not rushed up in a few months.

The art treasures are very valuable and resemble Greek and Roman models, while Egyptian affinities are also noticeable. The seal of Naram-Sin has been found on a brick.

Thus is link after link forged in the chain of evidence that shall vindicate the claims of Theosophy as to the history of humanity. H. T. E.

Herculaneum to Be Excavated

APROJECT is on foot for forming an international committee to excavate Herculaneum. This city was completely buried, and has therefore not attracted so much attention as Pompeii, which was only partially covered. It was first discovered in 1709 through the finding of some statues by workmen quarrying for marble, and exploration has since been pursued very intermittently. There are two modern towns above Herculaneum, and the ancient city is covered quite up with tuff, a stone made of fragments of lava imbedded in hardened mud. This material was carried into the city on a torrent of water and debris from the volcano.

It is expected that much more of interest and value will be found at Herculaneum than at Pompeii. The former was aristocratic and cultured, the latter commercial. Pompeii was largely overthrown by the eruption, and was probably revisited and ransacked after it, but Herculaneum was too much buried. The volcanic material was not deposited in a molten state, but carried there by water, and will have acted as a preservative. Not a single manuscript has been obtained from Pompeii, whereas at Herculaneum a single villa has yielded 1750 papyri.

It will need much time and money to excavate such an entombment, especially with the modern buildings overhead. STUDENT

The Cretan Discoveries

AREVIEW of the more recent discoveries at Knossos has been given at the London Society of Antiquaries by Mr. Arthur J. Evans, the explorer. These discoveries have been followed from time to time on this page, but it is well to keep them in mind owing to their important bearing on history and their vindication of Theosophical teachings as against orthodox historical views.

A cemetery was discovered on a hill north of the palace of Minos, and a hundred tombs opened. These were found to be of later date than the palace, and they prove that the civilization of the earlier epoch continued unbroken. The objects found in the tombs were bronze vessels, implements, and arms; jewelry and gems; a scarab of the

eighteenth dynasty; painted vases. The bones were mostly crumbled, but some skulls are to be brought to Europe.

At a place called Sopata, still further north, a still more important sepulchre was found—a square chamber about 8 by 6 meters, of limestone blocks, gabled in "cyclopean" style. In this and adjacent cells were found Egyptian alabasters, described as imported, and other jewelry of Egyptian pattern.

Thus are gradually filled in the missing links which show that the contemptuous theory of the rise of the Greeks from primitive barbarism is not true, and that their own "myths" are. E.

Man Contemporary With Mesozoic Monsters

IT has been said on this page that the proofs offered by H. P. Blavatsky, for the ancient teachings as to the great antiquity of Man on the earth are ample. It must be remembered, in this connection, that evidences, any one of which may not be sufficient by itself to establish a point, are, when taken together, overwhelming. The probability arising from successive evidences increases in a geometrical ratio. Hence we must consider each proof offered, not by itself alone, but in conjunction with all the others.

One such evidence of the antiquity of Man is that afforded by the tales of monsters, dragons, and the like. Says H. P. Blavatsky:

It is well known that antiquity has never claimed Palæontology and Palæontology among its arts and sciences; and it never had its Cuviers. Yet on Babylonian tiles, and especially in old Chinese and Japanese drawings, in the oldest pagodas and monuments, and in the Imperial Library at Peking, many a traveler has seen and recognized perfect representations of Plesiosaurs and Pterodactyls in the multiform Chinese dragons. Moreover the prophets speak in the Bible of the flying fiery serpents, and Job mentions the Leviathan. [Quotations from various sources follow.]

How could the ancient nations know anything of the extinct monsters of the Carboniferous and Mesozoic times, and even represent and describe them orally and pictorially, unless they had either *seen these monsters themselves or possessed descriptions of them in their traditions*; which descriptions necessitate *living and intelligent eye-witnesses?*

. . . How can humanity and the first palæolithic men be no earlier than about the middle of the Tertiary period? . . . Here we have extinct species of animals which disappeared from the face of the earth millions of years ago, described by and known to natives whose civilization, it is said, could hardly have begun a few thousand years ago. How is this? Evidently either the Mesozoic time has to be made to overlap the Quaternary Period, or man must be made the contemporary of the Pterodactyl and the Plesiosaurus.

The Zohar says that the serpent which tempted Eve was a kind of flying camel. "Cuvier, who has reconstructed their skeletons, is a witness to flying camels," in the Mesozoic age.

The existence of Man is traced back by Paleontologists to very various dates, which shows that the question is quite open and unsettled. It is certain Man was the contemporary of some animals that do not now exist. Among these are: The genus *Cidastes*, whose bones, found in Colorado, show them to have reached 200 feet in length. The *Titanosaurus Montanus*, 50 or 60 feet in length. The Dinosaurians in the Jurassic beds of the Rocky Mountains. The *Atlantosaurus Immanis*, a femur of which alone is over 6 feet in length, and which would thus be over 100 feet long.

There are others; and, as H. P. Blavatsky says, "*all these were co-existent with man, most probably attacked man, as man attacked them*. And we are asked to believe that the said man was no larger than he is now!" Is it possible to conceive that he could have survived and his foes perished? Did he kill the *Sivatherium* or a gigantic flying lizard with his stone hatchet?

Romance-writers, with clearer intuition and less pedantic minds than many of the devotees of "exact" science, have come nearer the truth. Jules Verne, in one of his entrancing stories, gives us a picture of a *gigantic* man tending a flock of mammoths. To an artist the sense of proportion and harmony in all things is a positive necessity. STUDENT

The Trend of Twentieth Century Science

More Friendly Bacteria

IT has been known for some time that a race of valuable bacteria exists whose work it is to stand between the plant and the nitrogen it needs and so "cook" the raw element that the plant can assimilate it.

Recent researches make it probable that there is another germ that does the same for sulphur. So far, it is only known that it detaches that element from its chemical compounds, such as sulphates and even sulphuric acid. But the probabilities are very strong that the sulphur which the germ thus sets free is in a "cooked" condition, fitted for animal and vegetable assimilation. In the case of the first germ, the nitrogen is worked up into some form of nitrate, since that is the way the plant wants to have it. The second germ works back from the compound to the element, because *that* is the way that the plant and animal need part of their sulphur. But both belong to the orders that serve the interests of higher life and are consequently, according to Theosophical classification—"builders."

A very curious question arises in connection with this subject.

Some of these germs, whilst serving our interests, haunt our blood. In various ways they enter and leave constantly. Are they, during their residence with us to be regarded as part of our body? Water, making five-sixths of the body, is also of course quite a temporary occupant. The further that research is carried into the microscopic world, the more probable does it seem that there is a set beyond that, the (at present) ultra-microscopic worlds. And one wonders whether, in addition to or beneath the slow losses and replacements which are steadily going on in the body, there may not be a much swifter set from instant to instant. A cistern that was constantly supplied by one pipe and as constantly and equally and swiftly emptied by another would not change in appearance; even the water might appear still.

So, beside the obvious taking in of food, air and water, and their equal excretion, may there not be a much swifter entry and exit of streams of infinitely minute lives, even ultra-molecular, which leaving the body apparently as unchanged as the walls of the cistern, even unchanged to the dim eye of the microscope, may yet be swiftly and voluminously changing it from moment to moment? Then "the body" would be but a formal appearance. The real body would be the teeming reservoirs of all nature, from which momentarily came, to which momentarily returns, the cloud of subtle lives which fill the form for the moment of their passage. STUDENT

Ultra-microscopy

FROM Professor Cleveland Abbe comes an interesting suggestion of a method for making particles visible which are too small for the highest powers of our present microscopes. He thinks that even the molecules of matter may thus be made microscopically visible and photographable.

Quite lately, some very remarkable results have been reached by illuminating the stage of the microscope from the side by a brilliant search-light. In high magnification the lens is too close to the stage to illuminate from above. And to illuminate from below, through the stage, makes a glare into the observer's eye. By the new plan a film of intense light is shot across the stage sideways into the thin plane between the lens and the object.

It occurred to Professor Abbe to use ultra-violet light instead of visible light, in conjunction with fluorescence.

Fluorescent substances are such as shine when ultra-violet light—light invisible to us because beyond the spectrum to which our eyes are responsive—falls upon them. A solution of quinine is an example. Its delicate fluorescence in light may equally occur in what is to us darkness if ultra-violet rays are passed through it. The action of these substances is really to translate the high vibrations into the lower ones of our octave.

Professor Abbe's suggestion is that microscopic preparations should be impregnated with a solution of a fluorescent substance, and then examined under ultra-violet light. Particles which are too small for visibility by ordinary light passing through them from the mirror below or thrown on them from above or sideways, might then show up. Ordinary light being excluded, the eye of the observer would be free to detect the points of fluorescence and perhaps discern their shape and structure. STUDENT

Guiding Nature

THE same process of selection and breeding which Luther Burbank is applying with such extraordinary success to fruits and flowers is now in use in the animal kingdom. To some extent, as in the case of the fruits, this has always been done. But the full possibilities of the method are only now appreciated.

Professor Lowell, of the University of Maine, has evolved a hen that lays four eggs to one laid by an ordinary bird, that is, about 250 eggs against 60.

The process of evolution was simple, if slow and troublesome.

Ascertaining which, among a number of hens, laid most eggs in the year, these were used to breed from. The most prolific among their progeny were similarly selected. And so on till the present point was reached.

All these processes depend upon eliminating or diminishing all the life activities of the organism we are working with, except the ones wanted. The flower is made to forget about seeds, and give all its energy to petals; to forget that the petals are no longer wanted to attract insects after fertilization is effected, and to maintain the supply of sap that would ordinarily be shut off, and so on. Nature's purpose has given way to man's.

Yet that may not be correct. Man's work may be in her larger program. He may be her servant whilst thinking himself her master. If we consider a plant as a little conscious entity, with a path of evolution (of its consciousness) before it, may not that long path, the treading of which is nature's purpose for the plant, be greatly shortened and evolution greatly quickened, by this curious human manipulation? To speak of quickening the consciousness and intelligence of a plant may sound fantastic now, but perhaps that may not be the case in a few years. The sound is only strange in our atmosphere of materialism. STUDENT

Actio in Distant

IN discussing the connection between sun-spots and the earth's magnetism, a great point is made of the fact that the theory supposes "no mysterious action at a distance," but avoids that supposition by another explanation.

Why this anxiety to avoid postulating *actio in distans*? All action is *actio in distans*—according to the atomo-mechanical theory of the universe. Are not the atoms of bodies separated by space from each other? Has not the notion of a *continuous* substance (*i. e.* a substance not so separated), been proved to be unthinkable? Why then, since all action is action at a distance; quarrel over it in this particular case?

This is one of the irresolvable dilemmas of science. Spatial extension, being merely a conceptual abstraction, cannot be treated as an entity. Dimensions, mass, etc., which are merely qualities of matter (or, more correctly, percepts) cannot be predicated of such things as atoms which are *ex hypothesi* elementary. Hence the dilemma.

If one atom can influence an adjacent atom, why cannot a planet influence a planet? In neither case is there any dynamical explanation. Why trouble to invent a plausible explanation of how the sun influences the earth, when we do not know how a magnet attracts a needle?

Mr. Maunder, in his attempts to explain the mechanism of the sun's action on the earth, falls back on an "emission" theory, and supposes the sun-spots to emit electrified particles. But is anything gained by substituting a push for a pull? E.

The Mystery of Petroleum

NO one yet knows how petroleum originated. Some think it arose from the decomposition of animal and vegetable remains; but the only evidence pointing this way is the fossil egg recently found, whose contents had become asphaltum. On the other hand the immense stores of petroleum in the Caspian and Caucasus regions render the hypothesis very difficult to hold. There is no evidence for such a vast accumulation of animal and plant life as would be needed. A Russian chemist suggests a mineral origin and points to the possible decomposition of Carbides. If he is correct there would be no reason to fear exhaustion of the supply. But if the other view is the true one, then the supply will have as limited a life as that of coal. STUDENT

Nature

Studies

The Camel in South Africa

IT is said that attempts are to be made to introduce the camel into South Africa, and that experiments as to its capacity for resisting the diseases there have been satisfactory. This would certainly be an enormous gain to cheapness and efficiency of pack-transit, the camel being so infinitely superior in strength, endurance, docility, and every virtue necessary to a beast of burden to the mules and oxen. Camels can become acclimatized. The camel that revels in the icy blasts of the Mongolian steppes is not the one who basks in the torrid sands of the Nile. Doubtless also his cushioned foot, accustomed to sand, might become inured to other kinds of ground. STUDENT

Growing Beauty at Point Loma
SOME things that have a charm for us at first, grow commonplace with familiarity, and finally become worthless. This cannot be truthfully said of the beauties of Point Loma. There is an eternal quality in them that makes them not only preserve their charms, but increase them.

When one first stands on a Point Loma hill-top and looks upon the blue Bay of San Diego, the city beyond on the hillside gleaming like mosaic in the sunshine, the foothills and mountains still beyond in varying tints of color and light and shade, the picture seems beautiful beyond possibility of growing more so; yet it does. Day by day it sinks deeper into the heart, and reveals itself in new beauties that seem impossible to be surpassed, and one longs to put it on canvas and preserve it. But another day comes with another picture more beautiful still, and so on from year to year. The glories of the dawn and the sunrise over the mountains, reflected in the bay, and the equal glories of the sunset sky above the great sea, are infinitely varied; and ever some new wonder shines forth to surprise and delight.

Either the beauty grows or the heart of the beholder unfolds a deeper power of appreciation. Perhaps both are true, and the mother heart of nature responds to a truer, kinder, more harmonious life among her children.

Here at Point Loma, it is not alone in nature that beauty seems to grow. The buildings, in their style, arrangement and position, so harmonize with the natural surroundings that they partake of the living quality of growing more beautiful the more they are seen and known. The Temple and Academy, with their sky-like domes, are marvelously beautiful on a starry night, when all surrounding objects are but dimly

LOGS OF CUBAN MAHOGANY

THE Mahogany Tree is indigenous to Central America and the Antilles, and grows in luxuriant abundance in Cuba, so large a part of whose area is still a dense forest. Cuban mahogany is especially valuable on account of the size of the logs, which can be obtained up to thirty-five feet long and two feet square in cross section. Not much is exported as yet, and the primitive old bullock drag shows that modern wholesale methods of lumbering have not invaded the sanctity of the forest.

button-ball tree, from the appearance of the fruit, which is a round ball of many seeds hanging at the end of a long swinging stem.

A peculiarity of this tree is the position of the buds. Instead of being just above where the leaf-stock joins the branch, they are within its hollow base, only a portion of the upper side of the bud being exposed. The tree is deciduous, and if the leaves did not fall off from any other cause, the swelling of the buds would push them off.

The sycamore, or plane-trees on the Point Loma Homestead grounds were, in January, stripped of their leaves except one quite small tree on which a few remain.

There are two species of the tree in the United States, the occidental and the Californian. The occidental, *Platanus occidentalis*, is native to the Eastern and Middle States, both north and south. It is their largest tree, growing from sixty to one hundred and ninety feet in height and from six to fourteen feet in diameter of trunk. The outer bark of this tree peels off in large irregular patches, leaving white spots. Its wood is used in cabinet work.

The Californian species, *Platanus racemosa*, which is the kind growing at Point Loma, is not as large as the other. Its leaves are not as much notched and its stems of fruit balls do not hang singly, as in the other species, but a number of them hang from one main stem in a raceme.

The plane-tree is noted and prized for its shade. Its broad top and the arrangement of its branches and broad leaves are specially fitted to form a large and dense shade. The tree has a very unusual appearance with its long pendular racemes, nine inches long, each with from three to five balls. The wood is superior to that of *Platanus occidentalis*. STUDENT

seen; and they stand forth in their white purity and shining lights against the starry depths of the dark blue dome of sky like heavenly visions, and hold him spell-bound who feels their charm.

It is as if nature had taken them to her bosom, as her own, and endowed them with her gift of growing beauty. STUDENT

The Sycamore Tree

THE sycamore of Egypt and Syria is a species of fig tree, *Ficus sycamorus*, which resembles both the fig and mulberry. This is the sycamore of the Bible, the tree which Zaccheus climbed to see Jesus pass by.

In the sacred dramas of the Middle Ages the larger maple was used to represent

this tree, and it is that which is called sycamore in Great Britain.

The tree called Sycamore in the United States is a plane or buttonwood tree. It is also called

Seek consolation only in immortal things.—Carmen Sylva

WITHIN the last month a New York State jury has granted a certain wife \$50,000 dam-

ages in a suit brought by her against a woman who had alienated the affections of her husband. The case is worthy of critical notice for several reasons. The wife did not sue for divorce nor was any effort made to show that the defendant—a spinster—had been guilty of any such moral discrepancies as would, in that State, have constituted the only cause for a divorce. More than that, there was no evidence to show that the wife had suffered any bodily injury, or that the husband or his spinster friend had been guilty of brutality in any of its grosser forms. The wife testified to having been “simply ignored,” her home life, in its real sense, having been broken up, her peace of mind ruined and her happiness destroyed. That the jury grasped the situation is a striking sign of the nearness of that day when the interpreters of our laws shall recognize the law of morality and common justice as being higher than some, at least, of the confessedly experimental enactments on our statute books today.

But will the transfer of this \$50,000 serve to remedy matters? It were absurd to suppose so. The wife’s happiness and hopes were killed long ago. The disillusionment of her husband or of the spinster will scarcely result from any jury decision alone, whatever its nature. But—just a question or two. This wife and husband are the parents of sons and daughters. What would the father probably do if some married man of his acquaintance were to induce one of his daughters to enter upon a relationship which—no matter how much glossed over by talk of “spiritual affinity”—would result in the crucifixion of a sister woman, the breaking up of a home, and, for herself, social ostracism? Then, too, would not this spinster, herself, become relieved of certain illusions if she should some day marry, later to find herself “simply ignored” by her husband because of his having entered upon some “high comradeship” with another woman?

The ease and grace with which certain types of otherwise clear-headed and high-minded women will bind their sisters to the rack merely to give themselves the satisfaction of chasing up an illusion, is strangely reminiscent of those palmy days when courtesans ruled kingdoms and when queens were forced to receive at their own tables royal mistresses. The

Another Interpretation

NOW, having studied a great deal on Theosophical lines, we should begin to practically apply our studies. This must mean ALL that is implied. It is not a mere general unity, but is a similarity, and communion in every part of the nature. If there is uncharitableness, if there is disloyalty, if there are harshness and unbrotherliness in the race, they exist also in us if only in the germ. Those germs require only the proper personal conditions to make them sprout. Our duty therefore is to continually encourage in ourselves the active feelings that are opposites of those.—William Q. Judge in 1894

who have even borne them sons and daughters, savors too strongly of the logic of harem and tepee. Such were indeed anachronisms today—at least by decision of this jury!

There is a virtue far higher than that ordinarily indicated by the word. There is a sacrifice of soul that has, in its beginnings, nothing to do with the flesh. There are Eternal Laws which make it forever certain that those who sow the wind shall reap the whirlwind. God speed the day when our courts of justice shall stand closer to the Higher Law! In that day there will be recognized a brutality, compared with which the physical blow is a slight thing. There will be recognized a crucifixion which has nothing to do with bodily injury and an immorality that has nothing to do with what is now ordinarily meant by the term.

The stupidest today recognize that inner unseen bond which may exist between man and woman and which, for the sake of the child and the future and the peace of the human heart, society has sought to dignify by the institution of marriage. But many have yet to learn that there is an equally sacred bond between woman and woman and that to hold it lightly, to bestow on a sister woman torture instead of love, is an insult to that Divine Law which rewardeth and adjusteth, *surely and in its own time.* STUDENT

A SIGNIFICANT bill has recently been brought by Senator Merton of Wisconsin before the legislature of that state. By it wives are to be given statutory right to bring suit for damages for the alienation of affections and loss of society of their husbands. Two points may be observed: first, this assurance of a growing perception on the part of legislators of the outrage of those subtler forms of torture not technically included in “immorality” or “corporal injury;” second, that the bill was presented by a man. Who knows how rapidly we may be nearing that wiser time when the notion that men cannot legislate justly for their sisters “because, being men, they cannot understand,” will be recognized as the fallacy that it actually is?

The Higher Wisdom is a spiritual thing, born not of the head, nor of the flesh, but of the heart. It has naught to concede to either sex, neither has it aught to demand. The Wisdom that knoweth the just and dareth to utter the true, comes alone from the Heart Compassionate. E.

The Effort of a Queen

THE visit to America of Mrs. Elizabeth Anrep-Nordin, the noted Swedish teacher of blind deaf-mutes, has served to call attention to Queen Sophia's remarkable school for the blind deaf-mutes of Sweden. About twenty years ago the Queen's attention was called to a little child belonging to one of the gardeners at the Swedish royal palaces, the child being both blind and deaf. The Queen requested it be sent with a special nurse to one of the state institutions for the blind, but to her intense surprise, her protégée was refused entrance, the directors explaining that they admitted only blind children who could talk and hear. She then sent the child to a state institution for deaf-mutes. Here she was again refused and the Queen was informed that only deaf-mutes who could see were admitted to deaf-mute schools. Then Queen Sophia learned that in all Sweden the only institution to which this little child could be admitted was an asylum for idiots.

She laid the question before King Oscar and he brought it to the attention of the Parliament of Sweden. Here his proposition—to appropriate money for an institution for blind deaf-mutes—met serious opposition. Said one member, "Why spend the State's money on nondescripts that can never give any return to the State?" Another declared that blind deaf-mutes could scarcely be considered human beings and should be quite content to be placed in institutions with idiots. Still another said that even the poorest laborer should feel disgraced to have such a child. The bill, however, was carried through, the institution established, and the results among the little unfortunates there receiving instruction are simply marvelous. Among them is a young girl of eight who promises to be another Helen Keller. STUDENT

FOR the first time in the history of the medical profession in the United States, a statue has been erected as a memorial to a woman physician, the late Dr. Mary Harris Thompson of Chicago. Dr. Thompson was the pioneer physician of the Northwest. She was noted for her work as a surgeon, but was even more remarkable for her work among women and children. There are occasional women doctors, just as there are women in other lines of work, who are by no means a credit to their profession. Dr. Thompson had no part nor lot with such as these. By her womanliness, the purity of her life, her steadfast adherence to principle, she has done for the medical profession and for the cause of women what no intellectual training alone could ever have accomplished. She was an example on higher lines, noble, unselfish, just and pure. Her life was an inspiration. E.

WE rarely realize the tragedies that are tucked away in the corners of our daily papers. A brief item in today's issue tells of a sixteen-year-old girl, a bride of two months, appearing against her husband in a Justice Court because he had cruelly beaten her with a wire cable. The Court fined the husband \$20 and dismissed the case! Said husband left the court room giving his opinion in vigorous terms about the laws of this land—he came from Southern Europe—but the opinion of the wife who meekly followed him back to their "home," presumably to await the next beating, was not recorded.

ELIZABETH DUSE, the daughter of the great Italian tragédienne, has recently entered an English college for the purpose of devoting herself to the study of floriculture and horticulture. She is but seventeen years of age, and to her mother's delight has shown no taste for stage life. It is said that she has never even seen her mother act.

IN 1793 when Lyons was besieged, a young French girl, Marie Adriam, was arrested. Being asked why she had used arms she replied, "To serve my country." She was condemned and executed, because, said her executioners, "Such conduct is unseemly for a woman."

Race-Suicide Again

WE are in danger of being rescued from a dilemma at last! Professor Bailey, who is at the head of the political economy department at Yale, has been getting data with which he refutes the race-suicide theory, proving that the number of children among the poor is only a fraction more than among the rich. He has compiled extensive statistics from investigations among the wealthy classes—such as those represented by the families of Yale students—and the poorer classes in New York and elsewhere. Comparing the two sets of figures, we see that the families of the wealthy classes average, as to children, three and three-fifths, while with the poorer classes the average, though a fraction greater, is still less than four. However, we should not despair. Today's paper relates the case of a husband and wife, recently presented to the President, who are parents of twenty-seven children and also another case in which a certain Frau Stroer has just presented her husband with his thirty-eighth child! So much for quantity. But what about quality? Isn't it time for our statisticians to examine that phase of the question? E. W.

HELEN KELLER says, in her recent book, *My Key to Life*:

We have seen that the world's philosophers—the sayers of the word—are optimists; so also are the men of action and achievement—the doers of the word. Dr. Howe found his way to Laura Bridgman's soul because he began with the belief that he could reach it. English jurists had said that the deaf-blind were idiots in the eyes of the law. Behold what the optimist does. He controverts a hard legal axiom; he looks behind the dull, impassive clay and sees a human soul in bondage, and quietly, resolutely, sets about its deliverance. His efforts are victorious.

He creates intelligence out of idiocy, and proves to the law that the deaf-blind man is a responsible being. When Haüy offered to teach the blind to read he was met by pessimism that laughed at his folly. Had he not believed that the soul of man is mightier than the ignorance that fetters it, had he not been an optimist, he would not have turned the fingers of the blind into new instruments.

No pessimist ever discovered the secrets of the stars, or sailed to an uncharted land, or opened a new heaven to the human spirit. St. Bernard was so deeply an optimist that he believed 250 enlightened men could illuminate the darkness which overwhelmed the period of the crusades; and the light of his faith broke like a new day upon western Europe.

ACCORDING to the *London Spectator*, women, now that they have testamentary powers in England, are inclined to be more charitable with their possessions than are men. Covering a period of eight years, during which time 150 women made wills, they bequeathed more than 25 per cent. of their fortunes for humanitarian objects. The proportion given by men by bequest during the same time has been but 11 ¼ per cent.

ONE of the Russian officers recently released by the Japanese is quoted as having said:

The real heroine of the siege of Port Arthur was Madame Zouhaneli, who, when her husband was killed, took command of a battery of three eleven-inch guns at a point commanding the water supply and held them until she herself was killed. Her courage was an inspiration to our men.

SAID a well-known Chief of Police recently, with regard to the criminal records of the largest city in America:

They say that alcoholic drinking is on the increase among American women, but police experience does not bear out the claim. The arrests this year from that cause are fewer, by a large per cent, than any previous year, while the city itself has grown enormously.

FOUR of the senators who were counted upon as supporters of the Woman's Suffrage Bill recently presented to the State Senate of California, were at the time they were needed, under indictment for bribery.

IN THE INTERNATIONAL HEADQUARTERS LOMALAND

THE drops of water wept to leave the sea.
But the sea laughed and said, "We still are we."
God is within, without, and all around,
And not a hair's breadth severs me and thee.
—York Powell's version of Omar

THE CHILDREN'S HOUR

The Raja Yoga Question Box

IN many cities of Europe skilled art-workers formed brotherhoods, or guilds. The great Flemish artists belonged to the Guild of Painters.

1 Who were Hubert and Jan Van Eyck?

ANSWER—Hubert Van Eyck was the eldest of a family of painters. He joined the Guild of Painters in Ghent in 1412. He painted an altar-piece with many figures. It was so beautiful and so valued that it was shown to the people only on festival days. Hubert Van Eyck was the first to introduce the use of colors mixed with oil. This invention was a great benefit to the whole world. Hubert Van Eyck taught his two brothers and his sister to paint. His brother Jan was twenty years younger than he was. Jan Van Eyck carried on the work of his brother, and improved the method of using oil-colors. He taught this method to the Italian artists of his day, and this helped them to make their pictures clear and rich in color. Jan Van Eyck was a famous artist and also a diplomat. He visited many

countries and was received with great respect wherever he went.

2 Who was Rubens?

ANSWER—Peter Paul Rubens was born in 1577. As a boy, in Antwerp, he showed great talent for painting. He studied in Italy. In 1607 he returned to Antwerp. He had many pupils. It was Rubens' custom to have some one read aloud to him while he painted. His favorite authors were Seneca, Plutarch and Livy. Rubens visited Spain twice. While he was in Madrid Velasquez lent him his studio. Rubens also visited France and England. He was a skillful diplomat and a scholar. He could speak seven languages. Rubens is called the "magnificent" painter. The portraits he painted deserve the highest praise and all his work shows skill in his art. Rubens' friends were the scholars and kings and brave men of his time. He used his great gifts to encourage the love of art in all the countries he visited.

Mother Nature's Playground

LITTLE folks the world over enjoy playing in the sand. Indeed, the sea-shore is one of the play-grounds Mother Nature keeps ready for children. She sends old Ocean with his waves to sweep up over it every day and make it fresh and smooth.

Children are always sorry to leave this pleasant play-ground. Once some little boys and girls who lived in the city were very happy all summer playing with the shells and sand. But winter came, and they went back to their city home.

One morning they looked out of the window, into the little square yard that is at the back of houses in the city. What do you think they saw? A great load of clean white sand, right in the middle of the yard. Their father had it put there for them to play in. They were as happy as could be.

The Japanese children have a pretty game with sand. I have never seen any other children play it. You may see them in the play-grounds of the ancient temples. They have bags of sand of different colors—red, blue, black and yellow. They find a smooth place on the ground. They shake white sand out over it for a background. Next, they outline a man or a flower, or some animal in black sand. Then they fill it in with another color.

Some of the little ones are very clever at this game. They pour the sand out quickly just where they want it, and make a picture in a very short time. Making sand pictures is a favorite game with these artistic little people.

At Point Loma, every morning, you may see a group of tiny tots running down the path. They know just where to go. Down behind a certain bush, in a place fixed for them by one of the big kind guards, are the pails and shovels. They sit down in the sand and have a merry time. When a bird lights on a bush near them they say, very softly, "Oh see!" and watch it until it flies away. Sitting in the sand at play, they are like a nest of happy chirping birdies themselves. They like to play making gardens in the sand, and set up little sticks for plants and trees. By and by they pile up the pails and shovels, and take a walk with their teacher over the hillside. The air is fragrant with Yerba Santa and Sage. Happy Raja Yoga babies in the sweet sunshine! AUNT MARJORIE

LITTLE RAJA YOGA STUDENTS OF LOMALAND

Trained Military Pigeons

PIGEONS have long been known as birds of peace. The Bible records give the account of the dove that was sent out from the Ark to find out if the waters of the flood had disappeared.

The dove, returning with an olive leaf, really brought back the word of peace in this sign, in answer to the message with which he had been sent out.

Being now used, not uncommonly, by man, especially to carry messages during war times, when almost no other secret way is open for communication, these birds are most valuable helpers.

It is recorded that they did a most excellent work a generation ago, during the siege of Paris, and also in the Franco-German war. The messages were placed in goose quills, which are exceedingly light, and by the process of microscopic photography, thousands of words could be put into a very small space. These quills were then fastened by a silk thread to the tail feathers of the birds.

The usefulness of sending messages this way has led all the nations of Europe to have trained pigeons, and there are now more than sixty

military pigeon stations on that continent.

It is only within recent times that we have also adopted this simple way of carrying messages in case of war, and we already have several fine places for training military pigeons in a most scientific manner.

We have reason to trust that in the future pigeons will serve humanity in a larger way, and wing across seas and continents the messages of peace and good will from the hearts of the nations, in the service of brotherhood—no longer of distrust and hatred in the service of war. A LOTUS GROUP TEACHER

THE DAISY

WITH little white leaves in the grasses,
Spread wide for the smile of the sun,
It waits till the daylight passes
And closes them one by one.

I have asked why it closed at even,
And I know what it wished to say:
"There are stars all night in the heaven,
And I am the star of day."—Selected

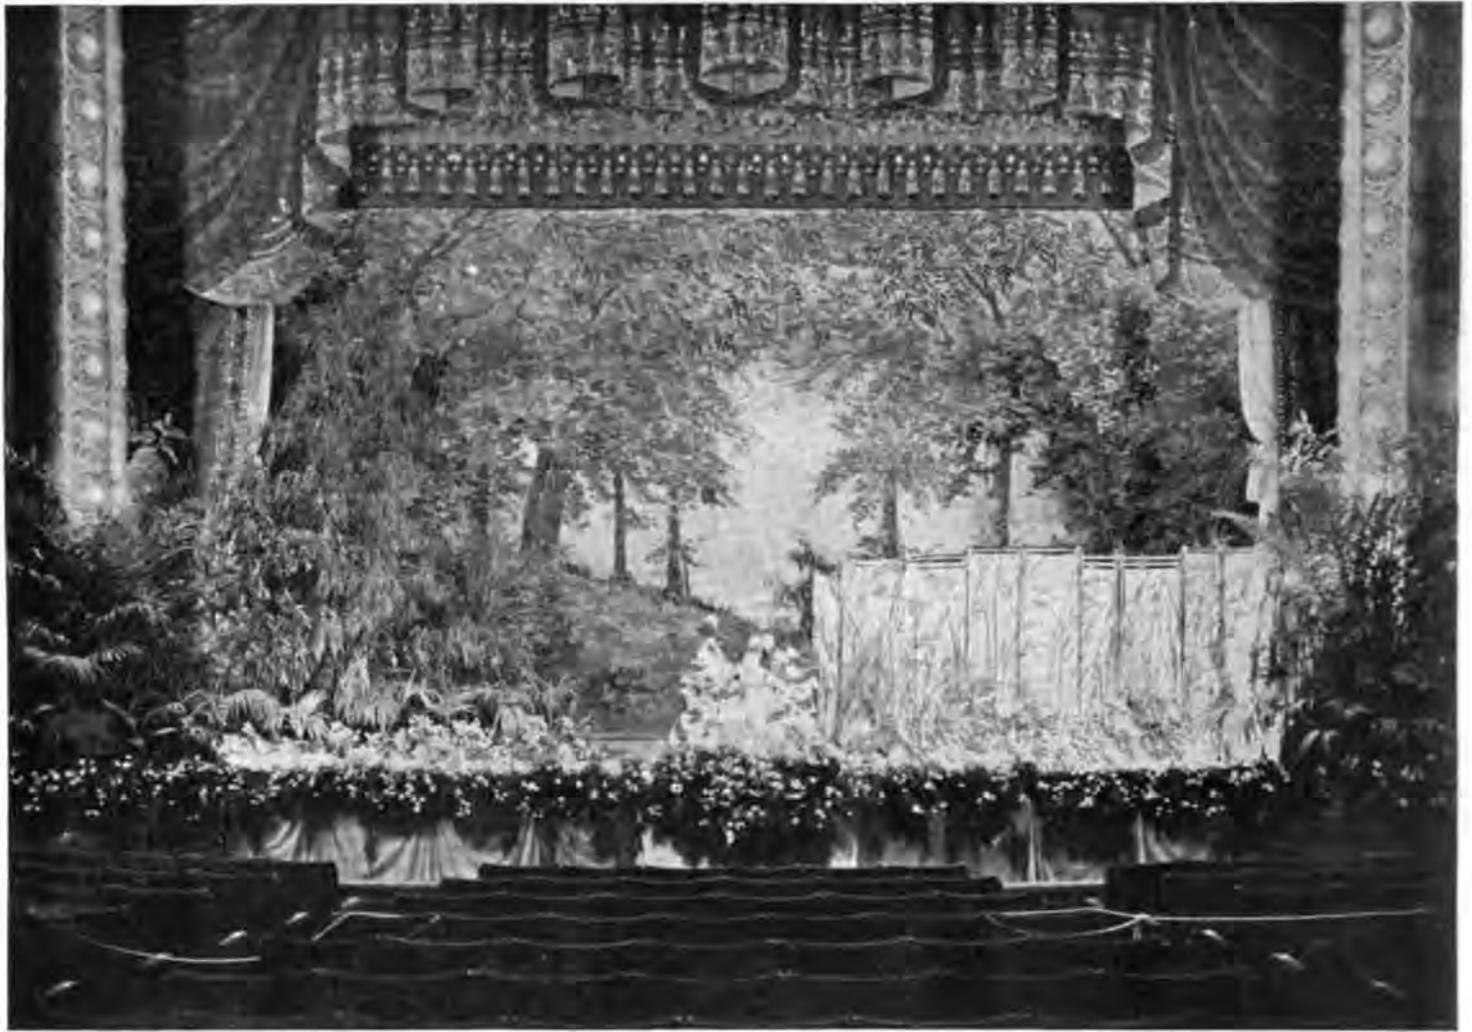

THEY tell a beautiful story about a certain wealthy man who owns marvelous rose gardens, where the roses growing about his castle form, during the summer, a great blossoming pink and white picture. One day the head gardener asked to speak to the owner of the estate. "Sir," he said, "I have a complaint to make."

"What is it?" inquired the millionaire. "I have to inform you that the village folk are plucking the roses in your garden."

"Well, well," was the reply, "are they indeed? Then you must plant more." And that is just what the gardener did! H.

THE THEOSOPHICAL FORUM, IN ISIS THEATRE

TWO papers were read at the Universal Brotherhood meeting at Isis Theatre last Sunday evening. The first was by Rev. S. J. Neill, his subject being, "The Religion of Jesus and Revivalism." In part the speaker said: "I will not yield to anyone in the high opinion I hold of Jesus. Nor will I, for a moment, deny that men need to be stirred up to a sense of the right life. We need a revival all the time. We need a steady growth day and night, not anything fitful, spasmodic, and therefore spiritually exhausting, in the long run.

"Let us look at the spirit of Christ's life and teaching. The first thing we notice is the utter absence of all the dogmatic teaching which orthodoxy has put in the place of Christianity. We notice the utter absence of all that unnatural, unhealthy excitement which characterizes revivals.

"See how quietly Jesus lives his life till about thirty years of age. And then he goes about doing good; he has the shyness and timidity of a boy or girl, and tries to escape all praise or recognition for what he has done. Then look at his teachings. Take the Sermon on the Mount, or the discourses given elsewhere. There is no appeal to the lower nature. There is no effort to produce excitement. Blessed are the merciful, the meek, the pure in heart. Do not make a spectacle of your religion as those do who pray at the street corners, that they may be seen of men. Do good without looking for results. Do good, hoping for nothing again. There was nothing very new in all this. It was the old teaching which had been from the beginning—a fragment of the old Wisdom Religion—which has cast some light upon all peoples, and races, and nations. It was sweet, simple, practical."

The second paper of the evening, written by Katherine Tingley, was read by Miss Ethelind Wood, the subject being, "True Revival." "All," she declared, "which goes to serve the permanent life, the true and ennobling life, comes from experience and those gradations of thought and effort which are found in experience. To understand the laws of human life, and the way to use them for the upbuilding of the character, one must recognize the latent forces in man; the mysterious and wonderful powers of the human soul, which are ever striving to manifest the divine self; and also the subtle, savage, lower qualities that

play their parts in the drama of life so effectively, obscuring Wisdom, and leading man to the depths of indifference, despair and recklessness.

"To redeem man, *man must know himself*, and these mysteries. And in his research along the path, he must *revive the soul energies* of his being. He must not be satisfied with the common belief of humanity to the effect that man possesses an immortal soul; *he must know that he is one*, and that he can evolve and bring his whole nature into a high state of spiritual strength if he *wills* and works with the *higher laws of his being*.

"At this point there must be a careful consideration and recognition of the difference between instinct and intuition—between emotion and illumination.

"Instinct is the director of the lower nature; intuition is the guide of the higher humanity in man—a part of soul life. A man who has evolved to the point of drawing the dividing line, and taking a heroic stand for his soul's advancement and for that of his fellows, needs not exciting influences nor other people's fearful exhortations to call him to his own. The *reviving*, the *revivifying of spiritual life*, works its way slowly and surely into the larger field of endeavor along the path of righteousness, through aspiration and *self-control*; and in the years to come he will be found well up the mountain path, never satisfied not to be more tomorrow."

Delightful music, quotations recited by a number of the Raja Yoga children, and a recitation by a little Raja Yoga girl, completed an evening of rare pleasure and profit.

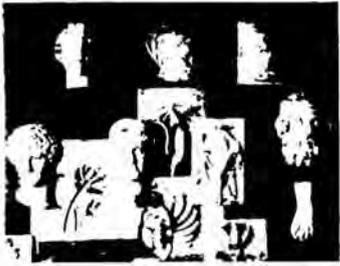

Theosophical Meetings for Sunday Night

Public Theosophical meetings are conducted every Sunday night in San Diego at 8.15, at the Isis Theatre, by the students of Lomaland.

Theosophical subjects pertaining to all departments of thought and bearing on all conditions of life are attractively and thoughtfully presented.

Other interesting features of these weekly gatherings are the excellent music rendered by some of the Students of the Isis Conservatory of Lomaland, and the efforts of the children of the Raja Yoga Schools at Point Loma. Theosophical literature may always be purchased at this meeting.

Art Music Literature and the Drama

The "Penalties of Genius"

AS a race we have for so long been destitute of the ability to look below the surface that, in nine cases out of ten, we judge merely by appearances. Directly due to this is the universal tendency to believe that heartache and privation, sorrow and sin, are the invariable penalties of genius; that epilepsy and neurotic conditions

generally—even insanity—are among the open doors to the genius life, instead of being what they really are, barriers closing it in.

That genius persists not because of, but in spite of, disadvantages, rarely occurs to the average person, and in support of the common theory he will quote crooked little Pope and his hallucinations, Chopin, Tasso, Cæsar and a list of others. What can one expect? Is this universal belief so strange when we realize the extent to which we are psychologized by the idea that genius insists upon a condition of unbalance somewhere?

It argues strangely for our insight as a race that true genius is so incomprehensible to us. It is a strange commentary upon our trust in the Higher Law that we make so slight a distinction between the few who are truly inspired and the many who are led here and there by brain mind notions; between the many who are erratic, irascible, lacking in will power and destitute of all mental control, and the few in whom the soul-light gleams serenely, never obscured by clouds.

Looked at from the standpoint of the soul, and of the truth that the past of humanity is a glorious past, genius *should* not be so unusual as stupidity; the inspired poet and musician *should* be much more common than the clod; a genius *should* be *more* apt to be blessed with a healthy body, a balanced nervous system and sane tendencies than his valet or charwoman. By all logic this *should* be the case, granting that genius is that nearness to the God-light which can neither be described nor defined.

As to the contention that great talent, or genius, necessarily insures a life fraught with sorrow—whence this notion? By all that the Law carries as its message, there is no reaping in fields wherein no harvest was sown. By all that the soul counts true, he who sows the wind will reap the whirlwind and he who sows in folly will reap in discontent, *whether he be genius or imbecile or knave.*

It is true, however, that the higher the development and the finer the nervous balance, the greater is the capacity for suffering. One's very nearness to the Light is an unconscious appeal to the great heart of life for its saving wisdom, the wisdom that comes to most of us only through suffering. It need not be always so vouchsafed, yet even the inspired genius is dual, and so it often is. Then, too, by every step away from the fringe and ragged edge of life nearer to the center, we grow in compassion. Let the sorrows of others appeal to the genius-soul, and the truly compassionate and inspired genius becomes a Savior. Such, in her own way, was Joan of Arc; such, in their way, were Æschylus, Shakespeare, Goethe, Socrates, Paul.

To argue that unsound bodies, unhealthy morals, unstrung nerves and mental "crotchets" generally are necessary accompaniments of genius, is absurd. It is merely one way of indicting our present ideals of heredity, of marriage, of morality and of education. The future will demonstrate why, for to the higher possibilities of that future Raja Yoga holds the key. To those who can see the effect in the cause, who can discern the oak within the tiny acorn, the time is not far distant when genius will mean joy, not pain; health, not disease; balance and purity and beauty; not idiosyncrasy, moral or otherwise. STUDENT

The Magic of Right Environment

THE musician who is helped instead of hindered by environment is comparatively rare. The lives of our children of genius almost invariably record hardship and, frequently, persecution. The life of Liza Lehmann, however, has been an exception. She was particularly fortunate in her parentage, her father being a celebrated artist and her mother a musician of unusual ability, and the little Liza's childhood home was the rendezvous of literary and musical celebrities, among them Joachim, Clara Schumann and Jenny Lind. It was not, however, until after her marriage and retirement from the concert stage that Mme. Lehmann, (or Mrs. Bedford as she is known in private life) did her real work in composition.

She is best known for her song-cycle "In a Persian Garden," which, by the way, was first rejected by nearly every publisher in London. Among other poems, she has set to music "Endymion" and Browning's "Prosopice." When questioned as to her method, she said:

First of all I find the words—the most beautiful words I can discover—and from these I seek inspiration. My aim is to suit the atmosphere of the music to that of the verse.

I do not agree with those who declare that women have been inconspicuous as composers from lack of talent. They have suffered from many drawbacks. Until quite recently it has not been considered necessary to teach them thoroughly the fundamental principles of musical theory. Then, too, most women have duties to family and home which are insistent, and which can never be neglected by one worthy to be called a home-maker. S. H.

A BELL

by CLINTON SCOLLARD

HAD I the power
To cast a bell that should from some grand tower,
At the first Christmas hour,
Ousting
And ring
A jubilant message wide,
The forged metals should be thus allied:—
No iron pride,
But soft Humility, and rich-veined Hope
Cleft from a sunny slope;
And there should be
White Charity,
And silvery Love, that knows not Doubt nor Fear,
To make the peal more clear;
And then to firmly fix the fine alloy,
There should be joy!—Selected

TIME was—many thousands of years ago—when Ireland was a leader in the arts. There blossomed that divine flower of national life. Ireland had her singers, her harpers, her builders of churches, her masters on all lines, her craftsmen and designers. Then came, in the Twelfth century, the Anglo-Norman invasion and all was obscured.

It is only within the last generation that any general interest has been manifested in the art life of Ireland, or that any attempt has been made to restore it. In today's paper we see that President Roosevelt has recently sent to Lady Gregory the following message, "I cordially sympathize with you in your efforts to keep such a collection of pictures in Dublin." The words of themselves mean little to the casual reader, but to the investigator they show that another step has been taken and another link forged in the chain which shall yet bind Ireland's glorious past to a mighty future, on art lines. E. M.

THIRTEEN years ago only 313 pupils in Ireland were being taught the Gaelic tongue. Today 3000 of the national schools are teaching the language to nearly 10,000 pupils.

A PROMINENT Californian artist has recently been made an Officer of Public Instruction by the French Republic and honored with a decoration by M. Chaumie, the Minister of Instruction.
