E.

WAS not initiated in the Science of Animal Electricity and Magnetifm, until I was introduced to the Augustin Convent at Paris, where the celebrated Father Harvier, attended daily a great number of patients, of every rank and degree, gratis. I was inftantly ftruck with aftonifhment by the Magnetical Somnambulifm, which I faw constantly performing before crouds of the most respectable and dignified clergy, who affembled every day, all of whom were thoroughly convinced that the art was practifed by men of integrity, without any deceit. I was foon after prefented to the famous and learned Marquis de Puyfegur, and to feveral other noblemen, diffinguished in the literary world; who took delight in flewing those phenomena to their friends. Scarcely had I acquired a knowledge of the fcience, before I put one perfon in a state of Somnambulism, which made me exult on the fuccefs, as my tutors in the fcience were prefent, viz. General Meziere, Chevalier Justamond, who encouraged me to perfevere. I na little time I produced numbers, who in that state answered my questions ; found out the diseases of the people prefent, and prefcribed infallible cures. for them; they are called Malade Medecin, concerning 'whom I shall speak at large, in my Treatife upon the Doctrine of Somnambulifm.

A 2

That

That it is practicable to put certain perfons into this flate, need be no longer doubted, without touching or giving them any previous operation. It is a matter ftrange to perfons unacquainted with the fcience, but that will vanifh when the mind receives inftruction and becomes familiar with it; in order to the attainment of which, I invite all perfons of every fex, rank and degree, to come, fee, and judge for themfelves. I fhall foon publifh one Number on Theory, and another on the Practice.

#### ON THE PROBABILITIES OF

Electrical and Magnetical Somnambules,

0 1

# SLEEP-WALKERS.

JF all the novelties which are created by Animal Electricity and Magnetism, Somnambulism is, doubtless, the most interesting.

By Somnambuliim is meant that peculiar flate when the fenfes are fufpended between fleeping and waking; partaking of both, and is also productive of many phœnomena, which each are ftrangers to.

The patient being reduced to a ftate of Somnambulifin, without touching him, is deaf to all that is near him: Motionless amidit the greatest motions; he seems separated from nature, as if it were, to communicate only with the perfon who put him into that ftate.

The latter, owing to Magnetifation alone, has an intimate analogy with the patient; by the means of a kind of an invisible leaver, he causes him to move at his pleasure; and fuch is the power of his influence, that he not only makes himfelf underftood by fpeaking and figns, but even by the very thought itfelf; and what is still more extraordinary, the Magnetifer can, by a fingle contract, commu-

nicate

**mi**cate his faculty to other people; and from that moment there is a constant communication between the Somnambule and his new director.

The patient being put into a ftate of Somnambulifm, there is in him a want of organization, which breaks the equilibrium of his fenfes; to that fome experience an extreme degradation, whilft others acquire a prodigious degree of fubtlety.

Thus, fome have their hearing entircly loft or weakened, and their fight becomes prodigioufly penetrating. In others, the privation, both of fight and hearing, are amply compenfated by an incredible delicacy both of feeling and tafte.

And in many, a fixth fenfe appears to declare itfelf by an extreme extent of the intellectual faculty, far fuperior to the common altitude of the human mind.

In a word, the phoenomena, attending on the flate of Somnambulifm, daily offer new fubjects of aftonifhment, even to those who ought to be more familiar with them.

It remains to confider, whether those pretended phœnomena are fuch as is propagated; or, whether on the contrary, they are nothing else but illusions, kept up by the imposition of fome ill designed perfons and the credulity of others.

For it is well known that the human mind, naturally bent towards every thing marvellous, eagerly feizes on whatever is flattering to the tafte; and there are exalted geniuffes to be found that employ both their head and talents to realize mere chimeras.

Among the perfons who have been witneffes to the fingularities attending on Somnambulifun, fome ftruck with aftonifhment and admiration, have given full credit to its influence, and look on it as an irrefiftible proof of Animal Electricity and Magnetifm.

Others, though convinced of the reality of its phœnomena, are yet incredulous with regard to the caufe which produced them. They had rather fuppofe in this affair fome fecret fpring productive of illufions; and, though incapable of comprehending those means of intelligence, they have, nevertheles, fuppofed their existence; alledging, for example, those cunning tricks which a fubtle philosopher \* made use to aftonish all Paris and London during many years.

As

Digitized by GOOgle

As to the Phylicians, most of them have difdained to prove witness to the effects of Magnetical Somnambulism, under the pretence that it was fulficient for them fuch a pheenomenon was contrary to those notions confecrated in physic and physiology; they have confidered those pretended marvels as mere chimeras unworthy a ferious examination.

There was even a learned body who wen't fo far as to forpid their members to entertain the leaft doubt on the fubject, and expelled from their fociety whomfoever have given themfelves up to the fludy of this new dectrine  $\dot{+}$ .

However, on the other hand, Magnetical Somnambulifm becomes daily more and more confistent; a great number of people remarkable for their learning, probity, found judgment and fagacity, certify beyond a doubt the reality of Magnetical Somnambulifm; and that contradiction of refpectable authorities on both fides, leave the public in fufpence, who, to take a decifive part in the conteft, impatiently wait until the matter is more fully investigated.

The following impartial reflections may ferve to fix the opinion of impartial people on the fubject of Magnetical Somnambulifm. To treat this object with the more fuccefs, I think it is neceffary to divide the difcuffion into three parts.'

The first point to be confidered, is to know, in fact, the public have been witnefies of phœnomena of fome importance, well deferving to excite their curiofity, and of which the cause ought to be investigated.

Secondly, fuppofe the effects fpoken of deferved to be enquired into, it is proper to examine whether they cannot reafonably be fufpected of artifice.

Laftly, admitting it impossible to find out the artifice, it will remain to examine whether they are contrary to common notions already received.

Ift. Are Magnetical Somnambulifm phœnomena of fuch an importance as to deferve the curiofity of both the public and the learned?

The object of this queftion is, I believe, very plain and obvious; I mean to fay, that previoufly to our being at the trouble of examining whether Magnetical Somnambulifm be an illufion, or reality, we must establish, that, there exist,

+ A decree of the faculty of Paris, 17?4, which is the fame as they fil for inoculation, which is now adopted by them.

Digitized by GOOGLE

-exilt, at leaft feemingly, fome fingularities which concern both the public good and the improvement of learning.

Many people, however, might have a right to doubt it, becaufe they had no occasion to know the truth of the affertion. They have a right to require to be fatisfied, previoully to the difcuffion of the two following propositions, viz. "That there are either at Paris, Dublin, &c in the provin-"ces, or any where elfe fome people, who being naturally "forced into a flate of fleep, really offer the phoenomena "which we are about to examine."

For if it was not certain that fuch a fcene is not to be met with fomewhere, it would be a lofs of time to enquire into its principle.

It is, therefore, a preliminary obligation for any body elfe, to establish well the existence of Magnetical Somnambulism, whether right or wrong.

This point was, for a long time, a matter of general incredulity. They plainly denied that there were any fuch individuals existing any where, and the very difcourse held on the subject, was looked upon merely as a fable to amufe the public.

The first writing, which treated of Magnetical Somnambulists, was, if I am not mistaken, a letter from Mr. Cloquet, paymaster of rents at Soissons, who, relating what he had seen at Buzanci's treatment, by the Marquis de Puysegur, infinuated something which seemed to characterise Magnetical Somnambulism.

Since that letter, a gentleman, whofe candor is above all fufpicion, has configned in a writing, which is, in every refpect, interesting, feveral phœnomena he had observed in Buzócnei's treatment, still more wonderful than those which Mr. Cloquet had given a sketch of.

The perufal of this performance having infpired fome people of the first rank with the eager defire of being witnesses to a like Somnambulism, the author of the above found an opportunity of gratifying their curiosity at Paris, in the winter of 1785.

More than 5000 people have been at liberty to fee those phœnomena true or false, of which notice was taken both in the national and foreign prints. These Somnambules underwent repeated trials, which all met with more or less fucces.

Befides

Befides those mentioned, many more were made at Paris, or in fome other provinces. This Somnambulifm example having induced the Magnetifers to adhere to that part of Magnetifm, they applied themfelves to it with more zeal, as it feemed to be a fure way towards a remedy. Thus, the concern of Magnetism, and that of the patient, uniting both to prefcribe that mode of proceeding, it is become the common object of all Magnetifers attempts, and in all treatment they gloried in flewing fome patient more or lefs improved.

It is evident then that there exifts many individuals ftruck with a feeming Somnambulifm ; and I begin to eftablifh the queftion, in order to proceed methodically, after fettling conftant and notorious facts, which might lead to infallible confequences.

It is then certain and indifputable, that there are pretended Somnambules, which offer wonderful phænomena to the spectators, as compensative gratification for excited curiofity.

Now, the queftion is to know what opinion we fhould form concerning those Somnambules; if it be not a feigned ftate, by the means of which they endeavour to impose on the credulity of those whom they are furrounded by.

2d. How far are Magnetical Somnambules to be believed ?

Among the Somnambules I am here fpeaking of, I do not include that multitude of perfons of both fexes among the common people, who are to be feen at fome impostors, and may reafonably be fufpected to perform Somnambulifn, through imitation, or to make themfelves interefting, and others who are paid for it.

It is a misfortune, conftantly attending on good things, that they can never be preferved in their native purity, nor escape that mixture which malice or cupidity feldom fail to blend with them.

Those who, either through prejudice or interest, endeavour to difplay the difcovery, take care to examine it on that fide only, which feems to convey an idea of apparent quackery, and never fail to prefent it to the public in that view.

But those who fincerely wifh for information, pay but little regard to fuch a confideration, and throwing afide guackery and exaggerations, carefully penetrate as far as the principle

10

principle itself. Thus, a botanist, desirous of procuring the fruit of an Almond to be enabled to difcern its true quality, is not discouraged by the putrid fiesh which furrounds it; but chearfully lopping all naufeous fuperfluities, he finds at last the fruit which is to be the rule of his ftudy.

In that manner should every unbiassed man act, who fincerely feeks for truth, without having interest or defign to deftroy it.

Let us contemptuoully difregard those sufpicious apparent Somnambules, and attend to those who, by their civil existence, their character, manner, &c. are above fuspicion; and in whom, belides Somnambulifm, the fcience is portrayed, and brought to the highest degree of perfection.

I think those ought to be chosen among patients, in whom Somnambulism appears to be in a higher degree of perfection, and fuch a caution is, in my opinion, very material.

In fact, the more imperfect the Somnambule is, the eafier it is to impose; if he badly answers your figns, and follows your motions in an untoward and ill contrived manner, he apologizes by faying he is not, as yet, arrived to a state of perfect Somnambulifm, and the observator, who really conceives that fuch a state must have its degrees, is puzzled, on account of his not knowing whether the bad fuccefs he has experienced is to be attributed to the untowardness of the Somnamhule, or the imperfection of his flate.

But when I fix on a Somnambule, recommended as a perfect being, it is evident that this talk is very painful. In that cafe, there is neither excuse nor pretence; the observator is eafy, and Somnambulifm has a trial to undergo. which is to prove either his shame or his triumph,

Such perfect Somnambules have not been wanting laft year in France; and among those who have tried my experiments, there is one with whom I staid more than half an hour, and who has before me, and at my pleafure, executed fuch motions as I preferibed him.

Being at my own difpofal, without witneffes and contradictors, left nothing untried to difcover the fraud, if there had been in the cafe; but the fwiftness of his evolutions, the precision of his movements, a vast number of facts which it would be too tedious to relate, disconcerted all my attempts.

Many

Digitized by GOOGLE

Many other experiments, which had their intended effects with regard to other perfect Somnambules, have all given me the fame fatisfaction.

There are at Paris, and in the provinces, more than 600 perfons, who are in the fame predicament.

Therefore, to overthrow the confequences refulting from fuch experiments, there is no other refource left, but to perfevere in giving out that it was a deceitful trick on the part of Somnambules.

But fuch a fupposition carries with it the greatest difficulties, and is accompanied by improbabilities still more shocking than Somnambulism itself.

To admit that the phœnomena in queftion are the refult of impolition, two things are abfolutely required :

Ift. Somnambules must have an intention of deceiving.

2d. They must be endowed with an address to do it. But, we must first confess, that, among those who have already been or are daily infpired with Somnambulism, there are many above all kind of furpicion. They are respectable women of family, men of stability and known integrity, people of a plain and simple turn of mind, children, &c. in whom we cannot reasonably suppose to exist any design or interest, to feign a like situation.

Should they be led by any faction, or the intention of performing Animal Electricity and Magnetism with any seeming reality? But most of them have no concern at all, as to the fortune of Animal Electricity and Magnetism; nay, many of them had no notion of it at the moment they were confirming Magnetical fleep.

Shall it be faid, that, it is possible fome of those individuals are encouraged by the partisans of Animal Electricity and Magnetism, and that they are but a mere instrument in the hands of the latter to favour the fuccess of that fystem?

But, for what purpole fhould the partilans of Animal Electricity and Magnetifm have recourfe to fo capricious a ftratagem? The fuppofition, would, at the bett, be admiffible, if Somnambulifm had originally been announced as a neceffary effect of Magnetifm; fo that they muft have been forced to refign Animal Electricity and Magnetifm, had they been deprived of the refource tendered them by Somnambulifm : but the cafe is very different.

Animal Electricity and Magnetilm was originally announced without the attendance of Somnambulilm. This

B 2

ingularity

fingularity is a later difcovery, the refult of the habitual practice of Magnetifm. Even now, there are many Magnetifers who do not look on Somnambulifm as being an effential part of the fcience, but only as an accellary which may indifferently be united to, or feparated from Magnetifm.

From whence it plainly follows, that if the partifans of Animal Electricity and Magnetifm were in want of a refource to impose on the public, furely they must have been yery destitute of penetration to embrace fo ftrange a manœuvre, which carried with it a prodigious complication of fprings, and infuperable difficulties in its execution.

And, that had it been an artifice, it would have been fufficient to deter every honeft man from entering or affociating with it.

They must then, have only dealt with, and chosen people of profligate manners, and of the worlt fort, to invest them with that confidence, at the risk of feeing it betrayed, and made public on the very next day. That is not all, they must have found in those individuals an extraordinary address to act fo difficult a part, and deceive the experiments of an enlightened and incredulous people, at whose tribunal appearance must be made.

Had things been thus transacted, Somnambulism could not have lasted long, and far from gaining credit, time would foon have discovered the illusion and deceit, by the disficulty of finding actors capable of perpetrating the imposture. But the contrary has happened; every day Somnambulism gets new partians, and the credit which it constantly obtains, plainly contradicts every idea of deceit.

Patients are daily feen in that condition, in the very bolom of their family, under the infpection of their neareft relations, and those who are the most interested to verify their fituation.

Who could believe that fuch patients, furrounded with the very horrors of death and most painful fufferings, could diffemble for the fole interest of Magnetism? Their relations, fathers, husbands, wives, children—are they then concerned in the plot?

Shall it be faid that their illnefs is feigned? It is another fuppolition no lefs admifilible; for befices that it is no eafy matter to feign a malignant fever, a fluxion, dropfy, and other difeafes of that kind, there are fome fo well averred that that no man in his fenfes could poffibly doubt their existence.

Another confideration may be added here, that is, even in fuppoling that a healthy man could long act the part of a fick man, or the patient take upon himfelf to act the Somnambule; and, that people hidden before the curtain, fhould préfide over this mummery, I maintain would be impossible in the execution; and whatever address may be supposed to exift on both fides, the deceit must foon be difcovered, and, indeed, after a few moments, I would defy the most nimble buffoon, the most expert of all, and the most inured to bodily exercises, to affect Somnambulism before scientific perfons, or execute any fuch thing as is observed among the Somnambules, whom I am now treating of. I defy any one to remain during eight or ten hours, having his eyes flut, and his eyelids quite close together, without one eyelid feparating from the other during that period of time. Such a perfeverance feems to be much above the reach of human power and patience. Who is the man that could remain five or fix hours in a motionlefs attitude, without fliewing the leaft fentation of what paffes round him, inacceffible to every emotion, and all the fudden and unforefeen fhocks of noife which his attention shall, at periods, be gratified with? Who is that hiftrion, fubtle enough to imitate, with his eyes clofely fhut, the different figns which will be prefented him, and deferibe the lines which will be traced with a justnefs and acutenefs, that no interval shall be found between the order and the compliance. A few experiments of this nature would be fufficient to difcourage the most confummate Saltimbank, and make him give up his undertaking in two hours time.

Now, when we fee the fame effects conftantly repeated, without the leaft effort, and multiplied in the prefence of a prodigious number of perfons of all fexes, age, and rank, we muft neceffarily acknowledge that they act through a natural impulfe, without any affiftance of art: for it is well known that nature can eafily perfect what is impoflible for art to execute.

Thus, phyfical probabilities concur with moral ones to eftablith the reality of Magnetical Somnambulifm.—Somnambulifm cannot be rejected, without fuppoling it a deceit too palpable to credit, and in whatever manner you act, it will prove a phœnomenon, either moral or phyfical; and I confefs confers the latter is, by far, easier to be conceived than the former; for a natural phonomenon, after all, is furceptible of an explanation; and the plot of a deceit, without interest and motive whatever, is no lefs complicated in its execution.

A number of people are to be found over whom fuch confiderations, firiking as they are, can never triumph. Whatever difficulties may be encountered with, to make those firatagems fucceed, they suppose that fuch an address takes place, because they fay in the things hurtful to reason, the authority of testimonies is of no value.

That evident impofibility is a kind of refentment on that part of the public who have not feen the phoenomena in queftion, and infpire those who have actually feen them, with a certain degree of diffidence.

If a common fact, confiftent with the ufual proceedings of nature, was only agitated, it is in general confeffed, that there would be more proofs than requisite to eftablish its credit, on bare words and without having feen it. But as to a phoenomenon, fo little confistent with nature, which is neither explicable nor conceivable, and overthrows all received notions, we are authorifed not only to refue the teftimony of others, but even that of our own fenses. It is after fuch an abfurdity that many learned have been heard to fay, "That they would not believe it if they faw it."

Now then it remains to confider, whether Magnetical Somnambulifm, and the feveral phoenomena ufually attending on it, are as inconceivable as those gentlemen would infinuate.

Are Magnetical Somnambulifms phoenomena repugnant to the order of nature ?

Phylicians by affecting the greateft incredulity in Magnetical Somnambulifm, under the mere pretence that fuch phœnomenon is inconceivable, give no fatisfactory account of their difbelief, becaufe, that the identical difficulty they attempt to condemn, cannot withhold the victorious teftimonies which militate in favour of Magnetical Somnambulifm.

The difficulty of conceiving a phænomenon, by no mean deftroys its reality; we are furrounded with a multitude of natural marvels, which no one has the leaft doubt about, though they are incomprehensible; for it is evident that nature But, perhaps, fome will fay, "From fuch a mode ot "reafoning it will then follow that we must give credit to "every abfurdity we hear, and believe the greatest oddities "in the world; and those who will exact fuch a belief, shall only have to invoke the great power of nature, and the immense extent of its refources.

"That way of reafoning would deprive arts of their rules, and banifh principles from fciences, in order to make room for rafh affertions, &c. our learning, inflead of being fufceptible of improvement and enlargement, would fall again into chaos and confusion,"

But that objection is, by no means applicable; for the queftion is not to admit a phœnomenon under the fingle confideration that nothing is impossible to nature; it is, on the contrary, recommended that we should submit to the trial of contradiction, experience, and reasoning itself, a fact certified by a multitude of perfons of every denomination who have been eye witneffes to the fame.

Thus, till now, prefumption is still in favour of Somnambulism, fince being grounded on the strongest confiderations; those confiderations are neither overcome nor weakened by the pretended improbability urged against them.

But what will then be faid, if we were to difcover that Magnetical Somnambulifm? far from offering to the learned an inconceivable phœnomenon, incompatible with all notions admitted both in phyfic and phyfiology; it is on the contrary, a natural confequence from those very principles, acceffary of the common notions with which it is blended and united in a very natural manner?

1

It is what I propose to demonstrate, and in order to proceed methodically, I shall first fuccessively examine the two articles of Magnetical Somnambulism, which have excited the reclamation of the doctors. 1st. The facility of putting a patient in a state of Somnambulism. 2d. The phœnomena ufually attending on such a state.

Article 1ft. The Somnambulifm's communication is in the order of the already admitted notions in phyfiology.

It is fomething remarkable to hear many learned men obflinately declare it to be abfolutely impossible for a patient to be put in a state of Somnambulism, by any art whatever, when when we confider that it is one of the favourite maxims in phyfic, that by the affiftance of art all natural revolutions may be imitated in the human body. It is on that principle that the partifans of inoculation chiefly relied to defend both the practice and fuccefs of that proceeding.

All phyficians agree, that the art of inoculation confifts in preventing by a factitious indifpolition in an individual, the real one which nature would have foon or late occationed.

It is ftill according to the fame maxim, that phyficians attempt to inoculate many kinds of diftempers, either to prevent them, or to make them ferve as a counterpoife to other difeafes; and now the art of curing one difeafe by another, is effected in medicine as a compleat knowledge of phyfic.

The cafe being thus, and fince it is acknowledged that nature is liable to imitation, by introducing fuch or fuch maladies in the human body, is it fo ftrange, fo inconceivable, that Somnambulifm fhould alfo be transmissible through artificial means?

Somnambulifm is by phyficians entitled a diferate; it is, therefore, in that quality as in the number of those revolutions which the power of art introduces. To that effect one more step is to be made in the career of distempers, and inoculation: but such an extension, far from contradicting the principles of physiology, only confirms them.

It is expected, however, that phyficians will oppofe this fimilitude, in eftablishing fome differences and distinctions; nay, they will perhaps forget themfelves fo far as to take Somnambulism from the number of maladies, by difforming their nofologists in this point.

That no pretence may be left for fubterfuge, we fhall be intent on maladies and difcourfe folely on fleep.

Neither doctor, or natural philotophers, have as yet been able to explain the caufe of fleep, nor the manner by which it is produced.

Whatever has been faid on the fubject offers nothing but mere conjectures, the work of imagination; one thing only is certain, that fleep comes on whenever the body is in any difpolition to produce it, and is put in fuch a difpolition by the affiftance of art. Such is the evident effect of narcotical plants, as opium, cockle-weed, &c.

Now,

Now, if there exifts any art whatever conducive to put the body in a difpolition to fleep, it is not furpriling at all that Magnetical proceedings might also produce the fame effect. Will they fay that there is a want of fimilitude, becaufe in Magnetical proceedings neither decoctions nor infusions are employed to create fleep? I answer that there is no need at all to have recourfe either to drink, or any drug whatever, to convert any one into the state of sleep; the same effect is produced by a multitude of other means and proceedings; and it is even one of the particular fingularities inherent to fleep, that it is produced by an infinitely different number of caufes, and which are all contrary to each other. For example, if excellive heat caufes fleep, it is also the effect of exceffive cold. Soldiers have been feen to fall afleep on the fnow, and even perifh with cold in that flate of drowfinefs.

If gentle and foft friction invite to fleep, exquisite fufferings act the same; which is proved by the example of those wretches, who being put to the torture, fall alleep at the very moment of their most poignant fufferings. Others are faid to have yielded to fleep while lying on the wheel.

Gemelli Carreri relates, that when in China he travelled with a Tartar, who, every night, was obliged, in order to procure fleep, to defire fomebody to beat him for a while on the belly, as they do a drum.

Hunger and the excefs of food, fatigue and reft, and cool and warm refrefhments likewife produce fleep; it is also the refult of the increase or decrease of the blood running in the brain. It is the effect of bathing as well as bleeding: fever, which causes infomnies, likewise creates drowfines; a small difference in a dose of wine awakes or makes a man fleep. It would be an endless task to fum up all the various cause, which induce man to that state; whether because these causes produce themselves, or that many different combinations are likewise capable of producing fleep, or because, notwithstanding the seeming difference, the refult is the fame.

But in both cafes, one must confess that the means productive of fleep are infinite, and that we are unable to determine on their nature or quality. This confideration alone, doubtles, fuffices to destroy the improbability of a fleep arising from Magnetical feelings.

Those means, which at first feem to extraordinary, ap-C ptar pear far lefs marvellous when compared with others fill more ftrange, concerning which, not a doubt can be reafonably entertained, fuch as those as have just now been mentioned.

The efficacy of fimply touching to create fleep, feems befides to be a neceffary confequence, flowing from the general law of nature, that has defigned the five fentes to ferve as an introduction to fleep. If touching could not produce it, it would be the only one deprived of that faculty.

Indeed, if we confider but a moment the four other fenfes, hearing, fmelling, fight and tafte, we fhall perceive in *them* as many conductors to fleep. No one can deny but the ear is a very efficacious way to fleep: the noife of a mill, the murmur of a river, the fpouting of waters, a lingering converfation, the monotony of the voice, a flow and melancholy mufic organize the body, more or lefs quickly, in a manner fit for fleep.

The fmell of aromatical and narcotical plants occasions a drowfinefs, and fome chymifts have in their works given the receipt of fomniferous effences, which criminals have often abufed.

Tafte is another introductor to fleep, and medicine eftablifhes those means in administering narcotical physics, either to procure fleep to those who naturally want it, or to render patients infentible to painful operations.

It is to be observed that most of the drugs productive of that effect, display their power, before they have been decomposed in the stomach, even before they are come down to it, merely by contract of the palate, or tongue; which plainly shews that such an effect belongs to the taste.

Laftly, the fight is no lefs productive of fleep. Too bright a light, by inviting the eyelids to flut themfelves, infenfibly encourages and caufes fleep.

It is also well known how far reading contributes to invite fleep. Many people never result that impression, and even they make, upon occasion, a fure resource of it.

And it must not be faid that fleep is then the effect of tedioufnefs, fince fleep is, for the most part, involuntary, and comes on in the middle of the interesting lectures we could hear other people deliver, without feeling the least propenfity to fleep.

It is then, doubtlefs, fight, which in that cafe, ferves as a vehicle to floop.

From

From whence it follows, that it is clearly proved that fleep comes in through five of our fenfes; now that obfervation naturally leads us to think that touching is endowed with the like power, becaufe the conftant uniformity which is visible in all nature does not permit us to fuppose that fenfe alone would have been made particular exception of.

Moreover, a little reflection will fhew that the above faculty ought to belong to feeling more fpecially than any other fenfe. It is agreed, that, generally fpeaking, there is but one fenfe, which is feeling, and that the other four are only a modification of it.

The fight, hearing, tafte and fimelling produce no fenfation in us but through the means of contact. The light, found, favours and fimell only act upon us by fhaking the nervous tufts of our organs, and fuch a fhaking can never be obtained before they have touched them. This is an uncontrovertible truth.

Feeling, properly fo called, only differs from other fenfes by its great energy and vaft extent. The other fenfes occupy but a very narrow place, and are only fufceptible of a local imprefion; but feeling, by experience, is fpread over all the furface of the body: and this is fufficient to fhew that feeling ought to enjoy, in a fuperior manner, the faculty of opening a way to fleep: for being the chief fenfe, and almost to fay the principal one, from which the others are derived, how is it possible to conceive it deprived of a power which the fubordinate fenfes are endowed with?

Laftly, it is fo certain that fleep is introduced by feeling, that the faculty prefcribe opium taken in topic and applied to the fkin, which really produces fleep. The touching \* of an organized body may then, without any marvel, occafion fleep; and it is the point I want to clear and anfwer fully the objection of improbability. But, will they fay, fuppofing the Magnetifers to be endowed with the power of producing fleep, there is not the like reafon to lead us to think that they can likewife produce Somnambulifm ?

The answer is plain and obvious.

Somnam-

Digitized by GOOGLE

\* We may even recollect on that account the manner of touching made use of in India, by which means flaves procure fleep to their mafters; which is called *Maffer*. Somnanbulifm itfelf is nothing else but a mere modification of fleep. There is no Somnambulifm without fleep.

We might even add that there is no fleep without Somnambulifm, and that every man is born a Somnambule.

This propolition, which is apparently a paradox, is no lefs inconteftable, provided too much extent is not allowed to the meaning of the word Somnambule. Perfect fleep is a time of reft, during which, fenfations are reduced to a flate of concentration, which different feedingly no other fign of life but refpiration and the motion of the pulfe.

Imperfect fleep is that in which fuch a concentration is not complete, fo that it flill leaves fome accefs for the interior difplay of organs. We feldom enjoy the former kind of fleep.

In a found and natural fleep, the perfon whofe mental powers were abfolutely in fulpenfion, preferves ftill a more or lefs active portion of watching, by the means of which divers motions are performed: Who does not know that during our very fleep, the body is agitated and combines itfelf, in order to chufe an advantageous position; the hand is continually affifting the incommoded parts, properly adjusts the bed clothes, deftroys infects, &c. All these things doubtlefs belong to the watch, and of courfe conftitute a kind of Somnambulism. For we must comprehend, under that denomation, the exercise of every motion whatever occasioned during fleep.

Most men carry still farther the effects of Somnambulism, fince there are many people who speak during their sleep, make different gestures, hold discourses of a considerable length, address those whom they think themselves in company with, get out of their beds and in again, &c.

So common are fuch practices, that they are to be met with almost in every house.

Whenever Somnambulifm acquires a more extended penetration, it produces wonderful things.

Then the fleeper is feen writing, working, opening the doors, lighting the fire, afcending the tops of houfes, fwimming over rivers, currying horfes, &c.

But you must observe that Somnambulism in this last degree is no new state, nor contrary to the nature of sleep; it is singly a reinforced modification of a state natural to man and inherent to sleep; which naturally leads us back to the following following propolition, "That every fleeper is in the commencement of Somnambulifm;" that whoever gives himfelf up to fleep is in a near flate of Somnambulifm, which is to difplay itfelf in a more or lefs flriking manner, according to the phyfical confitution of the fleeper, the nature of his diftemper, and especially according to the different caufes which have produced, preceded, or accompanied his fleep.

From thence it is eafily conceived that a fick perfon already inclined, either by his conftitution, or the nature of his difeafe, to a Somnambulifm in its juvenile flate, is liable to receive with Magnetical fleep a greater determination towards Somnambulifm.

Is fuch a ftate ufeful in curing the difeafe ? Such a queftion is not now to be difcufied. Whether Somnambulifm be falutary or not, it is however certain, that it is a dependent on fleep, introduces itfelf with it, and ought confequently to predominate more or lefs.

There are people whofe Magnetical drowfinefs is attended by no very firiking figns of Somnambulifm, who are only drowfy, and poffefs a continual formolency not infenfible to any thing that may be transacted round them.

Others are only drowfy for a fhort time, then awake, and fall again into a ftate of drowfinefs. The nuances are infinitely multiplied from the very fleepers, who difplay nothing but what ufually appears in a common fleep to those who perform the wonderful things fo much spoken of in all the world.

It is those very marvels that remain to be explained : for having fully proved that Magnetical proceedings, or a contact graduate and combined according to principles, can produce fleep and then Somnambulifm; I thall be obliged to reduce Magnetifm to that rule which is already known. But the Animal Magnetifm's adversaries will not fail to object that Magnetical Somnambulifm extends ftill further, by offering the spectacle of a Somnambulifm of which we can have no idea, is attended with phœnomena never before observed in natural Somnambulifm.

Such is the laft allegation, which ferves as a refuge to the incredulity of those who never faw any Somnambule, and the difbelief of them who had it in their power to see and be convinced. But it will, in a moment, be deemed furprifing, to observe that Magnetical Somnambulism has nothing

thing fuperior to the effects of natural Somnambulifm; that, on the contrary, it exactly agrees with the phœnomena of the latter itate, which is nothing more than a mere difcovery; and tuch a confideration might be, by many people, looked on as a victorious argument in favour of Magnetical Somnambulifm.

ARTICLE 2d. Magnetical Somnambulifin's phœnomena, far from being inconceivable, are, on the contrary, a neceffary confequence of Somnambulifin.

According to the virulent declamations thrown out againft Magnetical Somnambulifm, reprefenting it as a bafe and deceitful trick, unworthy the leaft credit, it would be natural to fuppofe that fuch Phœnomena are without precedents, and only concentered in Magnetical Somnambulifm.

Such is the prevalent opinion with the public, even among the fentible part, composed of people no lefs remarkable for their virtues than their learning; but who, not being familiar with physiological phoenomena, must neceffarily have adopted that way of thinking.

Those very perfors might, perhaps, have had a different opinion on that matter, if it had been in their power to know that there exists in nature a state absolutely the same as that given out merely as a feigned one; and, that, the fame phoenomena, which are, in the one, pronounced to be chimerical, impossible and inadmissible, are, in the other looked upon as incontestable, and certainly beyond any manner of doubt.

Such a circumstance makes a material difference; for they only refuse to give credit to the phænomena of Magnetical Somnambulism, because reason will hardly admit of facts by which it is hurt, and which are grounded on no precedents.

But if credit ought to be given to natural Somnambulifm, the fame muft be granted to Magnetical Somnambulifm; for, it being proved that those phoenomena really exist with regard to one of these two species of Somnambulism, it would be to contend for contradiction's fake only, to deny the possibility of their existence in the other.

We must then neceffarily know that there exists a state of natural Somnambulism, acknowledged and awarded by the faculty, during which, fleepers execute things imposfible for any man awake to perform.

Without

Without entering into a detail of the fingularities already obferved on that account, I fhall only mention the phœnomena perfectly analogous to those observed among Magnetical Somnambules.

Nothing is more common than to fee Magnetical Somnambules walk, go towards other people, fpeak to them, come back to their places, take a book, paper, ink, in a word, perform a prodigious number of things which fupports the idea of perfect reafon and fenfe.

Thus is the public juftly incenfed when any one prefumes to infinuate, that fuch perfons are not in a flate of fleep, and that they neither fee nor hear through their ufual organs.

Some of those Somnambules having their eyes open, the spectators naturally thought they must make use of them, and the faculty themselves have ridiculed this pretension, "That people could see without the use of their "eyes, and having their eyes open, could not make use of "them."

But, unhappily for them, fuch a pufillanimous obfervation lofes much of its ftrength, when we confider that even our learned have confectated that very truth in one of their books, calculated to teach pofterity the actual ftate of our knowledge. Open the Encyclopedia, and at the word Somnambule, you may read literally thus:

"People ftruck with Sommambulifm, given up to a "found fleep, walk, talk, write and perform many other actions as if they were awake; nay, even fometimes "with more differnment and exactitude;" and afterwards,

"Some Somnambules have their eyes op in, but do not feem to make use of them."

The learned confequently (for Encyclopedia is their work) are convinced plainly to believe, with Magnetifers, that it is possible to fee without the eyes affistance, and that though the Somnambule has his eyes open *he does not make* use of them.

Magnetifers have often obferved, that Magnetical Somnambulifm difplayed in many patients a wonderful fubtlety of fight, fo far that they difcern very delicate objects through a bandage, or any other intermediate body.

That proposition, has not been more favourably received.

They

They have laughed at the ftory of a Magnetical Sommanbule, who had written when his eyes were covered with a head-band, and corrected words, eraied letters to fubfitute others, upon or near them.

They faid fuch a thing flould be feen before it was believed; and even after having really feen it, they fufpected the good faith of the Somnambule, fo extraordinary the event appeared.

But how could they forget that our learned had beforehand prepared us to believe those phoenomena, by prefenting them to us, as a neceffary consequence from Somnambulism? " If you follow a Somnambule," fays the already quoted article, " it is eafy to perceive, that his " fleep, fo much alike when he is awake, offers a prodi-" gious number of wonderful things. Truth itself becomes " incredible."

The author defpifing the exaggerations often attending on fuch ftories, has only referred " to notorious facts, of " which the truth cannot even be fufpected."

It is after fuch a preamble, that he relates the flory of a young Somnambule, a clergyman and fellow-fludent of the Archbifhop of Bourdeaux. That Prelate ufed to go every night in that Somnambule's room, as foon as he thought him afleep. He remarked in particular, that the perfon got up, took paper, composed and wrote fermons. When he had finished a page, he read it over, and repeated it very loud; if, adds the author, that action was done without the eyes affistance, can it be called reading ?

The fame clergyman with his cyes that composed mufic; a cane ferved him as a compass; with it he traced, at an equal diftance, the five neceflary lines, put in their stead the *Key*, *Flat*, *Sbarp*, then marked the notes which he had first done all white; and when he had finished, in taking up again every one of them, he made them *black*, fuch as should have been fo, and wrote the words under.

It once happened that he wrote them with too large characters, fo that they were not placed directly under their corresponding notes; he foon perceived his mistake (without the affistance of his eyes) and in order to mend it, he erafed what he had just done, by passing his hand over, and made again lower that musical line with all possible precision.

The

The Prelate to whom we are indebted for these particulars, having placed himself before the Somnambule to be enabled to follow him with more application, observed a very wonderful circumstance: The young clergyman having put in some place of his fermon the words, this divine infant, perceived in reading it over again, that these two words made a disagreeable diffonance, and substituted the epithet adorable instead of the word divine; but that alteration left an imperfection in the phrase, because there was ce adorable enfant; the Somnambule perceiving the error, very dexteroully added a t after ce, so that it was written cet adorable enfant.

Whenever the Somnambule read or corrected what he had written, he took care to put his fingers on the characters that were not yet dry; he made a digreffion to avoid rubbing them: a caution he never took when the letters were not wet.

It is to be observed that the Prelate, in order positively to know whether he made any use of his eyes, had imagined to put a passe-board under his nose; and it was in that position he continued the operations above-mentioned.

There are facts certified in the Encyclopedia itfelf, equally notorious, and above all contradiction; which is no doubt fufficient evidently to prove one of these two points, viz. That the Somnambule can see without the *affifance of his eyes*, or that his sight, exalted to an inconceivable degree, pierces through his eyelids and the opacous bodies.

The memorials of the Academy of Sciences, and the phyficians works, contain a prodigious number of obfervations which plainly confirm the facts hinted, and others of the fame nature. When an explanation of fuch a fingularity is demanded, they all unite to acknowledge the weaknefs of our comprehension, and exhort us to admire what we cannot understand. What Encyclopedia fays on that account well deferves to be related.

count well deferves to be related. "How is it poffible," fays he, "that a man buried in "a *found* fleep thould hear, walk, write, or fee; in a word, "enjoy the exercise of all his fenses, and perform divers "motions with exactness and precision?

"We must freely own there exist many things, the reafon of which we are quite ignorant of, and D "which

" which we cannot penetrate into, nature has its myste-

The author of the fame article, after having mentioned many furprifing facts, which he afferts as inconteftable, makes a judicious farcafm against those pretenders in point of learning, who believe nothing but what they can account for, and will not for a moment fuppose, that there are in nature mysteries impenetrable to their fagacity. Let us now observe the dangerous effect of prejudice.

Whenever the fame phœnomena are repeated by a Magnetical Somnambule, it is infinuated those concerned in them use deceit and fraud, because such phœnomena are contrary to all received notions, and have no instance in nature to authorife a belief. But how is it possible to reconcile such a reclamation with the various examples which have just now been quoted ?

One of the chief objections against Magnetical Somnambulism is, because it offers both *contradictions and inconfequences* with that pretended subtlety of both sense and seel; ing.

It has been observed that those Somnambules, fo difcerning with regard to certain objects, were altogether infensible of others.

For example, fuch a man who dexteroully crolles a row of chairs without touching them, and writes or reads through a pafte-board, fhall not fee whether there are people round him; he will take one thing for another, and fhall not perceive the fraud imposed on him.

But natural Somnambulium's example fully answers that objection, and the fuppofed contradiction, far from being an argument against the reality of Magnetical Somnambulism, better establishes its veracity, since it prefents a degree of refemblance more confistent with natural Somnambulitm.

The natural Somnambule of Encyclopedia well faw his paper and letter through a pafte-board, and yet could not file the very perfor who was placed before him, bufily employed in examining his motions.

The fame Somnambule imagining he was walking-on the border of a river, thought he faw a child falling into the water; immediately he precipitates himfelf on his bed, making

making the fame geftures as a man fwimming, and after having much moved and fatigued himfelf, finding the bed clothes in a heap, he fuppofes it the child, takes it up with one hand and employs the other to return, by fwimming on fhore ; when he thinks himfelf there, he lays himfelf on the bed, and rattles his teeth, conveying the appearance of a man quite wet and cold ; he then afks the byftanders' for a glafs of brandy to warm him, and as they were giving him a glafs of water he perceived the trick, and infifted on having brandy, which, as foon as he has got, he eagerly drinks it, declaring, at the fame time that it does him good.

By that example it is evident that the Somnambule, though deceived by the fight and feeling, had his tafte found and perfect, fince he well knew how to difcernt brandy from water.

Such contradictions being hereditary to natural Somnambules, they fould not be looked upon as extraordinary in Magnetical Somnambules, fince both Somnambulifms are derived from a fecret disposition which, likely, are very near the fame.

I had many times an opportunity of feeing myfelf fuch contradictions, which at first produced in me a great diffidence, becaufe I was not then well acquainted with the fingularities inherent to Somnambulifin.

Two years ago being at the Marquis of Puylegur's I ordered a Magnetical Somnambule, whom he fnewed mc, to take a hat which was lying on a table in the closet, and to go and put it on the head of fome of the company.

I did not express my command in speaking, but only by fign in tracing the line which I gave him to run over, and at the end of which was the hat. The Somnambule, (whofe eyes were covered with a paste-board) got up from his chair, follows the direction fhewn with my finger, advances towards the table, and takes the hat amidft many other objects that were on the fame table; but before he prefented it to the perfon, thinks it civil to brush it; and though there was no brush on the table, he makes the gefture of a man who took one; and holding the hat with his left hand, he brushes it on the three fides with his right hand, puts the imaginary brush on the table, and carries D 2

the

the hat, placing it on the head of the indicated perfon. Though that Somnambule had perfectly fulfilled my intention, I conceived fome diffidence on account of the circumftance of the brufh.

How could that man whofe fight and feeling were feeming perfectly found, not perceive there was no brufn on the table ! How could he miftake himfelf fo far as to think he had one in his hand ?

From thence I inferred, that having committed fo grofs and palpable a miftake, he was far from having the feeling and fight as fubtile as they would give to underftand, and that there was in the reft of his operations more addrefs than fair practice.

The Magnetical Somnambules, whom I have fince feen, have all given me reafon for the fame diffidence, by difplaying contradictions of the fame nature.

But how great was my furprife, when, after having confulted the works, memorials, and relations made on Somnambulifm, I obferved the fame contradictions in natural Somnambules, and that they were alfo an object of great aftonifhment to fpectators; fo what at first teemed to me a motive of fuspicion, became at last a new reafen to ground my perfuasion. "What is inconceivable," fays *Pigatti*, an Italian doctor, (fpeaking of Somnambules) " is, that, " on certain occasions their fenfations are very fubtile, " whilft, on others they are very impenetrable."

I faw in the fame work an infinite number of other Somnambules, which, after having at first shewn a wonderful fubtlety of fensation, feemed the next moment to be entirely deprived of them, by taking one thing for another, and confounding the objects which could claim no analogy to one another.

The most astonishing Somnambule that ever existed, is, without a doubt, *John Baptifl Negretti*, who was both followed and closely examined during five fucceflive nights, by a vast number of people. Mr. Pigatti, who was prefent at those experiments, has given an exact and precise account of them, which is found in the *Journal Etranger*, March 1756.

That Somnambule, having his eyes closely shut, took fnuff out of a box presented to him, came down many large

ftairs

ftairs without groping, hefitation, or even touching, turning and ftopping precifely where he fhould; placed bottles, and glaffes on a fmall pillar which was in his way; went and came into the different apartments without running againft any thing; ftopped at doors which were fhut, and opened them; went to draw water from the well, took out of the buffet napkins, towels, knives, and generally all that was neceffary for a table; and performed many other things no lefs furprifing, too tedious to relate, but-which all fuppofe an exquisite fubtlety in the fight and feeling.

Next to this, are to be feen miftakes, which quite contradict that perfection in the fenfes. After having looked for a light, the Somnambule imagines he has a candle in his hand; without perceiving his error, he thinks he holds a candleftick whilft it is only a bottle; he helps himfelf with that pretended light by carrying it along with him; he draws near the chimney to dry a wet towel, though there is no fire; he falutes the ladies and gentlemen in whofe company he imagines himfelf, whilft there is not any fuch perfon as he fuppofes among those that furround him: He goes to the public-houfe, thinking to be accompanied by a comrade, though there is not fuch a thing; he pours him fome drink, addreffes him, and drinks his health, without perceiving he is alone. When bufy in eating a fallad, they take his plate away to fubftitute a difh of cabbages imbibed with vinegar and cinnamon, unknown to him : they take the laft difh to ferve him with a plate of raw fritters, and he continues to eat; they give him water inftead of wine; at last fomebody jestingly rubbing his legs with a cane, he takes it for the beating of a dog which he fuppofes near him; he falls in a paffion against the dog, looks for him, endeavours to beat him, goes and fetches a whip to chaftife him : after having returned with the whip, fome of the fpectators throw a muff at him; then imagining to lay hold of the dog, he beats him with violenc.

There are contradictions to explain that which ftruck me fo forcibly in the Somnambule of the Marquis of *Puy/egur*, on account of the imaginary brush he thought he held.

There are an infinite number of other examples which might be quoted, and which all tend fully to manifeft that inequality inequality of fenfations and fenfibility obferved in the teveral Somnambules.

The Library of Medicine, vol. x. p. 477. mentions a Somnambule, who getting out of his bed at mid-night, went to a neighbouring decayed houfe, and of which but little remained, faving the bare walls and fome pieces of timber.

The Somnambule mounted to the very top of that house, and jumped from one beam to another, though there was under a profound abyfs.

In the fame work is related a ftory of another Somnambule, who, in the night time dreffed himfelf, put on his boots and fpurs, and then leapt on the border of a window five ftories high, which he miftook for his horfe, and in that pofture agitated himfelf with all the geftures of a cavalier who rides poft.

In the two laft inftances, there is an inexplicable affociation of the moft perfect penetration, with the greateft itupidity. How a man, who had addrefs enough to climb up the top of a decayed houfe, and run on a few weak beams, could not perceive the profound abyfs which lay under? and how he, who dreffed himfelf as a cavalier, put on his boots and fpurs, could take the border of a window for a horfe? To explain those fingularities, the principle of Somnambulis, and that want of organization which at that moment took place in the individual, should be better known.

That induces Mr. *Rehelini*, a cclebrated Italian doctor, author of many observations on Somnambulism, to fay, that we ought to content ourselves with admiring the wonderful effects of that condition which Providence seems to present to the learned, in order to consolut them, and shew the narrow compass of human understanding.

The apparent immobility and infenfibility of Magnetical Somnambules, for whatever is faid or transacted round them, is also experienced in natural Somnambules. He whom I just now spoken of, was quite infensible to the approach of a candle, which almost burnt his eyebrows.

There is likewife in the memorials of the Academy of Sciences for the year 1742, p. 409, a differtation of Mr. de Savage de la Creix on the Somnambulifm of a girl from Mont-

Montpellier, exhibiting a ftriking inftance of the like infenfibility:

"On the 5th of April, 1757," fays the author, "when I vifited the hofpital at ten o'clock in the morning I found the patient in Bed.

" She began to fpeak with a degree of vivacity and wit, " which the never thewed when out of that fituation; the " changed now and then her difcourfe, and feemed to ad-" drefs many of her friends who were affembling round " her bed; what the uttered feemed to bear fome analogy " with what fhe faid in her attack of the preceding day, " wherein having verbatim related an inftruction, in the " way of a catechifm, which the heard the day before, the " made fome moral and malicious applications to the pco-" ple of the houfe, whom the took care to mention under " fictitious names, accompanying the whole with geftures " and motions of her eyes, which fhe had opened: in a . " word, with all the circumstances attending on the ac-" tion done the day before; and yet fhe was in a found " fleep. It was a very awarded circumstance which no one " doubted; but forefeeing I could never prefume to afcer-" tain it, unlefs I had previoufly rendered fome formal ex-" periments, I made them on her fenfes and organs whilft " fhe was in the act of fpeaking.

"At first, as the girl had her eyes open, I thought that "diffimulation, if there was any in the cafe, could not "withstand a flap on the hand, or one given fuddenly on "the face; but this repeated experiment did not either coccasion the least grimace or interrupt her discourse : I had recourse to another experiment, which was to put brickly my finger to her eye, and to approach a lighted "wax candle near enough to burn her eye-brows; but the did not even twinkle on the occasion.

"Secondly, a hidden perfon made fuddenly a great noife in the girl's ear, and repeated it with a ftone againft the bolfter of her bed : at any other time fhe would have been trembling with fear, but then fhe appeared perfecting hybrid inferifible to what paffed.

" Thirdly, I poured in her eyes and mouth fome brandy, and fpirit of ammoniac falt; I even applied on the horny tunicle of the eye, a feather's beard, then the end of

" of my finger, but in vain: Snuff blown up her nofe, " pricking with pins, and fingers extorted, had on her the " fame effect as on a mere machine; fhe never gave the " leaft fign of fentiment."

The 10th vol. of the Medicine's library contains a memorial on a female Somnambule, who was infentible to the blows the received with a whip on her naked thoulders; one day they rubbed her back with honey, and in that condition exposed her in the fun's meridian to the ftinging of bees, which occalioned a great number of blitters on her body, without thewing the least motion in the world : but when the awoke, the feemed to fuffer acute pain in the affected places, and bitterly complained of the hard utage and treament the had met with.

Concerning that woman, I obferved an interesting cirrumstance, which is perfectly conformable to what is now past; it is because the learned and other professions of medicine declined to go and verify the case of that fleeper, under the pretence that such a state contradicted the notions already received in physiclogy.

The author of the relation thus expresses himfelf : "" " The long ftay that woman made at Louvain, gave " every body an opportunity of feeing her, and fcrupul-" oufly examining fo extraordinary a phœnomenon. The " ancient professions in that town looking on the event as a s fable and mere chimera, could not take on themfelves to " increase the number of spectators. It is thus," continues the author, " that prejudice thuts the eyes of men of the " first merit, and hinders them from studying and applying " themfeives to the difcovery of feveral things which might " prove very beneficial to monkind-Laftly," fays the fame author, " the young professors and other physicians in the " town, looking on this phoenomenon with an indifferent " eye, ferioufly enquired into the cafe of that fleeper, and " after a thorough investigation, had every reason to be " fully fatisfied."

It will not be amifs to obferve, that the author of this page is "a phyfician of the faculty at Paris."

Such an infenfibility is true, for the noife which furrounds Magnetical Somnambules does not extend to every kind of noife, fince the Somnambule preferves the facul-

ty

Digitized by GOOGLE

ty of hearing those perfons with whom he is in analogy and harmony.

This diffinction has been deemed, by many, a mere extravagance, as it is not conceivable how, in the fame individual, a faculty could exift which lies open only to fuch a perfon, and open for all others.

But that wonder, repugnant to reason, finds its analogy in natural Somnambulis, wherein Somnambules are seen, who, though deaf to thundering noises and the voice of several people, yet hear very well, and without the least difficulty, another person with whom they keep an exclusive relation, such as *patients*, *nurfes*, or others they have more specially approached, as a *hufband*, wife, or children.

These last have not only the faculty of making themselves heard to a natural Somnambule, but even that of making him speak.

This fingularity is so very remarkable, that many authors complain that certain perfons avail themfelves of fuch a circumstance to catch the fecret of the Somnambule. It is thus that begins the article Somnambule in Encyclopedia:

"Somnambules are frequently feen," fays that article, who, in their fleep relate whatever happened to them in the courfe of the day; fome anfwer the queftions made them, and hold very confiftent difcourfes. There are perfons fo uncandid as to avail themfelves of the condition they are in, " to catch in fpite of them," certain fecrets which it is much their intereft to conccal."

Observe well these expressions " to catch in fpite of " them." This plainly shews the acknowledgment of the formal influence which certain perfons awake can exercise over the Somnambule.

But by fimilar means and proceedings can fuch a relation take place betwixt the perfon awake and the Somnambule? Magnetifers pretend, and infinuate, that the relation is eftablished by mere contact, by touching the Somnambule in the extremities of his fingers or pulfe; or by touching, in a like manner, any body elfe in relation with him; which prefents a kind of refemblance with the loadstone.

They have not failed in exclaiming against this affertion; and when experience has feemingly convinced them of the truth, a deceit has been fulpected on the part of the pretended Somnambul.

E

But

But to what purpose then have they recourse to that pretended reluctance, to admit of so ancient an effect, and long fince well known in the world? A proverbial expression traces us this opinion of old; for, it is well known that most proverbs are but scattered remains of forgotten truths.

But as many performs might refufe fuch authority, we must furnish them with a teltimony given out by the learned themselves, and which fully evinces the efficacy of the proceeding taught Magnetifers.

Henry de Steers, a Flemish physician, certifies, that he knew from his infancy a Somnambule, who, during his fleep, performed wonderful things; among others, he relates that in the middle of night, and during a most profound fleep, he went and took his child out of the cradle where he lay, and then walked over all the house, holding the infant in his arms: his wife, who had accidentally perceived this, afraid of the child, followed her husband ftep by ftep, with an intent of affisting them if occasion required: or, as she had observed that, in that stuation her husband answered all questions she put to him, and took the freedom of interrogating him on the most fecret things she wanted to know.

The author observes that the husband was in day-time very circumspect with his wife on his perfonal affairs, which he affected to conceal from her : but being interrogated by his wife, when in a flate of Somnambuilism, and "holding his child in his arms," then, faid the author, he plainly answered all the questions put to him by his wife, who followed him, and " then had nothing concealed " from her," and was often furprifed to hear her fpeaking of things which he thought were only known to himself. Vide Library of Medicine, vol. x. p. 463.

The testimony of a respectable author ferves first to confirm that influence spoken of in the Encyclopedia, which lies in certain perfons " to oblige the Somnambule to speak " and declare those very thing which it was his inte-" rest to conceal." It also confirms the possibility of finding out a means to establish a *relation* between the perfon who is awake and the Somnambule.

The Somnambule we were fpeaking of, was in no relation with his wife, from the moment he entered into the flate of Somnambulifm;

Somnambulifm; to eftablifh a communication, it was neceffary he fhould have had his child in his arms. Laftly, obferve, that the circumftance of having his child in his arms, perfectly anfwers the proceedings pointed out by the Magnetifers. The child, placed in his father's arms, and on the other hand fupported by the hands of a trembling mother, eftablifhed a relation between the hufband and wife, through the communication and analogy he bore to each of them.

Thus, that altonifhing marvel, againft which phyficians have fo much inveighed as a mere chimera, a fable, a fraud, has, long ago, been attefted by one of their authors, who confirms in the most precife manner what Magnetifers had advanced.—It is eafy to perceive that Magnetifers, by putting themfelves in harmony with Magnetical Somnambules, do nothing elfe but procure themfelves that intimate analogy, of which inftances are to be found in natural Somnambulifm, and into the principle of which they have neglected to enquire.

As to the faculty the Magnetifers pretend to be endowed with, to direct the Somnambule's motions, by making him go from the right to the left, forwards and backwards; in a direct and circulary line, after the manner of a loadítone, in the prefence of the Carupeas, that faculty is a neceffary confequence of what has been faid before; and after having admitted and acknowledged the power " of making a Som-" nambule fpeak againft his will, and declare those very " things he has a material intereft to conteal," ought not have any great objection to admit the faculty of directing his motions.

An inftance quoted by Kaau Boerhaave, will afford an idea of the aftonishing fubjection which a man is liable to with regard to another perfon with whom he is in affinity.

That author fpeaks of a man who had the whim quickly to enter in affinity with all those whom he approached.

After a few moments, his body acquired a fympathetical flexibility which forced him to imitate, with precifion and rapidity, all the motions he perceived in the perfon he had fixed upon, as, " to move his eyes, lips, hands, arms, " feet, to cover or uncover his head, walk, &c." and all this in fpite of himfelf, and through the influence of a fuperior force, which prompted his fympathetical organs to act with those of ethers.

It

(

It was an amufement to hold his hands in the prefence of any one who happened to make geftures, and then he was extremely agitated, continually ftruggling and endeavouring to fet himfelf at liberty.

If any kind of fentation was required of him, he was in those moments constrained, and answered he had the head or heart ach.

Boerhaave adds, that in confequence of that odd kind of organization, he was obliged to go in the ftreet with his eyes clofely fhut, and that he was a very troublefome member of fociety.

The example of fuch a fympathetical fentibility may ferve to diminifh the improbability, of the affinity and relation which Animal Magnetifm feems to eftablifh between the patient and the Magnetifer; and it is on that account that Kaau Boerhaave certifics, that a man can, by the means of fuch an affinity well eftablifhed, become "a god for another "man," by making him fubfervient to his will and pleafure. Sie homo homini Deus eft.

We read in the work of the Marquis de Puyfegur, entitled, " Memorials to ferve for establishing Animal Mag-" netifin," many observations of that nature, concerning the patients he had put in a state of Somnambulism.

The very first perfon, whom, to his great astonishment he put in that state, was in such perfect assimity with him, that he exactly followed all his motions, and loudly repeated every air which the Marquis internally fang.

That fingularity which at first appeared incredible, acquires (notwithstanding the high character of the author) a new degree of authority from the above related examples, and the testimony of the authors, who have spoken of that kind of sympathetical influence.

The proceedings made ufe of by Magnetifers find likewife their analogy and authority in natural Somnambulifm.

Mr. Figati was used to put an end to the flate of Somnambulifm, by lightly pailing the extremity of his fingers over the Somnambule's cyc-lids. It is exactly the method used by Magnetifers. We read in the work of the Marquis de Puyfegur, that he made, at his pleasure, a patient change his conversation, by deterring him from fad objects, and

Digitized by GOOGLE

and prefenting him with fome of a more confoling nature,

"When I thought," fays the author, that his thoughts ought to affect him in a difagreeable manner, I ftopped him, and tried to infpire him with agreeable ones, which I eafily did, and then faw him perfectly pleafed, and imagining that he either aimed at fome prize, or danced at an entertainment. I united those thoughts in him, and by that means forced him to move himfelf in his chair, as in imitation of dancing, &c."

Those phoenomena have been suffected, though they are fully confirmed by the Encyclopedia in the article of Somnambule.

The author of that article, relating a number of wonderful facts in the Somnambule mentioned, continues thus :

"The fame Somnambule has furnished us with a great "number of extraordinary facts: but those which I have "related are fufficient to my purpose. I shall therefore "only add, that whenever I had a mind to make him "change his discourse, leave off fad and disagreeable sub-"jects, it was sufficient to pass a pen over his lip, and "immediately he discussed quite different question."

That conformity betwixt both recitals, ferves to confirm the one by the other; and if, after that double testimony, any one is authorized to perfevere in his furprize, he is ftill more fo to perfevere in his fuspicions.

To conclude, the last proof of refemblance between the two kinds of Somnambules is, that of waking: they both entirely forget whatever they have either done or faid during their fleep.

I could, by extending fuch difcuffion, account for the communication of thoughts, without the affiftance of either voice or figns, it being eafy to fhew that this fingularity is not more difficult to be underftood than the other; that it has been fufpected by ancient phyfiologifts; and even mentioned in modern works of celebrated phyficians; but I think it ufelefs to expatiate any further on a phœnomenon with which the different minds are not as yet grown familiar enough.

My object is, by no means, to write a complete work wherein the fubject of Magnetical Somnambulifm floudd

be

be fully difcuffed. I only meant to elucidate fome ideas, and to encourage judicious perfons to inveftigate the matter, excite their reflections, and provoke in them a philofophical doubt, and laftly, to encourage them to contribute, by inveftigation and obfervations, to refolve a problem no lefs interefting to mankind than conducive to the im-

In my next I shall give an Essay on the Theory of Somnambulism.
