SCIENTOLOGY: A NEW SCIENCE

by I. ron hubbard

SCIENTOLOGY: A NEW SCIENCE was written by L. Ron Hubbard in 1947 fifteen years after he began his studies of the mind, and was the manuscript offered to such organizations as the American Medical Association and the American Psychiatric Association. Instead of being accepted by these organizations, this thesis was accepted broadly by the public at large. Tens of thousands of copies of it have been circulated all over the world mostly by the public itself, duplicating it, mimeographing it, even typing it with many carbons.

The basic science was named "Scientology" in 1938. In 1947 L. Ron Hubbard changed its name to "Dianetics" in order to make a social test of publication and popularity. That test completed, in 1952 he changed the science back to its original name, SCIENTOLOGY. This was done to inhibit its being monopolized for private purposes.

The changed title of A NEW SCIENCE was ABNORMAL DIANETICS. Copyrighted months before any magazine article or book was printed on the subject of Dianetics, carrying always its copyright notice, A NEW SCIENCE is the basic copyright on the word DIANETICS. The date of its copyright is January, 1950. The first article, DIANETICS: THE EVOLUTION OF A SCIENCE, appeared and was copyrighted months afterward. It was four months after the copyright date of this thesis that DIANETICS: THE MODERN SCIENCE OF MENTAL HEALTH was published. Although the latter is widely known as "the first book", A NEW SCIENCE actually holds that honor by three years.

This work in its first manuscript form was called SCIENTOLOGY: A NEW SCIENCE. This was changed soon by L. Ron Hubbard to ABNORMAL DIANETICS for offence to the medical profession.

Seven years after its first appearance, SCIENTOLOGY: A NEW SCIENCE is issued again for its historical importance, its simplicity and its usefulness to those studying the evolution of the science itself. It is very simple and workable even in the early form presented here.

primary axioms

Scientology is a mental science built upon axioms. Workability rather than Idealism has been consulted. The only claim made for these axioms is that by their use certain definite and predictable results can be obtained.

The principle achievement of Scientology is in its organization. Almost any of its parts can be found somewhere in history, even when they were independently evolved by the writer. There are no principal sources, and where a prac-

tice or a principle is borrowed from some past school the connection is usually accidental and does not admit any further use or validity of that school. Scientology works, and can only be worked, when regarded and used as a unity. When diluted by broader applications of older practices, it will no longer produce results. To avoid confusion and prevent semantic difficulties, new and simplified terminology has been used and is used only as defined herein.

Scientology is really a family of sciences. It is here addressed in the form of a science of thought applicable to psychosomatic ills and individual aberrations.

The field of thought may be divided into two areas which have been classified as the "knowable" and the "unknowable." We are here concerned only with the "knowable." In the "unknowable" we place that data which we do not need to know in order to solve the problem of improving or curing of aberrations of the human mind. By thus splitting the broad field of thought, we need not now concern ourselves with such indefinites as spiritualism, deism, telepathy, clairvoyance.

Conceiving this split as a line drawn through the area, we can assign a dynamic principle of existence to all that data remaining in the "knowable" field.

After exhaustive research one word was selected as embracing the finite universe as a dynamic principle of existence. This word can be used as a guide or a measuring stick and by it can be evaluated much information. It is therefore our first and our controlling axiom.

The first axiom is:

SURVIVE!

This can be seen to be the lowest common denominator of the finite universe. It embraces all forms of energy. It further delineates the purpose of that energy so far as it is now viewable by us in the "knowable" field. The activity of the finite universe can easily be seen to obey this axiom as though it were a command. All works and energies can be considered to be motivated by it. The various kingdoms have this as their lowest common denominator, for animals, vegetables and minerals are all striving for survival. We do not know to what end we are surviving, and in our field of the "knowable" and in our choice of only the workable axioms, we do not know and have no immediate reason to ask why.

All forms of energy are then surviving to some unknown end, for some unknown purpose. We need only to know that they are surviving and that, as units or species, they must survive.

By derivation from the first workable axiom, we come into

possession of the second. In obedience to the command "survive," life took on the form of a cell which, joining with other cells, formed a colony. The cell, by procreating, expanded the colony. The colony, by procreation, formed other colonies. Colonies of different types united and necessity, mutation and natural selection brought about specializing which increased the complexity of the colonies until they became an aggregation. The problems of the colonial aggregation were those of food, protection and procreation. In various ways a colonial aggregation of cells became a standardized unity and any advanced colonial aggregation came into possession by necessity, mutation and natural selection of a central control system.

The purpose of the colonial aggregation was to survive. To do this it had to have food, means of defense, protection and means of procreation. The control center which had developed had as its primary command, Survive! Its prime purpose was the food, defense, protection and means of procreation.

Thus can be stated the second workable axiom:

THE PURPOSE OF THE MIND IS TO SOLVE PROBLEMS RELATING TO SURVIVAL.

The ultimate success of the organism, its specie or life would be, at its unimaginable extreme, immortality. The final failure in obedience to the law *survive* would be death. Between eternal survival and death lie innumerable gradations. In the middle ground of such a scale would be mere existence without hope of much success and without fear of failure. Below this point would lie, step by step, innumerable small errors, accidents, losses, each one of which would tend to abbreviate the chances of reaching the ultimate goal. Above this point would lie the small successes, appreciations, and triumphs which would tend to secure the desirable goal.

As an axiom, the mind can then be said to act in obedience to a central basic command, *survive*, and to direct or manage the organism in its efforts to accomplish the ultimate goal for the individual or specie or life and to avoid for the individual or specie or life any part of the final failure, which leads to the stated axiom:

THE MIND DIRECTS THE ORGANISM, THE SPECIES, ITS SYMBIOTES OR LIFE IN THE EFFORT OF SURVIVAL.

A study of the field of evolution will indicate that survival has been, will be, and is the sole test of an organism, whether the organism is treated in the form of daily activity or the life of the specie. No action of the organism will be found to lie without the field of survival, for the organism is acting within its environment upon information received or retarded, and error or failure does not alter the fact that its basic impulse was motivated by survival.

Another axiom may then be formulated as follows:

THE MIND AS THE CENTRAL DIRECTION SYSTEM OF THE BODY, POSES, PERCEIVES AND RESOLVES PROBLEMS OF SURVIVAL AND DIRECTS OR FAILS TO DIRECT THEIR EXECUTION.

As there are many organisms in the same specie, all attempting to accomplish the same end, and as there are many species, and as matter itself is attempting in one unit form or another to survive, there is necessarily conflict and contest amongst the individuals of the specie, species, or units of matter. Species cannot survive without being interested primarily in the species. Natural selection and other causes have established this as a primary rule for survival: *That the unit remain alive as long as possible as a unit and, by association and procreation, that the specie remain alive as a specie.* Second grade interest is paid by the unit or the species to its symbiotes. Third grade interest is paid to inanimate matter. As this is apparently the most workable solution, natural selection best preserves those species which follow this working rule. And the symbiotes of the successful specie therefore have enhanced opportunity for survival.

Man is the most successful organism currently in existence, at least on this planet. Man is currently winning in the perpetual cosmic election which possibly may select the thinker of the new *THOUGHT*.

Man is heir to the experience and construction of his own

ancestors. As cellular conservatism is one of the factors of survival, his brain is basically the same brain which directed and resolved the problems of his animal forebears. By evolution and natural selection, this brain therefore has the primary priority in emergencies. Superimposed on this animal brain has been developed an enormously complex analyzer which probably exists as his frontal lobe.

The command, *survive*, is variable in individuals and species to the extent that it may be strong or weak. Superior strength of the command in the individual or specie is normally, but variably, a survival factor. The primary facet of personality is the basic strength of the DYNAMIC drive.

The DYNAMIC is variable from individual to individual and race to race. It is varied by physiology, environment, and experience. Its manifestation in the animal brain effects both the tenacity of the individual to life or purpose, and it effects the activity of the analyzer. The first characteristic of the individual which should be considered is the basic strength of his DYNAMIC. By this an axiom can be formulated:

THE PERSISTENCY OF THE INDIVIDUAL IN LIFE IS DIRECTLY GOVERNED BY THE STRENGTH OF HIS BASIC DYNAMIC.

The analytical, human, or as it has elsewhere been called erroneously, the conscious mind, is variable from individual to individual and race to race in its ability to perceive and resolve problems. Another axiom can then be formulated:

INTELLIGENCE IS THE ABILITY OF AN INDIVIDUAL, GROUP, OR RACE TO RESOLVE PROBLEMS RELATING TO SURVIVAL.

It should be noted that there is a distinct difference between the DYNAMIC and the intelligence. High intelligence may not denote high DYNAMIC. High DYNAMIC may not denote high intelligence. Intelligence is mental sensitivity and analytical ability. DYNAMIC is the persistency of the individual in obedience to the command, *survive!*

It has been noted that there is a gradation in the scale of survival. Gains toward the ultimate goal are pleasurable. Failures toward the final defeat are sorrowful or painful. Pleasure is therefore the perception of well-being, or an advance toward the ultimate goal. Pain, therefore, is the perception of a reduction toward the final defeat. Both are necessary survival factors.

For the purpose of Scientology good and evil must be defined. Those things which may be classified as good by an individual are only those things which aid himself, his family, his group, his race, mankind or life in its dynamic obedience to the command, modified by the observations of the individual, his family, his group, his race, or life.

As *evil* may be classified those things which tend to limit the dynamic thrust of the individual, his family, his group, his race, or life in general in the dynamic drive, also limited by the observation, the observer and his ability to observe.

Good may be defined as constructive. *Evil* may be defined as destructive—definitions modified by viewpoint. The individual man is an organism attempting to survive in affinity or contest with other men, races, and the three kingdoms. His goal is survival for himself, his progeny, his group, his race, his symbiotes, life and the universe in general in contest with any efforts or entities which threaten or impede his efforts to attain the goal.

His happiness depends upon making, consolidating, or contemplating gains toward his goal.

The purpose of Scientology is to pass man across the abyss of irrational, solely reactive thought and enter him upon a new stage of constructive progression to the ultimate goal.

an analogy of the mind

It is not the goal of Scientology to reconstruct the human mind. The goal of Scientology is to delete from the existing mind those physically painful experiences which have resulted in the aberration of the analytical mind, to erase from the body psychosomatic illnesses which are physical abnormalities and the physical manifestation of the

aberration, and to restore in its entirety the proper working function of a brain not otherwise physically deranged.

When an individual is acting contrary to survival of himself, his group, progeny, race, mankind, or life he can be considered to be unintelligent, uninformed or aberrated. *Every single instance of aberrated conduct threatening the general goal of the individual as outlined in the last chapter can be proven to have a source which will specifically be found to be a painful experience containing data not available to the analytical mind.* Every single instance and facet of aberrated conduct has its exact causation in the physically painful error which has been introduced during a moment of absence of the analytical power.

Scientology is the discovering of the aberration in the individual, finding the physically painful experience which corresponds to it and placing the data therein contained at the disposal of the analytical mind.

More as an effort to demonstrate how that is accomplished than as actual outline of the character of the mind, the following analogy is offered.

First there is the physio-animal section of the brain, containing the motor controls, the sub-brains, and the physical nervous system in general, including the physical aspect of the analytical section of the brain. The control of all voluntary and involuntary muscles is contained in this section. It commands all body fluids, blood flow, respiration, glandular secretion, cellular construction, and the activity of various parts of the body. Experimentation has adequately demonstrated this. The physio-animal mind has specific methods of "thinking." These are entirely reactive. Animal experimentation—rats, dogs, etc.—is experimentation on and with precisely this mind and little more. *It is a fully conscious mind and should never be denoted by any term which denies it "consciousness" since there is no period in the life of the organism from conception to death when this mind is not awake, observing, and recording percepts.* This is the mind of a dog, cat, or rat and is also the basic mind of a man so far as its operating characteristics are concerned. A man in the deepest possible somnambulistic sleep is still in possession of more mind and thinking and coordinating ability than a lower animal.

The term "consciousness" is no more than a designation of the awareness of *now*. The physio-animal mind never ceases to be aware of *now* and never ceases to record the successive instances of *now* which in their composite make up a *time track* connecting memory in an orderly chain.

Cessation of life alone discontinues the recording of perceptions on this orderly track. *Unconsciousness* is a condition wherein the organism is disordinated only in its analytical process and motor control direction. In the physio-animal section of the brain, a complete time track and a complete memory record of all perceptions for all moments of the organism's existence is available.

As life progresses, for instance, from a blade of grass, greater and greater complexities and degrees of self-determinism are possible. Energy in its various forms is the primary motivator in the lower orders, but as the complexity of the order is increased into the animal kingdom, the physio-animal brain attains more and more command of the entire organism until it itself begins to possess the second section of the mind.

All animals possess in some slight degree an analyzer. This, which we designate the *analytical mind*, is present even in lower orders, since it is only that section of the brain which possesses the self-deterministic coordinative command of the physio-animal brain and thus of the body. In a rat, for instance, it is no more than its "conscious" awareness of *now* applying to lessons of *then* without rationality but with instinct and painful experience. This is the analytical section of the mind in a lower animal but it is the *reactive mind* in a man whose *analytical mind* is so highly attuned and intricate that it can command entirely the physio-animal brain and thus the body.

Man not only possesses a superior physio-animal mind but possesses as well an *analytical mind* of such power and complexity that it possesses no real rival in any other species. The *analytical mind* of man cannot be studied by observing

the reactions of animals under any situations. Not only is it more sensitive but it possesses factors and sensitivities not elsewhere found.

Continuing this analogy: Lying between the *analytical mind* and the physio-animal mind may be conceived the *reactive mind*. This is the coordinated responses of the physio-animal mind, the "analytical" mind of animals and the first post of emergency command in man. All errors of a psychic or psychosomatic nature can be considered for the purposes of this analogy to lie in the *reactive mind*. The first human *analytical mind* took command of the body and physio-animal mind under strained and dangerous circumstances when man was still in violent contest with other species around him. It can be considered that the *analytical mind* received command with the single proviso that instantaneous emergency would be handled by the outdated but faster *reactive mind*.

Any and all errors in thinking and action derive from the reactive mind as it is increased in strength and power by painful experience. It can be called a shadow mind, instantaneously reactive when any of its content is perceived in the environment of the individual, at which time it urgently bypasses the analytical mind and causes immediate reaction in the physio-animal mind and in the body. Additionally, the reactive mind is in continual presence when chronically restimulated by a constantly present restimulator—which is to say, an approximation of the reactive mind's content or some part thereof continually perceived in the environment of the organism. The reactive mind is in action so long as it is activated by an exact or nearly exact approximation of its content. But given too continuous a restimulation, it can and does derange both the physio-animal mind and body below it and the analytical mind above it. It was created by deranging circumstances of a physical nature, hence it deranges.

The entire content of the reactive mind is records of physical pain with its accompanying perceptions during disconnection of the analyzer. All aberrated conduct and error on the part of an individual is occasioned by restimulation of his reactive mind.

None of these minds are "unconscious," nor are they subconscious. The entire organism is always conscious but the temporary dispersion of the thought processes of the analytical mind bring about a condition whereby that mind, having been dispersed and considering itself the residence of person, is unable to obtain and reach data perceived and received by the organism during the analytical mind's condition of dispersion. That the analytical mind can be thrown, by pain or shock, out of circuit is a survival factor of its own: as sensitive "machinery" it must be protected by a fuse system.

the dynamics

The basic dynamic, SURVIVE, increases in complexity as the complexity of the organism evolves. Energy may be considered to have taken many paths through eternity to arrive intact at the infinite goal. The "why" of the goal may lie above the finite line but below it, demarked by the word SURVIVE, definite manifestations are visible. Energy collects into various forms of matter which collect and aggregate in various materials and compounds. Life evolves from the simplest basic into complex forms since evolutionary change is in itself a method of survival.

Conflict amongst species and individuals within the species is additionally a survival factor. Affinity of individuals for groups, races, and the whole of its specie, and for other species, is additionally a survival factor, as strong or stronger than conflict.

Drive is defined as the dynamic thrust through time toward the attainment of the goal. Survive is considered to be the lowest common denominator of all energy efforts and all forms. It can then be subdivided specifically into several drive lines as applicable to each form or specie. The unaberrated self contains five main drives which are held in common with man.

The dynamics are: One, self; Two, sex; Three, group;

Four, mankind; Five, life; Six, the physical universe; Seven, thought; Eight, universal thought or theta.

An entire philosophy can be built around each one of these dynamics which will account for all the actions of an individual. Any one of these philosophies is so complete that it can be logically made to include the other seven. In other words, all purpose of an individual can be rationalized into the dynamic of self. A philosophy exists which attempts to rationalize everything into the sexual dynamic, and so on with all the dynamics. Observing that each one can stand as a logical unity, one finds it necessary to retire to the lowest common denominator of the basic dynamic which actually does explain the eight subdivisions. As each one of the subdivisions is capable of supporting the whole weight of a rational argument, it can readily be deduced that each is of nearly equal importance in the individual. The aberrated conditions of a society tend to vary the stress on these dynamics, making first one and then another the keynote of the society.

In an unaberrated individual or society, the validity of all eight would be recognized.

The unaberrated individual may physiologically possess or environmentally stress one or more of these dynamics above the others. In terms of basic personality, the physiological-environmental-educational aspect of the individual is varied strength in the eight dynamics.

Each one of the eight dynamics breaks further into purposes which are specific and complex. Purposes and other factors entangle these dynamics and varying situations and the observational power of the individual may conflict one against another of these dynamics within the individual himself. This is a basic complex factor of unaberrated personality.

I. *THE DYNAMIC OF SELF* consists of the dynamic thrust to survive as an individual, to obtain pleasure as an individual, and to avoid pain. It covers the general field of food, clothing and shelter, personal ambition, and general individual purpose.

II. *THE DYNAMIC OF SEX* embraces the procreation of progeny, the care of that progeny, and the securing for that progeny of better survival conditions and abilities in the future.

III. *THE DYNAMIC OF GROUP* embraces the various units of the specie man, such as the association, the military company, the people in the surrounding countryside, the nation and the race. It is characterized by activity on the part of the individual to obtain and maintain the survival of the group of which he is a part.

IV. *THE MANKIND DYNAMIC* embraces the survival of the species.

V. *THE DYNAMIC OF LIFE* is the urge of the individual to survive for life and for life to survive for itself.

VI. *THE PHYSICAL UNIVERSE DYNAMIC* is the drive of the individual to enhance the survival of all matter, energy, time and space.

VII. *THE THOUGHT DYNAMIC* concerns the urge of the individual to survive as thought.

VIII. *THE DYNAMIC OF UNIVERSAL THOUGHT* is the urge of the individual to survive for the Creator.

While man is concerned with any one of the above dynamics, any one of them may become antipathetic to his own survival. This is *rational conflict* and is normally and commonly incident to survival. It is non-aberrative in that it is rational within the educational limitation.

The family as a unit is not a dynamic but a combination of dynamics. And in this and other societies it attains a position of interest which is not necessarily inherent in the individual or group.

Basically simple, complexity is introduced amongst the dynamics by individual and group irrationalities. The basic (unaberrated) individual has continual difficulty rationalizing the problems of importances and choices amongst these dynamics. When the basic individual becomes aberrated and is attendantly unable to reason freely on all problems, a selection of importances amongst these dynamics becomes

early impossible and produces aberrated solutions which may resolve such an extreme as the destruction of the individual himself, by himself, under the mistaken solution that he may thus obey the primary command.

Note: All self-destructive effort is irrationality of a precise nature which will often be found by the auditor in a subject under treatment but which forms no part of the basic personality of the individual.

the basic individual

For the purposes of this work the terms *basic individual* and *clear* are nearly synonymous since they denote the unaberrated self in complete integration and in a state of highest possible rationality; a *clear* is one who has become the *basic individual* through therapy.

The precise personality of the basic individual is of interest to the operator. His complete characteristic is established by:

1. The strength of his basic DYNAMIC; 2. The relative strengths of his dynamics; 3. The sensitivity, which is to say the intelligence, of his analyzer; 4. The coordination of his motor controls; 5. His physiological and glandular condition; 6. His environment and education.

The experiences of each individual also create an individual composite and so may additionally designate individuality. There are as many distinct individuals on earth as there are men, women and children. That we can establish a common denominator of drive and basic function does not, can not, and will not alter the fact that individuals are amazingly varied one from the next.

It will be found by experience and exhaustive research, as it has been clinically established, that the basic individual is invariably responsive in all the dynamics and is essentially "good." There are varying degrees of courage but in the basic individual there is no pusillanimity. The virtues of the basic individual are innumerable. His intentional vices and destructive dramatizations are non-existent. He is in close alignment with that ideal which mankind recognizes as an ideal. This is a necessary part of an auditor's working knowledge, since deviations from it denote the existence of aberration and such departures are unnatural and enforced and are no part of the self-determinism of the individual.

Man is not a reactive animal. He is capable of self-determinism. He has will power. He ordinarily has high analytical ability. He is rational and he is happy and integrated only when he is his own basic personality.

The most desirable state in an individual is complete self-determinism. Such self-determinism may be altered and shaped to some degree by education and environment, but so long as the individual is not aberrated, he is in possession of self-determinism. So long as he is self-determined in his actions he adjusts himself successfully to the degree that his environment will permit such an adjustment. He will be more forceful, effective and happier in that environment than when aberrated.

That the basic personality is "good" does not mean that he cannot be a terribly effective enemy of those things rationally recognizable as destructive to himself and to his.

The basic individual is not a buried unknown or a different person but an intensity of all that is best and most able in the person. The basic individual equals the same person minus his pain and dramatizations.

The drive strength of the person does not derive from his aberrations. The aberrations lessen the drive strength. Artistry, personal force, personality, all are residual in the basic personality. This is derived from clinical research and experimentation. The only reason an aberrant occasionally holds hard to his aberrations is due to the fact that his engrams have a content which forbids their removal.

engrams

The reactive mind consists of a collection of experiences received during an unanalytical moment which contain pain

and actual or conceived antagonism to the survival of the individual. An engram is a perceptic entity which can be precisely defined. The aggregate of engrams compose the reactive mind.

A new sub-field entitled "Perceptics" has been originated here to adequately define engramic data. Perceptics contains as one of its facets the field of semantics. Precisely as the field of semantics is organized so is organized in perceptics each sensory perception.

The audio-syllabic communication system of man has its counterpart in various languages observable in lower animals. Words are sounds in syllabic form delivered with a definite timber, pitch, and volume or sight recognition in each case. Words are a highly specialized form of audio-perceptics. The quality of the sound uttering the word is nearly as important as the word itself. The written word belongs in part to visio-perceptics. Having but lately acquired his extensive vocabulary, the mind of man is least adjusted to words and their sense. The mind is better able to differentiate amongst qualities of utterance than amongst the meanings of words themselves.

Included in perceptics in the same fashion and on the same axioms as semantics are the other sensory perceptions—organic sensation, the tactile sense, the olfactory sense and the senses involved with sight and hearing. Each has its own grouping. And each carries its class of messages with highly complex meanings. Each one of these divisions of the senses is plotted in time according to the earliest or most forceful significances. Each class of messages is so filed as to lead the individual toward pleasure and away from pain. The classifications and study of this varied sensory file has been designated "Perceptics."

Engrams are received into the mind forming a reactive area during moments of lowered analytical awareness of the individual and they contain physical pain and antagonism to survival. The engram is a packaged perceptic not available to the analytical mind but intimately connected to the physio-animal mind. Under normal conditions it reacts as a dramatization of itself when approximated by the organism's perceptions of its content in the immediate environment during periods of weariness, illness, or hypnotic moments in the life of the individual.

When injury or illness supplants the analytical mind producing what is commonly known as "unconsciousness" and when physical pain and antagonism to the survival of the organism are present, an engram is received by the individual. Subsequently, during moments when the potential of the analytical mind is reduced by weariness, illness or similar circumstances, one or more of the perceptics contained in the engram may be observed by the individual in his environment and without his perceiving that he has observed it (or the identity of it), the individual dramatizes the moment of receipt of the engram.

An engram impedes one or more dynamics of the basic individual. Being antagonistic to his survival it can be considered analogically to consist of a reverse charge.

As an example, the analytical mind can be said to possess multiple scanners in layers. Ordinary or pleasurable memory can be considered to have, as an analogy only, a positive charge. The multiple scanners are able to sweep these areas and make available memory data to the analytical mind so that it can arrive by various mathematical means at a solution for its various problems.

The engram, as a specific memory package, can be considered to have a reverse charge which cannot be reached by the scanner of the analytical mind but which is directly connected to the motor controls and other physical functions and which can exert, at a depth not nearly as basic as the basic drive but nevertheless low, a hidden influence upon the analytical mind through another circuit. The analytical mind in awareness of *now*, nevertheless, is able to discover, without therapeutic assistance, the existence of such an impediment since it was received during a moment of extremely low potential on the part of the analytical mind.

As a further analogy, and for demonstration only, an engram can be considered to be a bundle of perceptions of a precise nature. An engram is an entire dramatic sequence,

implanted during unconsciousness, which possesses specific perceptic keys, any one of which when unanalytically perceived by the individual in his environment, may in greater or lesser degrees set the engram into reaction.

Denied to the analytical mind at its reception, it is denied to the analytical mind in its exact character during its dramatization. Its content is literal and, on the physio-animal level, demands action. Man's analytical ability and his vocabulary are imposed above both the physio-animal mind and the reactive mind, both on the evolutionary time track and in awareness. The charge contained in the engram is inextinguishable and remains reactive in full force whenever keyed into the circuit by restimulators.

Restimulators are those approximations in the environment of an individual of the content of an engram. Restimulators can exist in any of the various senses. The orderly filing of perceptics in the memory does not, apparently, include the content of engrams, these being filed separately under an "immediate danger" heading.

There are three kinds of thought: The first is *engramic*, or *literal*. It demands immediate action without examination by the analytical mind. A hand being withdrawn from a hot stove when burned is being governed by the reactive principle, but as the ensuing instant of unconsciousness caused by the shock is ordinarily slight, no real engram can be said to have formed.

The second type of thought is *justified thought*. Engramic thought is literal, without reason, irrational. Justified thought is the attempt of the analytical mind to explain the reactive, engramic reactions of the organism in the ordinary course of living. Every engram may cause some form of aberrated conduct on the part of the individual. Justified thought is the effort of the conscious mind to explain away that aberration without admitting, as it cannot do normally, that it has failed the organism.

The third and optimum type of thought is *rational thought*. This is the thought used by a "clear."

An engram is an apparent surcharge in the mental circuit with certain definite finite content. That charge is not reached or examined by the analytical mind but that charge is capable of acting as an independent command.

When the basic drive of the individual is boosted in potential by an observed necessity, the residual charge in an engram is insufficient to contest, at times, the raised purpose. The analytical mind can then be seen to function in entire command of the organism without serious modification by engramic command.

At other times, hostility in the environment and confusion of the analytical mind combine to reduce the dynamic potential to such a degree that the engramic command, in comparison to the basic drive, can be seen to be extremely powerful. It is at such times, in the presence of even faint restimulators, that the individual most demonstrates his aberrations.

EXAMPLE: Engram received at the age of three and one-half years. Adult patient. As child in dental chair, against his will, under antagonistic conditions, given nitrous oxide and tricked by dentist. During painful portion of treatment the dentist says, "He is asleep. He can't hear, feel or see anything. Stay there."

The perceptics which can be restimulated in this are the quality, pitch and volume of the dentist's voice; the sound of the dentist's drill; the slap of the cable running the drill; street noises of a specific kind; the tactile of the mouth being forcibly held open; the smell of the mask; the sound of running water; the smell of nitrous oxide; and in short, several of each perceptic class, excluding only sight.

The effect of this experience, being a part of an engramic chain which contained two earlier experiences, was in some small degree to trance the individual and maintain some portion of him in a regressed state.

This engram is too brief and extraordinarily simple but it will serve as an example to the auditor. The timeless quality of the suggestions, the conceived antagonism, precursors on the engramic chain awakened and re-enforced, all these things confused the time sense with the individual and was otherwise reactive in later life.

For every engram there is a somatic as part of that engram. No aberration exists without its somatics unless it is a racial-educational aberration, in which instance it is compatible with its environment and so is not considered irrational.

Every aberration contains its exact command in some engram.

The numbers of engrams per individual are relatively few. The aberrated condition of the individual does not depend on the number of engrams but the severity of individual engrams.

An engram is severe in the exact ratio that it is conceived by the organism to have been a moment of threat to survival. The character of the threat and the perceptic content produces the aberration. A number of engrams with similar perceptics in an individual produce a complex aberration pattern which nevertheless has for its parts individual engrams.

An aberration is the manifestation of an engram and is serious only when it influences the competence of the individual in his environment.

Engrams are of two types depending upon the duration of restimulation. There are "floaters" and "chronics." A floater has not been restimulated during the lifetime succeeding it in the individual. A chronic is an engram which has been more or less continuously restimulated so that it has become an apparent portion of the individual. A chronic begins to gather "locks." A floater has not accumulated locks since it has never been restimulated.

A lock can be conceived to be joined to an engram in such a way that it can be reached by the multiple scanners of the analytical mind which cannot reach the engram. A lock is a painful mental experience. It is or is not regarded by the analytical mind as a source of difficulty or aberration. It is a period of mental anguish and is wholly dependent upon an engram for its pain value. When an engram is activated into a chronic, it accumulates numerous locks along the time track of the individual. The engram itself is not immediately locatable, except somatically, along the time track of the individual. Locks are of some diagnostic value but as they exist as experiences more or less recallable by the analytical mind, they can be depended upon to vanish upon the removal of the engram from the reactive mind without further therapy.

The treating of a lock as a lock has some therapeutic value but the exhaustion of locks from an aberrated individual is long and arduous and is seldom productive of any lasting result. Upon the location and exhaustion of the engram from the reactive mind, all of its locks vanish. An engram may exist unactivated as a floater for any number of years or for the entire duration of an individual's life. At any future moment after the receipt of an engram, whether that time period consists of days or decades, the floater may reactivate into a lock at which time it becomes part of the command obeyed by the analytical mind in its efforts to rationalize. The removal of the individual from his restimulators, which is to say, the environment in which the engram was reactive, is in itself a form of therapy, since the engram may then return to its status as a floater.

EXAMPLE: Engram—At birth occurs the phrase, "No good," uttered during a moment of headache and gasping on the part of a child.

Lock: At the age of seven while the child was ill with a minor malady, the mother in a fit of rage said that he was "No good."

The removal of the engram also removes, ordinarily without further attention, the lock.

Note: Birth remained inactive in the above case as a floater until the moment of reduced analytical power at the age of seven when a birth phrase was repeated. It is worth remarking that the entire content of the birth engram is given simultaneously both to the child and to the mother, with only the difference of somatics. It is further worthy of note that the mother quite often perceives in the child a restimulator and uses against it the phrases which were said when the child gave the mother the greatest pain, namely, birth. The child is then victimized into various psychosomatic ills by the repetition of its birth engram restimula-

tors, which may develop even more seriously into actual disease.

The brain controls the multiple and complex functions of the growth and condition of the organism. Containing organic sensation as one of its perceptics, the engram then, when reactivated, causes a somatic and additionally may deny body fluids, i.e., hormones and blood, to some portion of the anatomy, occasioning psychosomatic ills. The denial of fluid or adequate blood supply may result in a potentially infective area. The psychosomatic reduces the resistance of some portion of the body to actual disease.

Semantic and other sensory errors find their basis in unconscious antagonistic moments. A semantic may be adjusted by an address to a lock but the permanency of adjustment obtains only until such time as the engram is again reactivated, causing another lock.

All aberrations are occasioned by engrams.

An engram is severely painful or severely threatening to the survival of the organism and is an engram only if it cannot be reached by the awake analytical mind.

A simple approximation of the action of an engram can be accomplished by an experiment in hypnotism whereby a positive suggestion is delivered to an amnesia-tranced patient which contains a post-hypnotic signal. The subject, having been commanded to forget the suggestion when awake, will then perform the act. This suggestion is then actually a light portion of the reactive mind. It is literally interpreted, unquestionably followed, since it is received during a period of unawareness by the analytical mind, or some portion of it. The restimulator, which may be the act of the operator adjusting his tie, causes the subject to commit some act. The subject will then try to explain why he is doing what he is doing, no matter how illogical that action may be. The post-hypnotic suggestion is then recalled to the subject's mind and he remembers it. The compulsion vanishes (unless it is laid upon an actual engram).

The obedience of the subject to the command has, as its source, engramic thought. The explanation by the subject for his own action is the analytical mind observing the organism which it supposes to have in its sole charge, and is justifying itself. The release of the post-hypnotic suggestion into the analytical mind brings about rational thought.

Engrams can be considered to be painfully inflicted, often timeless, post-hypnotic suggestions delivered antagonistically to the "unconscious" subject. The post-hypnotic suggestion given the subject in the above example would not have any permanent effect on the subject even if it were not removed by the operator because there was presumed to be no antagonism involved (unless, of course, it rested on a former engram).

The physio-animal mind of an organism never ceases recording on some level. The exact moment when recording begins in an organism has not at this date been accurately determined. It has been found to be very early, probably earlier than four months after conception and five months before birth. In the presence of pain, any moment prior to the age of two years may be considered to be unanalytical. Any painful experience received by the foetus contains its full perceptic package, including darkness.

Once an operator has worked a prenatal engram and has seen its influence upon the engramic chain and the awake life of the adult, no question will remain in his mind concerning the actuality of the experience. That the foetus does record is attributable to a phenomenon of the extension of perceptions during moments of pain and the absence of the analytical mind.

Laboratory experiment demonstrates that under hypnosis an individual's sensory perception may be artificially extended.

The existence of pain in any large degree is sufficient to extend the hearing of the foetus so that it records, during the existence of pain and the presence of exterior sound, the entire and complete record of the experience. As a chronic engram is but precariously fixed on the mind, the syllables or voice timbres contained in the prenatal will reactivate the somatic and the emotional engramic content whenever the approximations of that engram appear in the child's (or the adult's) vicinity.

The understanding of language is not necessary to reactivate an engram since the recording of the brain is so precise that the utterance of the identical words in similar tones during later prenatal periods or during birth, or immediately after birth, can and may occasion the original prenatal or any of the prenatals to become reactive, producing locks, injuring the health of the infant or, for that matter, of the foetus.

The perceptives of the foetus are extended only during moments of pain. But a chain of prenatal engrams can occasion a condition wherein the hearing of the foetus is chronically extended forming numerous locks before birth. These locks will vanish when the actual engrams are discovered and exhausted from the psyche.

Any painful unanalytical moment containing antagonism is not only a matter of record but a source of potential action in the human organism at any period during its lifetime, reserving, of course, the question of when the foetus first begins to record.

Birth is ordinarily a severely painful unconscious experience. It is ordinarily an engram of some magnitude. Any one who has been born then possesses at least one engram. Any period of absence of analytical power during receipt of physical pain has some engramic potentiality.

Moments when the analytical power is present in some quantity, when physical pain is absent and only antagonism to the organism is present do not form engrams and are *not* responsible for the aberration of the individual.

Sociological maladjustments; parental punishments of a minor sort, even when they include pain; libidos; childhood struggles and jealousies are not capable of aberrating the individual. These can influence the personality and environment adjustment of the individual but so long as he is not pathologically incompetent, he can and will resolve these problems and remain without aberration.

The human mind is an enormously powerful organism and its analytical ability is great. It is not overlaid above naturally unsocial or evil desires but is founded upon powerful and constructive basics which only powerful, painful and antagonistic experiences can impede. Engrams will be found to have been conceived by the individual as intensely antagonistic to the survival of the organism.

The discovery of the basic engram is the first problem of the operator. It normally results in an engramic chain. The content of that chain will be found to be physically severe.

An engram is physically painful, is conceived by the organism as an antagonistic threat to its survival, and is received during the absence of the analytical power of the mind. These factors may vary within the engram so that an engram may be of minimal pain, maximal antagonism and minimal absence of the analytical power, but no engram is available to the scanners of the unconsciousness.

NOTE: ONE HAS AS MUCH FUNCTIONING ANALYZER AS ONE HAS AWARENESS OF NOW

The body is to some degree re-living the experience of the engram whenever the experience is restimulated. A chronic psychosomatic, such as a painful arm, indicates the chronic, continuous co-existence with *NOW* of the moment the arm was broken or hurt. Several engrams reactivated into a chronic state brings several moments of unconsciousness, pain, and antagonism into a co-existence with *NOW*. The engram is a bundle of perceptives which include, as the primary manifestation, organic sensation. The organic sensation is enforced on the members of the body to a greater or lesser degree whenever, and as long as, the engram is restimulated. There is only *one* psychosomatic which is common to all engrams. Any engram contains this as part of the command it will enforce upon the body. The analytical mind is an organism and a part of the human body. As a stomach may be made to ache chronically (ulcers), to feel broken, the engram also enforces a command upon the *organ* of the analytical mind. That command is common to every engram. Engrams are valid only when they are received during a momentary dispersal, or shocked nul condition, of the analytical mind.

Every engram contains and enforces the command on the analytical mind that *it has been dispersed and is not operating*. This is common to every engram. This is reduction of the intellect by engrams totally aside from specific engramic content. It explains at once insanity and the remarkable mental facility of a cleared individual.

aberrations

All aberrations of any kind are of precisely the same nature (as covered in the last chapter). It is the content of the engram which causes the aberration and forms its nature. Complexity amongst engramic contents may demonstrate a most complex aberration.

The various commands contained in the engrams, reactivating and modifying the basic dynamic command of the mind, produce abnormal characteristics in the behavior of the analytical mind which are chronic or sporadic as the engrams occasioning them are restimulated. An entire concept of existence may be built from engramic content. Conflicts in the commands contained in engrams and conflicts between the basic drive and the engramic content combine into behavior patterns.

When the organism has become so impeded that it can no longer influence or command its environment, it can be considered to be insane in that environment. Change of environment may relieve the condition or, more certainly, the exhaustion of the content of the reactive mind will restore the ability of the analytical mind to solve the problems with which it is confronted.

Whatever the engramic content of the reactive mind and its potential influence upon the behavior of the individual, it does not necessarily follow that the reactive mind may be chronically restimulated. However, when the reactive mind has been restimulated consistently, the analytical mind, called upon to solve the problems around and through antagonistic and incorrect data, may be unable to perform its task. In the absence of disease or injury, any mind not in a physiological amnesia state may be restored to normal function by the removal of the reactive mind. It should be noted however that this is modified by the fact that patients who have received insulin shocks, pre-frontal lobotomies, electric shocks and other treatments are regarded as equivocal and are temporarily classed with disease cases for lack of adequate observation in this stage of the experimental research.

Patients can be regarded as rational or irrational only in so far as they react in their customary environment. But any patient in possession of a reactive mind is an unknown quantity until that reactive mind has been examined. If he has been examined, his mind can be cleared in the same process.

There are several factors contained in the engrams in the reactive mind which most certainly tend toward aberration. These include engramic commands which derange the time sense of the individual and thus apparently destroy his time track, and engrams which contain restimulators of such timelessness and such perceptive content that they remain thereafter continually with the individual and seem to arrest him or regress him in time. Engrams containing commands which make the individual chronically unable to conceive differences are especially harmful since these tend to compare everything to engramic value and thus cause the individual to arrive at a chronic state of engramic thinking.

The mind resolves problems related to survival, utilizing its ability to conceive similarities and observe differences.

Engrams which destroy or tend to hold in suspension the analytical mind's ability to conceive associations most influence the apparent intelligence of the mind. But engrams which tend, by their command content, to destroy the mind's ability to conceive differences may produce severe aberration.

EXAMPLE: "All men are alike," received as powerful engramic content would tend to compare every man and associate him with those men contained in the reactive mind as painful and dangerous.

An aberration may attain any form or complexion. As a

rough analogy, a compulsion may be conceived to be an engrammatic command that the organism *must* do something; a repression is a command that the organism *must not* do something; a neurosis is an emotional state containing conflicts and emotional data inhibiting the abilities or welfare of the individual; and a psychosis is a conflict of commands which seriously reduce the individual's ability to solve his problems in his environment to a point where he cannot adjust some vital phase of his environmental needs.

All this variety of manifestation of aberration is occasioned by the pain-enforced commands or contents of engrams.

Physical aberrations are occasioned by engrams when they are not the result of injury or disease; even then, the aspect may be improved by the exhaustion of the reactive mind of the sick individual. The engram cannot manifest itself as a mental aberration without also manifesting itself to some degree as somatic aberration. Removal of the somatic content of engrams which is also necessary to obtain any other relief, can and does occasion glandular readjustment, cellular inhibition and other physiological corrections.

the tone scale

The tone scale denotes numerically, first, the status of an engram in the reactive mind, next, its erasure or reduction, and provides a measure for sanity in an individual.

The derivation of this scale is clinical and is based upon observation of engrams being worked. When an engram is located and developed, the extreme range it can follow begins with apathy, develops into anger (or the various facets of antagonism), proceeds into boredom, and arrives at last in cheerfulness or vanishes utterly.

The tone scale is essentially an assignation of numerical value by which individuals can be numerically classified. It is not arbitrary but will be found to approximate some actual governing law in nature.

Zero is equivalent to death. An individual with a zero tone would be dead.

Ranging upwards from zero to one is then that emotional bracket which may be denoted as apathy along its graduated scale from death to the beginnings of apathetic resentment.

From one to two is the range of antagonism, including suspicion, resentment, and anger.

Boredom and its equivalents, by which is denoted minor annoyance, begin at two and end at three.

From three to four are the emotions which range from carelessness to cheerfulness.

The term *tone four* denotes a person who has achieved rationality and cheerfulness.

Each engram residual in the reactive mind has its own independent tonal value. Serious engrams will be found in the apathy range. Dangerous engrams will be found in the anger range. Above two point five an engram could not be considered to have any great power to affect the analytical mind. Each engram in the reactive mind then can be said to possess a tone value. The composite sum of these engrams will give, if added, a numerical value to the reactive mind.

Engrams can be computed as they lie along the dynamics, and to each dynamic may be assigned a tone. The sum of the tones of the dynamics, divided by the number of the dynamics will give a potential numerical value for an individual. This, of course, is variable depending on the existence of restimulators in his environment to reactivate the engrams. The general tone of an individual is important both in diagnosis and in establishing a cure.

The probable average of mankind at this writing may be in the vicinity of 3.0. Complete rationality depends upon exhaustion of the reactive mind and complete rationality is invariably the result of reaching tone four.

The initial diagnosis is done by the assignation of a general tone to denote the condition of an individual's reactive mind.

His methods of meeting life, his emotional reaction to the problems in his environment can be evaluated by the use of the tone scale.

In therapy, as will be covered later, an engram normally can be expected to run from its initial value in the apathy or anger range to tone four. Very shortly after it reaches tone four it should vanish. If it vanishes without attaining the laughter of tone four it can be assumed that the individual's basic engram has not been erased.

The tone scale has value in the therapy and should be thoroughly understood.

the character of engrams

There are several general types of engrams. It must be understood that the mind possesses a time track of one sort or another and that this track is a specific thing. The time track of an individual will include all those things available to his analytical mind when in a light trance or during regression. However a person can be regressed, the data which he can easily contact along his time track is definitely not engrammatic even if it possesses an emotional charge. Everything on this track will be rational or justified experience. It will not include engrams. It may include locks—which is to say that it may include moments of mental anguish or antagonism and may even include instants of unconsciousness which have some slight engrammatic command value.

An engram has several specific, positive characteristics. It is received by the individual at some moment of physical pain. It is not available to the analyzer and it includes conceived or actual antagonism to the survival of the organism. Certain mechanics such as "forget it" may swerve a minimumly painful or unconscious experience off the time track. In that case it becomes possessed of engrammatic command value.

All engrams with power to derange the analytical mind and aberrate the physical body lie off the time track and are not available to the analytical mind.

By reason of its disorganization during the moment the engram was received, or because it has been forcibly instructed that the data in the engram is not to be recalled, the analyzer cannot reach the engram by ordinary means because the data has been erroneously labeled "dangerous," "important," or "too painful to touch." The engram then, by a by-pass circuit, feeds hidden commands into the analyzer. By a direct instantaneous circuit it is permanently connected to the motor controls, all perceptive channels, the glands, and heart. It is awaiting a moment of low general tone, weariness, or injury when the analytical mind has reduced powers. It is also awaiting the perception of one or more of the engram's restimulators in the environment of the organism.

Continuous restimulation of the engrams can, in itself, cause a low general tone which in its turn permits more engrams to become restimulated. As the reactive mind comes into a more or less completely chronic state of reaction, the individual becomes more and more governed by this mind. His thought becomes more and more engrammatic and he can be seen to drop in general tone on the tone scale down to the break point which may be arbitrarily placed somewhere between 2 and 2.5 and below which lies the region of insanity.

Engrammatic thought is irrational identity-thought by which the mind is made to conceive identities where only vague similarities may exist. It is necessary that the auditor thoroughly understand engrammatic thought, for it is with this complete irrationality of identity that he will basically deal. As he works with any patient, sane or insane, he must continually employ in the bulk of his computation on the case the equation of engrammatic thinking.

Engrammatic thinking can be stated by: A equals A equals A equals A equals A.

The engram, when one or more of its restimulators is perceived in the environment during a moment of low general tone, may dramatize. The dramatization is the precise content of the engram. The aberration is the precise content of the engram. The reaction of an individual's analytical mind when an engram is reactivated is justification.

There is reason to believe that part of this survival mech-

anism consists of the axiom: *The analyzer must never permit an incorrect solution.* The engram brings about many incorrect solutions. The analyzer may very well become entirely involved with the attempt to discover and deliver to a society, or to itself, adequate rational reasons for the behavior of the organism.

The analytical mind, though working from the command of the engram itself, is unaware of the source of the command. Not being able to discover the source, it introverts more and more in an effort to solve a problem which contains danger to the organism. The analytical mind tends to find the danger without and within the organism.

There are five ways that the organism can react to a danger in its vicinity. It can attack it, avoid it, neglect it, run from it, or succumb to it. In just these ways can the analytical mind which, it must be remembered, is possessed of self-determinism and will power, react to the reactive mind. As the general tone lowers, which is to say, as the analytical mind becomes less and less powerful through weariness, continual reverses in general health, etc., the more and more heed it must give to the problems unsolved in the reactive mind. These are in essence unsolved problems. As such, they contain their own solutions. The analytical mind, unable to reach them, justifies the organism's reaction to them (succumbs to them), causes the organism to attempt to flee from them, apathetically may neglect them (as in pre-frontal lobotomy), avoids them in many intricate ways, or attacks them. The analytical mind is not only not certain where the experience lies on the time track, it also does not know whether the menace is within the organism or without it. So it can become entirely indiscriminate and eventually it may achieve highly irrational solutions by which it seeks to solve the problems of the highly irrational reactive mind.

The deep sensory perception channel entering the mind is evidently equipped with an appreciator which sorts according to the momentary general tone or potential of the analytical mind. The higher the general tone or potential of the analytical mind the better the data in the appreciator is sorted. The appreciator circuits are evidently fully appraised of engramic content in the reactive mind and evaluate restimulators perceived in the environment against the general tone of the analytical mind. When that is low, restimulators route more or less directly to the reactive mind which instantly responds by fixed connections into the motor controls. Commands to the various members, muscles, glands and organs of the body may be sporadic or constant, producing a high variety of responses in the body. Entire vocabularies are fed into the voice circuits directly from the reactive mind when an engram is restimulated. Orders to be active or inactive are fed to other portions. The individual time track of the engram spaces the commands to the organism and a dramatization is accomplished which may contain a portion or all of the content of the engram as governed by the situation. Psychosomatic ills, hysterias, rages, tantrums, criminal acts and any and all content prejudicial to the survival of the organism in which the organism is seen to be indulging has as its source the reactive mind.

The sole and only content of the reactive mind is *what exterior sources have done to the organism.*

None of the content of the reactive mind is self-motivated. The auditor is then interested only in what is done to the person, not what the person himself has done, since, for purposes of therapy, the acts of the organism in its society can be discounted beyond diagnosis. Even then they are of small importance to the auditor.

An organism possessed of an analytical mind, not victimized by incapacitating disease or injury (and unimpeded) will commit no act knowingly prejudicial to the survival of the organism or other facts within the dynamics. It will combat only those dangers in society which are actual menaces.

Whatever may be the status of the "innate moral sense," the basic intent of the basic personality is to further various energy forms along the dynamics toward the goal. Only moments of actual dispersal of the awareness of the analytical mind permit data to be received which is prejudicial to

the intent of the dynamics. Only from these "unconscious" moments can the basically stable and enormously powerful and able analytical mind be aberrated through the implantation of unanalyzed, painfully administered, and antagonistic information. It is the purpose of the auditor to find and exhaust these moments from the life of the individual. This therapy includes therefore, as its basic principle, the exhaustion of all the painfully unconscious moments of a subject's life. By eradicating pain from the life of an individual, the operator returns the individual to complete rationality and sanity.

The auditor should never be content with merely bringing the person back to normal. He should achieve with the person a tone 4 (four) even though this is far in advance of the average state of society at this time. A tone 4 (four) with his drives intact and powerful, with his rationality and intelligence increased to the optimum, becomes extremely valuable to the society, whatever his past.

Knowing this the auditor can expect a maximum result of lasting duration with any patient not physically hopeless.

A capable auditor will achieve the best results by ignoring impulses to educate or inform the subject in any way beyond instructions sufficient to acquire cooperation.

The entire purpose of the auditor is to rehabilitate the basic dynamic and the normal purpose or profession of the individual whom he audits. Anything implanted by positive suggestion or education in the course of therapy is harmful and must be cancelled if delivered. Only the basic personality of the individual can decide and evaluate things in his environment. Therefore, hypnotism as practiced with positive suggestions should be shunned since any and all hypnotic commands with the attendant forgettor mechanisms are no more than artificially implanted engrams. Indeed, it is quite usual for the auditor to have to exhaust hypnotically implanted material received either from some hypnotist or from the analytical mind itself when the person has been operating under auto-control. Hypnotism as such does not work, and a study and short practice in Scientology reveals exactly why.

The auditor is attempting to delete the reactive mind from the individual. This reactive mind is an infestation of foreign, careless and unreasoning commands which disrupt the self-determinism of the individual to such an extent that he no longer has charge, through his analytical mind, of the organism itself but finds himself under the continual and chronic orders of unseen, never-reviewed exterior forces, often and usually antipathetic to the survival of the mechanism.

Engrams deal with identities where no identities exist. They therefore pose many strange and irrational problems which are seen as aberrations in patients. If a human being has been born, he can be supposed to have at least one engram. Anyone who has a birth which has not been cleared by therapy has therefore a reactive mind. There is no disgrace attached to having a reactive mind since it was thrust without his consent and without his knowledge upon an unconscious and helpless individual. Sometimes this was done by persons with the best of imaginable intentions. A person not possessed of a rational mind cannot be rationally considered to be morally responsible, no matter the demands of the current society which hitherto lacked any method of determining responsibility.

The pain contained in the reactive mind is normally severe. The usual parental punishments, family complications, reprimands, minor accidents and the battle of the individual with his environment influence but do not cause a reactive mind, nor do these things have the power to change materially the reactions of an individual.

In the background of any individual exist many hidden personalities contained in the reactive mind. Dealing in identities, the reactive mind often confuses identities of individuals. Therefore, irrational attachments and antipathies are formed by aberrated individuals who can often find no reason for such attachments or antipathies in their contemporary environment.

The content of an engram is literally interpreted, not as

it was stated to the "unconscious" subject, but as it was received in its most literal phraseology and perception.

The organism possesses many inherent mechanisms and abilities by which it can learn or preserve or forward itself along the dynamics. Any one of them may be exaggerated by engrams to a point where it becomes an actual threat to the organism or impedes it. Engrams can and do aberrate all the sensory perceptions, any and all parts of the body, and the mind itself. By demanding suicide the engram can destroy the entire organism.

The error of the reactive mind was introduced by the evolution of speech, for which the basic mechanism was not designed. When all perceptics save speech formed the reactive mind, it was to some degree serviceable. With speech came such complexities of perception and such interchanges of ideas that a whole series of illusions and delusions could be derived from the reactive mind's necessity to determine identities for purposes of emergency.

Without the reactive type mind, survival would be extremely difficult since it must be there to care for emergencies during moments of dispersal of the analytical mind by shock or other means.

With speech the reactive mind came to possess far more power and extensive content. The analytical mind, being a delicate mechanism in some respects no matter how rugged and capable in others, then could become subjected to delusions and illusions which however shadowy and unreal nevertheless be obeyed. By stripping the reactive mind of its past painful content the analytical mind may be placed in complete command of the organism.

The moment a man or a group becomes possessed of this ability, it becomes possessed of self-determinism. So long as these possess reactive minds, irrationalities will persist. Because it contains literal speech, no reactive mind can be conceived to be of any value whatsoever to the rational organism since the methods of that reactive mind remain intact and will continue to act to preserve the organism in times of "unconsciousness" of the analytical mind. There is no residual good in any reactive mind. It is capable of any illusion. It has no assist power along the dynamics save only to cancel or modify other reactive mind content. The source of the individual's power and purpose is not derived from the reactive mind but from the Basic Dynamic and its eight divisions. Any auditor will establish this to his own satisfaction after he has run a very few cases.

When an individual in therapy is attempting to "hold onto his aberrations," the auditor may be assured that that person has as part of the content of the reactive mind such phrases as, "don't dare get rid of it" which, identically translated, apparently applies to aberrations. It may, in fact, apply in an engram containing an attempted abortion.

The identity factor in the reactive mind may cause the analytical mind to respond irrationally to treatment and to justify the aberrations in many irrational ways. Whatever means he uses or statements he makes to avoid the exhaustion of his reactive mind is contained exactly in the reactive mind as a positive suggestion and has no application whatsoever in rational thought.

Individuality (if by that is meant a man's desires and habits) is not traced to the reactive mind save when by individuality is meant those flagrant eccentricities which pass in Dickens for characters.

A man is much more an individual after his reactive mind has been cleared.

dramatization

Dramatization is the duplication of an engramic content, entire or in part, in his present time environment by an aberree. Aberrated conduct is entirely dramatization. Aberrated conduct will occur only when and if an engram exists in the reactive mind of the aberree. That conduct will be a duplication of such an engram. The degree of dramatization is in direct ratio to the degree of restimulation of the

engrams causing it. A mild dramatization would be a similarity to the engram. A severe dramatization would be an identity with the engram.

The general tone of an aberree, when high—when his person is unwearied and he is well and not directly menaced in his environment—does not permit as great influence by the reactive mind, since the tone level of the entire individual possesses too great a differential from the tone of the engram. As the general tone of the individual approaches the tone level of the engram under restimulation, dramatization becomes more severe.

The analytical mind is present to the degree that the general tone of the aberree is high. As this general tone lowers through ill health, reverses, or constant restimulation of the reactive mind, the analytical mind is proportionately less aware. Dramatization is demonstrated by the aberree in inverse ratio to the potential of the analytical mind. A geometrical progression is entered as general tone lowers to cause the analytical mind to lose its entire awareness potential. Since every engram contains, as the common denominator of all engrams, the unconsciousness of the organ which is the analytical mind, dramatizations bounce rapidly as this interaction progresses.

In the presence of a relatively high analytical mind awareness-potential dramatization takes the form of similarity. The data of the engram is present but is interspersed with or modified by justified thought. The physical pain which is always present as part of the dramatization is equally mild, a duplication of the pain which was present during the engram. The awareness potential of the analytical mind reduces in the restimulation of the engram which again reduces the general tone.

The aberree is subject to almost continuous dramatization of one engram or another as the restimulators appear in his vicinity. (Although the aberration may be so mild as to include only some chronically affected organ.) Complete dramatization is complete identity. It is the engram in full force in present time with the aberree taking one or more parts of the dramatae persona present in the engram. He may dramatize all the actors or merely one of them. His dramatization is identity, is unreasoned and always entirely reactive. When the analytical mind reaches the low point of awareness potential it held during the engramic incident, that point is also forced upon the aberree as a part of the dramatization. The aberree may also dramatize himself as he was at the moment of the engram's receipt.

The words, physical actions, expressions, and emotions of an aberree undergoing an identity dramatization are those of the single or various dramatae persona present in the engram.

An engram which can be dramatized may at any time in an aberree's future be dramatized as an identity dramatization when and if his general tone is low and his environment becomes infiltrated by restimulators.

An aberree, because of high general tone and other factors, may not suffer the restimulation of an engram for a number of years after its receipt. A large number of engrams may be present and undramatized in any aberree, if he has never been presented with their particular restimulators in an optimum moment for restimulation. The common denominator of all insanity is the absence of all or almost all awareness potential in the analytical mind. Insanity can be acute or chronic. Any identity dramatization is insanity, by which is meant the entire absence of rationality.

The aberree commonly and chronically dramatizes locks. The engramic content may compel or repress the aberree whenever restimulated.

An irrational person is irrational to the degree that he dramatizes or succumbs to engramic content in his reactive mind. The computations which can be made on the basis of dramatization are infinite. The reactive mind thinks in identities. Dramatizations are severe as they approach identities with the engrams which force them into being in the conduct of the aberree.

A scientologist can profit in many ways by these principles

of dramatization. By examination of the rage or apathy or hysteria patterns of the pre-clear, a scientologist will find himself in possession of the exact character of the engrams for which he is searching.

In the case of the manic, the fanatic, or the zealot an engram has entirely blocked at least one of the purpose lines deriving from a dynamic. The engram may be called an "assist engram." Its own surcharge (not the dynamic force) leads the individual to believe that he has a high purpose which will permit him to escape pain. This "purpose" is a false purpose not ordinarily sympathetic with the organism, having a hectic quality derived from the pain which is part of it, even though that pain is not wittingly experienced. This "assist engram" is using the native ability of the organism to accomplish its false "purpose" and brings about a furious and destructive effort on the part of the individual who, without this "assist engram" could have better accomplished the same goal. The worst feature of the "assist engram" is that the effort it commands is engramic dramatization of a particular sort and if the engram itself is restimulated, the individual becomes subject to the physical pain and fear which the entire experience contained. Therefore, the false purpose itself is subject to sporadic "sag." This sag becomes longer and longer in duration between periods of false thrust. It is easy to confuse, in casual observation, an "assist engram" and an actual, valid drive, unless one also observes the interspersed periods of "sag." The "assist engram" may or may not occasionally accomplish something but it does accomplish a confusion in the society that the dynamics of the individual are derived from his bad experiences. This is a thing which is emphatically untrue.

Inherently the individual has great will power. This however can be aberrated. Will power or its absence occasions the attitude of the aberree toward his reactive mind.

The prevention of the dramatization of an engram or a lock further reduces dynamic thrust of the aberree. Chronic prevention lowers his general tone toward the break point. Unhampered dramatization, as it contains restimulation of a physical pain and the reduced potential of the analytical mind, produces other harmful effects.

Necessity can and does render inactive the entire reactive mind.

Dramatization occurs most often in the absence of necessity or when the reactive mind has obscured the presence of necessity.

Dramatization is residual in the motor controls including speech and can be allayed by the physical exhaustion of the individual. The organism during dramatization tends to revivify toward the moment of the engram's occurrence; the engram containing, as one of its identity parts, the complete physical condition of the organism as at the moment of laying-in of the engram.

There is no folly or facet of human activity which cannot be dramatized. An immediate alleviation can be achieved when addressing an aberree who is in identity dramatization by acting upon the fact that the conditions of therapy, with no exception, already exist; i.e., the pre-clear returned to the moment of occurrence. Affinity may be established and therapy begun at once. He can be persuaded to listen for the phrases he is uttering and they can be alleviated by exhaustion on routine procedure.

the auditors code

Not because it is a pleasant thing to do or because it is a noble idea the auditor must always treat a pre-clear in a certain definite way which can be outlined as the auditor's code. Failure to follow this code will cause trouble to the auditor, will considerably lengthen and disturb his work and may endanger the pre-clear.

The auditor in the first place, at the optimum, should be himself cleared; otherwise he will find that many of his own engrams are restimulated as he listens to the engrams of his pre-clears. This restimulation may cause his own engrams to become chronic, victimizing him with various allergies and

delusions and causing him to be, at best, extremely uncomfortable.

An auditor can audit while he himself is being cleared as this is a peculiar and special method of locating his own engrams, since they become restimulated. Becoming painful to him, they can be found and speedily removed.

Even if he is not himself cleared, the auditor must act like a clear towards the pre-clear. The auditor's code is the natural activity of a clear.

The auditor must act toward the pre-clear exactly in the way that the pre-clear as an organism would desire that his own conscious analytical mind would react to and consider the organism.

An affinity must therefore be maintained at all costs. The auditor must never permit himself to lose his temper, become aggravated, to scold or badger or antagonize the pre-clear in any way. To do so would not merely disturb the comfort of the patient but might additionally derange him and might even prohibit further beneficial therapy by the auditor.

The code is nearly "Christlike."

The auditor must be confident in that he must continually reassure the pre-clear when restimulated engrams cause dependency on the pre-clear's part. A cheerful optimistic presence encourages the pre-clear through his most painful experiences.

The auditor must be courageous, never permitting himself to be intimidated by either the aggression or hostility of the pre-clear.

The auditor must be kind, never indulging in hostilities or personal prejudices. The auditor must be trustworthy, never betraying or capriciously denying a pre-clear and above all never breaking his word to the pre-clear. An auditor must be clean for personal odors or bad breath may be restimulators to the pre-clear or may disturb him. The auditor must take care not to offend the concepts or sensibilities of the pre-clear.

The auditor must be persistent, never permitting the case of the pre-clear to either resist him or to remain unsolved until it is in a proper tone four, since the restimulation of engrams is a malady unto itself unless they are being properly exhausted.

The auditor must be patient, never hurrying or harrasing the patient beyond the needs of stirring an engram into view. He must be willing to work at any and all times necessary for the length of time necessary to exhaust the engrams in process of elimination.

In addition to these things it may be remarked that a definite affinity is established between the auditor and pre-clear during the time of treatment. In the case of opposite sexes this affinity may amount to an infatuation. The auditor must remain aware of this and know that he can and should redirect the infatuation to some person or activity other than himself when treatment is at end. Not to do so is to produce an eventual situation wherein the pre-clear may have to be rebuffed with consequent trouble for the auditor.

auditing

The auditing technique consists of assisting the pre-clear's analytical mind or some part of it with the auditor's analytical mind. The auditor then functions during each successive period of treatment, and only during the periods themselves, as an extra analytical mind of the pre-clear.

The reactive mind was received during the dispersal or inactivity of the analytical mind. The reactive mind is removed by "returning" the pre-clear to the engram, and laying its contents before the scrutiny of the analytical mind.

This technique may be considered the lowest common denominator of a number of techniques. Anything which will serve this purpose and permit this therapy to be accomplished efficiently is valid technique.

The optimum is purely personal affinity brought about by understanding communication with the pre-clear on agreeable subjects. Another and almost useless method is narco-synthesis together with the various drugs and hypnotics used to produce sleep. Methods can be found such as faith healing, books on medical hypnosis, the techniques of Indian medi-

cine men and so forth. It is pointless to delineate these methods here. They are currently available under the name of hypnotism but a caution should be enjoined that hypnosis as itself is not acceptable to Scientology and indeed has extremely limited use. Briefly however, it must be remarked that if hypnotism is studied to advance these techniques, all positive suggestion and post-hypnotic suggestion must be avoided as these suggestions depend for their effectiveness upon the already existing content of the reactive mind and will only form additional locks.

Any and all so-called hypnotic drugs have definite drawbacks since they, like so many other things, may be termed "shot-gun" methods. These paralyze not only the analytical mind but the remainder of the organism so that it is nearly impossible to obtain the proper somatic reaction in the pre-clear. They are not anesthetics but anesthetics. By using them the operator instantly denies himself the main material which will lead him to the engram, which is to say, restimulated physical pain. Such restimulated pain is never of very great magnitude and is obliterated by the use of anesthetics.

At no time should the auditor permit the pre-clear to be under the delusion that he is being treated by hypnosis. This is mentioned because hypnotism is a current fad and the principle of Scientology has nothing whatever to do with hypnotism. Both are based upon simple natural laws but have between them an enormous gulf. One is the tool of the charlatan and the other is the science of the human mind.

Regression in its simplest form, hereafter called **return**, is employed by this therapy. It would be an extraordinary case which required revivification. Return is the method of retaining the body and the awareness of the subject in present time while he is told to go back to a certain incident. Dates are not mentioned. His size is not mentioned. Various means are used to restimulate his memory. Any of the preceptics may be employed to return him to some period of his past. He is told simply to "go back to the time when _____." He is asked to recount what he can of the incident. He is told that he is "right there" and that he can "recall this." Little else is said by the auditor save those hints necessary to return the pre-clear to the proper time.

The pre-clear is not allowed at any moment to revivify in that period since the data is drained as a surcharge from his time track to present time. He is told that he can remember this in present time since that will occasion the somatics to return to present time. Most of the data is located by observing some somatic pain in the individual or some somatic aberration and seeking to discover wherein it was received.

The somatics are employed primarily because the motor controls possess a less disturbed time track than the sensory strip. Anything which tends to lighten these somatics is then antipathetic to the therapy. It must be remembered that there is no aberration without an accompanying somatic. The somatics alone, being physical ills of one sort or another, hold the aberrated content of the reactive mind in place. The motor controls can be returned to a period although the conscious or analytical mind believes itself to be entirely in present time. By talking to the muscles or motor controls or various bodily aches and pains, the auditor can shift them at will up and down their time track. This time track is not connected to the analytical mind and speech but is apparently a parallel time track with greater reliability than the sensory track. The precision of data contained in the motor control time track is enormous. Muscles can be made to tense or relax. Coughs, aches, and pains can be made to come and go simply by uttering the right words for the engrams, or the wrong words.

It is the primary task of the auditor to cause the time tracks of the motor strip and the sensory strip to come into parallel. That the time track exists in the strips has not been proven but they can so be considered for the purposes of this explanation. That they exist is extremely apparent. The motor strip time track can be asked questions down to the smallest moment of time, and the area of an engram can be so located and its character determined.

As an analogy, a dream may be considered as the reception of the remaining analytical mind of a distortedly reflected and indirectly received picture of the engrams. This applies

only when the dream is specifically directed at the reactive mind. It will be found that a pre-clear with a large and active reactive mind does not dream to any great extent in normal sleep but that a clear may dream pleasantly and consistently. A dream in its normal function is that powerful and original mechanism called the imagination compositing or creating new pictures.

The use of the dream in this therapy is not highly technical, but has little value in practice. The auditor gleans data from the pre-clear by his own remarks about any subject, or by the pre-clear's illogicalness on a subject. The auditor tells the pre-clear to dream about this data. When the pre-clear has had the dream he is directed to go back to the engram causing the dream. Quite often he will do so. If he does not, or if he becomes hostile, it is certain that an engram exists on the subject.

The lie detector, the encephalograph and many other means are of limited usefulness in determining both the character and the extent of the engrams since into these as into the dreams can be fed the restimulators of the pre-clear. A codified restimulator list can be created which will be found to be common to most pre-clears. It should include all types of illnesses, accidents, the common trite phrases of the society, and names of various persons who commonly surround a child during his childhood. Such a codified restimulator list would be interesting for experiment and every operator can compose his own. These are best composed after auditing the individual pre-clear and after inquiry into his life to determine the various irrationalities of thought.

In that engrams are identity thought, the remarks of the patient about his engrams will be found to be included in the content of those engrams. When the pre-clear is asked to imagine a bad situation at certain ages and under hypnotic conditions, he will very often deliver up a complete engram. The auditor must realize that every remark that a pre-clear makes while he is going over his reactive mind is probably some part of the content of that reactive mind. That mind is literal. The words the pre-clear uses when referring to it must be literally evaluated.

diagnosis

It is a useful and positive principle that whatever confronts or contests the analytical mind of the pre-clear will also confront and contest the analytical mind of the auditor. When the auditor is acting as the analytical mind of the pre-clear, whatever emotion or antagonism is directed toward him is the emotion or antagonism which is directed by the reactive mind toward the pre-clear's own analytical mind. If a pre-clear cannot hear what people are saying in his engrams, he has another engram about "can't hear." If he cannot feel anything in his engram, it is because he has an engram about "can't feel." If he cannot see, he has an engram about not being able to see, and so forth. If he cannot return, he has an engram about going back, or returning to childhood, or some such thing. If he is doubtful and skeptical about what is happening or what has happened to him, it is because he has an engram about being doubtful and skeptical. If he is antagonistic, his reactive mind contains a great deal of antagonism. If he is self-conscious or embarrassed, it is because his reactive mind contains self-consciousness or embarrassment. If he insists on maintaining his own control, refusing to do what the auditor tells him to do (although he is returned), it is because he has an engram about self-control, and so forth and so on. This is identity thought, and is used in diagnosis.

The return is the best method of learning the problems of the pre-clear. Trying to work the pre-clear into remembrance, hearing, seeing, feeling, going back and forward, going to sleep, awakening, and taking due notice of what he says about the entire process will form a rather complete diagnosis on one who is not insane. Questioning the pre-clear as to what is wrong with him while returned will elicit replies straight out of his principle engrams. Listening to an endless justification of his actions is both a delay and a waste of time but listening to what he has to say about what he thinks has happened to him or what he is afraid of is of definite value.

Insane pre-clears form and pose a slightly different problem but essentially the same.

It is a clinically established observation that the reactive mind is relatively shallow. Below it lies the basic personality of the individual no matter how "insane" he may be. Therefore, by one means or another, a rational being may be reached within a patient, a being which is not aberrated. It is this fact of non-aberration which makes the basic personality a difficult aid in diagnosis. Here however it can be established what the pre-clear really wants, what he hopes, what he actually feels. It has been observed that no matter what his raving state, providing his brain structure is normal and complete, the basic personality is entirely sound and sane and will cooperate. After therapy the pre-clear will become this strong, competent and able personality.

The reactive mind, when unable to exert itself to its aberrated full in the environment of the person, will break the person, or cause him to lose tone. Therefore it is of definite interest to discover what immediately preceded the break of the pre-clear or what is currently causing him unhappiness. Something is dispersing his dynamics. The probability is that he has a chronic restimulator in his vicinity. Wives, husbands, mothers, fathers, superiors, etc., can be the source of such breaking since they turn the purpose of the reactive mind, which pretends to desire above all else the best interest of the person, back upon the person himself. Thus these sources cause the individual to lower back into the tone of the reactive mind, apathy, or a low tone two.

The problem of the fixed person and the problem of the sympathy engram are both visible in the aberrated individual. The identity thought of the reactive mind has taken some part of the person of some individual in the current environment and referred it to some part of the person of an individual in the engramic past. The discovery of this identity is one of the principle problems of therapy. The sympathy engram is of a very specific nature, being the effort of the parent or guardian to be kind to a child who is severely hurt. If that parent or guardian has shown the child antagonism prior to the time of the injury, the adult (pre-clear) is prone to reactivate the injury in the presence of the identity personality with whom he is now associated. This causes many somatic ills to present themselves in the present. Only the exact words of a sympathy engram will soothe the aberrated personality.

There are not many personality types. A human being learns through mimicry. If his own self is found to be too painful he can become another self and very often does. A tone four can become another person at will without being aberrated about it, thus enjoying books and plays by "being" the person portrayed. But an aberrated individual can become part of the engramic caste of his reactive mind and so solve all of his problems in such an aberrated fashion. Aberrated persons are not themselves since they do not possess their own determinism.

As has been stated, those emotions, doubts, worries and problems which comfort the auditor when attempting to place the pre-clear in reverie or to work him in that reverie will lead the auditor into the basic content of the reactive mind.

There are certain definite manifestations which can be suspected and certain routines which follow every case. Every human being has been carried in the womb and every human being has been born. The discovery of the basic engram on each chain is extremely necessary for the commencement of therapy. Finding the basic engram is like taking the enemy in the flank. There is nothing before it, therefore the end most remote from the adult life of the individual is the end most exposed for the attack of the auditor.

In the basic engram the patient can see, feel, hear, and freely emote. When he is returned to later incidents, it may be found that he cannot do these things no matter how hard the auditor works to enable him to do so. By pursuing the engramic chain up its chronological sequence, this ability will be restored. Therefore it is necessary first and foremost to locate the basic engram. This may, in some few cases, lie later than birth. In the majority of the cases it will be found to lie at or before birth. No discussion is here entered about the

ability of the human mind to remember at such remote periods. It can be stated however that when engramic data does exist, the time track is opened by pain and antagonism at these extreme points and can be contacted and exhausted. It is with the greatest difficulty that the operator will find the basic engram. Since it is ordinarily quite painful and the scanning mechanism having as its purpose (or one of its purposes) the avoidance of pain, it will not easily reach them. Like the scanning mechanism on a cathode ray tube, the scanners of even a very reduced potential analytical mind sweep over, skipping and not touching the data on the engramic chain. By various means the auditor must then require the scanners to contact that data and force the data back onto the time track where it can be properly exhausted.

Light prenatals are the best possible approach to a case. When the only prenatal is an extremely heavy one or an attempted abortion (which, by the way, are very common), the auditor must use a great deal of guile. Dream therapy, causing the patient to imagine, and other mechanisms are sometimes useful in discovering the basic engram. It can be said that the basic engram and the beginning of the actual engram chains is very early, before, near, or during birth, is painful, and will not be easily contacted. In that few pre-clears have more than a few hundred serious engrams, the task is light when once begun but requires a great deal of imagination and persuasion.

A prenatal must always be suspected unless birth, when lifted, rises easily into a tone four. If none of the engrams will rise into a tone four, the auditor would suppose that he has not discovered the basic. There are three kinds of engrams: The precursor, the engram and the follower. By engram here is meant that experience which the auditor has found and is working upon. If it does not seem to be lifting after a few recountings, a precursor (earlier engram) must be suspected and returned to. In this way an earlier basic may be discovered. Blows in the womb, attempted abortions, and birth are the usual basics. Easily the most important are the prenatals.

When a child is abnormally afraid of the dark, he probably has a severe engramic experience in prenatal. This prenatal experience will include all the sound data and sensory data of the incident. It is idiotic and identical. The pre-clear will have somatics. These on the first few recountings will be ordinarily faint and then become more severe as more data is located. The data will finally be in more or less complete state and the engram will begin to lift, rising up through the various tones. All prenatals are apathy experiences and are therefore serious.

Minor taps and discomforts in the womb are of no consequence. A true engram will consist of such a thing as a knitting needle being rammed through the foetus, half of the foetus' head being badly injured, blows of various kinds bringing about foetal unconsciousness and so forth. Return eventually will find an opening into any period when there has been pain.

Disbeliefs and antagonisms from the pre-clear on the subject of such a thing as an attempted abortion should be overlooked by the auditor or taken into account as the sign of an existing engram. A case is recalled wherein a girl insisted that if an abortion had ever been attempted on her it should have been successful. Through several sessions, while an attempt was made to lift birth, she continued this assertion until the auditor realized that this was probably a remark made by the abortionist (or the mother) when his efforts failed. As soon as this was suggested to the girl she was able to contact the actual incident. A chronic apathy case under treatment for some years in an institution, she suddenly responded to treatment, brought the abortion to tone four, erased birth to tone four and recovered mentally and physically into a social asset well above normal.

The auditor should continue to suspect prenatals as long as he cannot get later engrams easily into tone four. Once an engramic chain has been lifted at its end nearest to conception, the pre-clear should begin to clear relatively automatically, aided but little by the auditor. The eraser should be in terms of laughter at its optimum. This laughter is the reversing of charges residual in the locks which depended for their fear content or antagonistic content upon the basic engrams.

Abortion attempts are easy to recognize when an auditor has had some experience. The parent who attempted the abortion will, after the child's birth, likely be a source of anxiety to the individual who seems to require a great deal of affection and attraction from that parent. The individual will be found to be most fond of the parent (or other) who did not aid, or who actually tried to prevent the abortion attempt. At this time abortion attempts are extremely common.

When an abortion attempt has been lifted, the engramic chain should easily be brought to the time track and exhausted.

Therapy is essentially very simple but it demands precise understanding of the principles involved and imagination and sympathy on the part of the auditor. He must learn to compute engrammically—or learn to think with his analytical mind, only for the purposes of therapy to others, engrammically. His biggest problem is the discovery of the basic of basics. It may elude him for a considerable period of time.

There is, however, preparatory work to do in a case other than the discovery of the basic. Occasionally an entire time track must be rehabilitated in which "do not remember" and "can't remember" have obscured the track. Later locks can be found and exhausted in the same manner that engrams are exhausted, and rapid scanning methods may be developed in the future for these. The hysteria or fear of the individual can be momentarily allayed one way or the other and the problem of reaching the basic can be entered upon. There are as many types of cases as there are cases, but these are the primary fundamentals.

An operator must think his way through every case, taking as his data the constantly reiterated statements of the pre-clear during therapy, and accumulating experience as to how incidents can be thrust off the time track, burying them from sight by the analytical mind, thus forming a reactive mind to the detriment of the organism.

exhaustion of engrams

The technique of exhausting an engram is not complicated but it must be adhered to. An engram is an unconscious moment containing physical pain and conceived or actual antagonism to the organism. Therefore, that engram before it is discovered will exhibit antagonism toward the auditor trying to discover it. When it is first discovered, it may be found to be lacking in its essential data. There are many techniques by which this data can be developed. In a prenatal engram the analytical mind apparently must redevelop the situation. Many returns through the incident are therefore necessary.

When an engram will not exhaust, the first thing the operator should suspect is an earlier engram. It is actually possible for a later one to contain essential information which will not permit the information to rise. In the course of therapy, when an engram is restimulated by the auditor but will not rise above apathy and does not seem to contain all the necessary data, the operator must look for an earlier engram, and it almost inevitably will be found to exist. This precursor is then developed as the basic engram. If it follows the same behavior pattern of not lifting or becoming complete, another previous to it must be discovered. If at last the operator is entirely certain that there is no engram ahead of the one being run, some possible locking mechanism later on may be found and exhausted, at which time the basic may show itself. Continual application of energy to the basic will at length bring it into full view and continual recountings of it will gradually develop it, raise its tone and lift it into tone four.

The principle of recounting is very simple. The pre-clear is merely told to go back to the beginning and to tell it all over again. He does this many times. As he does it the engram should lift in tone on each recounting. It may lose some of its data and gain other. If the pre-clear is recounting in the same words time after time, it is certain that he is playing a memory record of what he has told you before. He must then be sent immediately back to the actual engram and the somatics of it restimulated. He will then be found to somewhat vary his story. He must be returned to the consciousness of somatics continually until these are fully developed, begin to lighten and are then gone. Tone four will appear shortly afterwards. If

the pre-clear is bored with the incident and refuses to go on with it, there is either an earlier engram or there is other data in the engram which has not been located.

The operator will discover that an engram occasionally when lifted into a three, or even erased, without reaching laughter will sag. This is a certain sign of an earlier basic on that chain. Any kind of sag from a tone four is impossible if tone four has truly been reached. Tone four will not be reached if there are earlier basics. The engram may vanish and be erased, but there will be no cheerfulness or laughter about it at the end if it is not the basic.

Once the basic has been reached and brought into tone four, it will disappear. The next engram on the chain will be located and rather easily brought into tone four. If one is accidentally skipped, the third in line will be found to hold or sag. The intermediate must then be located and brought into a tone four. In such a way the chain will gradually come up into a complete tone four. At this time it will begin to clear automatically the locks, the merely mentally painful incidents in the person's life. These will erase or lift without any attention from the auditor. While these are clearing, the operator must concern himself with secondary engrams. These would be engrams on their own if they had not had forerunners. They therefore do not relieve after the removal of the basic but must be located as themselves. These in turn will start a chain of releasing locks which again need no attention. There may be entirely distinct engramic chains in the reactive mind which are not appended in any way to the original basic.

So long as a pre-clear retains any part of a reactive mind, he will be interested in himself (in the condition of his mind) and be introverted. Therefore, so long as he is interested in his own reactive mind, he is impeded in his dynamic pursuit of survival. A guarantee of a tone four is the patient's interest in positive action along his dynamics, and his application of himself to the world around him. Introversion is not natural nor is it necessary to the creation of anything. It is a manifestation of the analytical mind trying to solve problems on improper data, and observing the organism being engaged in activities which are not conducive to survival along the dynamics. When a clear has been reached, the basic personality and self-determinism of the individual will have asserted itself. No somatics chronic in the present will remain (excepting those which can be accounted for by actual disease, injury or mal-construction of the brain).

Though more germane to child treatment, it is of help to the auditor to know that a child can be considered to have formed his general basic purpose in life somewhere around the age of two. This purpose is fairly reliable as at that time his engrams have probably not gained much force over him since his responsibilities are slight. He will have tried to hold his main purpose throughout his life but it will undoubtedly have been warped both by his reactive mind's experience content and by his environment. The time when the purpose is formed varies and may indeed never have manifested, as in the case of amentias. As the pre-clear is normally interested in this purpose and its rehabilitation, he will often take a more intense interest in therapy if there is an attempt made to discover it. This purpose is quite valid and the pre-clear can be expected to rehabilitate his life along its dictates unless he is too oppressed by his environment. (It can be remarked that a clear will ordinarily order or change his environment.)

Vocational therapies have as their source the tenet of the rehabilitation of the general purpose of an individual or the establishment of a false purpose in order to allay the activity of his reactive mind.

The auditor should be prepared to have to solve many individual problems since above these basics are almost as many problems as there are cases. For example, in the case of a patient who has several very nasty prenatals it will be found that the formation of the body in the womb has overlaid or confused the time track so that a later prenatal must be partially lifted before an earlier prenatal can be exhausted. This is often true of a later period of life. In one case an entire series of prenatals was held down by a dental operation under nitrous oxide at the age of twenty-five. Until some portion of the dental was removed, the bulk of the prenatals were not

available. In short, the circuits of the mind can become entangled to a point where even the motor control time track is confused.

Dispersal of purpose by some engram along some dynamic or purpose line is a common situation and is indeed the basic concept. As a stream of electrons would behave if they were to encounter a solid object in their path, so does a drive or purpose disperse. These many varied and faint tracks after impact with the engram are symptomatic. Along dynamic two, the sexual drive, promiscuity inevitably and invariably indicates a sexual engram of great magnitude. Once that engram is removed promiscuity can be expected to cease.

Anxiety is established in the pre-clear's mind by such dispersals and he dramatizes because of the dispersal. This is one of the manifestations of his malady. No pervert ever became a pervert without having been educated or abused by a pervert. And that abuse must have been very thorough. The contagion of engrams is an interesting manifestation which the operator should and must observe. It can be said that insanity runs in families, not because this is a eugenic truth but because a standard pattern during emergencies or stress creates certain types of engrams which in turn create types of insanities. Insanities are so definitely contagious that when a child is raised by aberrated parents, the child becomes aberrated. As would be stated by Child Scientology, the best way to guarantee a sane child is to provide it with cleared parents. This is of definite interest to the operator since he will discover that in cases of severe prenatals and birth the engrams were also received by the mother exactly as they were received by the child. The child will thereafter be a restimulator to the mother and the mother a restimulator to the child for the severe incidents. The mother, having received the exact wording of the engram, contains also the engram. Restimulation by the child will occasion the use of the engramic language toward the child. This brings the infant and child and adolescent into the unhappy situation of having his birth engram or his prenatal engrams continually restimulated. This occasions dire results and very great unhappiness in the home and is one of the main sources of family difficulties.

A child, even if he despises them, will dramatize the actions of his parents when he himself is married and when he himself has children. In addition to this the other partner in the marriage also has his or her own engrams. Their engrams combine into doubled engrams in the children. The result of this is a contagion and a progression of aberration. Thus any society which does not have a high purpose finds itself declining and gaining to itself greater numbers of insane. The contagion of aberration is at work progressively and the children become progressively aberrated until at last the society itself is aberrated.

While the fate of society belongs definitely in Social and Political Science, the auditor is interested in the fact that he can take the prenatal and birth content of the engrams of his patient and run them to discover post-birth locks and secondary engrams. The mother will normally have used much the same data whenever the troubles of the child impinged upon her reactive mind; this of course accounts for the locks.

The auditor will also discover that where he has a married pre-clear who is aberrated, he should have two pre-clears, which is to say, the partner. It is useless to return a pre-clear to his or her aberrated spouse and expect domestic tranquility to result. While the clear cannot and will not pick up his old engrams from the spouse in whom he has implanted them, he will, nevertheless, find his life made unbearable by the mere existence of a spouse that he himself may have aberrated.

Further, the children of these people will also need auditing, since they will be found (if the parent's aberrations were of any magnitude) to be sickly or aberrated or deficient in some way. The auditor should therefore, when he undertakes a case, be prepared to assume the family of his pre-clear, should an investigation of that pre-clear make it seem necessary.

Aberrations are contagious and where a person has been aberrated, his environment will to some degree also have be-

come aberrated. The pre-clear may, for one thing, be somewhat victimized and impeded by his reactive mind which is now existing in his associates.

The auditor should not permit such terms as "psycho-neurotic," "crazy," or "mentally exhausted" to exist for long in the pre-clear's mind. These are depressive and are actually aberrations in the society. It is true and provable that the pre-clear is on his way to being, not a person who is crazy or neurotic, but an individual who will have more stability and self-command and ability, possibly, than those around him. To be blunt: this is not the process of reviving corpses into a semblance of life. It is a process which, at its best usage, is taking the "normal" and "average" and giving them their birthright of happiness and creative attainment in the world of man.

engram chains

More than one engramic chain will be found in every aberration. When this person becomes a pre-clear the auditor will do well to discover the earliest chain. It is not always possible to do this with accuracy since a pre-clear is sometimes in such a nervous condition that he cannot be worked on his basic chain but must be alleviated in a greater or lesser degree by the exhaustion of a later and more available chain. This last however is not the usual case.

The Scientologist should well understand certain working principles and definitions. By an engram is meant a moment of unconsciousness accompanied by physical pain and conceived antagonism. There are two classes of engrams. One is the basic engram which is the earliest engram on an engram chain. The other is the secondary engram which is an engram of the same character and kind on the same drive line as the basic engram of the chain. An engram chain is then composed of a basic engram and a series of secondary engrams. Engram chains also contain locks which are instances of mental anguish more or less known to the analytical mind. These are often mistaken by the pre-clear for the cause of his conduct. A true engram is unknown to the conscious computer of the pre-clear but underlies it as a false datum on which is erected almost equally unknown secondaries and an enormous number of locks.

In order to release an engram chain it is vital and absolutely necessary to discover the engrams of that chain. An individual will have more than one engram chain but he has a basic chain. This must be cleared as soon as possible after treatment is engaged on the pre-clear.

When an engram is located by the scientologist, he must examine the aspect of it to determine whether or not it is the basic. Discovering it is not, he must immediately determine an earlier basic, and so forth until he is obviously on the scene of the basic engram.

There are certain tests which he can apply. A basic engram will rise to laughter, "sag" slightly, and then rise to tone four and vanish. Successive engrams will then erase from that chain with very little work. Almost any engram on an engram chain can be exhausted, but if it is secondary and not a basic engram it will recede and vanish at times but will rise in part again when the basic engram has been reached and the pre-clear is brought forward into its area.

A secondary is subject to "sag." Which is to say that it may be brought to the two point zero (2.0) tone, but after a certain length of time has elapsed—from one to two days—it will be found to have "sagged" and to be, for instance, in a one point one (1.1) tone. It can be successively lifted until it is apparently in a three point zero (3.0) tone, at which point much of its content will disappear. This is reduction.

Any engram chain can be reduced to some degree without reaching the basic but when the basic has been reached the basic itself and subsequent secondaries can be brought rapidly to tone four providing no secondaries are slipped on the return up the time track.

When an engram chain has been brought to tone four, it can be considered to have vanished although, while the pre-clear can no longer find it on the time track (he may even be unable to recall some of its most painful and disheartening

aspects), the mind apparently has been proofed against the data it has contained. A search for an engram chain after it has been exhausted and a tone four has been achieved should, for purposes of therapy, be entirely fruitless.

Once the basic has been discovered and the engram chain has been brought to tone four the locks will vanish of their own accord. If this does not occur then there is something remaining or the auditor has been too optimistic about the selection of his basic engram for the chain and has not, in reality, discovered it.

All engram chains should be exhausted from a pre-clear. These may be discovered to lie along the various dynamics but any chain may influence more than one dynamic.

Another type of engram is the cross engram. This is usually a childhood or adult engram which embraces more than one engram chain. The receipt of the cross engram, containing as it does the convergence of two or more engram chains, is often accompanied by a "nervous breakdown" or the sudden insanity of an individual. A cross engram may occur in a severe accident, in prolonged or severe illness under antagonistic circumstances, or a nitrous oxide operation. Cross engrams are very easy to locate but should not be addressed by a scientist as such since an enormous amount of work upon them will not exhaust them until the basic and the chains on which the cross engram depends have been brought to tone four.

Post-battle neurasthenia is almost always traceable to the receipt of a cross engram. This must be, of course, an engram in its own right, as well as secondary on more than one chain. It is conceivable that a secondary may be so severe that it "breaks" the individual even if it lies on only one chain.

There are certain rules an auditor may employ to establish the basic engram of a chain. In first entering a case these rules apply as well to the first goal which is the location of the basic engram of the basic chain.

Number one: No engram will lift if the basic of that chain has not been lifted.

Number two: The basic engram will not lift until the basic instant of the basic engram has been reached, which is to say, the first moment of the engram. Ordinarily this is the most obscure.

Number three: If after two or three test recountings of an engram it does not seem to be improving, the auditor should attempt to discover an earlier engram.

Number four: No engram is valid unless accompanied by somatic pain. This may be mild. Incidents which do not contain somatics are either not basic (the chain having been suspended by some such command as "can't feel" in the basic) or else it may not even be an engram.

Cases should be entered as near as possible to the basic engram. Then they should be returned to earlier incidents until the basic is discovered.

The treatment of locks themselves may accomplish some alleviation of a case.

prenatal, birth and infant engrams

The human mind and the human anatomy are enormously more powerful and resilient than has commonly been supposed. Only incidents of the greatest magnitude in physical pain and hostile content are sufficient to aberrate a mind.

The ability of the mind to store data can scarcely be overrated. In early life before sound is analyzed as speech a human being receives and stores exact impressions of everything which occurs. At some future date, when similar perceptics are encountered, the reactive mind re-analyzes—on the basis of identities only—the content of the early mind. This becomes the foundation of the post-conception personality. The actual personality in the individual is powerful and very difficult to aberrate. Unlike animals which can be driven mad by minor mechanisms of experimental psychology, a man must be most severely handled before he begins to show any signs of derangement. That derangement proceeds from the ability of the reactive mind to store perceptions from the earliest moments of existence and retain them on either the analytical or the reactive plane for future reference.

The basic personality does not proceed from engrams, and the dynamics of the individual are impeded not enhanced by engrams. The dynamics are entirely separate and are as native to the individual as his basic personality, of which they are a part.

Information falls into two categories, the educational or experience level, banked and available to the analytical mind on at least its deeper levels; and aberrational, or data stored in the reactive mind and often used by but never reached by the analytical mind save through therapy.

There would seem to be two types of recording. The first is cellular recording in which the cells would seem to store data. In that cells in procreating become themselves again—which is to say that when cell A divides, both halves are still cell A—cellular intelligence is not lost. Personal identity is duplicated. In the case of individual men procreation is far more complex and individual identity is lost—the son is not the father but a genetic composite of vast numbers of ancestors.

The cells of the human being shortly after conception are capable of enormous perceptic and retentive power. After a very short time in the womb, the brain and nervous system are already operating. From then until birth the human being is apparently capable of computations of a rather complex nature on the analytical mind level. Far more certainly he retains information on the reactive level.

Fear, pain, and unconsciousness extend the range of perception of the individual. When the human being in the womb is injured his senses extend so as to record sounds outside the mother's body. He records them so well that their precise nature is stored for future reference. The human being in the womb responds exactly as it does after birth to the receipt of engrams, storing the data with precision and reacting to it.

The repair facilities available to a human being before birth are greatly enhanced by the presence of ample connective tissue, oxygen and sustenance. These repair facilities are unimaginably great so that a prenatal human being can be severely torn and ripped without becoming structurally deficient. It does, however, receive engrams and these are subject to restimulation. In many cases of attempted abortions it was found that large sections of the prenatal human being's brain could apparently be injured without the brain being deficient or even scarred after birth. These repair facilities do not however lessen the extreme severity of the engrams which can be received by the prenatal human being. The word *fœtus* is dropped at this point and it is advised that it should be dropped from the language as a description of a pre-birth human being. Insufficient evidence is at hand to make an outright declaration that attempted abortions are responsible for the bulk of our criminal and insane aberrations. But according to the cases at hand the attempted abortion must be accounted responsible for the majority.

The attempted abortion is the most serious aberration producer. So exact is the recording of the pre-birth human being of prenatal that the reactive mind makes no errors in recognizing its enemies after birth. The mind becomes aberrated in having to depend upon these same enemies for the ordinary sustenance of life while the child is a helpless infant.

The diagnosis of a prenatal case is relatively simple. Nearly all patients will be found to have at least one prenatal engram and the case will not solve unless that prenatal is reached and exhausted.

The auditor can usually establish the attempted abortion pre-clear by an investigation of the conduct of the infant and child. Uneasiness or unhappiness in the home, a feeling of not being wanted, unreasonable fear, and a strong attachment to grandparents or another non-parental member of the household are often signs of an attempted abortion. Fear of the dark is usually but not always a part of the attempted abortion case. The auditor should suspect an abortion attempt in every patient he treats, at least for this next generation. Whether or not the pre-clear disbelieves the diagnosis is of no importance to the auditor as the prenatal engrams may very well contain the words, "Can't believe it." The parents themselves, as well as society, mislead the individual as to the enormous prevalence at this time of this practice.

The attempted abortion pre-clear may not be discovered to

be such until considerable therapy has already been done. Any therapy done on an attempted abortion pre-clear, unless it is solely addressed to making the case workable, is wasted until the attempted abortions are reached.

The post-birth aberree presents a somewhat different case than the prenatal since his case can be entered at any point and the earliest moments of it can be attained easily. This is not true of the attempted abortion pre-clear. Attempted abortions may run to any number. Since they are easily the most prevalent dramatization of engrams in the society, they are repeated time and again. The auditor will find it necessary to "unstack" the prenatal period. He will ordinarily reach the latest prenatal injury first. As he finds and examines it, it places itself on the time track. By going to earlier and earlier attempts, more and more of these engrams are revealed until at last the earliest is discovered. The auditor must be prepared to spend many hours of hard work in unstacking injuries. He will many times believe that he has reached the basic of that engram chain only to discover that another type of abortion was attempted prior to that moment. He need not address these engrams for any length of time before he goes on to the earlier one. He should only get some idea of them so that they will be easily locatable on the return. The basic engram on the attempted abortion case may be found shortly after the first missed period of the mother.

Its emotion will be exactly that of the person or persons attempting to perform the abortion. The prenatal human being identifies himself with himself but an adult returned to the prenatal period is reinterpreting the data and will find that he has and is confusing himself with other people associated in the attempts. This engramic data may have slumbered for years before it became violently restimulated and may indeed never have been awakened. It must be removed, however, before a clear can be obtained. The auditor should be prepared to unstack fifty or more incidents before birth if necessary.

When he is at last in the vicinity of the basic, even the most skeptical pre-clear (one who has skepticism as part of the prenatal engram chains) will have no further question as to what is happening to him. The auditor should be prepared to encounter difficulty in the ability of the pre-clear to hear voices or feel pain as it is quite common for the engramic content to contain such phrases as, "Unconscious," and "Can't see, can't feel, can't hear," this having been the misconception of the society regarding prenatal life.

The auditor should never be appalled at the damage the prenatal human being has received and so question the validity of his pre-clear's data. Unless the umbilical cord is severed or the heart is stopped it is apparently the case that no damage, particularly in the earlier months, is too great for the organism to reconstruct.

In that parents performing abortions are usually dramatizing attempted abortions which have been performed on them, rationality of content in the engrams should not be expected. Even the data given for it by the abortionist's father, mother or professional is often entirely inaccurate.

The test of an engram is whether or not it will lift and whether or not the somatics which accompanied it disappear and a tone four is obtained. Rearranging data into other sequences will not obtain this. The exact content must be brought out.

The attempted abortion human being is often struck unconscious by the earliest part of each attempt since the head is so available to the knitting needles, hat pins, orange-wood sticks, buttonhooks, and so forth which are employed. These periods of unconsciousness must be penetrated and will quite ordinarily release slowly.

The number of prenatal engrams should not particularly appall the auditor for when the basic has been discovered and a tone four achieved, the succeeding experiences will lift with greater and greater ease. The periods of consciousness interspersed between the prenatal engrams, being locks, will vanish.

Birth is in itself a severe experience and is recorded by the human being from the first moments of pain throughout the entire experience. Everything in a birth is engramic since the human being conceives the ministrations to be more or less

antagonistic when they are accompanied by so much pain. A birth must be lifted as a matter of course but not until the presence or absence of prenatals have been established. Even after birth has been lifted prenatals should be looked for, since prenatals may often be found only after birth has been exhausted. The habits of obstetricians, the presence of sound and speech in the delivery room, the swabbing of an infant's nostrils, the examination of its mouth, the severe treatment administered to start its breathing and the drops on the eyes may account in themselves for many psychosomatic ills. A cough however, although it is present in birth and seems to be alleviated by the exhaustion of the birth engram, is quite ordinarily blood running down the throat of the prenatal during an attempted abortion. Any perception during birth, when difficulty is encountered with breathing, may become a restimulator for asthma. Clean fresh air and electric lights may cause allergies and may be the principle restimulators. Everything said during birth, as well as everything said during prenatal experiences, is recorded in the reactive mind and acts as aberrational matter which can and does cause psychological and physiological changes in the individual. Because the parents are not greatly in evidence at birth, this experience may not be restimulated for many years. Prenatals, on the other hand, restimulate more easily.

Infant life is very sentient. Delay in learning to talk is delay in learning the complexity of handling vocal muscles rather than a delay in ability to record. Everything in infant life is recorded and the engrams received in it are extremely valid.

The auditor will find himself dealing mainly with prenatal, birth, and infant life. The cases are very rare which have many important basics in childhood or adult life. These last periods contain mainly secondary engrams which, though they must be addressed to create the clear, should not engage much initial attention on the part of the auditor. Most of the experiences of mental anguish in childhood and adult life are founded on very early engrams and are locks which are almost self-removing.

Moments of unconsciousness which contain physical pain and conceived antagonism lying in childhood and adult life are serious and can produce aberration. Engram chains complete with basic may be found which will, all by themselves, exhaust.

the "laws" of returning

By aberration is meant the aberree's reactions to and difficulties with his current environment.

By somatic is meant any physical or physically sensory abnormality which the patient manifests generally or sporadically in his environment, or any such manifestation encountered and re-experienced in the process of therapy.

The aberration is the mental error caused by engrams and the somatic is the physical error occasioned by the same source.

The auditor follows the general rule that no aberrations or somatics exist in a subject which cannot be accounted for by engrams. He may ordinarily be expected to discover that anything which reduces the physical or mental perfection of the subject is engramic. He applies this rule first and in practice admits no organic trouble of any character. Only when he has obviously obtained a clear and when he has observed and medically examined that clear after a period of sixty days to six months from end of therapy should he be content to assign anything to organic origin. He cannot be expected to know until the final examination exactly what somatic was not engramic. In other words he must persistently adhere to one line of thought (that the patient can be brought to mental and physical perfection) before he resigns any mental or physical error in the patient to a purely organic category. Too little is known at this writing of the recoverability of the mind and body for an auditor to deny that ability to recover. Since primary research considerable practice has demonstrated that this ability to reconstruct and recover is enormous, far beyond anything previously conceived possible.

Scientology accounts for faith healing phenomena on an entirely scientific basis and the scientologist expects himself to consort daily in his practice with what appear to be miracles.

In addition to knowledge of his subject, considerable intelligence, and imagination and a personality which inspires confidence, the scientist must possess persistency to a remarkable degree. In other words, his drives must be phenomenally high. There is no substitute for the auditor's having been cleared. It is possible for an individual to operate with Scientology without being cleared and he may do so for some time without repercussion, but as he practices he will most certainly encounter the precepts contained in some of his own engrams time after time until these engrams are so restimulated that he will become mentally or physically ill.

In psychoanalysis it was possible for the analyst to escape this fate because he dealt primarily with locks occurring in the post-speech life. The analyst might even experience relief from operating on patients since it might clarify his own locks which always had been more or less completely available to his analytical mind. This is very far from the case with the auditor who handles continually the vital and highly charged data which cause physical and mental aberrations. In Scientology an auditor works with impunity for a very short time only before his own condition demands that he himself be audited. While this is aside from the main subject of auditing it has been too often observed to be neglected.

Every engram possesses some quality which denies it to the analytical mind. There are roughly four types of denial. First there is the "self-locking" engram which contains the specie of phrases, "Frank will never know about this," "Forget it!" "Cannot remember it!" and so forth. Second is the self-invalidating engram which contains the specie of the phrases, "Never happened," "Can't believe it," "Wouldn't possibly imagine it," and so on.

Third is the pre-clear ejection engram which contain the specie of phrases, "Can't stay here," "Get out!" and other phrases which will not permit the pre-clear to remain in its vicinity but return him to present time. The fourth is the seizing engram which contains the specie of phrases, "Stay here," "Hold still," "Can't get out," and so on.

These four are the general types which the auditor will find to occasion him the greatest difficulty. The type of phrase being encountered, however, is easily diagnosed from pre-clear reaction.

There are many other types of engrams and specie of phrases which will be encountered. There is the self-perpetuating engram which implies that, "It will always be this way," and "It happens all the time." The auditor will soon learn to recognize them, forming lists of his own.

An engram would not be an engram unless it had strong compulsive or repressive data contained in it. All engrams are self-locking to some degree, being well off the time track and touching it slightly, if at all, with some minor and apparently innocuous bit of information which the analytical mind disregards as unimportant. Classed with the self-locking specific variety are those phrases which deny perception of any kind. The capable auditor will continually encounter perception denial and will find it one of the primary reasons the pre-clear cannot recall and articulate the engram. "Can't see," "Can't hear," "Can't feel," and "Isn't alive" tend to self-lock the whole engram containing any such phrases.

As the engram is a powerful surcharge of physical pain, it will without any phrases whatsoever deny itself to the analytical mind which, in seeking to scan it, is repelled by its operating principle that it must avoid pain for the organism. As has already been covered, there are five ways the organism can handle a source of pain. It can neglect it, attack it, succumb to it, flee from it, or avoid it. As the entire organism handles exterior pain sources, so does the analytical mind tend to react to engrams. There is an exterior world reaction of the organism to pain sources then. This is approximated when the analytical mind is addressed in regard to engrams. There is an excellent reason for this. Everything contained in the reactive mind is exterior source material. The analytical mind was out of circuit and was recording imperfectly if at all in the time period when the exterior source was entered into the reactive mind.

An analytical mind when asked to approach an engram re-

acts as it would have had it been present, which is to say, in circuit at the moment when the engram was being received. Therefore, an artificial approach to the engram must be made which will permit the auditor to direct the subject's analytical mind into but one source of action: Attack.

The actual incident must be located and re-experienced. In that the analytical mind has five possible ways of reacting to the engram and in that the operator desires that only one of these—attack—be used, the pre-clear must be persuaded from using the remaining four.

On this general principle can be created many types of approach to the problem of obtaining a clear. The one which is offered in this manual is that one which has met with quicker and more predictable results than others researched. It has given, in use, one hundred per cent results. In the beginning, at this time, an auditor should not attempt to stray far from this offered technique. He should attempt to vary it only when he himself has had extensive and sufficient practice which will enable him to be very conversant with the nature of engrams. Better techniques will undoubtedly be established which will provide swifter exhaustion of the reactive mind. The offered technique has produced results in all types of cases so far encountered.

There are three equations which demonstrate how and why the operator and pre-clear can reach engrams and exhaust them:

I. The auditor's dynamics are equal to or less than the engramic surcharge in the patient.

II. Pre-clear's dynamics are less than the engramic surcharge.

III. The auditor's dynamics plus pre-clear's dynamics are greater than the engramic surcharge.

When the pre-clear's dynamics are entirely or almost entirely reduced, as in the case of amnesia trance, drug trances and so forth, the auditor's dynamics are not always sufficient to force the pre-clear's analytical mind into an attack upon the engram.

The auditor's dynamics directed against an engram in a pre-clear who has not been subjected to a process which will inhibit the free play of his reactive mind and concentrate it, ordinarily provokes the pre-clear into one of the four unusable methods of succumbing, fleeing, avoiding or neglecting the engram. Demanding that the pre-clear "face reality," or "see reason," or that he "stop his foolish actions" fall precisely into this category. The auditor's dynamics operating against an awake patient can produce an "insanity break" temporary or of considerable duration in the pre-clear.

When the pre-clear is in reverie some of his own dynamics are present and the auditor's dynamics added to these make a combination sufficient to overcome the engramic surcharge.

If the auditor releases his dynamics against the analytical mind of the pre-clear, which is to say, the person of the pre-clear, while an attempt is being made to reach an engram (in violation of the auditor's code, or with some erroneous idea that the whole person of the pre-clear is confronting him) will receive in return all the fury of the engramic surcharge.

An engram can be dramatized innumerable times for such is the character of the reactive mind that the surcharge of the engram cannot exhaust itself and will not exhaust itself regardless of its age or the number of times dramatized until it has been approached by the analytical mind of the subject.

The additive dynamic drive law must be made to apply before engrams are reached. It is occasionally very necessary to change someone's auditor for some pre-clears will work well only with either a male or a female auditor, or with one or another individual auditor. This will not be found necessary in many cases. Three cases are on record where the pre-clear was definitely antipathetic toward the auditor throughout the entire course of therapy. The auditor was found to be a restimulator for one or more of the persons contained in the engrams. Even so, these persons responded. Greater patience was required on the part of the auditor. Closer observance of the auditor's code was necessary and a longer time was required for therapy. It will be discovered that once the pre-clear understands what is desired of him and why,

his basic personality is aroused to the extent that it will cooperate with any auditor in order to be free. It will suffer through many violations of the auditor's code. Once a pre-clear has been entered upon therapy he will ordinarily continue to cooperate in the major requirements to the fullest extent, no matter what apparent antagonisms he may display in minor matters.

Reverie is therefore the desirable method. The analytical mind of the pre-clear, while reduced in its potential and under direction, is still capable of thinking its own thoughts and forming its own opinions. Implicit obedience to whatever the auditor suggests is not desirable as the pre-clear will inject extraneous material at the faintest suggestion of the auditor. Drugs inhibit the somatic but may have their uses in entering a case.

The fact that a scientologist is interested only in what has been done to the pre-clear and is not at all interested in what the pre-clear himself has done to others greatly facilitates therapy since there is no social disgrace in having been an unwitting victim.

The pre-clear is placed in a light state of "concentration" which is not to be confused with hypnosis. In the state of alliance, therefore, the mind of the pre-clear will be found to be, to some degree, detachable from his surroundings and directed interiorly. The first thing that the auditor will discover in most pre-clears is aberration of the sense of time. There are various ways that he can circumvent this and construct a time track along which he can cause the pre-clear's mind to travel. Various early experiences which are easily reached are examined and an early diagnosis can be formed. Then begins an immediate effort to reach basic, with attempted abortion or prenatal accident predominating. Failures on the first attempts to reach prenatal experiences should not discourage the scientologist since many hours may be consumed and many false basics reached and exhausted before the true prenatal basic is attained.

In this type of reverie the scientologist uses and will observe certain apparently natural laws in force. They are as follows: The difficulties the analytical mind encounters when returned to or searching for an engram are identical to the command comment of that engram.

An aberration in adult life is more or less obeying, as restimulated, the composite experiences contained in his engrams.

The pre-clear's behavior in reverie is regulated by the commands contained in the engram to which he is returned and is modified by the composite of chronologically preceding engrams on his time track.

The somatics of a pre-clear are at their highest in an engram where they were received and at the moment of reception in that experience.

When returned prior to an engram, the commands and somatics of that engram are not effective on the pre-clear. As he is returned to the moment of an engram, the pre-clear experiences, as the common denominator of all engrams, a considerable lessening of his analytical potential. He speaks and acts in a modified version of the engram. All complaints he makes to the auditor should be regarded as possibly being verbatim from, first, the engram that he is re-experiencing, or second, from prior engrams.

At the precise moment of an engramic command the pre-clear experiences obedience to that command. The emotion a pre-clear experiences when regressed to an engram is identical to the emotional tone of that engram. Excesses of emotion will be found to be contained in the word content of the engram as commands.

When a pre-clear is returned to before the moment of reception of an engram he is not subject to any part of that engram, emotionally, aberrationally, or somatically.

When the time track is found to contain loops or is blurred in any of its portion, its crossings or confusions are directly attributable to engramic commands which precisely state the confusion.

Any difficulty a pre-clear may experience with returning, reaching engrams, perceiving, or recounting, are directly and precisely commanded by engrams.

An engram would not be an engram were it easy to reach, gave the pre-clear no difficulty and contained no physical pain.

The characteristic of engrams is confusion. First, the confusion of the time track; second, the confusion of an engramic chain wherein similar words or somatics mix incidents; third, confusion of incidents with engrams.

This confusion is occasioned by the disconnected state of the analytical mind during the receipt of the engram. Therapy, by location and identification of hidden incidents, first rebuilds at least the early part of the time track, locates and fixes engrams in relation to one another in time, and then locates the basic of the basic chain and exhausts it. The remainder of the chain must also be exhausted. The secondaries exhaust with ease after the erasure of the basic or the basic of any chain (within that chain). Locks vanish without being located. A tone-four gained on basic permits the subsequent erasure on the time track to go forward with ease. A whole chain may rise to four without the basic chain having been located.

Any perception of pre-speech life during reverie connotes the existence of engramic experience as far back as the time track is open.

If the individual's general tone is clearly not tone four, if he is still interested in his engrams, another more basic chain than the one found still exists.

Engramic patterns tend to form an avoidance pattern for the pre-clear. From basic outward there is an observable and progressive divergence between the patient himself and his returned self. In the basic engram of the basic chain and for a few subsequent incidents on that chain, he will be found within and receiving the experiences as himself. In subsequent incidents, cleavage is observable and in late engrams the patient is found to be observing the action from outside of himself, almost as a disinterested party. This forms the principle primary test for the basic of the basic chain. Another test for basic is "sag."

Any engram may be exhausted to a point where it will recede without reaching tone four. Although it is temporarily and momentarily lost to the individual and apparently does not trouble him, that engram which has been exhausted in a chain without the basic having been reached will "sag" or reappear within twenty-four to sixty hours. Basic on any chain will not "sag" but will lift on a number of recountings, rise to tone four and will remain erased. Another test for basic is whether or not it begins to lift with ease. If an engram does not intensify or remain static after many recountings, it can be conceived to be at least a basic on some chain. Locks will lift and disappear without returning as they are not fixed by physical pain. Large numbers of locks can be exhausted bringing an alleviation of the pre-clear's difficulties and such a course may occasionally be pursued in the entrance of a case. The discovery and lifting of the basic to which the locks are appended removes the locks automatically.

These rules and laws unless modified in their statement will be found invariable. Incompetent auditing cannot be excused by the supposed discovery of a special case or exception. A physical derangement must be in the category of actually missing parts of the organism to cause permanent disability, and instances of this are not common.

case histories

The following case histories have been selected at random. Due to lack of time, these case histories are releases, not clears. The releases have been fully diagnosed and researched.

CASE NO. 1.

**HYPERTENSION, COMBAT FATIGUE
TUBERCULOSIS, ARRESTED
MYOPIC ASTIGMATISM**

A forty-three year old ex-Army officer and author; inclined to petty tyrannies; twice divorced; no children. Processed by army as psycho-neurotic.

Birth was discovered immediately but would not satisfactorily release. The patient experienced great difficulty in visualizing and his aberrations intensified during therapy.

By use of dreams and restimulation of somatics the pre-clear was able to reach the beginning of the engramic chain as counted backwards from birth. Fifteen prenatal experiences were unstacked. They were found lying in two loops. The loops were corrected and the basic engram of the basic chain was reached. (A loop is a redoubling of the time track back on itself. In this case incidents are not in their correct place on the time track.)

The basic consisted of a severe quarrel between his mother and father with several abdominal blows being received by the mother. The mother was protesting that it would make her sick all of her life. At the same time the mother was coughing from a throat blow. The father was insisting that he was master in his own home and that people had to do what he told them. This quarrel occurred at about four and a half months after conception and resulted in the temporary paralysis of the pre-clear's right side. The remainder of the chain consisted of similar incidents, evidently dramatizations on the part of the father of his own engrams, as the words used were almost identical, one engram to the next. This chain accounted for and relieved the subject's fear that he would be ill and his desire to tyrannize others.

Birth was then found to consist of near suffocation and considerable antagonism between the doctor and the nurse. This was registered as commands to himself to the effect that he was blind and could not see. Birth was in the home and dust, camphor, the smell of clean sheets and greased metal were the restimulators for this severe lung irritation. This birth was not restimulated until the age of five and the prenats were not restimulated until entrance into service when the need for authority manifested itself.

No locks were found to need attention and only one half hour of his war experience failed to release, that being a new basic.

Number of hours on case: fifty-five.

CASE NO. 2

APATHY, PRE-CLEAR HAD BEEN UNDER PSYCHIATRIC TREATMENT FOR TWO YEARS HAD EXPERIENCED NO RELIEF MALNUTRITION.

An eighteen year old girl in a condition of apathy bordering upon a break and worsening. She had been recently married. Afraid of her husband. She had done very badly in school, sporadically engaged in sexual escapades, relapsing afterwards into an illness which was variously diagnosed.

Case was entered with ease. Birth was reached and would not exhaust. A search for prenats was for ten hours fruitless, until certain somatics were artificially restimulated and intensified to the point that the patient had to recall the incident to find relief. Eight prenats were then unstacked and only two incidents were discovered in confusion with each other, held together with a head somatic.

The basic proved to be a mutual abortion attempt by the mother and father. The mother said she would die if anyone found out but that she would probably die anyway. The father said that the baby was probably like her and that he didn't want it. Eighteen penetrations of the head, throat and shoulders with a long orange-wood stick—probably in the third month. Several similar incidents completed this chain. Coitus followed each attempt at abortions. Another incident proved to be a basic without a chain and with innumerable locks: an attempted abortion by a professional abortionist who used some form of needle and scraper. Birth was found to be a mild experience. Three infant engrams with their own basic were discovered. They consisted of the mother's fear over the injury and the fear that the baby would die.

Contagion of attempted abortion engrams was particularly manifest in the mother's neurotic dwelling on fear of death, which was obviously a dramatization.

All neurotic and psychotic symptoms were relieved with a marked improvement in the health of the patient and an increase of twenty-seven points on the Army Alpha test. Time of work: 65 hours.

CASE NO. 3

PSYCHOTIC MURDEROUS RAGES CHRONIC SKIN RASH

A thirty-year-old male negro, six feet four inches in height, about two hundred and fifty pounds—swamp worker. He was in continual trouble with police and had a considerable jail record. He continually dramatized a hatred of women. He also dramatized a continuous suspicion that he was about to be murdered. His I.Q. was about eighty-five.

Uniquely enough this case offered no difficulties in entrance. The subject was extremely cooperative with the auditor. Birth was found and exhausted without improvement in the case. A number of infant and childhood engrams were discovered and tested. Continual address of the patient's attention to prenatal life finally brought about a convulsion in which terror and rage alternated. The auditor was able to induce the patient to listen to the voices he was hearing and to go through with the experience.

The convulsion proved to be twenty engrams nearer birth than the basic, which lay on another chain and which was discovered by dream technique. The convulsion was caused by the dramatization of an engram involving the injection of turpentine into the uterus by the mother in an attempted abortion. The main engramic chain consisted of the mother's efforts to abort herself. From engramic content it was gathered that the mother was a prostitute, for as many as twenty experiences of coitus succeeded two of these abortion attempts. They were too numerous to be evaluated.

The basic chain contained many quarrels about money between the mother and her customers. The somatics of this chain were largely bruises and concussions caused by the mother ramming herself into pointed objects, or beating her stomach and abdomen. There were many loops in the basic chain caused by the similarity of incident and the confusion of coitus with abortion attempts. The basic incident was at last discovered and exhausted. It was found to lie about twenty days after conception, when the mother first discovered her pregnancy.

All engrams were exhausted in the basic chain. The convulsion was fully cleared and birth was suddenly found to have been a very painful experience. Particularly because the child was taken by others immediately after birth, only one engram chain (unconsciousness resulting from fist fights) was found in childhood.

L. Ron Hubbard has advanced Dianetics and Scientology a very long way since he wrote the thesis in this issue. His developments as the years progressed have been detailed in many publications and lectures. Series of lectures on tape, volumes of self-help such as Self-Analysis (\$3.00), the twice a month magazine Scientology (\$5.00 per year) and additional copies of this issue (\$.75 each) are available
